ℂ - Use Float & Needle Seat Modification Kit, Part No. 7022705.

STROMBERG WWC 2-BARREL (CHRYSLER & DODGE) CARBURETORS

CHRYSLER & DODGE	Str mb rg Cod No.
Chrysler Newport 361" Eng.	WWC 3-201
Dodge Custom 880 361" Eng.	WWC 3-201

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 CARBURETOR LEAN CONDITION CORRECTION:* A lean road load performance condition can be corrected by installing .066" jets to replace the standard .065" jets. *CAUTION - Do not use Stromberg Part No. 38811-68 or 69 j ts. Th se ar for earlier carburetors and must not b us d on 1962 models.*

►*HARD COLD WEATHER START CORRECTION:* Hard starting may be caused by choke piston sticking. To correct, remove gum formation by removing air cleaner and squirting carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke to flush out gum formation.

DESCRIPTION: 2-Barrel downdraft type of same design as previous models.

ADJUSTMENT: Make all adjustments as follows:

Idle Setting: For initial setting, turn idle mixture screws 1-1½ turns open from a lightly seated position, then bring engine to normal operating temperature with choke fully open and fast idle inoperative.

Idl Sp ed – 500 RPM with transmission in "N" (Neutral). *NOTE – 550 RPM with air conditioning compressor operating (if s equipped).* Adjust idle speed with throttle stop screw on throttle body casting.

Idl Mixtur – Turn both idle mixture screws in equally until engine begins to run rough, then turn screws out until engine rolls (from rich mixture). Now turn screws in to a point about halfway between these two positions where smoothest idle is obtained. *NOTE – Both screws must turn equally.* Recheck idle speed.

Fast Idl Sp d (On Car): With engine at normal operating temperature and fast idle screw on TOP step of fast idle cam, adjust fast idle screw to obtain an engine speed of 1400 RPM.

Fast Idle (Off Car) & Cam Position Adjustment: Back throttle. stop screw out far enough to clear throttle lever tang when throttle valves are closed, then hold throttle valves in closed position. Turn fast idle screw out so it can be positioned on **second step** of cam (against top step), and **turn fast idle screw in 3½ turns.** Distance between edge of choke valve and air horn should be 15/64". To adjust, bend fast idle rod at upper angle.

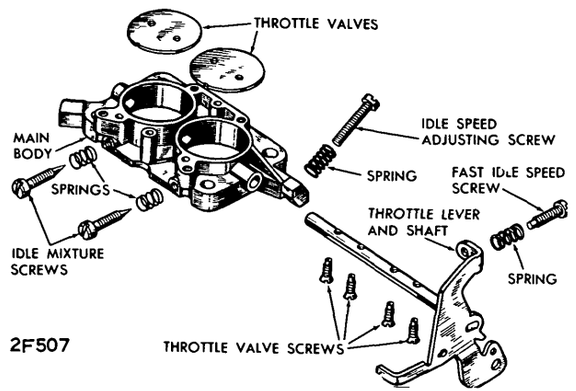
Unloader: With choke valve held lightly closed, open throttle valves to wide open position. Clearance between top edge of choke valve and wall of air horn should be 15/64" (use a 15/64" drill to measure). To adjust, bend tang (long narrow extension) on throttle lever. Make sure throttle valves fully open and close when choke valve is wide open.

Accelerating Pump: With throttle valves fully closed, pump travel from fully closed to fully open positions should be 9/16", measured at small raised boss near connecting rod end of pump lever. To adjust, bend pump rod at right angle bend. *NOTE – Pump rod must be installed in center slot of pump arm.*

Bowl Vent Valve: With idle speed screw backed out, hold throttle valves in closed position and choke valve wide open. Opening of vent valve at center of hole, with rubber valve hanging free, should be 5/64". To adjust, bend bowl vent lever (extension of accelerator pump lever).

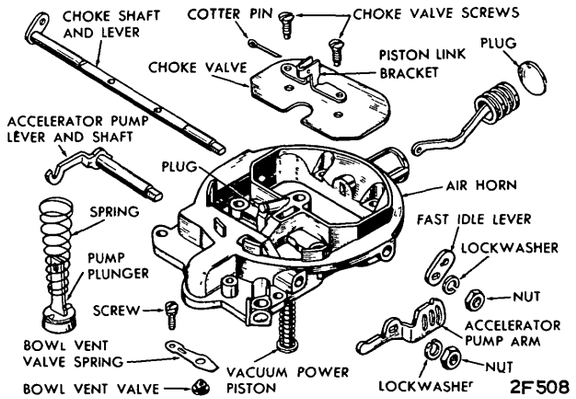
►*CAUTION: Make sure th v nt valve is not distort d and that it properly seals the bowl vent hole when throttle valve is open.*

Choke Vacuum Piston: Remove welch plug from choke piston cylinder and insert a hook gauge (.036" to .040" diameter) into slot in cylinder wall. Rotate hook end so that it engages end groove in piston. Apply light closing pressure against choke valve so that hook gauge is gripped between groove in piston and end of slot. With choke piston in this position, a .170" drill (No. 18) should fit between choke valve and air horn. To adjust, bend bracket on choke valve.



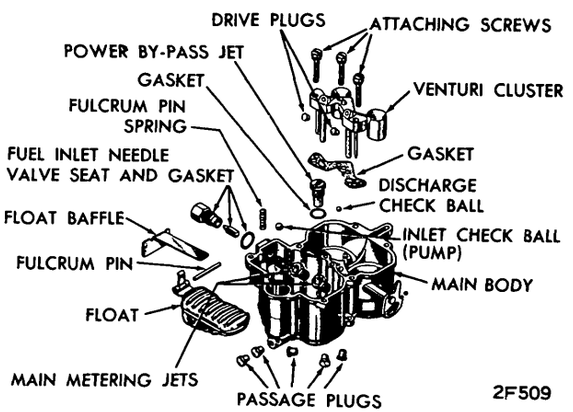
Float Level: With float installed in float bowl and lip of float held against inlet needle, distance from top of float at center to top of float bowl (gasket removed) should be 1/8". Use Gauge 73725 or "T" scale. To adjust, bend lip of float with Tool 73605.

►*FLOAT LEVEL CHECKING NOTE:* With carburetor installed on engine, the air horn can be removed as follows: Remove three short air horn-to-main body attaching screws, then remove one long air horn-to-throttle body screw next to fuel bowl. Assemble a short screw through main body flange and thread into throttle body. Remove long screw from side away from fuel bowl and on opposite side, then assemble a short screw through main body flange. Securely tighten the short screws, then remove remaining two long screws and lift off air horn. Assemble air horn to main body by reversing removal procedure.



Automatic Choke: Cross–Over type mounted in well in intake manifold. *See "Stromberg (Cross–Over) Typ Automatic Choke".*

Setting - 1 Point Lean (Chrysler); 2 Points Rich (Dodge).



OVERHAUL: *See 1960 Final, Page 310, or later Manual edition.*

THROTTLE BODY (EXPLODED VIEW)

AIR HORN (EXPLODED VIEW)

MAIN BODY (EXPLODED VIEW)

STROMBERG WW 2-BARREL (DODGE & PLYMOUTH) CARBURETOR

DODGE DART & PLYMOUTH	Stromberg Code No.
1962 318" Eng. (Synchro-mesh)	WW 3-198
1962 318" Eng. (Auto. Trans.)	WW 3-199
1962 318" Eng. (All Trans.) (CCV)℄	WW-3-200

℄ - Closed crankcase ventilation.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 DODGE & PLYMOUTH STUMBLE OR SURGING (DUE TO LEANNESS) CORRECTION (AUTO. TRANS. CARS WITH WW 3-199 CARB.):* Replace standard .051" jets with .052" jets. *NOTE - In extreme cases, use .053" jet.* Make sure float level is properly adjusted.

►*1962 DODGE & PLYMOUTH STUMBLE ON ACCELERATION OR ENGINE DYING DURING WARM-UP CORRECTION:* This condition may be caused by a bent accelerator pump rocker arm. Check to make sure the rocker arm is not bent in its center section adjacent to pivot screw. *The center section of rocker arm, between normal bends at outer ends, must be straight.* If straightening pump rocker arm does not provide specified bowl vent opening, bend pump operating rod. *(See "Accelerating Pump & Idle Vent Adjustment" below).*

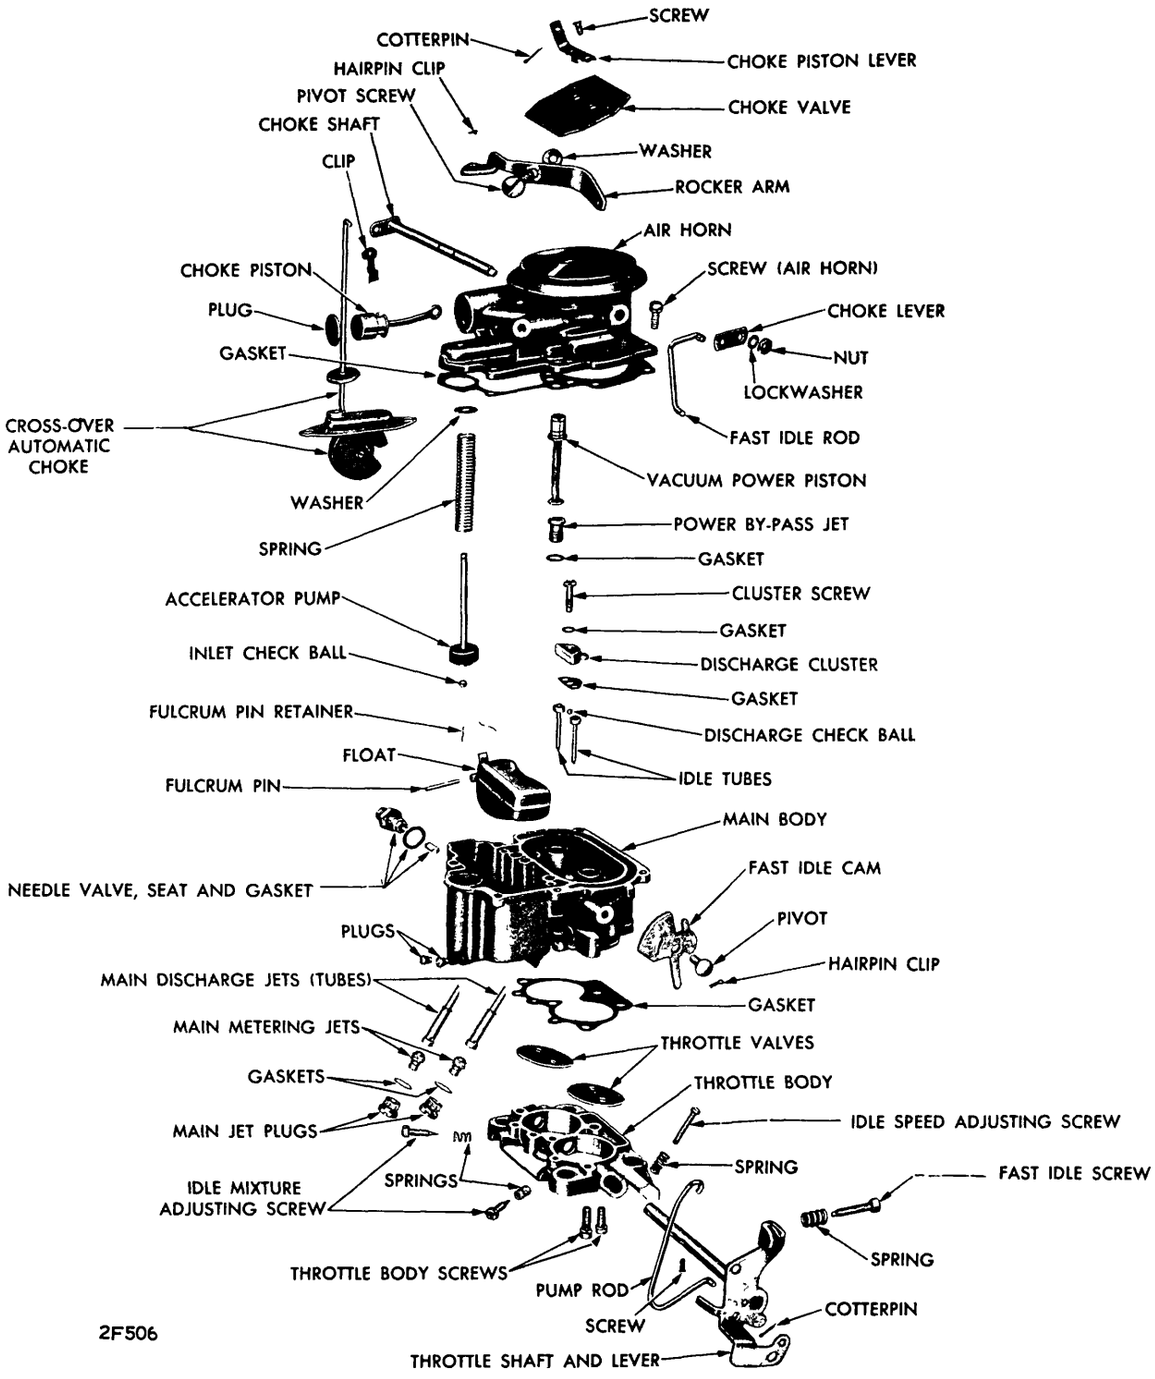
►*1962 DODGE & PLYMOUTH HARD COLD WEATHER START CORRECTION:* Hard starting may be caused by choke piston sticking. To correct, remove gum formation by removing air cleaner and squirting carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke

DESCRIPTION: Dual downdraft type of same design used on previous models. Automatic choke is "Cross-Over" type mounted in a well in intake manifold and connected to choke shaft lever by linkage.

ADJUSTMENTS: Make all adjustments as outlined below.

►*DODGE & PLYMOUTH IDLE SETTING CAUTION:* When making idle speed and idle mixture adjustments, turn headlights on to high beam to compensate for alternator load. On automatic transmission cars, loosen nut on sliding link of carburetor-to-bellcrank rod so transmission internal stop will not interfere with carburetor throttle lever. When adjustments completed, move sliding link to rear against its stop and tighten locknut.

Idle Adjustment: For initial adjustment, turn idle mixture screws 1¼ turns open from a lightly seated position. Bring engine to normal operating temperature with choke valve wide open and fast idle inoperative. Set engine idle speed (see below), then adjust idle mixture.



Idle Mixture - Turn both idle mixture adjusting screws in equally until engine begins to run roughly from a lean mixture. Then turn screws out until engine rolls from rich mixture. Now set screws about half way between these positions where smoothest idle is obtained. Recheck idle speed.

Idle Speed - Adjust by turning throttle stopscrew located on boss on throttle body for desired speed as follows:

Car Model	Idle Speed Setting Engine Speed
Dodge & Plymouth	℄ ℗ 500 RPM

℄ - 550 RPM on Air Conditioned cars.
℗ - Headlights turned on.

CONTINUED ON NEXT PAGE

STROMBERG WW (DODGE & PLYMOUTH) DOWNDRAFT CARBURETOR WITH CROSS-OVER CHOKE

STROMBERG WW 2-BARREL (DODGE & PLYMOUTH) CARBURETORS (Cont.)

Fast Idle (On Car): With engine at normal operating temperature and fast idle adjusting screw contacting top step of fast idle cam, adjust engine speed to 1250 RPM.

Float Level (Dodge & Plymouth): *NOTE - Fuel inlet needle is rubber tipped. Do not allow more than weight of float to rest on needle when checking float level.* Invert float bowl and check distance between surface of fuel bowl (gasket removed) and top of float at center with Gauge 73725 or a "T" gauge (Scale). This measurement should be 7/32". To adjust, hold float at bottom of bowl and bend tang on float as necessary. *CAUTION - When bending float tang, do not allow tang to push against needle. When float is correctly set, float tang should be perpendicular to needle or slanted not more than 10° away from needle.*

►*ADJUSTMENT NOTE: Make following adjustments in the order indicated.*

Fast Idle (Off Car) & Cam Position Adjustment (Dodge & Plymouth): Back throttle stop screw out far enough to clear throttle lever tang when throttle valves are closed, then hold throttle valves in closed position. Turn fast idle screw out so it can be positioned on **second step** (against top step), and **turn fast idle screw in 7½ turns.** Distance between edge of choke valve and air horn wall should be 13/64". To adjust, bend fast idle rod at upper angle.

Unloader (Dodge & Plymouth): Close choke valve lightly, then fully open throttle valves. Clearance between choke valve and wall of air horn should be 15/64" (No. 1 drill). To adjust, bend tang on throttle lever.

Choke Vacuum Piston (All Models): Bend a .040" wire gauge so it will engage slot at bottom of choke vacuum piston cylinder, then with gauge in place, lightly close choke valve until inner end of piston grips gauge at end of slot. Measure choke valve opening or clearance between upper edge of choke and air horn wall using a gauge or drill rod. Clearance should be 21/64" (Auto. Trans.); 13/32" (Synchro-mesh). To adjust, bend ear on piston lever.

Accelerating Pump & Idle Vent (Dodge & Plymouth): *NOTE - This is a combination adjustment. Accelerator pump travel is automatically set when bowl vent is properly adjusted.* Back off idle adjusting screw and open choke valve so that when throttle valves are closed, fast idle screw will not contact cam. Place pump rod in center hole in throttle lever and pump vent clip (located on pump stem under bowl vent valve) in center notch. With throttle valves closed tightly, clearance between bowl vent and bowl vent seat should be 5/64" (pump travel should measure 9/32"-5/16"). To adjust, bend pump rod at lower angle.

►*DODGE & PLYMOUTH ACCELERATING PUMP ADJUSTMENT CAUTION: If pump rod is moved to either the short or long stroke position, a corresponding change must be made in location of bowl vent clip, and the amount of lift of bowl vent rechecked and adjusted.*

Automatic Choke (Dodge & Plymouth): "Cross-Over" type mounted in well in intake manifold. *See "Stromberg Cross-Over Automatic Choke".*

Setting - Centered (At Index).

OVERHAUL: *See 1958 Final Data, Page 294, or later Manual editions.*

STROMBERG WW 2-BARREL (STUDEBAKER) CARBURETORS

STUDEBAKER	Stromberg Code No.
V8 Engine	WW 6-127, 127A
V8 Engine (CCV)℄	WW 6-128

℄ - Closed Crankcase Ventilation.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 ENGINE SURGE (UNDER LOAD AT 30-50 MPH) CORRECTION:* This condition may be caused by a lean condition and can be corrected by installing .055" main metering jets to replace the standard .054" main metering jets. On cars with closed crankcase ventilation, install accelerator pump link in the long stroke position in addition to the larger main metering jets.

►*1962 AUTOMATIC CHOKE STICKING CORRECTION:* Replace choke rod with later type choke rod, Part No. 1555388. Check all other components of choke assembly for proper operation.

DESCRIPTION: 2-Barrel downdraft type similar to previous models. Automatic choke housing is mounted on throttle body and is connected to choke shaft lever by linkage.

ADJUSTMENT: Make all adjustments exactly as detailed below.

Idle Setting: For initial setting, set idle adjusting screws (located in throttle body below float chamber) 1¼ turns out from a lightly seated position. Bring engine to normal operating temperature with carburetor air cleaner in place, choke fully open, carburetor off fast idle.

Idle Speed – 550–600 RPM with selector lever in "N" on Flightomatic cars. Set idle speed by turning throttle stopscrew located on boss on throttle body until correct speed is obtained.

Idle Mixture – Turn both screws in equally until engine begins to run roughly from lean mixture. Then turn screws out until engine rolls from rich mixture. Now set screws about halfway between these positions where smoothest idle is obtained. Both screws must be turned equally. Recheck idle speed.

Accelerating Pump: No seasonal adjustment. Three holes provided in throttle lever for pump connector rod engagement.

Center Hole – Normal operating conditions.
Upper Hole – Shorter stroke, less fuel discharge.
Lower Hole – Longer stroke, more fuel discharge.

Float Level: 3/16" from top of float to top of main body with air horn and gasket removed. Use Gauge J–7477. Top of float should just touch gauge. To adjust, bend float lip.

Fast Idle: With choke valve closed and high step of fast idle cam touching fast idle screw, adjust fast idle screw so that a .030" gauge wire can be inserted freely between throttle valve and throttle body on idle port side.

Fast Idle Cam: Place fast idle screw on highest step of fast idle cam, then close choke valve until fast idle rod contacts upper end of slot in fast idle cam. With choke valve in this position, clearance between top edge of choke valve and air horn wall should be 9/64" (Gauge J-9598). To adjust, bend fast idle rod.

Unloader: To check setting, hold choke valve closed lightly, then open throttle valve to wide open position so throttle lever stop rests against throttle body stop. Clearance between choke valve and wall of air horn should be .196" (Gauge J-7477). To adjust, bend ear on throttle lever.

Choke Vacuum Piston: Open choke valve and place end of .040" wire gauge in inner end of choke piston housing slot. *NOTE - Bend wire as necessary to insert int choke piston housing from within air horn.* Close choke valve until end of wire gauge is gripped between skirt end of vacuum piston and end of slot. Clearance between top edge of choke valve and wall of air horn should be .228" (Gauge J-9598). To adjust, bend piston lever bracket on choke valve.

Choke Thermostatic Spring Operating Lever: With thermostatic coil cover assembly removed, and with choke valve closed, distance between top of tang on thermostat lever and center of screw hole directly above lever should be 1 3/32". To adjust, bend rod connecting thermostat lever to lever on choke shaft.

Automatic Choke: Centered (At Index). To change setting, loosen cover screws and rotate cover as necessary.

OVERHAUL: Disassembly - 1) Remove accelerating pump lever (pivot screw has left hand thread) and unhook from pump rod. Remove cotter pin from lower end of pump rod and remove rod from throttle shaft lever. Disconnect fast idle rod from fast idle cam, then disconnect upper end of choke rod from choke shaft lever.

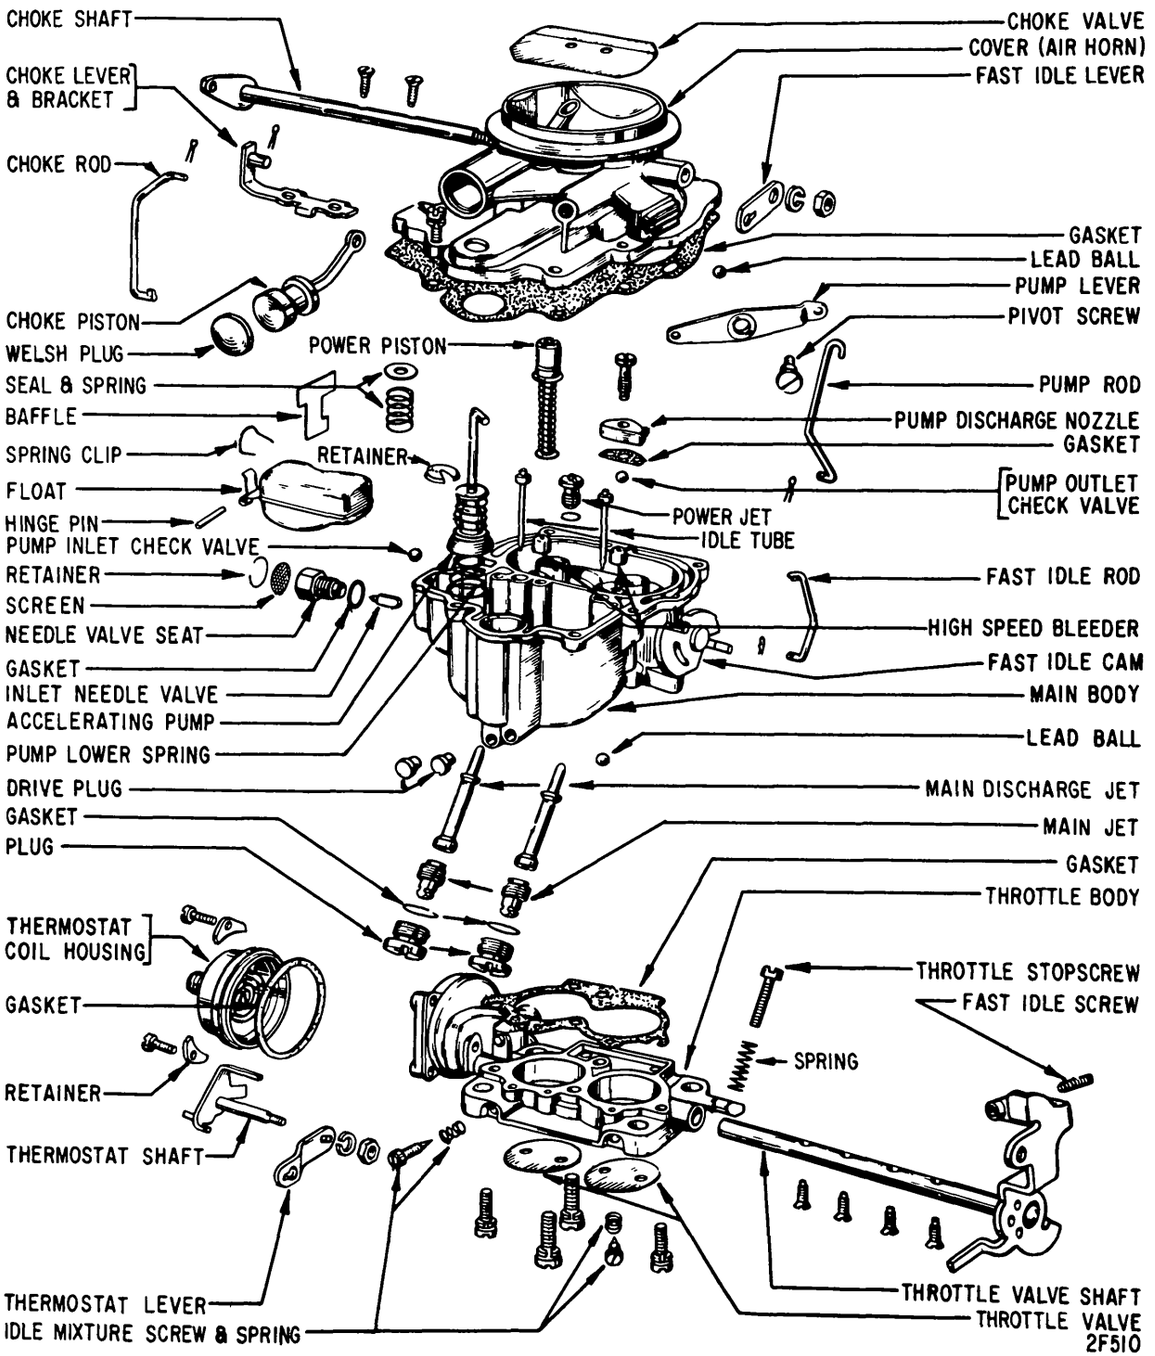
STROMBERG WW 2-BARREL (STUDEBAKER) CARBURETORS (C nt.)

2) Remove cover assembly from main body, then remove accelerating pump spring from end of pump plunger (spring may remain in pump cylinder). Remove accelerating pump piston from cover and disassemble pump by removing flat washer and retaining spring from pump rod. Remove pump duration spring by depressing spring and slipping retainer out of groove in piston rod. Remove cover gasket, then remove staking from around vacuum power piston retaining washer and remove vacuum power piston.

3) To remove choke vacuum piston, use a sharp awl to remove welch plug, then remove cotter pin from choke piston lever at choke valve bracket and remove piston and connecting rod assembly. To remove choke valve shaft, remove fast idle lever from choke shaft, then remove valve retaining screws and choke piston lever and bracket. Remove choke valve and choke lever.



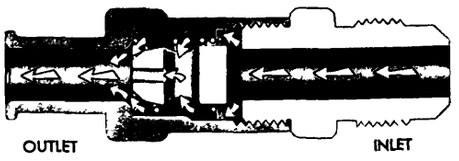
4) Remove thermostat cover and gasket. To remove thermostat spring operating lever and shaft assembly, remove lower choke rod lever retaining nut and washer and slip operating lever and shaft assembly out of choke housing.

5) Remove idle tubes from carburetor body, then tip main body and remove inlet check ball from accelerating pump well. Invert bowl assembly and remove throttle body retaining screws and lockwashers, then separate main body from throttle body. Remove main metering jet plugs and gaskets, then use Tool J-1561 to remove main metering jets; and Tool KMO-269-S-4 to remove main discharge jets. Remove pump discharge nozzle and gasket. Place a hand on top of main body, invert the body, and catch pump outlet check ball.

6) Remove inlet pipe fitting and remove screen retainer and screen. Remove needle valve, seat, and gasket. Remove baffle from main body assembly, then remove spring float retainer, float pivot pin and float. Remove power bypass jet and gasket. Remove idle mixture adjusting screws and springs. If it is necessary to remove throttle valves and shaft because of damage or wear, mark each throttle valve and place corresponding marks on throttle body to insure installation in original location. Remove throttle valve retaining screws and remove throttle valves, then pull shaft out of throttle body.

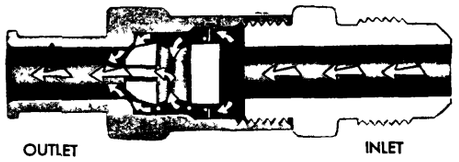
Cl aning & Inspection: Wash all parts with a suitable carburetor cleaner and rinse with solvent. Dry all parts with air and blow out all passages. Replace all damaged or worn parts and use new gaskets at reassembly. *NOTE - Do not clean carburetor cover ass mbly with cleaner or solvent unless choke vacuum piston is removed (liquid can be trapped in cylinder and passages and prev nt pr p r p rati n).*

R ass mbly: Reverse disassembly procedure.



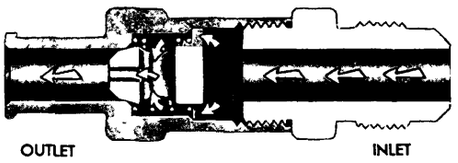
STROMBERG WW 6-127 & 6-128 (STUDEBAKER) CARBURETOR

CLOSED CRANKCASE VENTILATION (EXCEPT OLDSMOBILE F-85 JETFIRE)



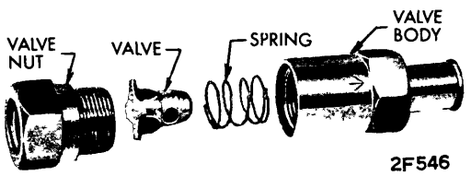
DESCRIPTION: Closed crankcase ventilation systems utilize vacuum in intake manifold to remove unburned gases from engine crankcase and return them to the combustion chambers to be burned. This unit which consists of a check valve, hose, and carburetor adapter or carburetor connection, replaces the conventional crankcase ventilator tube.

OPERATION: The crankcase vent valve assembly automatically meters flow of gases so that normal operation of engine is not disturbed. Under high vacuum conditions such as at idle or during deceleration, the valve is held closed and only small amounts of gases are allowed to pass through a metered orifice and into intake manifold. During periods of low vacuum in intake manifold, a spring holds the valve open and larger amounts of gases pass through to intake manifold. Fuel vapor is prevented from entering crankcase by the crankcase vent valve which is held closed by any reverse air flow.



SERVICING: See table below for servicing intervals. *NOTE - Indicated intervals are for normal operation. If car is operated under low temperature conditions; in "stop and go" service, or in dusty areas, ventilation system should be cleaned or serviced more frequently. A clogged system will result in erratic idle speed, stalling at low speed, or stumble on acceleration.* Remove ventilator hose from connections and blow out with air (replace hose if necessary). Remove crankcase vent valve and disassemble by unscrewing connector and removing check valve and spring. *NOTE - A "crimped type valve assembly is used on Pontiac V8 and Pontiac Tempest 4 Cyl. engines. These valves cannot be disassembled and must be replaced with new ones at the indicated intervals.* Clean all parts in solvent or carburetor cleaner and blow dry with air. Clean out metering orifice using a suitable size drill to remove varnish and carbon accumulation. *CAUTION - Do not enlarge metering hole.* Inspect all parts for damage or excessive wear and replace valve if necessary. Install spring on valve until spring is properly seated in groove in valve, then place valve and spring in valve body and install connector. *CAUTION - Do not stretch or distort valve spring.* If damaged, replace assembly. Clean crankcase and intake manifold (or carburetor) connectors. Clean crankcase oil filler cap in solvent and blow dry with air. *NOTE - On Lincoln models, install new oil filler cap.* Reinstall ventilating system.

LOW VACUUM



INTERMEDIATE VACUUM

HIGH VACUUM

Rambler	10,000 miles
Studebaker	10,000 miles
Willys	④

① - If car is operated in cold temperature, "stop & go" service or in dusty areas, clean system more frequently.
② - Service at time of engine oil change.
③ - See "Cadillac Note" above.
④ - At each tune-up, overhaul, or as required.
⑤ - Vent valve cannot be disassembled, Replace unit.
⑥ - Every 12,000 miles or 12 months

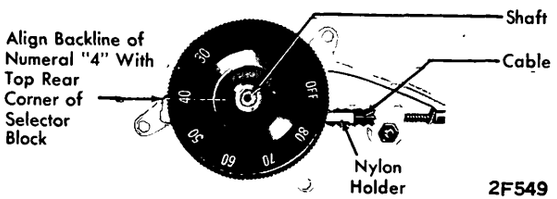
OLDSMOBILE F-85 JETFIRE CLOSED CRANKCASE VENTILATION

DESCRIPTION: Vacuum diaphragm type ventilator check valve located on left hand rocker arm cover controls flow of crankcase vapors between crankcase breather cap and intake manifold and air cleaner.

OPERATION: At idle, and low engine RPM, crankcase vapors are drawn into intake manifold from crankcase side of diaphragm valve (valve is closed) through a small tube connected to carburetor throttle body. At higher engine RPM, air flow through carburetor air cleaner snorkel opens diaphragm valve allowing major portion of crankcase vapors to be drawn through large tube into air cleaner. Orifices in breather cap assembly control this flow.

2F562

OLDS F-85 JETFIRE POSITIVE CRANKCASE VENT VALVE



SERVICING: Every 10,000 miles, remove hoses and blow out with air. Remove diaphragm check valve assembly and clean in kerosene. *NOTE - Diaphragm check valve cannot be disassembled.* Install valve and hoses.

CRUISE CONTROL & AUTOMATIC SPEED CONTROL

Cadillac (1962)
Chevrolet (1962)
Lincoln (1962)
Mercury (1962)

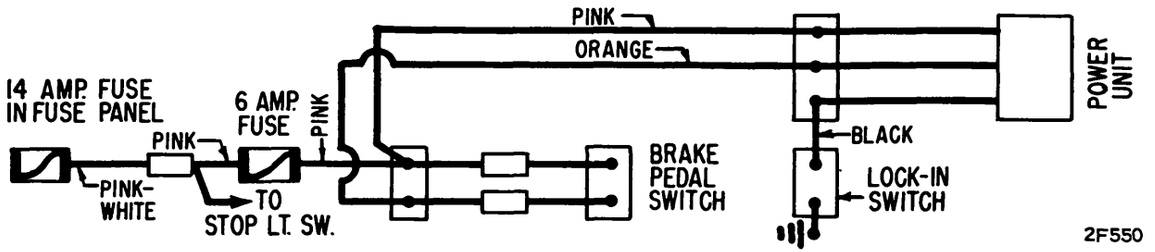
►CHANGES, CAUTIONS, CORRECTIONS

►*1962 CADILLAC CRUISE-CONTROL FAILURE TO "LOCK-IN" FOR AUTOMATIC SPEED CONTROL:* Make sure the brake stop light switch is not faulty or is not out of adjustment. If switch circuit is normal, the probable cause of "no lock-in" is a broken spring washer in the speed selector shaft which results in a poor ground. To check for a broken spring washer, disconnect negative cable at battery, then disconnect speed selector control cable from regulator. Remove screws retaining upper instrument panel cover to lower panel, then remove left windshield reveal molding. Remove screws at speed selector control panel, raise upper instrument panel and move extension panel away from its mounting far enough to disconnect light bulb wire at its connector. Check to see if a cadmium plated spring washer is used under the retainer in the speed selector shaft. If so, replace cadmium washer as follows: Remove selector control-to-extension screws and pull control cable through grommet in firewall. *CAUTION - Do not remove control cable from selector head.* Remove selector dial, then lay dial end of selector shaft against a wooden block and tap the base of three or four retainer prongs with a sharp punch to loosen retainer. Remove retainer and spring washer. Install a new spring washer, Part No. 1479947 and a new retainer, Part No. 1479948 on selector shaft and tap into place with a 5/16" I.D. sleeve. Set dial on shaft without the hold-down screw, rotate counter-clockwise as far as possible without forcing, then rest dial on shaft so that backline of the numeral "4", when in a horizontal position, aligns with top rear corner of selector block and install dial retaining screw. *CAUTION - This alignment is very important, as it calibrates speed setting of selector dial with speedometer. See illustration.* Reassemble selector assembly to car and adjust control cable.

CADILLAC CRUISE CONTROL SELECTOR ADJUSTMENT

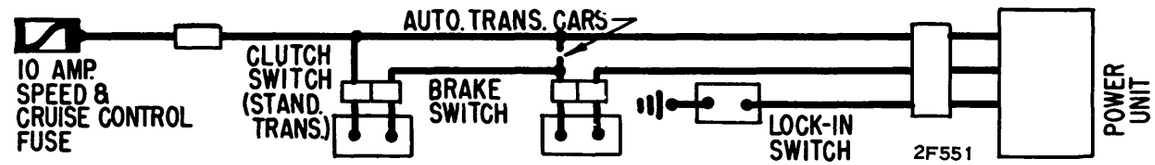
DESCRIPTION: Electrically controlled speed warning devise and automatic speed control of same design used on previous models.

TROUBLE SHOOTING & DIAGNOSIS: *Same as for 1959 Cadillac Cruise Control. See 1959 Annual Data, Page 259, Chilton's Manual edition.*



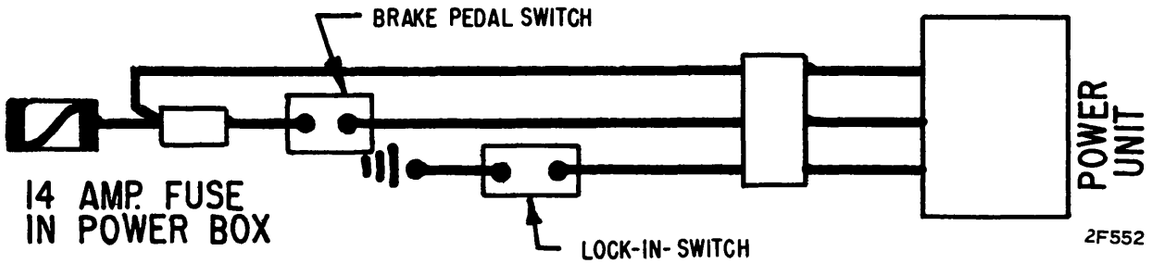
ADJUSTMENTS: Accelerator Linkage (Cadillac) - With transmission throttle control rod properly adjusted (see "Carburetor" on Car Model page), start engine and operate at slow idle speed with transmission selector lever in "P" (Park) or "N" (Neutral). Remove cotter pin securing accelerator linkage trunnion on locking arm plate, remove washers, and separate linkage from locking arm. Insert Locking Arm Gauge, J-7652, over stop stud and hold locking arm plate securely against gauge. Turn trunnion on accelerator linkage until it aligns with and enters hole in locking arm plate freely, then install washers on trunnion and connect trunnion to locking arm plate. Install cotter pin and remove gauge.

Chevrolet - Remove cotter pin from swivel and remove swivel from regulator lever, then start engine and run at slow idle speed. Insert gauge pin *(NOTE - This is a .0625" pin furnished with accessory package)* over gauge bolt (located on housing adjacent to regulator lever) and hold regulator lever securely against gauge pin. Adjust swivel on long regulator rod until it will assemble to regulator lever. Replace swivel and cotter pin, then remove gauge pin.



Lincoln & Mercury - Remove cotter pin from accelerator linkage and pull linkage from exterior arm, then start and run engine until it operates at slow idle. Insert gauge pin over gauge bolt and hold exterior arm securely against gauge pin. *NOTE - Gauge pin is made from a 2" length of 5/16" copper tubing, and is supplied in Speed Control Kits.* Adjust swivel on throttle linkage until linkage will assemble to exterior arm. Replace linkage and cotter pin and remove gauge.

Control Cable: Cadillac - Loosen setscrew on end of dust shield and work control cable back and forth making certain that ferrule end of cable is free to move when dial is rotated. Rotate selector dial backward to "Low" position, as far as it will go without forcing it. Carefully insert ferrule back into dust shield without forcing, until ball socket just bottoms in housing. *NOTE - After positioning ferrule in dust shield, recheck selector ferrule in dust shield, recheck selector dial to be sure it is in extreme "Low" position.* Tighten setscrew securely on end of dust shield, being careful not to change cable position when tightening.



Chevrolet, Lincoln & Mercury - Turn selector knob counterclockwise as far as it will go without forcing, then hold dust shield so it will not rotate and unscrew clamp nut. Let clamp nut slide down cable. *NOTE - this nut holds control cable from bottom of dust shield.* Pull control cable out of dust shield until ferrule at end of cable is free from bottom of dust shield. *NOTE - If ferrule is tight in dust shield, carefully pry the four fingers apart until ferrule slides out freely. In some cases it may be necessary to unscrew the dust shield from unit in order to pry fingers apart. Hold hex fitting at top of dust shield so it cannot turn when unscrewing dust shield.* Reinsert ferrule in dust shield and push lightly on control cable until it stops. *CAUTION - Do not force cable beyond this point.* Fingers of dust shield must clamp ferrule on its largest diameter. Again try to rotate selector knob counterclockwise only, in order to make sure it is at low setting (this will position control cable to dust shield). Tighten clamp nut on bottom of dust shield securely.

CADILLAC CRUISE CONTROL WIRING DIAGRAM

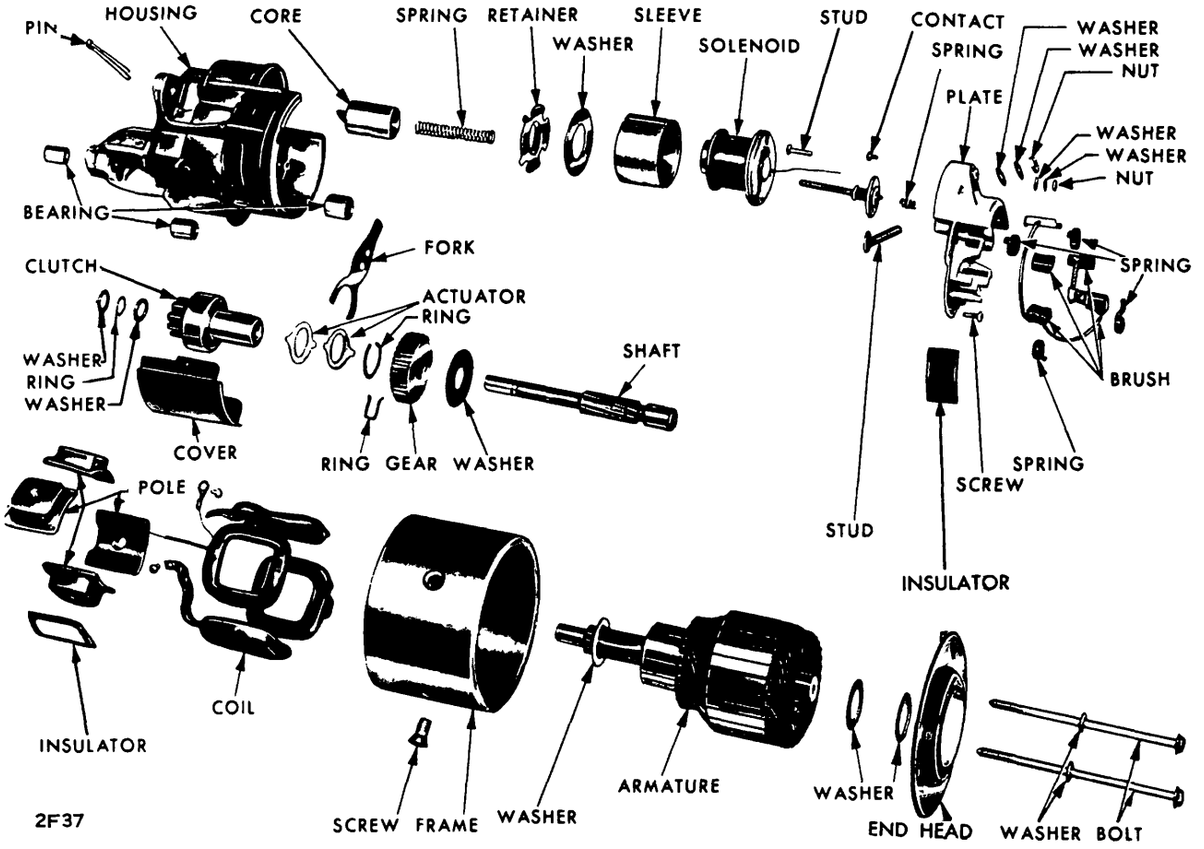
CHEVROLET CRUISE CONTROL WIRING DIAGRAM

LINCOLN & MERCURY SPEED CONTROL WIRING DIAGRAM

CHRYSLER CORP. STARTERS (REDUCTION GEAR TYPE)

DESCRIPTION: Four pole, four brush starter of conventional design. Field windings consist of three series coils and one shunt coil electrically ahead of the armature. Starter drive is overrunning clutch, solenoid pinion shift type with a 3.5-1 reduction gear set built into motor assembly. Motor drive end housing is die cast aluminum. This housing also forms the integral solenoid housing.

SPECIFICATIONS: R tati n - Clockwise at pinion end.
Brush Spring Tensi n - 32-48 ozs.
Armature Endplay - .010-.035".
Performanc Data - Se *individual Car Model pages.*



TESTING: Fr Running T st - Connect ammeter and carbon pile rheostat in series with battery positive post and starter terminal. Connect a voltmeter across starter. Turn all resistance into circuit, then connect battery negative post to starter frame. Adjust rheostat to obtain proper voltage and note current draw and starter RPM. S e *Car M d l pages for specifications.* Current draw and starter RPM should be as specified.

Stall T rqu T st: Mount starter in a test stand and follow test equipment manufacturer's instructions. Torque, volt, and ampere readings should be as specified. S *Car M d l pag s for specifications.*

DISASSEMBLY: 1) Remove through bolts and commutator end plate assembly. Remove armature, then remove steel and fiber thrust washers. *NOTE - Shunt field coil wir is s ld r d t brush t rminal and one set of brushes is c nn ct d t this t rminal. Other set of brushes is c nn ct d t s ri s fi ld coils by a terminal screw. Pull frame and fi ld ass mbly up just enough to expose t rminal scr w and s ld r c nnection at brush terminal. Plac tw w od blocks b tween frame and gear housing to aid r moval f t rminal screw and unsoldering of shunt fi ld wir .* Remove terminal screw and unsolder shunt coil lead. Remove brush insulator.

2) Remove brush holder plate-to-gear housing attaching screw, then remove brush holder plate, brushes, and solenoid as an assembly. Unsolder solenoid winding from brush terminal. Remove nut (11/32" wrench), steel washer, and nylon washer from solenoid terminal. Separate brush holder plate from solenoid. Remove nut and washers from starter battery terminal. Remove battery terminal from brush holder plate, then remove solenoid contact assembly.

3) Remove solenoid coil sleeve, return spring, retainer washer, and coil retainer from solenoid housing. Remove dust cover from gear housing. Remove snap ring holding driven gear on pinion shaft. *CAUTION - Use care to prev nt ring fr m flying away during removal as ring is und r t nsi n.* Remove retainer ring at front of pinion shaft. *CAUTION - Do not spread this ring any greater than utsid diameter f pinion shaft.* Push pinion shaft to rear of housing, remove snap ring, thrust washers, clutch and pinion assembly, with both shifter fork nylon actuators. Remove driven gear and friction washer. Pull shifting fork forward and remove solenoid moving core. Remove shifting fork retainer pin, then remove shifting fork assembly.

CHRYSLER CORP. REDUCTION GEAR STARTER ASSEMBLY (EXPLODED)

CLEANING: *DO NOT immerse parts in cleaning solvent.* Clean field frame and coil assembly, armature, and clutch unit by wiping with a clean cloth only. Clean clutch outer housing and pinion gear by wiping with a cloth moistened with cleaning solvent, then wipe dry with a clean dry cloth.

TESTING: Armature - Check for shorted armature with a growler. Check for ground to shaft with a test lamp. Commutator runout should not exceed .003". Reface commutator if necessary and undercut mica segments.

Field Coils & Frame: Remove frame assembly from starter, drill out rivet holding series coil ground lead and shunt coil ground lead to frame. Insulate field coil leads from frame. Use a 110-volt test lamp with one probe to series coil lead and other probe to frame. Repeat for shunt coil. If lamp lights, field coils are grounded and must be replaced.

REPLACEMENT & SERVICING: Brush s & Springs - Replace oil-soaked brushes and brushes worn to less than ½ the length of new brushes. Measure brush spring tension with spring scale hooked near end of spring. Pull scale parallel to edge of brush. Replace springs if not within specifications. *CAUTION - Make a strong, low resistance connection when soldering shunt field and solenoid lead, using high temperature solder and rosin flux only. Do not break shunt field wire when replacing brushes.*

Field Coils: Use a pole shoe impact screwdriver (C-3475) for replacing field coils. Make sure space between leads and frame is clean. Peen new rivet securely to insure good electrical contact (this rivet grounds both series and shunt coils to starter frame).

Bushings: Inspect armature and pinion shaft bearing surfaces and bushings for wear. If bushings worn, install new bushings, or replace commutator end plate and gear housing as necessary.

Clutch Unit: *CAUTION - Do not immerse clutch unit in cleaning solvent. Unit is pre-lubricated at factory, and solv nt will wash lubricant from unit.* Rotate pinion. Pinion gear should rotate (not necessarily easily) in one direction, but should not rotate in op-

CONTINUED ON NEXT PAGE

CHRYSLER CORP. STARTERS (REDUCTION GEAR TYPE) (Continued)

posite direction. If unit does not operate properly, or if pinion is worn, chipped, or burred, replace clutch unit.

REASSEMBLY: 1) *NOTE - There should be approximately 1/16" side movement of shifter fork plates for proper pinion gear engagement. Lubricate between plates with a very small amount of SAE 10 engine oil.* Install shifter fork in drive housing, then install fork retainer cotter pin. *One tip of pin should be straight, other tip should be bent at 15° angle away from housing. Fork and retainer pin should operate freely after bending pin tip.* Install solenoid moving core and engage core in shifting fork. Install pinion shaft into housing, then install friction washer and drive gear. Install clutch and pinion assembly, thrust washer, retaining ring and thrust washer. Finish installing pinion shaft and engage shifter fork with clutch actuators. *NOTE - Friction washer must be placed on shoulder of pinion shaft splines before driven gear is installed.* Install driven gear snap ring, and pinion shaft retaining ring (ring must fit tightly in shaft groove). Install solenoid coil retainer with tangs down. *NOTE - Retainer must be installed so the four tangs rest on ridge in housing bore and not in recesses.* Install solenoid coil retainer washer, and solenoid return spring. *NOTE - If solenoid switch contacting washer is burned from arcing, disassemble contact switch assembly and reverse washer.* Install solenoid contact assembly making sure contact spring is placed on contact assembly. Thread solenoid lead wire through hole in brush holder, then assemble solenoid stud, insulating and flat washers, and nut. Solder solenoid lead wire to solenoid contact terminal.

2) Install solenoid coil and coil sleeve into gear housing and place brush plate assembly into starter gear housing. Align tongue of ground terminal with notch in brush holder. Install and tighten brush holder attaching screw to 10-15 inch-lbs. Install flat insulating washer and hold with friction tape. Retract brushes with a suitable tool (C-3855), place field frame in correct position and solder field coil lead. Install brush terminal screw. Install armature thrust washer on brush holder plate, then install armature, making sure splines of shaft engage reduction gear. Remove brush holder tools. Install fiber thrust washer and steel thrust washer on armature shaft. Install commutator end plate, then install through bolts and tighten securely. Install gear housing dust cover, making sure dimples on cover are securely engaged in holes in gear housing.

DELCO-REMY DISTRIBUTORS (PIVOTED BREAKER PLATE)

DESCRIPTION: Single breaker, fully automatic type with aluminum housing. Breaker plate consists of a fixed lower plate mounted rigidly in distributor housing, and a moveable upper plate which is pivoted at one end. Condenser and contact points are mounted on pivoted upper breaker plate. Centrifugal advance mechanism is conventional type with weights and springs mounted under breaker plate. Vacuum advance controlled by conventional type vacuum unit mounted on distributor housing and linked to breaker plate at opposite end of pivot point.

ADJUSTMENT: As follows:

►*ADJUSTMENT & TESTING CAUTIONS:* **1) All Models** - Contact point gap and cam angle settings must be made with vacuum unit disconnected from vacuum source.

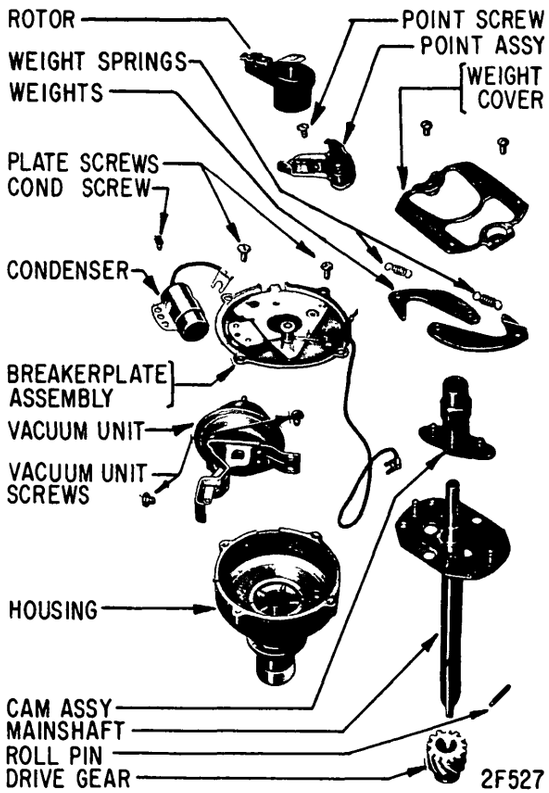
2) Chevy II - Contact point gap and cam angle must be adjusted with distributor on engine because of single bearing design of distributor.

3) Corvair - When mounting distributor in test stand, lower 1 3/8" of distributor shaft must be protected with a protective adapter furnished by test equipment manufacturer.

Automatic Advance: Check in test machine in the usual manner. Adjust or replace weights, springs, or cam in the usual manner. *See Car Model Pages for specifications.*

Vacuum Advance: Check in test machine after automatic advance checked and adjusted. If not within specifications, replace vacuum unit. *See Car Model Pages for specifications.*

Contact Point Gap, Alignment & Cam Angle: Check point opening with feeler gauge or dial indicator. To adjust, insert screwdriver through slot in breaker plate and turn adjusting screw as necessary. Align points by bending fixed contact support. DO NOT bend breaker plate. Check cam angle with accurate dwell meter. *See Car Model Pages for specifications.*



►*CHEVY II CAM ANGLE NOTE:* Variation in cam angle from idle to 1750 engine RPM should be not more than 3°. Readings taken above 1750 engine RPM may not be accurate.

Breaker Arm Spring Tension: Check with spring scale hooked to breaker lever. Pull should be exerted at 90° to breaker lever, and readings taken as points just start to separate. To adjust, bend spring. *See Car Pages for specifications.*

DISASSEMBLY: Remove cap and rotor and vacuum unit from housing. Disconnect condenser leads at quick disconnect and remove condenser and contact point set. Remove breaker plate from housing. *Do not disassemble breaker plate.* Remove driven gear retaining roll pin and slide gear from mainshaft, then remove mainshaft and cam from housing. Remove weight cover, springs, and weights, and slide cam assembly from mainshaft. Remove mainshaft bushing felt washer from housing and remove gasket from housing. *NOTE - Housing bushings are not furnished separately. Replace bushings and housing as a complete unit.*

Inspection: Wash and clean all parts. Check for wear, burrs, roughness and replace parts as necessary. Mainshaft runout should not exceed .002" (check in "V" blocks).

REASSEMBLY: Reverse removal procedure and note that contact point set pilot must engage matching hole in breaker plate.

DELCO-REMY PIVOTED BREAKER PLATE DISTRIBUTOR (EXPLODED)

DELCO-REMY DELCOTRON (1-D, 2-D, 3-D, 4-D SERIES)

►CHANGES, CAUTIONS, CORRECTIONS

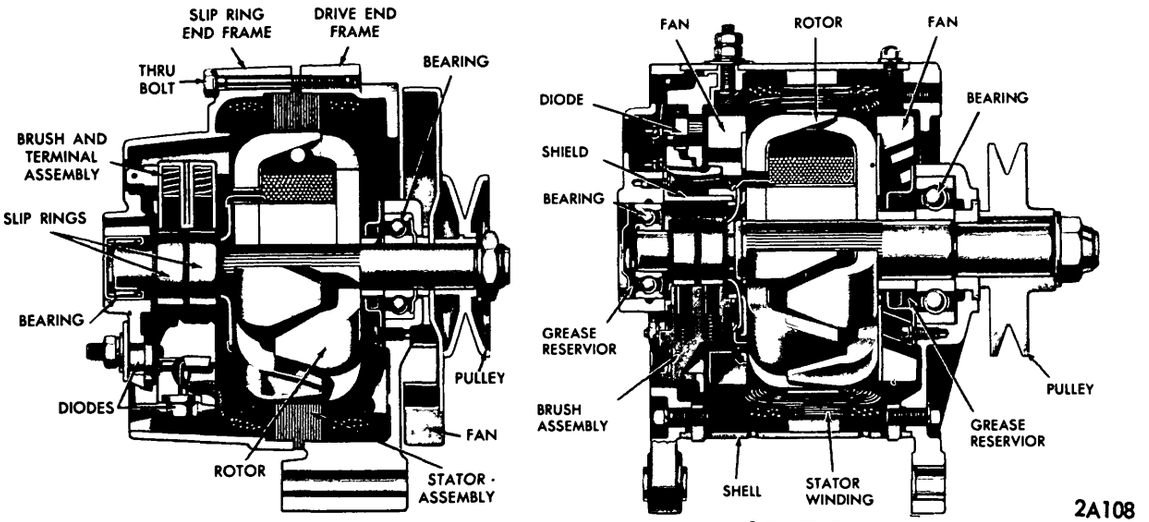
►*BATTERY INSTALLATION, BATTERY CHARGING OR USING A BOOSTER BATTERY TO START ENGINE CAUTIONS: R v rs d polarity or excessive voltage will r sult in xt nsiv damage to alternator system. NOTE THE FOLLOWING TO PREVENT DAMAGE:*

Batt ry Installati n - Alternator polarity determines which battery terminal is grounded. For negative polarity alternators, **negative** battery terminal must be grounded. *DO NOT REVERSE BATTERY LEADS or r ctifiers will b damag d.*

Charging Batt ry - If a "Fast Charger" is used, both car battery cables must be disconnected from battery. *DO NOT us a "Fast Charger" to provide starting voltag .*

B st r Batt ry (Us d To Start Engine) - Booster battery must be connected with negative lead to negative terminal of battery and positive lead to positive terminal of battery. *DO NOT REVERSE BATTERY LEADS.*

►*ALTERNATOR CIRCUIT NOTE:* Alternators may be either "A" or "B" circuit type. On "B" circuit types, ground brush is grounded directly to end housing and "F2" terminal position (if provided) is not used. *NOTE - Both slip rings are insulated from rotor shaft.*



DESCRIPTION: Conventional three-phase, self-rectifying type alternators. Alternators are of various series depending on design differences (regardless of part number series). Each series may be different in construction to the extent of having heavy duty or long-life components. All series, except 3-D Series as described below, have a single field winding wound on rotor shaft and encased between two multi-fingered overlapping iron pole pieces assembled on rotor shaft. Field winding (all series) is connected to two slip rings assembled on, but insulated from, rotor shaft.

1-D Seri s - 5.5" diameter, two-piece aluminum frame held together by through-bolts. Frame pieces enclose entire assembly. Some models may have "gull wing" type heat sink for positive diodes with diodes facing 90° to rotor axis. All other models have flat heat sink design (all diodes visible from rear of unit). Rotor shaft rear bearing is needle-roller type.

2-D S ri s - 6.2" diameter. Stator mounted inside a perforated frame piece. Two end frames, attached separately to stator frame, complete the assembly. Both front and rear rotor shaft bearings are ball bearing type.

3-D Seri s - 5¾" diameter. Outer surface of stator core forms alternator frame, and two end frames held together by through-bolts complete the assembly. Rotor consists of four field windings wound on a four pole rotor and shaft. Rotor shaft front and rear bearings are ball bearing type. Some models may have three A.C. terminals on slip ring end housing in addition to output ("BAT") terminal so a transformer may be connected to step up A.C. voltage or for conversion to operate D.C. powered accessories.

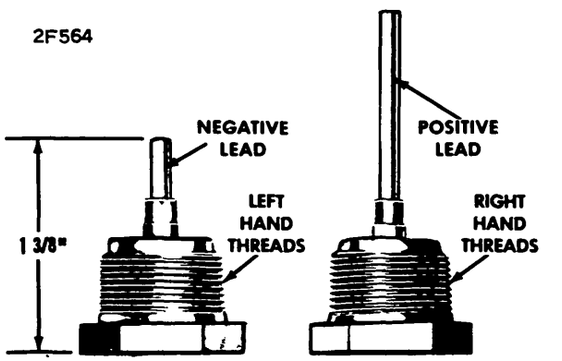
4-D Series - 6 9/16" diameter. Similar in design to 3-D Series except for larger diameter and single field winding with multi-fingered overlapping field pole pieces.

1-D SERIES 2-D SERIES

DELCO-REMY "DELCOTRON" ALTERNATORS

LUBRICATION: No periodic lubrication required. At time of overhaul, if bearings reusable (except slip ring end needle-roller bearings), pack grease reservoir ¼-½ full with Delco-Remy Lubricant, No. 1948791, and also pack bearings with same lubricant. *NOTE - Replace bearings if lubricant supply exhausted. DO NOT attempt to relubricate or reuse needle-roller type bearing.*

OUTPUT TEST



►*CAUTION:* 1) *Do not short across or ground any of the terminals on alternator or regulator.*
2) *Do not polarize alternator as it is not required and doing so will damage entire system.*
3) *Do not operate alternator on open circuit. Make sure all connections are secure and tight.*
4) *Before making test connections, ignition switch must be off.*

OUTPUT TEST: Connect an ammeter in series at alternator "BAT" terminal, and a voltmeter from alternator "BAT" terminal to ground. Connect alternator field directly to battery (regulator out of circuit) with a jumper wire. Turn on switch and slowly increase alternator speed and check for rated output *(see Car Model Pages for specifications). CAUTION - Load battery (carbon pile rheostat or turn headlights and other accessories on) to prevent high voltage. Do not allow alternator voltage to exceed voltage setting of regulator.*

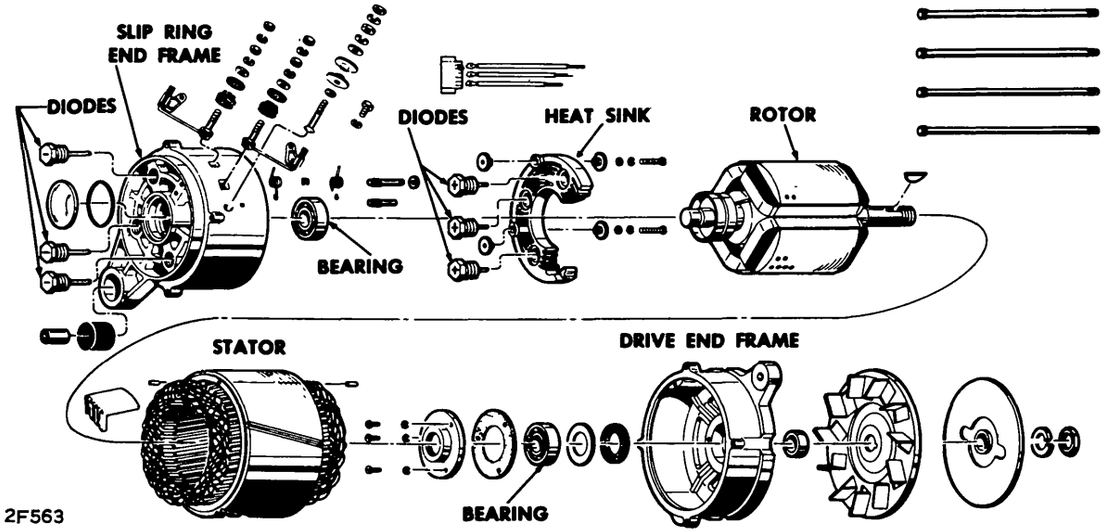
OVERHAUL

DISASSEMBLY: 1) Scribe mark all mating parts for reassembly. Remove through-bolts or end housing retaining screws and separate drive end housing and rotor assembly from slip ring end housing and stator assembly. Tape slip ring end housing needle-roller bearing to prevent dirt entry. *NOTE - Brushes may drop ont rot r shaft during s paration of c mp nents and com into contact with lubricant. Cl an brushes before installation with a non-toxic cleaner such as tri-chlorethylene.* Install rotor in a soft-jawed vise and remove shaft nut, washer, pulley, fan, and collar. Separate rotor from end housing. Remove drive end housing bearing by removing retainer plate, or pressing bearing from rotor shaft, depending on construction. 2) Separate stator from end housing as follows: On 3-D and 4-D Series with A.C. terminals, remove terminal leads, then pry both parts apart slowly, using a screwdriver to pry apart nylon stator winding-to-rectifier connector. On Other Series, remove stator lead attaching nuts, or cut diode soldered conneetors just below crimp mark, or cut diode leads as close to diode stem as possible, depending on construction. Separate stator from end housing. *NOTE - On 2-D Series, carefully note stator lead connections and location of h at sink in relation to end housing locating notch on sh ll. Also, note proper position of output terminal and insulator washers used on heat sink.*

CONTINUED ON NEXT PAGE

THREADED TYPE DIODE IDENTIFICATION

DELCO-REMY DELCOTRON (1-D, 2-D, 3-D, 4-D SERIES) Cont.



CLEANING & INSPECTION: Wash all metal parts except stator and rotor assemblies. Clean ball bearings and check for pitting, roughness, and proper sealing. Slip rings may be cleaned with 400 grain polishing cloth (rotate shaft while cleaning to prevent flat spots on rings). Slip ring maximum out-of-round limit is .002". Turn slip rings in a lathe to correct and remove only sufficient material to make rings smooth and round.

TESTING: Rotor - To test for grounded coils, connect a 110-volt test lamp or ohmmeter from either slip ring to rotor shaft or to poles or laminations. If lamp lights or ohmmeter reading is low, field windings are grounded. To test for open circuit, connect test lamp or ohmmeter to each slip ring. If lamp does not light or ohmmeter reading is high, windings are open. To test for short circuit, connect a 12-volt battery and an ammeter in series with slip rings. If ammeter reading is higher than specified *(see "Field Current Draw" on Car Model Pages)*, field windings are shorted. Replace rotor assembly or field windings as necessary.

Stator: To test for grounded coil, connect a 110-volt test lamp or an ohmmeter from any stator lead to stator frame. If lamp lights or ohmmeter reading is low, windings are grounded. For open circuit, connect test lamp or ohmmeter successively between each pair of stator leads. If lamp does not light or ohmmeter reading is high, stator windings are open. A short circuit in stator may be assumed if all other electrical checks are normal and alternator does not produce rated output.

Diodes: Use an ohmmeter or 12-volt test lamp as follows:
1) Ohmmeter - *CAUTION - Use ohmmeter with 1½-volt cell and a scale on which 300 ohm value is at or near mid-scale and can be accurately read. Ohmmeter polarity MUST be determined before checks are made.* Connect one ohmmeter lead to diode lead, and other ohmmeter lead to heat sink or end housing and note reading. Reverse ohmmeter leads and note reading. If both readings very low or very high, diode is defective. A good diode will give one low reading and one high reading.
2) 12-Volt Test Lamp - *CAUTION - DO NOT use 110-volt test lamp or diodes will be damaged.* Connect one test lamp lead to diode lead and other test lamp lead to heat sink or end housing, then reverse the leads. If lamp lights in both directions, or does not light in both directions, diode is defective. A good diode will cause lamp to light in only one direction.

REPAIRS: Diode Replacement - *Proceed as follows for different types, observing "Replacement Cautions" listed below.*

DELCO-REMY "DELCOTRON" ALTERNATOR (3-D SERIES)

►*DIODE REPLACEMENT CAUTIONS:* When cutting diode leads, leave ½" of lead on each side of diode to match new diode. Do not bend diode leads. Use only 60% tin, 40% lead solder, or other solder with 360°F or higher melting point.

Threaded Type Diodes - Coat new diode threads with silicone grease or light engine oil before installing, and torque new diode to 200 inch-lbs.

Pressed-In Type Diodes - Support end housing or heat sink with a suitable tool (J-9600-3) and press out diode with press or vise and suitable driver (J-9600-1). *CAUTION - Do not strike diode as shock will damage it and other diodes.* To install, press diode into heat sink or end housing with suitable installer (J-9600-2) and arbor press. Diode must be square with end housing or heat sink and started straight. *CAUTION - Do not move or bend diode stem or internal damage and diode failure will result.*

Slip Ring End Housing Replacement: When replacing slip ring end housing, note parts stack-up on terminals and brush holder very carefully to insure proper insulation of parts. If possible, insert a pin or wire in hole in bottom of brush holder to hold brushes in place. After unit assembled, remove pin or wire so brushes will drop into place on slip rings.

Bearing Replacement: Bearings may be removed from end housings after retainer plate removed. If bearing pressed on rotor shaft, press bearing off and on shaft in usual manner. *CAUTION - Use suitable tools when replacing bearings so pressure is exerted on bearing inner race only, and that rotor, end housings, are suitably supported.* Pack new bearings partly full with Delco-Remy Lubricant, No. 1948791, and also partly fill bearing grease reservoir with same lubricant. *See "Lubrication" above.*

Brush Replacement: Replace brushes if worn more than halfway or if contaminated. Replace brush springs if distorted or weakened (if brushes appear satisfactory and move freely in brush holder, springs may be reused).

Heat Sink Replacement: Remove terminal and heat sink attaching bolts and remove heat sink. Cut diode leads if diodes not previously removed. *NOTE - Observe carefully stack-up of parts on terminals so they can be reassembled in same manner.*

REASSEMBLY: Reverse disassembly procedures, and lift brushes from slip rings when installing rotor to prevent brush and slip ring damage. Make sure solder connections are good and that proper solder is used *(see "Diode Replacement Cautions" above).*

DELCO-REMY DOUBLE CONTACT ALTERNATOR REGULATORS

►CHANGES, CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTIONS: Reverse polarity or excessive voltage will result in extensive damage to alternator system. Observe all cautions as detailed on appropriate alternator data pages.*

►*CIRCUIT TYPE NOTE:* These units are "B" circuit type (field winding grounded at alternator).

DESCRIPTION: Regulators are of conventional design. Three different types, containing a double contact voltage regulator, a field relay, and sometimes an indicator light relay, are used as follows:

Type 1 - Identified by conventional lug-type terminals. Units may contain voltage regulator, field relay, and indicator light relay. If used on applications where an ammeter is used instead of an indicator light, regulator will contain a voltage regulator and field relay only.

Type 2 - Identified by blade type terminals to fit matching car wiring harness connector. Unit contains a voltage regulator and a field relay. This type used in circuits with an indicator light but a separate indicator light relay is not used. Indicator light circuit is such that closing of field relay contacts causes indicator light to go out.

Type 3 - Identified by blade type terminals to fit matching car wiring harness connector. Unit contains a voltage regulator and a field relay. Used in circuits

CONTINUED ON NEXT PAGE

DELCO-REMY DOUBLE CONTACT ALTERNATOR REGULATORS (C ntinued)

with either an ammeter or an indicator light. When used with indicator light, a separate double contact indicator light relay is also used.

TESTING & TROUBLE SHOOTING

►*DATA REFERENCE NOTE:* In the following testing and checking procedures, reference for test meter connections and other procedures will be made to type of regulator described above. All test connections are not the same for each type of circuit.

►*CAUTION: 1) Do not short across or ground any of the terminals on alt rnator r regulator.*
2) Do n t polariz alt rnator as it is not required and doing so will damag ntire system.
3) D not p rate alt rnator on open circuit. Make sure all conn cti ns ar s cure and tight.
4) Befor making t st meter connections, ignition switch must b off.

►*BLADE TYPE TERMINAL REGULATOR TESTING NOTE:* A special crble assembly or adapter must be used for testing this type so that meter connections can be made to the terminals. Adapter is available from various test equipment manufacturers. Except as described for Type 3 indicator light check below, all test connections must be made at the regulator.

►*BLADE TYPE TERMINAL REGULATOR TERMINAL NUMBERING NOTE:* With regulator terminals facing you, terminals are numbered from left to right as follows: F, 2, 3, 4. Test meter connections will be indicated according to terminal number.

INDICATOR LIGHT CIRCUIT: Type 1 - If bulb not burned out, check as follows: Connect a voltmeter from "R" terminal to regulator base (ground). With alternator operating, voltage should not be more than 5 volts. If more than 5 volts, relay is faulty. If 5 volts or less, other trouble is indicated.

Typ 2 - Disconnect wiring harness connector from from regulator. Turn on ignition switch (do not start engine) and momentarily (not more than 10 seconds) connect a jumper wire from No. 4 terminal of harness to regulator base (ground). If light still does not light, bulb is burned out or wiring between battery and jumper lead is open. If light comes on, connect a jumper from harness connector "F" terminal to No. 4 terminal. If light comes on again, circuit in regulator is open. If light does not come on, there is an open circuit in field lead between regulator and alternator, or in alternator field.

►*NOTE:* If light does not go out with alternator operating, trouble is elsewhere in system. If light does not go out when ignition switch is off, an alternator diode is shorted.

Type 3 - Test procedures and conclusions are same as for Type 1 above. Connect voltmeter from alternator "R" terminal to ground.

UNDERCHARGED BATTERY: Drive belt loose, battery defective, open resistor, field relay faulty, high circuit resistance, faulty alternator, low voltage regulator setting.

Open Resistor: Type 2 - *NOTE - Test not applicable to Types 1 & 3.* Connect a voltmeter from No. 4 terminal of wiring harness (regulator disconnected) to regulator base (ground). Turn ignition switch to "ACC" position. If voltmeter reading is zero, resistor on "ACC" terminal of ignition switch is open. *NOTE - Resistor may be a separate unit or a resistance wire.* Resistance value is 10 ohms; wattage is 6.25 watts minimum.

Field Relay: Type 1 - Connect voltmeter from regulator "F" terminal to ground. Turn on ignition switch (do not start engine). Voltmeter should read battery voltage. If reading zero, *see "Checking & Adjusting"*

Type 2 - If indicator light functions normally, field relay is operating normally. If indicator light does not go out when alternator operating, determine if field relay or alternator is faulty as follows: With regulator in circuit, connect a voltmeter from No. 2 terminal to ground. Run alternator at moderate speed and note voltmeter reading. If reading 5 volts or above and indicator light does not go out, relay is faulty. If voltmeter reading is below 5 volts, alternator is faulty.

Type 3 - With regulator in circuit, connect a voltmeter from "F" terminal to ground. Turn switch to "IGN" and note voltmeter. Reading should be battery voltage. If reading is zero, line between switch and regulator No. 2 terminal is open, or field relay is faulty.

High Circuit Resistance: Type 1 - *NOTE - Test not applicable to Types 2 & 3.* Connect voltmeter from battery positive terminal to alternator "F" terminal. Turn on ignition switch (do not start engine). If voltmeter reading exceeds .3 volt, there is excessive line resistance. After terminals and connections tightened and cleaned, if voltage reading still exceeds .3 volt, clean all regulator contact points. If reading still more than .3 volt, check alternator field by removing lead from regulator field terminal and connecting an ammeter in series with alternator field winding. Field coil draw must be within specifications.

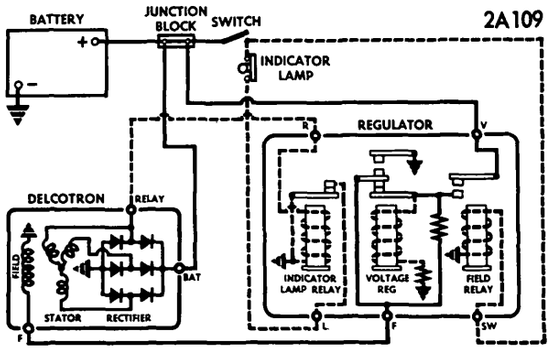
Alternator Output: All Types - Connect an ammeter in series at alternator "BAT" terminal, and a voltmeter from alternator "BAT" terminal to ground. Connect alternator field directly to battery (regulator out of circuit) with a jumper wire. Turn on ignition switch and slowly increase alternator speed and check for rated output. *CAUTION - Load battery (carbon pil rheostat or turn on headlights and other accessori s) to prevent high voltage. Do not allow alternator voltage to exceed voltage setting of regulator.*

OVERCHARGED BATTERY: Check for shorted battery cell, high circuit resistance (see "Undercharged Battery" above), or high voltage regulator setting.

►*VOLTAGE SETTING TAILORING NOTE:* If no circuit defects are found during all of the above tests and battery remains constantly over, or undercharged, voltage regulator setting may be raised or lowered .3 volt to compensate for various operating conditions.

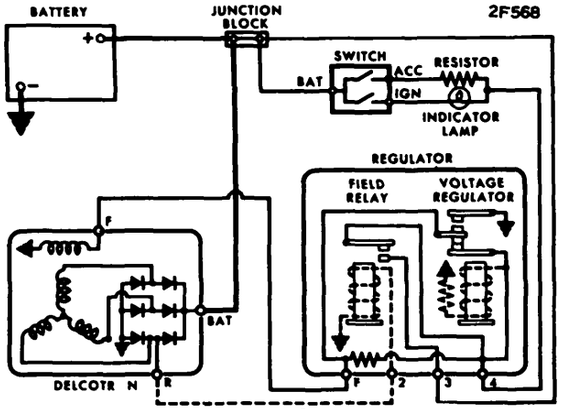
ADJUSTMENT

►*CAUTION: Observe all cautions listed under "Testing & Trouble Shooting" above.*



VOLTAGE REGULATOR

Contact Gap: Measure upper contact gap with lower contacts just touching. To adjust, bend upper contact arm. *Do not bend hinge.*



Air Gap: Measure gap between armature and core with lower contacts just touching. To adjust, turn nylon nut on contact support (Types 2 & 3). To adjust Type 1, loosen contact support bracket screw 1/8-1/4 turn, insert screwdriver into slot in contact support and into molded insulator. Raise screwdriver handle to increase air gap, lower handle to decrease gap. Tighten contact support bracket screw.

►*NORMALIZING THE REGULATOR:* Before checking or adjusting voltage regulator, bring regulator to operating temperature of 125°F by connecting a ¼ ohm fixed resistor and an ammeter in series with battery and alternator "BAT" terminal, and operating alternator for 15 minutes at approximately 3500 RPM (1500 Engine RPM) with 10 amperes or less output, with the regulator cover in place, until regulator heated and stabil-

TYPE 1 REGULATOR CIRCUIT DIAGRAM

TYPE 2 REGULATOR CIRCUIT DIAGRAM

TYPE 3 REGULATOR CIRCUIT DIAGRAM
(WITH INDICATOR LIGHT & SEPARATE RELAY)

DELCO-REMY DOUBLE CONTACT ALTERNATOR REGULATORS (C ntinued)

ized. Accessories and lights must be turned off. After warm-up completed, cycle alternator by stopping and restarting.

Voltage Setting: Test Meter Connections - Leave ammeter and ¼ ohm resistor connected as described under "Normalizing The Regulator" above. Connect a carbon pile rheostat across battery. Make other test connections as follows:

Type 1 - Connect a 25 ohm, 25 watt variable resistor in series with field winding at regulator "F" terminal. Disconnect lead from regulator "V" terminal. Connect a voltmeter from "V" terminal to regulator base (ground), and a jumper wire from "V" terminal to alternator "BAT" terminal.

Types 2 & 3 - Maintain connections at No. 2 & 4 terminals (No. 4 not used on Type 3). Connect a 25 ohm, 25 watt variable resistor in series at "F" terminal. Disconnect No. 3 terminal lead from wiring harness connector and connect a jumper lead from No. 3 adapter wire to alternator "BAT" terminal, and a voltmeter from No. 3 adapter wire to regulator base (ground).

Cycling - To cycle alternator during testing, proceed as follows: Turn variable resistor in field circuit to full resistance position. Momentarily disconnect and reconnect jumper lead from "V" terminal (Type 1), lead at No. 4 terminal on wiring harness connector (Type 2), jumper lead at alternator "BAT" terminal. *CAUTION - Do not disconnect leads with variable resistor in "no resistance" position.*

Checking Procedure - 1) Bring engine speed to 2500 RPM (approximately 6000 Alternator RPM) and note voltage reading which should be as specified in table below. Regulator should be operating on upper contacts. *NOTE - Best method of determining which contacts are in use is to use earphones to note the transfer. If regulator will not operate on upper contacts, partially recharge battery.* Adjust voltage within specifications for ambient temperature (see table below) by turning adjusting screw to adjust armature spring tension Cycle alternator (see above), recheck and readjust upper contact setting.

2) To check operation on lower contacts, operate engine at 2500 RPM (approximately 6000 Alternator RPM), and slowly turn variable resistance into the circuit until regulator operates on lower contacts, and note voltage which should be .1-.3 volt lower than when operating on upper contacts. *NOTE - If turning resistance into circuit does not make regulator operate on lower contacts, turn variable resistance out, load battery (carbon pile or turn headlights on), then adjust variable resistor for lower contact operation.* To increase difference in voltage between upper and lower contacts, increase armature air gap **slightly**; to decrease difference, decrease air gap **slightly**. *NOTE - This adjustment can be made with regulator operating. If necessary to make adjustment, recheck voltage setting of both sets of contacts.*

►*VOLTAGE SETTING TAILORING NOTE:* If battery consistently over- or undercharged after voltage regulator properly set and all other checks indicate no circuit defects, voltage regulator setting may be raised or lowered .3 volt to compensate for various underhood temperatures and other operating conditions. Allow reasonable length of time to check performance. Proper setting is obtained when battery remains fully charged with minimum use of water.

Voltage Regulator Specifications

Regulator Model	Air Gap	Contact Gap	Voltage Setting
1119501, 2, 3, 5	.067"	.016"	Chart No. 1
1119506, 7, 12	.060"	.014"	Chart No. 1

Voltage Setting - Ambient Temperature (Chart No. 1)

Temp.	ℂ Setting	Temp.	ℂ Setting
65°F	13.9-15.0	145°F	13.4-14.2
85°F	13.8-14.8	165°F	13.2-14.0
105°F	13.7-14.6	185°F	13.1-13.9
125°F	13.5-14.2		

ℂ - Operating on upper contacts. .1-.3 volt lower when operating on lower contacts.

FIELD RELAY

Air Gap: Check air gap between armature and core with contacts just touching. To adjust, carefully bend flat contact support spring.

Contact Gap: Type 1 - Normally not adjusted. If air gap and closing voltage within specifications, relay will operate satisfactorily even if contact gap not exactly as specified.

Type 2 & 3 - Adjust by bending armature stop.

Closing Voltage: Test Meter Connections - Make meter connections as follows:

Type 1 - Connect a 50-75 ohm variable resistor in series at "SW" regulator terminal. Connect a voltmeter from "SW" terminal to regulator base (ground).

Type 2 & 3 - Connect voltmeter from regulator base to regulator No. 2 terminal. Connect a 50-75 ohm variable resistor from regulator No. 2 terminal to wiring harness connector No. 3 terminal. *Other leads from regulator to wiring harness must be disconnected.*

Checking Pr c dur - Turn all resistance into circuit, turn on ignition switch, then slowly decrease resistance and note closing voltage of relay. If not as specified, adjust by bending armature heel iron as necessary.

Field Relay Sp cificati ns

Regulator Model	Air Gap	C ntact Gap	Closing V ltag

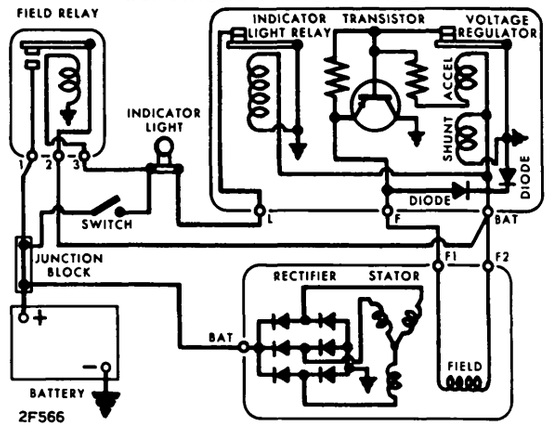
DELCO-REMY TRANSISTORIZED ALTERNATOR REGULATORS ("A" CIRCUIT TYPE)

►*BATTERY INSTALLATION, CHARGING, & BOOSTER BATTERY CAUTIONS: Observe the cautions for battery installation, battery charging, and using a booster battery as detailed at beginning of appropriate alternator data pages.*



DESCRIPTION: Transistorized type with two diodes. Transistor works with a conventional type voltage regulator unit to limit alternator voltage to pre-set value. Field discharge diode reduces arcing at voltage regulator contacts by dissipating energy created in alternator field windings when contacts separate. Suppression diode prevents damage from transient voltage in system. Two types of regulators are used:

4-Terminal Type - Used in circuits with an ammeter. Assembly contains a conventional vibrating type volt-

ALTERNATOR & REGULATOR WIRING DIAGRAM (4-TERMINAL TYPE)

ALTERNATOR & REGULATOR WIRING DIAGRAM (3-TERMINAL TYPE)

DELCO-REMY TRANSISTORIZED ALTERNATOR REGULATORS ("A" CIRCUIT TYPE) Cont.

age regulator and a field relay. Terminals are marked "BAT", "F-1", "F-2", "SW".

3-T rminal Type - Used in circuits with either an ammeter or charge indicator light. Assembly contains a conventional vibrating type voltage regulator and an indicator light relay. Terminals are marked "L", "F", "BAT". When an ammeter is used instead of a charge indicator light, the indicator light relay is not used and no connection is made at the "L" terminal. On all charging system circuits using this type regulator, an additional separately mounted field relay is used to energize alternator field current.

SPECIFICATIONS: *S e individual Car Mod l Pag s.*
TESTING & TROUBLE SHOOTING: *See 1961 Final Data, Page 281.*
CHECKING & ADJUSTMENT: *See 1961 Final Data, Page 283.*
UNIT REPLACEMENT: *See 1961 Final Data, Page 283.*

DELCO-REMY TRANSISTORIZED ALTERNATOR REGULATORS ("B" CIRCUIT TYPE)

►CHANGES, CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, CHARGING, & BOOSTER BATTERY CAUTIONS: Observe the cautions for batt ry installation, batt ry charging, and using a booster batt ry as d tail d at beginning of appropriate alternator data pag s.*

►*CIRCUIT TYPE NOTE:* These units are "B" circuit type (field winding grounded at alternator).

DESCRIPTION: Transistorized type with two diodes. Transistor works with a conventional type voltage regulator unit to limit alternator voltage to pre-set value. Diodes prevent damage from possible transient voltages in system. Assembly also contains a field relay for control of alternator field. When an indicator light is used on instrument panel, a separate indicator light relay is used for control of this circuit.

TESTING & TROUBLE SHOOTING

►*CAUTION: 1) Do n t short across or ground any of the t rminals n alt rnat r or regulator.*
2) Do n t p lariz alt rnator as it is not required and d ing so will damag ntire system.
3) D n t p rat alt rnator on open circuit. Make sur all c nn ctions ar secure and tight.
4) B f r making test meter connections, ignition switch must b ff.

INDICATOR LIGHT RELAY CHECK: If indicator light stays on with alternator operating, connect a voltmeter from indicator light "R" terminal and note voltage with alternator operating. If voltage is above 11-11.6 volts, relay is faulty and should be replaced.

UNDERCHARGED BATTERY: Drive belt loose or battery defective. Alternator faulty, high circuit resistance, low voltage regulator setting, field relay faulty or open transistor, faulty diodes.

Alt rnat r Output: Connect an ammeter in circuit at alternator "BAT" terminal and voltmeter from alternator "BAT" terminal to ground. Remove lead from regulator "F" terminal and connect to regulator "V" terminal. Slowly increase alternator speed and check for rated output. *CAUTION - Load battery (carbon pile rh ostat or turn on headlights and other accessories) to pr v nt high voltag . Do not allow alternator voltag to xce d voltag s tting of regulator.*

High Circuit R sistanc : Connect a voltmeter from battery insulated terminal to regulator "V" terminal. Turn on ignition switch (do not start engine) and note voltage drop. If voltage drop exceeds .3 volt, high circuit resistance is indicated.

Low V ltag R gulator Setting: Connect a voltmeter from regulator "F" terminal to regulator base (ground). Turn on ignition switch (do not start engine). If voltmeter reads 9 volts or above, voltage regulator setting is too low. If reading is less than 9 volts, field relay contacts are not closed, or resistor and transistor are burned open.

Diodes Faulty: Disconnect "F" and "V" leads from regulator, remove cover, and unsolder both diode leads. Connect an ohmmeter from diode case to diode lead and note readihg. Reverse ohmmeter connections and note reading. If both readings less than 2 ohms, diode is faulty. If both readings are very high (infinite), diode is faulty. A good diode will give one low reading and one high reading. Check other diode in same manner. *CAUTION - Use ohmmeter with 1½-volt cell and use lowest range scale. When replacing diode, limit solder time to minimum as high heat will damage diode.*

OVERCHARGED BATTERY: Make all tests as listed under "Undercharged Battery" above, and check for shorted transistor as follows:

Transistor Shorted: Connect a voltmeter from regulator "F" terminal to ground. Remove regulator cover, turn on ignition switch, and hold voltage regulator contacts open. If voltage reading above 9 volts, transistor is shorted and must be replaced. *NOTE - Replace transistor by removing attaching screws and unsoldering connections directly above transistor. Limit soldering time to minimum as high heat will damage transistor.*

►*VOLTAGE SETTING TAILORING NOTE:* If no circuit defects are found during all of the above tests and battery remains constantly over- or undercharged, voltage regulator setting may be raised or lowered .3 volt to compensate for various operating conditions.

ADJUSTMENT

►*CAUTION: Observe all cautions listed under "Testing & Trouble Shooting" above.*

FIELD RELAY

Air Gap: Check air gap between armature and core with contacts just touching. To adjust, carefully bend flat contact support spring.

Contact Gap: Normally not adjusted. If air gap and closing voltage within specifications, relay will operate satisfactorily even if contact gap not exactly as specified.

Closing Voltage: Connect a 50 ohm variable resistor in series from ignition switch to regulator "SW" terminal. Connect a voltmeter from regulator "SW" terminal to regulator base (ground). Turn all resistance into circuit, turn on ignition switch, and slowly decrease resistance and note relay closing voltage. If not as specified, adjust by bending armature heel iron as necessary.

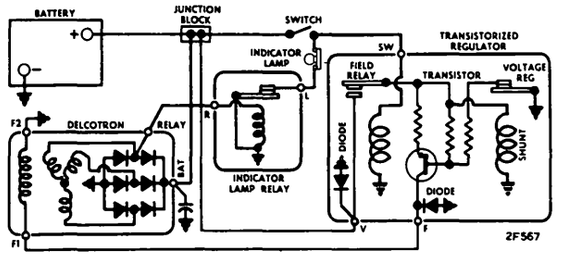
Field Relay Specifications

Regulator Model	Air Gap	Contact Gap	Closing Voltage
9000566, 567	.014"	.027"	5-9.5 volts
9000585, 586	.014"	.027"	5-9.5 volts

VOLTAGE REGULATOR

Air Gap: Measure air gap with armature pressed down to point where contacts just touch. To adjust, move upper contact support bracket as necessary.

Voltage Setting: 1) Connect an ammeter in ignition switch lead at alternator "BAT" terminal. Disconnect lead at regulator "V" terminal and connect a jumper wire from "V" terminal to alternator "BAT" terminal. Connect a voltmeter from regulator "V" terminal to regulator base (ground). Place a carbon pile rheostat across battery.



2) Bring regulator to ambient temperature of 125°F by operating alternator at 3000 RPM for 15 minutes with 3-10 amperes output, with regulator cover in place. After warm-up completed, cycle alternator by turning off switch, stopping alternator, and temporarily disconnecting jumper lead at regulator "V" terminal. Reconnect jumper lead, operate alternator at 3000 RPM and note voltage reading. If not within specifications listed below, adjust by turning adjusting screw to adjust armature spring tension. Recycle, recheck, and readjust if necessary. *NOTE - Always make final adjustment by turning adjusting screw clockwise. If alternator voltage drops below 3 amperes minimum, load battery with carbon pile rheostat or turn on headlights and other accessories to obtain 3-10 amperes alternator output.*

Voltage Regulator Specifications

Regulator	Air Gap	Voltage Setting
9000566	.075"	ℂ 13.2-14.2 volts
9000567	.075"	ℂ 13.2-14.2 volts
9000585	.075"	ℂ 13.2-14.2 volts
9000586	.075"	ℂ 13.2-14.2 volts

ℂ - At 125°F. Adjust to 13.7 volts.

►*VOLTAGE SETTING TAILORING NOTE:* If battery consistently over- or undercharged after voltage regulator properly set and all other checks indicate no circuit defects, voltage regulator setting may be raised or lowered .3 volt to compensate for various underhood temperatures and other operating conditions. Allow reasonable length of time to check performance. Proper setting is obtained when battery remains fully charged with minimum use of water.

ALTERNATOR & REGULATOR WIRING DIAGRAM (TYPICAL)
(NEGATIVE GROUND TYPE SHOWN)

PRESTOLITE (AUTOLITE) 12 VOLT "A" CIRCUIT REGULATORS

►CHANGES, CAUTIONS, CORRECTIONS

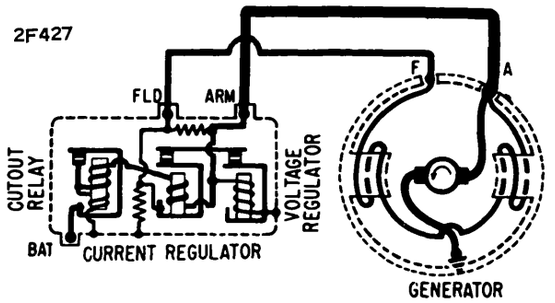
►*GENERATOR POLARIZING:* Whenever regulator or generator leads are disconnected for any reason, the generator must be polarized as follows: After generator and regulator leads are reconnected, connect jumper wire between "GEN" and "BAT" terminals momentarily to allow a quick current surge through generator windings. This will prevent damage to equipment caused by reversed polarity (vibration, arcing, and burning of contact relay points).

►*NORMALIZING THE REGULATOR:* Before checking regulator, bring it to normal operating temperature as follows: Operate generator at speed of 1500 RPM, adjust charging rate to 10 amperes (connect .25 ohm resistor in charging line, use a variable resistance across battery, or turn on headlights and other accessories). Continue operation for 15 minutes to "normalize" regulator (bring to operating temperature). Temperature can be checked by placing an accurate thermometer 2" from regulator cover.

DESCRIPTION: Similar in design to previous types with two resistors.

CHECKING & ADJUSTMENT: Connect ammeter in charging line at regulator "BAT" terminal (in series with battery). Connect voltmeter between regulator "BAT" terminal and ground (except for cutout relay cut-in voltage test when voltmeter should be connected between regulator "ARM" terminal and ground). Make tests as follows:

VOLTAGE REGULATOR



Air Gap: .048-.052". Check with wire gauge placed between armature and core at contact side of stop pin. Contacts should be closed with .052" gauge and should just open when armature pressed down against .048" gauge. Adjust by loosening stationary contact support screw and raising or lowering contact support.

Voltage Setting: After regulator normalized, and with generator charging at 7 ampere rate, note voltmeter reading and regulator temperature. If voltage setting not within specifications in table below, adjust regulator.

Adjustment - Decrease generator speed to slow idle, remove regulator cover, adjust voltage regulator by bending armature spring lower hanger down (increase spring tension) to increase voltage setting, or up (decrease tension) to lower voltage setting. After each adjustment, check setting by first cycling regulator (decrease speed until cutout relay contacts open), then rechecking voltmeter and temperature readings at correct charging rate.

Voltage Regulator Settings

Regulator Model	Voltage Setting Table
All VBO-4200 Series (Except 4201C, -1)	No. 1
VBO-4201C, -1	No. 2

VBO-4200 SERIES 12-VOLT REGULATORS (INTERNAL WIRING DIAGRAM)

Voltage Setting Tables

Table No. 1 Temp.	℃ Volts	Table No. 2 Temp.	② Volts
50°F	14.7	50°F	15.2
80°F	14.5	80°F	15.0
110°F	14.3	110°F	14.8
140°F	14.1	140°F	14.6

℃ - Plus or minus .3 volt. ② - Plus or minus .4 volts.

CURRENT REGULATOR

Air Gap: .048-.052". Check and adjust in same manner as Voltage Regulator (above)

Current Setting: After regulator normalized, current regulator setting should agree with "Test A" specifications in tables below. For "Test B", operate generator at 2000 RPM and add sufficient load to cause current regulator to operate (turn on lights and accessories, add additional load such as a light bank or carbon pile, or use a variable resistance across battery) with voltage of 13.6-13.8 volts. Continue to operate generator for 15 minutes to normalize current regulator by bringing it up to operating temperature (place an accurate thermometer 2" from regulator cover to check temperature). At end of total 30 minutes operation, current setting should agree with "Test B" specifications in table below. If not within range shown in "Test B" column, adjust current regulator.

Adjustment - Make adjustment in same manner as for Voltage Regulator (above).

Current Regulator Nominal Settings

Regulator Model	Nominal Setting
VBO-4201B-1	40 Amps.
VBO-4201E-4A	35 Amps.

130°	43 max. 32-36

CUTOUT RELAY

Air Gap: .025-.027" with contacts open. Check with feeler gauge between lower face of armature and core as close to armature hinge as possible. Use .025" and .027" gauges for "go" and "no go". Adjust by bending armature upper stop as required.

Contact Gap: .015" minimum. Check with feeler gauge. Adjust by bending stationary contact support as required.

Cut-In (Closing) Voltage: With ammeter in charging line in series with battery at regulator "BAT" terminal, and voltmeter between regulator "ARM" terminal and ground, connect a variable resistor in circuit between regulator "FLD" and generator "F" terminals. With regulator normalized, operate generator at engine slow idle speed and turn all resistance into circuit. Slowly decrease resistance and note voltmeter reading at instant relay contacts close (needle will jump slightly). If cut-in voltage does not agree with settings shown below, adjustment is required. After checking and adjusting cut-in voltage, check cut-out amperage (below).

Adjustment - Adjust in same manner as Voltage Regulator (above).

Cut-Out (Opening) Amperag : After checking cut-in voltage (above), turn resistance completely out of field circuit and note ammeter reading. If ammeter does not indicate charging current of 7 amperes, increase generator speed until correct ammeter reading is obtained. Turn resistance into field circuit slowly and note ammeter reading at point where ammeter indicates maximum discharge current (ammeter pointer will drop to zero, then go beyond the zero point, and finally return to zero). Take reading just before ammeter pointer snaps back to zero. This reading is the cut-out amperage and should agree with settings shown below. To adjust, vary contact gap.

Cutout Relay Settings

Regulator Model	Cuts-In	Cuts-Out
All VBO-4200 Series	12.5-13.5 volts	3-5 amps.

DELCO-REMY 12 VOLT "SINGLE CONTACT" REGULATORS

►*1962 PONTIAC CONTACT BURNING CORRECTION:* Generators No. 1102303 & 304 have 4.5 ohm resistance field windings which tend to produce high field current under slow driving conditions. To correct regulator contact point burning or material build-up, install a rectifier resistor, No. 1960461, between generator Field and Armature terminals.

DESCRIPTION: "Single Contact" type similar in design to previous models. Air Gap adjustment on some regulators is made by turning a nylon nut located at top or regulator unit. Point contact gap setting is made in same manner as for previous models. All voltage regulators and some current regulators are "temperature compensated" as indicated below.

CHECKING & ADJUSTMENT: Make all checks and adjustments in following sequence: Voltage Regulation, Cutout Relay Operation, and Current Regulation AFTER regulator has been brought up to normal operating temperature as directed below. Generator must be repolarized each time leads are reconnected and before operating.

►*GENERATOR REPOLARIZING:* After generator and regulator leads reconnected, connect jumper lead between regulator "GEN" and "BAT" terminals momentarily to allow a quick current surge through generator winding. This will prevent damage to equipment caused by reversed polarity (vibration, arcing, and burning of relay contact points).

VOLTAGE REGULATOR

►*NORMALIZING THE REGULATOR:* Before checking voltage setting, bring regulator to operating temperature as follows: Connect 1/4 ohm resistance in series with battery, see that regulator cover in place, operate regulator for 15 minutes continously with no other load than ignition (*NOTE* - If variable resistor used in place of fixed 1/4 ohm resistor, set resistor for 1-10 ampere charging rate).

Air Gap: .075" (except 1119004 and "E" Suffix Regulators), .062" (1119004), .060" (All "E" Suffix Regulators), with contacts just touching. Adjust by loosening upper contact mounting screws and raising or lowering contact bracket (models without nylon adjusting nut); by turning nylon adjusting nut (models with nylon nut). *NOTE* - On models without nylon adjusting nut, align contacts and tighten bracket mounting screws.

Voltage Setting: With regulator "Normalized" (see above), setting can be checked using either "Fixed Resistance" or "Variable Resistance" method as indicated below.

Fixed 1/4 Ohm Resistance Method

1) Connect 1/4 ohm fixed resistor (not less than 25 watts) in charging circuit at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "BAT" terminal and ground.

2) Cycle the generator using either of the following methods: (A) Move voltmeter lead from regulator "BAT" terminal to "GEN" terminal. Reduce generator speed until voltmeter reading is 4 volts, then move voltmeter lead back to "BAT" terminal. (B) Connect variable resistance in field circuit (in line between generator and regulator "F" terminals), turn out all resistance, operate generator at 3500 RPM and turn in resistance until generator voltage reduced to 12 volts, then turn out all resistance and remove variable resistor.

3) Operate generator at 3500 RPM (cars & trucks), note voltmeter reading with regulator cover in place. This is the voltage setting (see data below). Adjust by turning adjusting screw at voltage regulator armature spring lower bracket clockwise to increase setting, or counter-clockwise to decrease setting.

Variable Resistance Method

1) Connect variable resistance (not less than 25 watts) and ammeter in charging circuit at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "BAT" terminal and ground.

2) Cycle the generator (use either method outlined in step 2 of Fixed 1/4 Ohm Resistance Method above).

3) Check and adjust voltage setting as outlined in step 3 of Fixed 1/4 Ohm Resistance Method above.

Voltage Setting Specifications

Setting - As indicated in table below with regulator at a specific ambient temperature. When a voltage range only is given, set regulator within that range at 125°F ambient temperature. Regulator settings can be "tailored" to keep battery in satisfactory state under particular operating conditions as directed below.

►*AMBIENT TEMPERATURE NOTE:* "Ambient Temperature" is temperature of the air surrounding the regulator approximately 1/4" from regulator cover when regulator is at operating temperature ("Normalizing" procedure given above will result in an approximate ambient temperature of 125°F) and can be measured by placing a thermometer 1/4" from regulator cover. See table below for specific regulator settings at various ambient temperatures.

Voltage Regulator Setting

Regulator	Voltage Range or Table No.
1119000, 1, 1E, 2, 2E, 3	No. 3
1119004	13.6-14.3
1119122	No. 3
1119168	No. 3
1119235, 42, 53, 53E, 63, 64, 77, 99	No. 3

Ambient Temperature Voltage Tables (Volts)

Ambient Temp.	Table No. 3
165°F	13.1-13.9
145°F	13.5-14.3
125°F	13.8-14.7
105°F	14.0-14.9
85°F	14.2-15.2
65°F	14.4-15.4

"Tailoring" Voltage Regulator Setting

If battery is consistently undercharged or overcharged (using too much water), adjust voltage regulator within range specified for the ambient temperature in which the regulator is operating, as directed above. *CAUTION - Regulator setting above 14.8 volts (at 125°F) may cause damage to lights and other voltage sensitive equipment and should be avoided.*

1) Battery uses too much water. If voltage regulator setting **above** normal range listed above, reduce setting to within upper portion of normal range and check battery condition over a period of time. If voltage regulator setting **within** normal range listed above, reduce voltage setting 0.1 or 0.2 volts and check battery condition over period of time. This should be continued until battery remains charged with minimum use of water.

2) Battery is consistently undercharged. If voltage regulator setting is **below** normal range listed above, increase setting to within lower portion of normal range and check battery condition over a period of time. If voltage regulator setting is **within** normal range listed above, increase voltage setting 0.1 volt and check battery condition over period of time. This should be continued until battery remains charged with minimum use of water.

CUTOUT RELAY

►*ADJUSTMENT CAUTION: Disconnect battery lead before making Air Gap and Contact Gap adjustments.*

Air Gap: .020" with contacts just touching. To check press down on armature until points just close (use finger pressure on armature directly above contacts), and measure gap between armature and center of core. To adjust, loosen two screws at armature hinge on back of relay, raise or lower armature as necessary. *CAUTION - On relays with two sets of contacts, make sure both sets close simultaneously.*

Contact Gap: .020" with armature up against upper stop. *CAUTION - Gap must be same for both sets of contacts to insure simultaneous closing.* Use feeler gauge to check gap. To adjust, bend upper armature stop up or down as necessary.

Cut-In (Closing) Voltage: 11.8-13.5 volts (except 1119004), 11.5-13.0 volts (1119004). To check with regulator properly connected to generator and battery, connect voltmeter between regulator "GEN" terminal and ground. Use either of the following methods to check cut-in voltage.

1) Slowly increase generator speed and note voltmeter reading at instant contacts close, then decrease generator speed and make certain that relay contacts open. See item (3) for adjustment.

2) Connect a variable resistor in the field circuit between regulator "F" terminal and generator "F" terminal (use 25 ohm-25 watt resistor). Operate generator at medium speed with all resistance turned in, slowly turn out resistance and note voltmeter reading at instant relay contacts close. Slowly turn in resistance and make certain that relay contacts open. Adjust as follows:

3) Turn adjusting screw under armature spring (adjacent to contacts) in or clockwise to increase cut-in voltage, out or counter-clockwise to decrease cut-in voltage.

CURRENT REGULATOR

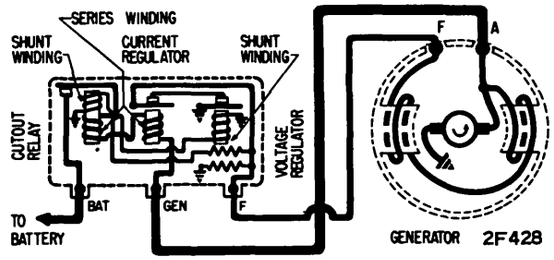
►*CHECKING & ADJUSTMENT CAUTION:* Temperature Compensated Current Regulators should be checked by the "Load Method" which provides for bringing the regulator up to operating temperature. Regulators which are not temperature compensated can be checked by the "Jumper Lead" Method.

Air Gap: .075" with contacts just touching. Check and adjust air gap in same manner as Voltage Regulator (above).

Current Setting: Use correct method for each type as listed below. *CAUTION - Do not attempt to short out voltage regulator by inserting screwdriver through hole in base (will short out both voltage and current regulators and cause generator to operate without control).*

CONTINUED ON NEXT PAGE

DELCO-REMY 12 VOLT "SINGLE CONTACT" REGULATORS (C nt.)



Load Method
(For Temperature Compensated Regulators)

1) Connect ammeter in charging circuit at regulator "BAT" terminal (in series with battery).

2) Turn on all accessory load (lights, radio, etc.) and connect additional load (carbon pile rheostat or bank of lights) to reduce voltage to approximately 1.0 volt below voltage regulator setting.

3) Operate generator at 3500 RPM (cars & trucks) for 15 minutes with regulator cover in place. This will bring regulator up to operating temperature.

4) Cycle the generator by using either of the following methods: **(A)** Connect voltmeter between regulator "GEN" terminal and ground, reduce generator speed until voltmeter reading is 4 Volts, then increase generator speed to 3500 RPM. **(B)** Connect variable resistance in field circuit (in line between generator and regulator "F" terminals), operate generator at 3500 RPM with all resistance turned out, turn resistance in until generator voltage reduced to 12 volts, then turn out all resistance.

DELCO-REMY 12-VOLT REGULATOR WIRING DIAGRAM

5) Operate generator at 3500 RPM and note ammeter reading which is the current setting. Adjust by turning the adjusting screw at the current regulator armature spring lower bracket clockwise to increase setting, or counter-clockwise to decrease setting.

Jumper Lead Method
(For Non-Temperature Compensated Regulators)

1) Connect ammeter in charging circuit at regulator "BAT" terminal (in series with battery).
2) Connect short jumper lead across voltage regulator points (from upper contact bracket to armature).
3) Turn on all lights and accessories or connect additional load (see step 3 under Load Method above) to cause current regulator to operate.

4) Operate generator at 3500 RPM (cars & trucks) and note ammeter reading which is the current setting. Adjust as directed in step (5) under Load Method above.

DELCO-REMY 12 VOLT "DOUBLE CONTACT" REGULATORS

►*REGULATOR TESTING & SERVICE CAUTION: When testing generator and this type regulator, observe the following precautions:*

1) *DO NOT GROUND GENERATOR FIELD WITH REGULATOR CONNECTED TO GENERATOR.* This will cause upper set of contacts in Voltage Regulator to burn up immediately.

2) *DO NOT FILE REGULATOR CONTACTS.* All contacts of the double contact voltage regulator are soft alloy and should be cleaned with crocus cloth or other fine abrasive and washed with carbon tetrachloride.

DESCRIPTION & OPERATION: Three unit regulator with conventional design, Cutout Relay and Current Regulator. Voltage Regulator has additional set of upper contacts connected directly across the generator field (to short out generator field circuit). Lower contacts are connected in series with the generator field. Regulator operates either on upper contacts or lower contacts (both sets are never in operation at the same time), depending on load and battery requirements as follows:

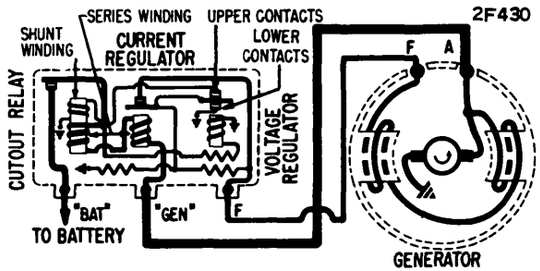
REGULATOR WIRING DIAGRAM (WITH EXTERNAL ADJUSTMENT)

Lower Contact Operation (Low Speed & High Load - High Generator Field Requirement) - Regulator armature travel opens and closes lower contacts (vibrating action), cutting regulator resistance in and out of field circuit. This operation is same as on regulators with a single set of contacts.

Upper Contact Operation (High Speed & Low Load - Low Generator Field Requirement) - Under these conditions, voltage control shifts to upper set of contacts. Armature travel opens and closes upper contacts (vibrating action) to short out the field (contacts closed), or to insert resistance into the field circuit (contacts open).

►*EXTERNAL ADJUSTMENT TYPE REGULATOR NOTE:* Some regulators in this series have an external adjustment feature to provide quick adjustment of voltage regulator setting for temporary unusual driving conditions and high or low battery temperature, without removing regulator cover, using electrical meters, or warm-up periods to bring regulator to operating temperature. External adjustment made by placing adjusting screw in one of the holes provided on side of regulator to add or remove additional resistance in circuit. *NOTE - Under normal conditions, external adjustment screw should be in middle or "0" position.*

ADJUSTMENT



►*TEMPERATURE COMPENSATION NOTE:* All Voltage Regulator units and some Current Regulator units are "Temperature Compensated". It is necessary to bring regulator to operating temperature ("Normalized"), before checking and adjusting, and that regulators be adjusted to setting specified in specification tables below for the "ambient temperature" of unit. "Ambient Temperature" is temperature of air surrounding regulator measured ¼" from regulator cover.

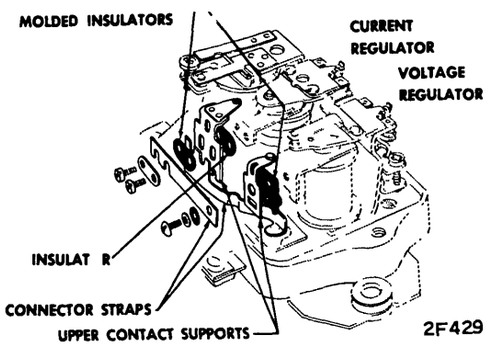
►*"NORMALIZING" THE REGULATOR:* Bring regulator to operating temperature as follows: Connect ¼ ohm resistor in series with battery and operate regulator (with cover in place) for 15 minutes with no other load than ignition. *NOTE - If variabl resistor used in place of fixed ¼ ohm resistor, s t r sistor for 1-10 ampere charging rate.*

CUTOUT RELAY: Air Gap - .020" (Except 1119635 & 1119654), .023" (1119635 & 1119654) with contacts just touching. To adjust, loosen screws at armature hinge on back of relay and raise or lower armature as necessary.

Contact Gap: .020" (All Models) with armature against upper stop. To adjust, bend upper armature stop up or down as necessary.

CONTINUED ON NEXT PAGE

REGULATOR WIRING DIAGRAM (WITHOUT EXTERNAL ADJUSTMENT)



DELCO-REMY 12 VOLT "DOUBLE CONTACT" REGULATORS (Cont.)

Cut-In (Closing) V ltag : 11.8-13.0 volts (Except 1119634), 11.5-12.7 volts (1119634). *For checking and adjustment, se "D lc -Remy 1119000 Series 12-Volt Single Contact R gulators" in this section.*

VOLTAGE REGULATOR: Air Gap - .067" (All Models) with lower contacts just touching. To adjust, loosen contact support bracket screw, place a screwdriver in slot in contact support bracket and into molded insulator, then raise or lower screwdriver handle as necessary. Tighten screw securely after adjustment made.

C ntact Gap: .016" (upper contacts) with lower contacts just touching (All Models). To adjust, bend upper contact arm (on armature assembly) as necessary.

Voltage S tting: *CAUTION - On regulators with external adjustm nt, mak v ltag setting with adjusting screw in middl ("0" positi n) hole.* Connect a ¼ ohm fixed resistor in series with battery at regulator "BAT" terminal. Connect a voltmeter from regulator "BAT" terminal to ground. Connect a 25 ohm, 25 watt variable resistor in series with field circuit. *NOTE - Variable r sistor sh uld hav an "open" position to aid in cycling generator.* With all resistance out of circuit, operate generator at medium or higher speed so voltage regulator will operate on **upper** contacts. Operate for 15 minutes to establish temperature, cycle generator (turn resistance to "open" position momentarily), and slowly turn out all resistance. Regulator should be operating on upper contacts and within range given for ambient temperature in table below. Now slowly turn resistance into circuit until regulator operates on lower contacts. Operating voltage on lower contacts should be .1-.3 volt lower than operating on upper contacts. If adjustment necessary, see "Adjustment" below.

REGULATOR CONTACT ASSEMBLIES

Adjustment - Upper Contacts - Turn adjusting screw clockwise to increase voltage and counterclockwise to decrease voltage. *CAUTION - If adjusting screw turned down beyond range, spring support may not return when screw backed off. If this happens, turn screw counterclockwise until there is good clearance between screw head and spring support, then bend spring support up car fully until it touch s scr w head. Final s tting should be mad by increasing spring t nsion.* After each adjustment, replace regulator cover and cycle generator.

Lower Contacts - Difference in operating voltage of upper and lower contacts is increased by **slightly** increasing armature air gap. If adjustment necessary, recheck voltage setting of **both** sets of contacts.

CURRENT REGULATOR: Air Gap - .075" (All Models) with contacts just touching. To adjust, loosen contact mounting bracket screws and raise or lower contact mounting bracket as necessary.

Current Setting: *See tables below for specifications.* On "Temperature Compensated" types, adjust to setting specified for ambient temperature of unit. *For checking and adjustment, see "Delco-Remy 1119000 Seri s 12-Volt Single Contact Regulators" in this section.*

FORD MOTOR CO. 12 VOLT "SINGLE CONTACT" REGULATORS

►CAUTIONS

►*GENERATOR POLARIZING: (NOTE* - Polarization is not necessary except when generator has been rebuilt or if new pole shoes have been installed). To polarize a generator on the car, disconnect the field wire and the battery wire from the regulator and momentarily connect the two wires together (engine not running). *CAUTION - Do not polarize generator by any method that applies battery voltage to field terminal of regulator.*

►*NORMALIZING THE REGULATOR:* **On the Car**–Clip special thermometer T56L-10505-A on regulator cover (see Note below). Operate engine with generator charging at 10 ampere rate for 30 minutes or until regulator temperature is stabilized.

On the Bench–Procedure is same as on the car except that a small fan should be mounted 12-15" from the regulator so as to circulate air over the regulator cover while it is being warmed up.

Thermometer T56L-10505-A Note–This thermometer is calibrated in 10° F. increments and has additional Voltage scales indicating the correct voltage regulator setting for each temperature reading (both 6 volt and 12 volt scales provided).

►*AMBIENT TEMPERATURE NOTE:* Ambient temperature is the temperature taken adjacent to the regulator, using Thermometer T56L-10505-A.

DESCRIPTION: These 12 volt regulators are the same design as previous 12 volt units.

CHECKING & ADJUSTMENT: *CAUTION*–Regulators are temperature-compensated and must be brought up to normal operating temperature before checks are made. This normal temperature is that existing adjacent to the regulator cover after 1/2 hour of operation in the car or after the regulator has been heated until the temperature is stabilized (standard normal temperature is 70-80° F.

►*TEST METER CONNECTIONS:* If special Test Sets used, make all connections in accordance with manufacturer's instructions. If individual meters used, make connections as follows: Connect test ammeter and 1½ ohm fixed resistor in series in charging line at regulator "BAT" terminal, from regulator terminal to ground (Ford). *CAUTION - Disconnect battery cable.* On other cars, connect test ammeter and 1½ ohm fixed resistor in series in charging line at regulator "BAT" terminal in series with battery. Connect voltmeter between regulator "ARM" terminal and ground (regulator base or battery grounded terminal). Connect a 50 ohm variable field rheostat (2 amp. rating) in generator field circuit (disconnect field lead at regulator "FIELD" terminal, connect rheostat between this lead and regulator "FIELD" terminal).

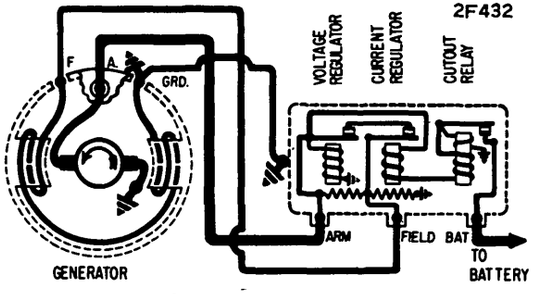
CUTOUT RELAY

Cut-In (Closing) Voltage: After regulator normalized and with test meters connected (see above), check cut-in voltage as follows:

Comet, Falcon, Ford - With field resistance completely turned in the field circuit, operate engine at 1500 RPM, slowly turn resistance out of field circuit and note voltmeter reading when relay contacts close (pointer will drop back slightly). Repeat this check several times by turning resistance in and out of field circuit.

Mercury - With all the resistance turned out of the field circuit, slowly increase generator speed and note voltmeter reading at instant relay contacts close (pointer will drop back slightly). Repeat this check several times by decreasing generator speed until contacts open and then increasing speed until contacts close. If closing voltage not correct as shown in setting table below, adjustment is required.

Adjustment - Bend adjusting arm under armature spring (to left of relay contacts) upward to increase cut-in voltage, or downward to decrease cut-in voltage. Replace regulator cover and recheck the setting.



Cut-In (Closing) Voltage Setting

12.0-2.8 volts (25 & 30 Amp.), 12.4-13.2 volts (35 & 40 Amp.).

Cut-out (Opening) Discharge Current: This can be checked after checking cut-in voltage by increasing generator speed (or turning out field resistance) until charging current is approximately 10 amperes, then slowly decrease generator speed (or turn in field resistance) until maximum discharge current indicated on ammeter (ammeter will return to zero as contacts open).

Cut-Out (Opening) Discharge Current

6-9 amps. (25 & 30 Amp.), 8 amps. (35 & 40 Amp.), reverse current.

GENERATOR & REGULATOR WIRING DIAGRAM

VOLTAGE REGULATOR

Voltage Setting: After Cutout Relay checked (above), cycle regulator by decreasing generator speed until cutout relay contacts open and then increase speed to 1500 RPM. Clip special thermometer on regulator cover to establish regulator ambient temperature and corresponding voltage setting (see Voltage Regulator Settings for various ambient temperatures below). Turn resistance completely out of field circuit (charging rate should be approximately 10 amperes). Note voltmeter reading. This is the voltage setting and should agree with setting listed below.

Final Test (Ford) - Remove all test leads except voltmeter leads and install "BAT" and "F" wires on regulator. Run engine at 1500 RPM (under battery load) and note voltmeter reading (voltage will rise to regulated value after a few moments operation).

Adjustment–Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase voltage setting, or downward to decrease voltage setting. Replace regulator cover and recheck the setting after each adjustment.

Voltage Setting

14.6-15.4 volts, with ambient air temperature of 75° F, *See table below.*

Ford Voltage Regulator Settings (Ambient Temperature Correction)

Ambient Temp. (° F)	All Exc. Auto-Lite 40 Amp. (Volts)	Auto-Lite 40 Amp. (Volts)
25°	15.1-15.9	14.3-15.2
35°	15.0-15.8	14.3-15.2
45°	14.9-15.7	14.3-15.1
55°	14.8-15.6	14.3-15.0
65°	14.7-15.5	14.3-14.9
75°	14.6-15.4	14.2-14.9
85°	14.5-15.3	14.1-14.8
95°	14.3-15.1	14.1-14.7
105°	14.2-15.0	14.0-14.7
115°	14.1-14.9	14.0-14.6
125°	13.9-14.7	13.9-14.5
135°	13.8-14.6	13.8-14.4
145°	13.6-14.4	13.8-14.4

CURRENT REGULATOR

Current Setting: This check requires that a load be added, or that the generator voltage be dropped to approximately 13 volts, to cause current regulator to operate. It is recommended that a heavy duty variable resistance (carbon pile) be connected across the 1-1/2 ohm fixed resistor in the charging line (connect resistance from ammeter lead terminal of fixed resistor to ground–see Test Meter Connections above). After Voltage Regulator checked (above), and with all resistance turned out of the field circuit, operate generator at 1500 RPM (Comet, Falcon, Ford), 2000 RPM (Mercury), decrease the resistance until voltage drops to approximately 13 volts and ammeter reading is at maximum. This ammeter reading is the current setting. If not correct (see table below), adjust as follows:

Adjustment–Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase current setting, or downward to decrease current setting. Replace regulator cover and recheck setting.

Current Setting

25 Amp. Regulator - 23-27 amperes (all models).
30 Amp. Regulator - 28-32 amperes (all models).
35 Amp. Regulator - 33-37 amperes (all models).
40 Amp. Regulator - 38-42 amperes (all models).

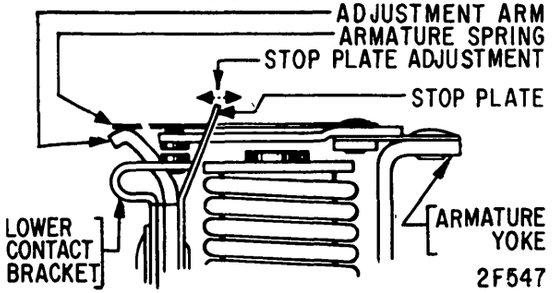
RAMBLER REPLACEMENT REGULATORS

DESCRIPTION: Three unit generator regulator of conventional design containing a cut-out relay, voltage regulator, and current regulator. Regulators are either 6-volt or 12-volt type.

CHECKING & ADJUSTING: Make all checks and adjustments with regulator at normal operating temperature and stabilized. Regulator cover and gasket must be fastened to regulator base and regulator mounted in normal operating position whenever readings are taken.

►*NORMALIZING THE REGULATOR:* Bring regulator to operating temperature as follows: Operate generator for at least 20 minutes at 3000 RPM with fully charged battery and sufficient load to equal 10 ampere (6-Volt), 5 ampere (12-Volt) charging rate. *NOTE - Specifications below are for regulator at 75°F ambient temperature.*

►*ADJUSTMENT CAUTION: Make all adjustments EXACTLY in the order given below.*



CUT-OUT RELAY

Air Gap: 1) Fr P sition - Bend armature stop plate to vertical position and bend armature spring adjustment arm down until tension removed from spring. Bend lower contact bracket down until points separate, then adjust armature free air gap at armature yoke to specifications (see below).

2) Cl s d P siti n - Close points by hand and adjust armature closed air gap to specifications (see below) by bending lower contact bracket upward. *NOTE - Maintain contact p int alignm nt.*

C ntact Gap: Bend armature spring adjustment arm up until armature touches stop plate, then bend stop plate down until specified contact gap is obtained (see below).

Cut-In Voltage: Bend armature spring adjustment arm up or down as required for correct voltage (see below).

RAMBLER REGULATOR CUT-OUT RELAY

Cut-Out Relay Specifications
(Mechanical)

Regulator Number	Air Gap (Free)	Air Gap (Cl sed)	Contact Gap
3203654	.001-.008"	.011-.014"	.025-.030"
3203655	.001-.008"	.011-.014"	.025-.030"
3203656	.001-.008"	.011-.014"	.025-.030"
3203657	.001-.008"	.011-.014"	.025-.030"
3203658	.001-.008"	.011-.014"	.025-.030"
3203659	.001-.008"	.011-.014"	.025-.030"
3203660	.001-.008"	.011-.014"	.025-.030"

(Electrical)

Regulator Number	℃ Voltage Setting
3203654,55,56(6-volt)	6.0-6.4 volts
3203657, 58, 59, 60 (12-volt)	12.6-13.4 volts

℃ - At ambient temperature of 75°F.

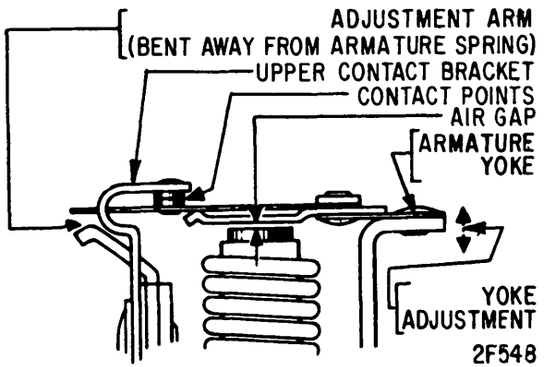
CURRENT REGULATOR

Air Gap: Bend armature spring adjustment arm down until tension removed from spring, then, with contact points open, adjust air gap to specifications (see below) by bending armature yoke. Now bend upper contact bracket until points are just touching.

Current Setting: Bend armature spring adjustment arm as required to bring current setting to specifications (see below).

Current Regulator Specifications

Regulator Number	Air Gap	Current Setting (Amps.)
3203654	.035-.045"	38-42
3203655, 56	.035-.045"	40-44
3203657, 58	.035-.045"	28-32
3203659, 60	.035-.045"	28-32



VOLTAGE REGULATOR

Air Gap: Bend armature spring adjustment arm down until tension removed from spring, then, with points open, adjust air gap to within .001-.005" of specifications (see below) by bending armature yoke. Insert a drill shank .001" larger in diameter than required air gap between armature and core adjacent to brass eyelets, and bend upper contact bracket until points just touch. Remove drill. With points just touching, air gap should be as specified.

Voltage Setting: Bend armature spring adjustment arm up to obtain correct voltage setting (see below).

Voltage Regulator Specifications

Regulator Number	Air Gap	Voltag Setting
3203654	.035-.038"	7.6-7.9

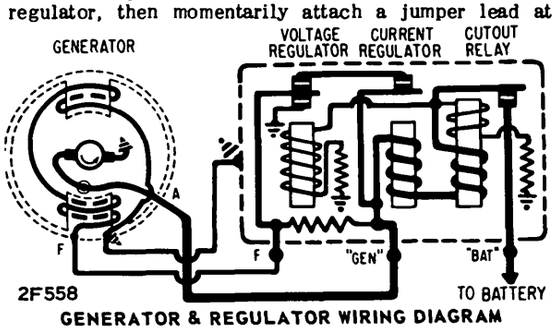
RAMBLER REGULATOR VOLTAGE & CURRENT REGULATOR

LINCOLN CONTINENTAL "DOUBLE CONTACT" REGULATORS

►CHANGES, CAUTIONS, CORRECTIONS

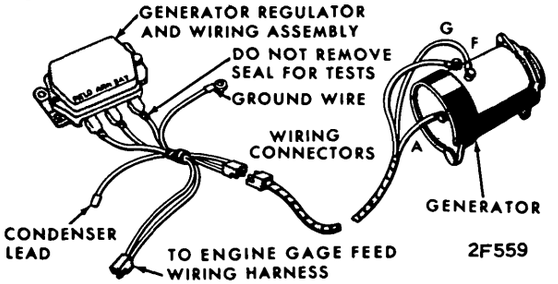


►*1962 INTERMITTENT OR INOPERATIVE CHARGING SYSTEM CORRECTION:* May be caused by a broken or poor weld at splice in wiring harness at armature lead of regulator. This splice connects heavy gauge armature wire and lighter gauge charge indicator wire. Correct by repairing splice using rosin core solder and plastic electrical tape.

DESCRIPTION: Three unit type of same design used previously. All wires at regulator terminals are entirely sealed at terminals and end in two multiple connectors. One connector contains field, ground, and armature leads. Other connector contains battery wire and charge indicator light wire.

►*GENERATOR & REGULATOR TEST CONNECTION NOTE:* **1)** All test connections must be made at battery and generator. Special adapter tool, Sun Electric No. 7052-001, is available to mount on battery positive post. Adapter has a bypass switch for starting engine.

2) On sedans, raise front of car and remove generator splash shield to attach tester leads to generator armature terminal. On convertibles, attach tester leads to generator junction terminal on right fender apron.



►*GENERATOR POLARIZING:* Polarize generator as follows: Separate connector between generator and regulator, then momentarily attach a jumper lead at generator "F" terminal and battery positive post.

GENERATOR & REGULATOR WIRING DIAGRAM

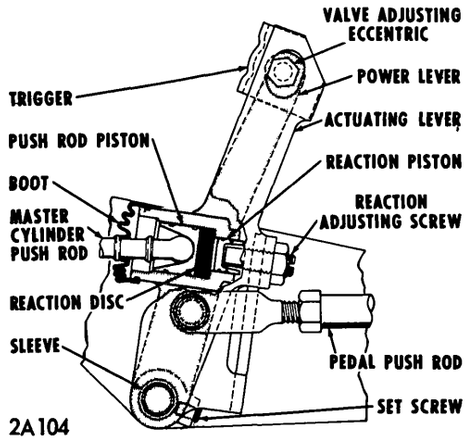
DIAGNOSIS, TESTS, & ADJUSTMENTS: *See 1961 Final Data, Page 294, and note the following:*

Test Connections - Make test connections at generator and battery as described under "Generator & Regulator Test Connection Note" above.

GENERATOR & REGULATOR EXTERNAL WIRING CONNECTIONS

BUICK SPECIAL & OLDSMOBILE F-85 POWER BRAKE UNIT

Buick Special (1962)
Oldsmobile F-85 (1962)



DESCRIPTION: Pedal-assist type power unit mounted on engine side of firewall and connected by pedal pushrod to brake pedal. The power unit consists of an air-vacuum bellows, mounting bracket, power lever assembly, actuating lever assembly, pedal pushrod and brake master cylinder.

OPERATION: Brake power lever is connected to valve housing of power unit through shank of valve adjusting eccentric bolt and it is also connected to master cylinder pushrod through the reaction disc and pushrod piston. The actuating lever is controlled by movement of brake pedal through the pedal pushrod and carries the valve actuating bracket or "trigger". It is also connected to reaction disc through the reaction piston and reaction adjusting screw. The actuating lever (and trigger) movement is transmitted through air control valve button and controls operation of the valves. In unapplied position, power unit bellows is fully extended and is filled with air (atmospheric pressure). Application of movement on brake pedal causes actuating lever to close the air valve and open vacuum valve, permitting vacuum to be applied to bellows, evacuating a controlled amount of air (depending on pedal pressure), causing it to contract and move power lever which, with actuating lever, moves pushrod into master cylinder. As fluid pressure increases in master cylinder, a reaction force is transmitted through pushrod to reaction disc and reaction piston to apply a pressure on actuating lever through the reaction adjusting screw. This reaction force moves actuating lever (and trigger) away from air valve button to close off vacuum port. This reaction force balances the force exerted on actuating lever, providing driver with brake "feel". When pedal pressure is held at any stage of application or release, both air and vacuum valves immediately close and hold power unit in a fixed position.

REMOVAL & INSTALLATION: Remove stoplight switch wires from master cylinder. Disconnect hydraulic line, vacuum hoses, and air supply hose. Disconnect pedal pushrod from brake pedal. Remove attaching bolts and remove master cylinder and power unit assembly. To install, reverse removal procedures and torque attaching bolts to 25 ft. lbs.

ADJUSTMENT: Valve Operation - *NOTE - Valve adjustment must be made without master cylinder installed.* Mount power unit assembly on car or clamp in a vise (make sure master cylinder pushrod is removed so that cut-in of unit can be checked without interference). Attach vacuum supply hose to unit and apply vacuum. *CAUTION - If a shutoff valve is used in vacuum line, DO NOT APPLY unit with shutoff valve closed.* Turn valve adjusting eccentric until unit chatters when pedal is depressed in a sharp and rapid movement. Then turn eccentric until chatter disappears. Do not turn eccentric more than necessary or the unit cut-in will be excessively high. Tighten eccentric nut to 180-220 inch pounds, then recheck adjustment.

Pushrod Adjustment: Buick - *NOTE - Adjustment must be made if master cylinder parts, power lever parts or pushrod has been changed.* With master cylinder and boot removed from unit, insert master cylinder pushrod into pushrod piston in power lever and hold it in with light pressure. Adjust pushrod length so distance between master cylinder mounting face and end of pushrod is .096-.116". Tighten locknut and recheck adjustment. With boot installed on master cylinder, attach master cylinder to mounting bracket and tighten nuts to 25 ft. lbs. *CAUTION - If pushrod adjustment is too long, it may force master cylinder piston forward, closing off compensating port and causing brakes to lock.. If this adjustment is too short, a "clunk" may be noticeable on operation of power unit.*

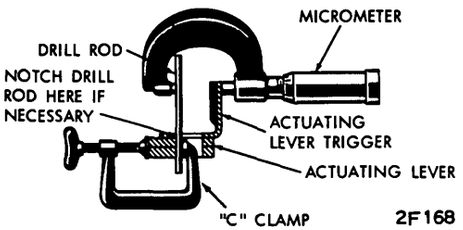
POWER LEVER ASSEMBLY

Oldsmobile F-85 - Adjust pushrod length until end of pushrod just touches master cylinder piston, then tighten locknut. Remove master cylinder filler cap and look for bubbles or spurt of fluid when brakes applied (indicates proper adjustment), then check and adjust fluid level in master cylinder (¼" below lip of master cylinder). *CAUTION - If pushrod adjustment is too long, it may force master cylinder piston forward, closing off compensating port and causing brakes to lock. If adjustment too short, a "clunk" may be noticeable when power unit operated.*

Reaction Adjusting Screw Adjustment: *NOTE - This adjustment must be made only if adjustment has been changed or actuating lever or reaction piston has been replaced. Either of the following methods may be used:*

Recommended Method - Install a gauge in hydraulic system and bleed system. Apply a 30 lbs. load perpendicular to pedal. Hydraulic pressure on gauge should be 340-350 psi. Adjust reaction adjusting screw to obtain this pressure. *NOTE - Make final adjustment by turning screw IN.* Tighten adjusting screw locknut and recheck setting.

Alternate Method - *NOTE - If gauges are not available, an approximate setting can be made as follows:* With unit completely assembled, and valve adjusting eccentric properly adjusted, turn reaction adjusting screw IN until rear of reaction piston skirt is FLUSH with back face of power lever. *NOTE - A light rearward pressure on master cylinder pushrod will maintain contact between reaction adjusting screw and reaction piston.* **Back off adjusting screw 1 2/3 turns and lock in place with jam nut.** After installation of unit in car and after all adjustments have been made, apply a load of 70 lbs. or more at pedal. Rear of reaction piston skirt should then be flush or exposed not more than .010".



Pedal Height Adjustment: Buick - Distance from center of brake pedal pad to floor should be 4⅛". To adjust, remove clevis pin at inner end of pushrod and adjust length of rod as necessary. *NOTE - This specification supersedes previous 3¾" for better pedal feel.*

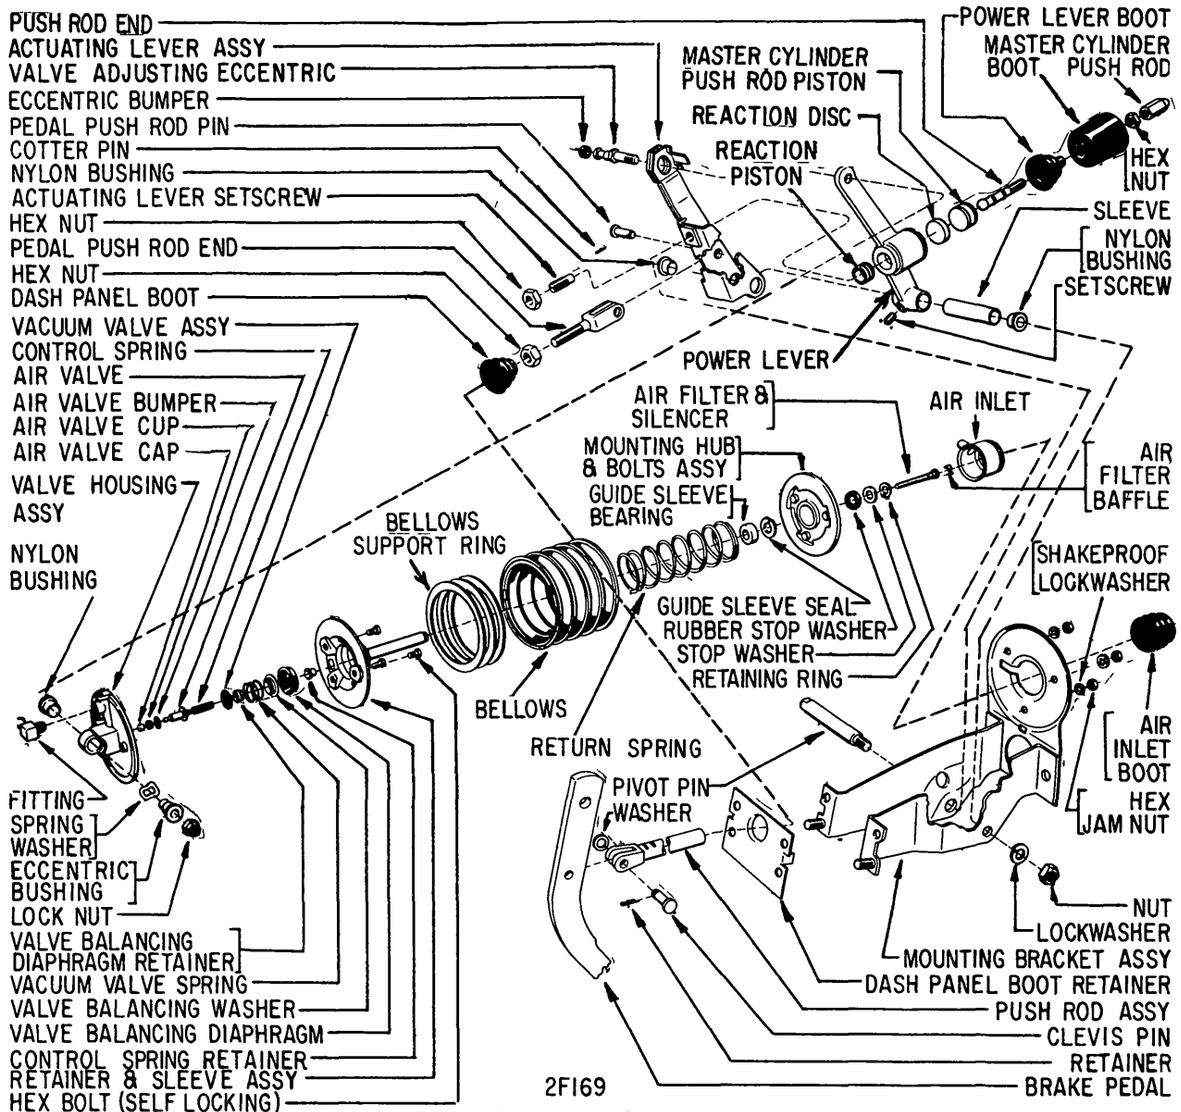
POWER BRAKE DISASSEMBLY: Remove master cylinder boot, and pushrod assembly (leave boot on power lever). *NOTE - Do not disassemble pushrod unless replacement is necessary.* Remove cotter pin from pedal pushrod actuating lever clevis and retract clevis pin through side of mounting bracket. Remove pedal pushrod assembly and dash panel boot (discard boot). Remove valve adjusting eccentric nut and remove spring washer and bushing. Remove valve actuating eccentric from power lever, then remove and discard rubber collar from eccentric. Remove and discard nylon bushing from valve housing. Remove pivot pin nut and lockwasher and slide pin out of mounting bracket. Remove power lever assembly and actuating lever assembly as a unit. Remove and discard nylon bushings in power lever sleeve, then remove sleeve setscrew. Push sleeve out of power lever assembly and separate power lever and actuating lever. Remove power lever boot, pushrod piston, reaction disc, and reaction piston from power lever. Discard boot and reaction disc. *CAUTION - Do not damage finish of bore of pistons. Do not remove reaction adjusting screw and locknut unless actuating lever is being replaced.*

POWER BRAKE REASSEMBLY: 1) Check actuating lever trigger position as shown in illustration. Drill rod must be perpendicular to flat side of actuating lever and tight against side of slot (notch drill rod if necessary to maintain squareness). Trigger position measured with micrometer must be .950"±.005". Bend trigger arm or replace actuating lever as necessary.

2) Reassemble reaction disc, pushrod piston, boot, and reaction piston into power lever (lubricate pushrod piston and reaction piston with lubriplate). Assemble power lever to actuating lever and apply lubriplate to outside of power lever sleeve. Install sleeve into power lever and actuating lever and lock in place with setscrew, then install sleeve bushings. *NOTE - If reaction adjusting screw has been moved, adjust as described under "Adjustments" above.* Install power lever and actuating lever assembly in mounting bracket and install pivot pin and lock in place with nut and lockwasher. Install nylon bushing in valve housing and coat with lubriplate. Install new rubber collar under eccentric (start collar under one side of hex, then

CONTINUED ON NEXT PAGE

TRIGGER LEVER POSITION CHECKING



BUICK SPECIAL & OLDSMOBILE F-85 POWER BRAKE UNIT (C nt.)

force over hex with thumb pressure). Assemble power unit to power lever and actuating lever assembly by installing valve adjusting eccentric bolt. *NOTE - Be sur nd f actuating l v r trigger does not strike side f air valv butt n. Curv of trigger should rest against nd f air valv button.* Install spring washer over spherical bushing, slide assembly over valve adjusting eccentric bolt and into valve housing, then install nut. Tighten valve adjusting eccentric nut until eccentric bolt is firmly locked to power lever but can still be turned for adjustment. Install pedal pushrod and boot and attach to actuating lever with clevis pin (use new cotter pin). Make Valve Operation, Pushrod, and Reaction Adjusting Screw Adjustments as detailed under "Adjustment" above, then install master cylinder and install unit on car. Make brake pedal height adjustment.

POWER UNIT DISASSEMBLY: Remove mounting bracket from power unit, then remove air inlet housing and boot. Clamp unit in a soft-jawed vise and remove air filter baffle from retainer sleeve by pushing down and sideways to unhook, then lift out air filter with baffle. Hold mounting hub and bellows against return spring and remove retaining ring, steel stop washer and rubber stop washer from guide sleeve. *CAUTION - Do not op n r taining ring t o wide or it will be damaged.* While still holding mounting hub down, remove lip of bellows from hub and then lift mounting hub assembly and return spring from power unit. Remove retainers and guide sleeve assembly with bellows from valve housing, then remove retainers and sleeve assembly from bellows. Remove air valve control spring, valve balancing diaphragm, vacuum valve spring, vacuum valve assembly, and air valve assembly from valve housing. Remove valve balancing washer and retainer from valve balancing diaphragm.

Cl aning & Insp cti n: Clean all metal parts (except mounting hub assembly), including air filter, in alcohol or other oil-free solvent and dry thoroughly. *CAUTION - Lubricant in l ather seal in mounting hub as s mbly must n t b wash d out.* Clean bellows in mild soap and warm water. Inspect all parts for wear or damage. If vacuum valve seat in valve housing is damaged, valve housing must re replaced. *Replace all parts suppli d in repair kit even if they do not show w ar r damage.*

POWER UNIT REASSEMBLY: 1) Clamp valve housing in a soft-jawed vise so alignment notch is visible. Install air valve assembly, vacuum valve, vacuum valve spring, valve balancing diaphragm with washer and retainer (small diameter of retainer toward diaphragm). Install balancing diaphragm with retainer first and make sure retainer is centered in vacuum valve spring and that center bead in retainer is pressed down snugly and evenly over neck or hub of vacuum valve assembly. Apply lubriplate to outside diameter of valve balancing diaphragm. *CAUTION - DO NOT apply brake fluid t rubb r parts.* Install bellows with support rings in place over retainers and guide sleeve assembly. Make sure three bosses in retainer are aligned with three recesses in bellows, and that guide sleeve projects into (not out of) bellows. Install bellows assembly over valve balancing diaphragm with a twisting motion,

POWER BRAKE UNIT (EXPLODED)

then place on valve housing. Install screws, check alignment marks for proper positioning, then tighten self-locking screws evenly to 85-115 inch-pounds. Sight down guide sleeve and see that air valve control spring is squarely in retainer.

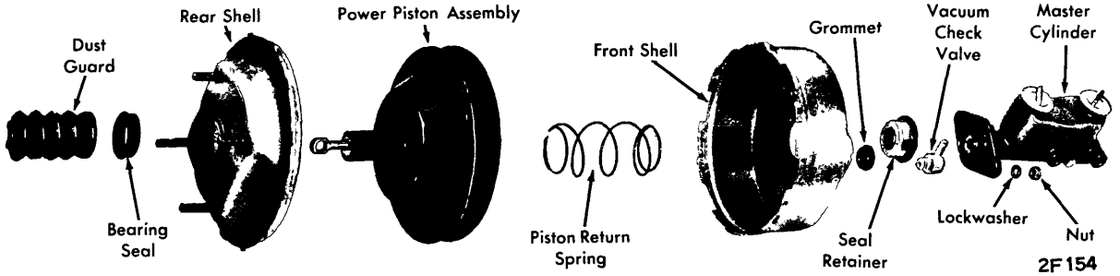
2) Remove assembly from vise and test air valve operation by pressing down with a screwdriver. Two stages of movement should be felt: In first stage, only air valve control spring is compressed; in second stage, resistance of vacuum valve spring is added. When pressure released, valve should snap back. Apply lubriplate to guide sleeve and inside of leather seal in mounting hub. Install return spring around guide sleeve and retainer assembly, slide mounting hub assembly (threaded studs up) over guide sleeve, then hold hub down against return spring and assemble flange of bellows evenly over outside edge of hub. Place rubber stop washer, then steel stop washer over guide sleeve, install retaining ring and make sure it is properly seated in groove. Assemble air filter baffle and air filter and installl into guide sleeve (air baffle clips over end of guide sleeve and into same groove with and above retaining ring). Install air inlet housing and boot (air inlet hose must be in alignment with clearance slot in mounting bracket). Install mounting bracket on hub, align slot in bracket with tab on bellows, and tighten attaching nuts to 85-115 inch-pounds.

DELCO-MORAINE VACUUM SUSPENDED POWER BRAKE UNIT

Cadillac, All Series (1962) ℂ
Chevrolet Pass. Cars (1962) ℂ
Chevy II (1962) ℂ

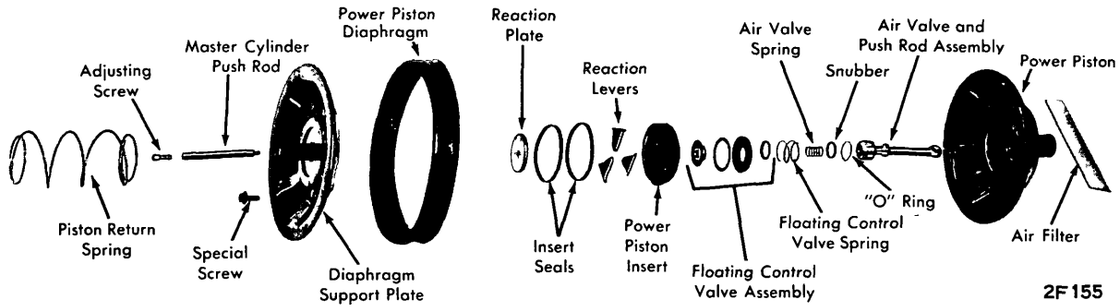
ℂ - "Bendix Power Brake Unit Diaphragm (Vacuum Suspended) Type" also used.

►CHANGES, CAUTIONS, CORRECTIONS



►*1962 CADILLAC VACUUM CHECK VALVE BUZZING NOISE CORRECTION (Early Cars):* On cars before Engine No. 014925, install a conical shaped check valve spring to replace original cylindrical shaped spring. New spring dampens valve flutter and was installed on cars after the above engine number.

DESCRIPTION: "Vacuum Suspended", folding diaphragm type consisting of a vacuum power cylinder which contains the power piston assembly that houses control and reaction assemblies, and the power piston return spring. Brake control valve assembly is composed of an air valve and floating control valve assembly. Brake reaction assembly consists of a hydraulic piston reaction plate and a series or reaction levers. Power unit hydraulic pushrod is provided with an adjusting screw to insure correct relationship between vacuum piston and master cylinder piston.

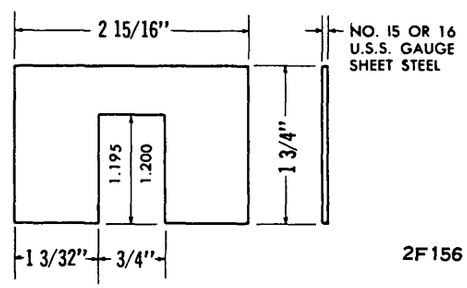


LUBRICATION & SERVICE: No lubrication required. Clean air cleaner filter twice a year as follows: Slide rubber boot to rear to remove filter. Wash filter in cleaning solvent and let dry before reinstalling.

REMOVAL & INSTALLATION: Disconnect vacuum line from power unit and hydraulic lines from master cylinder. Disconnect power unit pushrod from brake pedal assembly. Remove power unit-to-firewall attaching bolts and remove power unit and master cylinder as an assembly. To install, reverse removal procedure. *NOTE - On Chevrolet Pass. Cars, adjust brake pedal height by turning clevis on brake pedal pushrod at brake pedal. Pedal height should be 4 7/8" (Biscayne & Bel Air), 4 5/8" (Impala).*

DISASSEMBLY: Remove master cylinder from power unit. Scribe mark front and rear shells for mating at reassembly. Disconnect linkage (if equipped) at air valve pushrod. Place unit in a vise with rear shell up. Place metal bar (or Shell Separator J-9504) over studs, press down on bar and rotate rear shell counterclockwise to unlock shells. *CAUTION - Do not damage or loosen studs in shell, and make sure there is no pressure on plastic power piston extension.* Remove rubber boot from power piston extension and separate power piston from rear shell. Remove air filter element from extension. Remove mounting gasket and power piston bearing from rear shell. *CAUTION - Use extreme care when handling power piston diaphragm so that there is no grease, oil, foreign matter, nicks, scratches, or gouges on diaphragm.* Support power piston in upright position (master cylinder pushrod up) and remove support plate from piston assembly. Remove rolling diaphragm from support plate. Remove master cylinder pushrod from support plate, and press reaction plate from pushrod if necessary. Remove reaction levers from seats in power piston insert, then remove air valve return spring from air valve counterbore. Remove power piston insert, and both seals from O.D. of insert. Lift air valve and pushrod assembly from power piston, and remove snubber and "O" ring from air valve. Push floating control valve assembly out of position and disassemble valve. After floating control valve removed, floating control valve spring and seat can be removed. Remove power piston return spring from front shell, then remove front shell from vise. Remove support plate seal retainer from front shell and remove gasket and seal. Pull check valve from grommet and remove grommet.

DELCO-MORAINE POWER UNIT ASSEMBLY (EXPLODED)



DELCO-MORAINE POWER PISTON ASSEMBLY (EXPLODED)

CLEANING & INSPECTION: Use "Declene" or brake fluid to clean all metal, plastic and rubber parts. Blow out all passages, orifices, and valve holes with clean, dry air, and air dry all parts. Slight rust on inside of housing can be polished with crocus cloth or fine emery cloth. There should be no cuts, nicks or distortion of any rubber part. If in doubt about the condition of a part, replace the part.

REASSEMBLY: 1) Place power piston bearing in rear shell with large flange to outside. Lubricate grooves in I.D. of bearing. Install check valve grommet and check valve in front shell. Press reaction plate over small knurled end of master cylinder pushrod until plate rests against shoulder of pushrod. Install pushrod through support plate until reaction plate is against support plate. Place power piston in a vise with extension down. Do not clamp piston. Install floating valve spring and spring seat in piston, then assemble floating valve diaphragm over flanged hub of floating control valve. *NOTE - Flat surface of diaphragm will be on side opposite rubber face of floating control valve. Install* diaphragm plate under lip of diaphragm. Press floating control valve and diaphragm assembly into power piston so control valve bears against spring seat and compresses spring. *CAUTION - Do not distort diaphragm when pressing floating control valve assembly into power piston.* Install "O" ring and snubber on air valve, then place pushrod through floating control valve and into piston extension so pushrod passes through loading slot in extension. Install seals in insert and place insert over air valve. Install air valve return spring, then install reaction levers in insert. Place unfolded diaphragm over support plate with second bead on outside wall. Place support plate on power piston and make sure beaded edge of diaphragm is between flange on support plate and flange on edge of power piston. Install support plate to power piston and torque retaining screws to 80-100 inch-pounds. 2) Wrap filter around pushrod and slide filter into power piston extension. Install master cylinder retaining nuts on studs and place power unit in a vise so vise jaws bear against nuts. Install power piston return spring. Place power piston (air valve pushrod first) into rear shell until piston extension passes through piston

CONTINUED ON NEXT PAGE

PUSHROD GAUGE TOOL

DELCO-MORAINE VACUUM SUSPENDED POWER BRAKE UNIT (Cont.)

bearing. Fold rolling diaphragm over rear shell and apply talcum powder or rubber lubricant to beaded part of diaphragm. Install rear shell and power piston assembly into front shell (support plate extension must go through power piston return spring). Rotate rear shell to align scribe marks, then lock assembly together. *NOTE - If unit does not lock easily, hold shells tight and apply vacuum to check valve (support plate seal or retainer must be installed if vacuum assist unnecessary).* Install rubber boot over pushrod and power piston bearing flange. Connect linkage (if equipped) to air valve pushrod.

3) Rotate unit in vise so master cylinder pushrod is up. Adjust pushrod to proper height (see below). Install support plate seal in retainer so flat surface of seal is against bottom of retainer. Install gasket, and place retainer in front shell cutout so gasket is between front shell and retainer flange. Install master cylinder on power unit and torque master cylinder retaining nuts to 15-20 ft. lbs. Install mounting gasket on rear shell.

PUSHROD ADJUSTMENT: *NOTE - No periodic adjustment of pushrod height is necessary. Check pushrod height if unit disassembled or if adjusting screw length is changed.* Place Pushrod Gauge J-7723-01 over end of pushrod with legs of gauge resting on face of power unit. Pushrod should just touch gauge at center. To adjust, hold pushrod at serrated end with pliers and turn adjusting screw as necessary.

►*GAUGE TOOL & PUSHROD HEIGHT NOTE:* If Gauge J-7723-01 is not available, a suitable gauge can be made according to dimensions shown in illustration. Pushrod height should be 1.195-1.200" (All Models).

MORAINE HYDRAULIC (DIAPHRAGM) REACTION BRAKE POWER UNIT

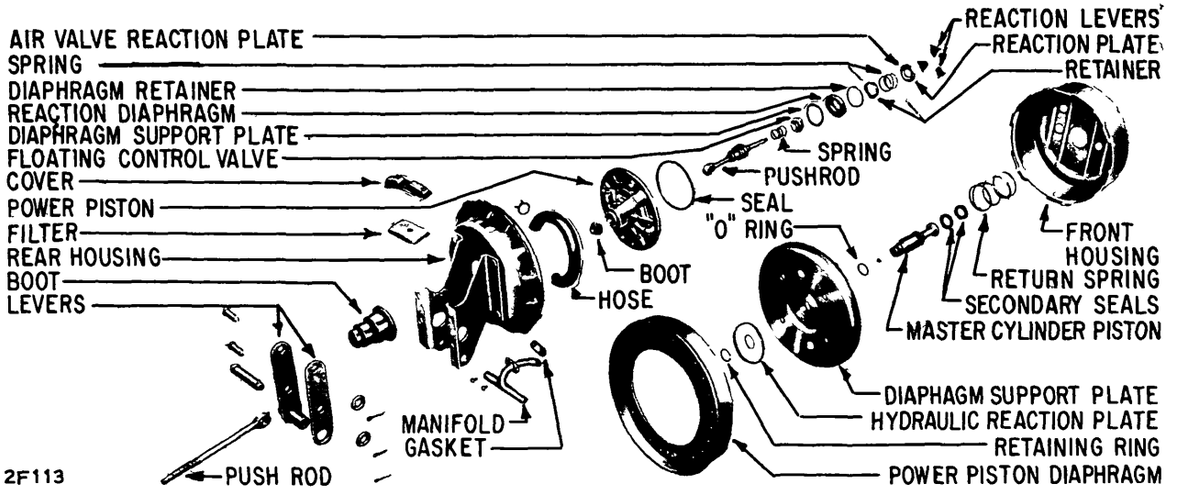
Buick (Except Special) (1962)
Oldsmobile 88, S88, 98 (1962) ①
Pontiac (Except Tempest) (1962) ②
① - "Bendix Power Unit Hydraulic (Disc) Reaction Type" also used.
② - "Bendix Power Unit Hydraulic (Disc) Reaction Type" and "Bendix Power Unit Diaphragm (Vacuum Suspended Type)" also used.

DESCRIPTION: Design is similar to previous models except for the use of selective shims between power cylinder and brake master cylinder. On Buick models, an additional reaction disc is used between master cylinder piston reaction plate and reaction levers.

OPERATION: As brake pedal is depressed, the operating rod moves air valve forward until its seat contacts floating control valve, sealing off atmospheric pressure. Further movement carries floating valve away from seat on power piston and opens the area forward of diaphragm to vacuum source while air valve remains closed. As air is exhausted forward of diaphragm, atmospheric pressure on opposite side moves diaphragm and piston assembly forward. As diaphragm and piston assembly moves forward, the master cylinder piston is depressed into master cylinder. As pressure builds up in master cylinder, the hydraulic piston reaction plate moves away from its stop and presses against the reaction levers. These levers in turn swing around their pivots and push the valve reaction plate back against the floating control valve snubbers. In this manner, approximately 40% of the load on master cylinder piston is transferred through air valve and operating rod to the brake pedal.

REMOVAL: Power Brake & Master Cylinder - Disconnect hydraulic line from master cylinder and vacuum line from power unit, then disconnect pushrod from brake pedal. Remove nuts attaching power unit to firewall and remove unit.

Master Cylinder: *NOTE - Master cylinder can be removed from power unit without removing power unit from car.* Remove hydraulic connection from master cylinder (cover opening and pipe to prevent dirt entering). Remove master cylinder attaching nuts and remove master cylinder from vacuum unit. *NOTE - Master cylinder piston assembly will remain attached to vacuum unit. If necessary to replace piston, it will be necessary to disassemble vacuum unit.*



►*DISASSEMBLY & OVERHAUL CAUTION: Use care to prevent damage to parts. Do not allow oil or grease to come in contact with diaphragm or other rubber parts.*

OVERHAUL: *See 1959 Final Data, Page 317, or later Manual edition and note the following:*

Disassembly: If necessary to remove power cylinder from master cylinder be careful not to damage selective shims found between these two parts. If shims are damaged, replace with new shims of the same thickness.

►*1962 BUICK & OLDSMOBILE GAUGE TOOL NOTE:* 1962 Buick and Oldsmobile units have a different shape front housing and require Gauge Tool J-8531-01 to obtain proper master cylinder piston height. Gauge J-8531 may also be used if modified as follows: Grind a 45° chamfer 1/4" from outer end of each gauge leg, and cut a 1/16" deep notch on inner end of each gauge leg to a distance of 1 3/8" from center of gauge.

Gauging Master Cylinder Piston: *NOTE - It is necessary to gauge piston if front or rear housing, power piston assembly, master cylinder piston, or master cylinder assembly is replaced with a new part.* To check master cylinder piston, remove front housing from master cylinder (DO NOT remove selective shims from studs). *CAUTION - Be sure parts are not displaced from bore of master cylinder.* Place Gauge J-8531 so that it stands perpendicular to front housing next to two lower studs, and bridges over end of master cylinder piston. Piston should be flush with gauge plus or minus .010". If there is excess clearance under legs of gauge, add shims (gasket material) over front housing studs as required to take up clearance. If there is excessive clearance at center of gauge, remove shims. When all shims are removed, and piston end is still lower than gauge, check for deformed parts and replace as required. Install front housing on master cylinder and tighten nuts to 20 ft. lbs. *NOTE - The dimension of Gauge J-8531 provides a measurement of 1.833-1.844" from end of master cylinder piston to master cylinder surface on power cylinder.* If more than five .010" shims are required for correct adjustment, recheck assembly of vacuum piston.

MORAINE BRAKE POWER UNIT ASSEMBLY

BENDIX TANDEM DIAPHRAGM POWER BRAKE UNIT

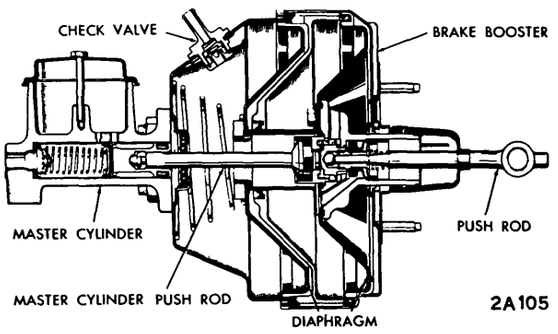
Plymouth (1962) ℂ

ℂ - Early cars. Later cars use Midland-Ross Power Unit. *See "Midland-Ross Diaphragm Type Power Brake Unit" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS



►*1962 DODGE (EXC. CUSTOM 880) & PLYMOUTH POWER BRAKE HIGH PEDAL OR LOW & SENSITIVE PEDAL CORRECTION:* This condition may be caused by installation of either a Chrysler or Dodge Custom 880 power brake unit and master cylinder. To check, remove unit from car and remove master cylinder. Pushrod length measured from face of unit to head of self-locking screw should be .905-.920" (.912" preferred) and master cylinder bore should be 1". The power unit used on Dodge Custom 880 & Chrysler is similar to that used on Dodge & Plymouth, however, pushrod length is 1.240-1.255" and master cylinder bore is 1 1/8". *CAUTION - Do not attempt to adjust pushrod length. Replace complete unit with correct assembly.*

►*1962 ERRATIC BRAKE OPERATION CORRECTION:* This condition accompanied by slow pedal return or build-up, and a loud scrubbing noise on pedal release (especially when unit cold). Caused by insufficient lubrication on power unit center plate hub.

DESCRIPTION: Vacuum-hydraulic power brake assembly with tandem vacuum diaphragms. This unit is a "vacuum suspended" type and does not require a vacuum reservoir. The vacuum power chamber consists of a front and rear shell, center plate, front and rear diaphragm, hydraulic pushrod and a vacuum diaphragm return spring. The hydraulic master cylinder is connected directly to vacuum chamber.

REMOVAL & INSTALLATION: From under dash, remove pushrod nut and bolt from brake booster and brake pedal, then disconnect brake line from master cylinder and vacuum line from check valve. Remove four brake booster attaching nuts and washers and withdraw power brake assembly from support bracket. Remove master cylinder attaching bolts and remove master cylinder from power unit. To install, reverse removal procedure.

OVERHAUL: *CAUTION - Do not attempt to disassemble power unit. Return to authorized manufacturer's service station.*

CHRYSLER CORP. POWER BRAKE UNIT

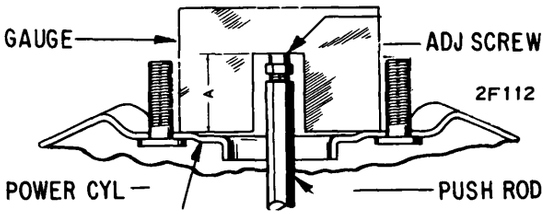
BENDIX HYDRAULIC (DISC) REACTION POWER BRAKE UNIT

Lancer (1962)
Lincoln Continental (1962)
Oldsmobile 88, S88, 98 (1962) ①
Pontiac (Except Tempest) (1962) ④
Studebaker (Except Hawk) (1962) ②③
Valiant (1962)

① - "Moraine Power Unit (Hydraulic Diaphragm Reaction Type)" also used.
② - "Hydrovac Piston Type" used on Hawk models.
③ - Early Cars up to Serial Nos. 62S-16410 & 62V-11992. Later Cars use "Bendix Power Brake Unit Diaphragm (Vacuum Suspended) Type".
④ - "Bendix Power Brake Unit Diaphragm (Vacuum Suspended Type)" and "Moraine Power Unit (Hydraulic Diaphragm Reaction Type)" also used.

DESCRIPTION: Similar in design to units used on previous models. A plastic type piston plate is used on some models. Service procedures for this type plate are different than for die-cast plate.

OPERATION: *See 1959 Final Data, Page 316, or later Manual edition.*



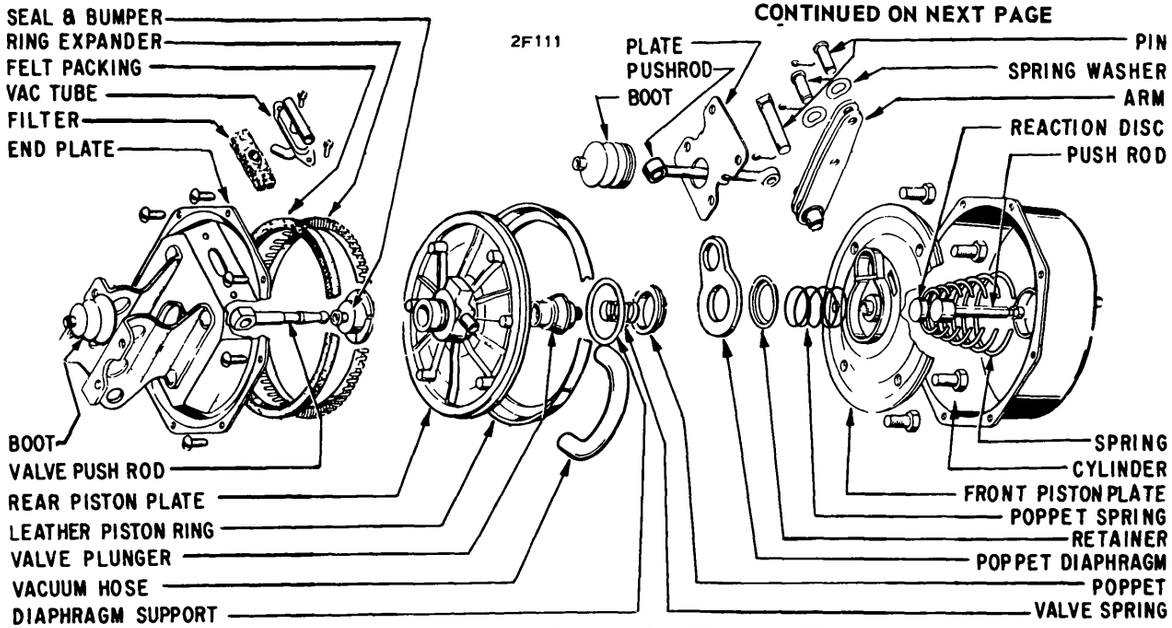
REMOVAL & INSTALLATION: *See 1959 Final Data, Page 316, or later Manual edition and note the following:*

Master Cylinder: *NOTE - Master cylinder can be removed from all cars without removing power brake assembly from car.* Disconnect hydraulic brake line from master cylinder and remove nuts and bolts securing master cylinder to power brake unit. *CAUTION - Keep area around pushrod clean.*

Pushrod Adjustment (All Cars): *NOTE - The self-locking screw on end of pushrod is set to correct height on original assembly and adjustment is not required unless hydraulic pushrod has been replaced, or if adjustment has been changed. If necessary, adjust as follows:* With piston assembly free in cylinder and firmly seated in a released position, hold pushrod seated against reaction disc and centered in spring of master cylinder. Use Gauge indicated in table below or measure distance from mounting face of power cylinder to end of pushrod adjustment screw (see table for correct dimension). Rotate adjusting screw as necessary to obtain correct adjustment.

Pushrod Adjustment

Car Model	Gauge No.	Dimension
Lancer	C-3815	1.195-1.200"
Lincoln Continental		1.175-1.180"
Oldsmobile	J-7723	1.195-1.200"
Pontiac	J-7723	1.195-1.200"
Studebaker		1.195-1.200"
Valiant	C-3815	1.195-1.200"



PUSHROD ADJUSTMENT

OVERHAUL: *See 1959 Final Data, Page 316, or later Manual edition and note the following:*

Vacuum Power Piston (Plastic Type): Disassembly - Remove piston felt and expander ring from piston assembly, then lift rod seal and bumper boot from rear piston plate and slide off eye end of operating rod. Remove capscrews from front piston plate, separate

CONTINUED ON NEXT PAGE

BENDIX "HYDRAULIC (DISC) REACTION" POWER BRAKE UNIT

BENDIX HYDRAULIC (DISC) REACTION POWER BRAKE UNIT (C ntinued)

front and rear piston plates, and remove leather packing. Remove poppet spring, valve, return spring retainer, poppet diaphragms, poppet, poppet spacer, and plunger and rod assembly. *NOTE - Do not separate valve p rating rod from valv plunger unless replacement f valve rod or plunger is necessary.* If valve rod or plunger must be replaced, hold assembly with valve plunger down and inject alcohol into cavity around valve rod to wet rubber lock in valve plunger, then drive or pry valve plunger off valve rod. Use care not to damage plunger if it is to be reused. Remove rubber reaction disc from front piston plate if necessary. *CAUTION - When cleaning, use only alcohol on parts containing rubber or plastic.*

Reassembly - Position plunger and rod assembly into rear piston plate, and install rod seal and bumper boot. Position spacer washer into cavity inside rear piston plate, then assemble poppet through poppet diaphragm, and install poppet spring retainer on end of poppet. Position leather packing on rear piston plate, then install poppet spring and valve return spring on plunger and poppet reaction plate. Position and align front piston plate against rear piston plate, and secure in position with capscrews. Soak piston felt in shock absorber fluid, then insert felt in expander ring, and position expander and felt in groove around rear piston plate with expander teeth up.

BENDIX DIAPHRAGM TYPE (VACUUM SUSPENDED) POWER BRAKE UNIT

Cadillac, All Seri s (1962) ①
Chevrolet Pass. Cars (1962) ①
Chevy II (1962) ①
P ntiac, Except T mp st (1962) ④
Rambler, All S ries (1962)
Studebak r (Except Hawk) (1962) ②③

① - "Delco-Moraine Power Brake Unit (Vacuum Suspended Type)" also used.

② - "Hydrovac Piston Type" used on Hawk models.

③ - Later Cars after Serial Nos. 62S-16410 & 62V-11992. Early Cars use "Bendix Power Brake Unit (Hydraulic Disc Reaction Type)".

④ - "B ndix Power Brake Unit (Hydraulic Disc Reaction Ty pe)"and "Moraine Power Brake Unit (Hydraulic Diaphragm Reaction Type)" also used.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 RAMBLER CLASSIC (6210 SERIES) BRAKE SENSITIVITY CORRECTION:* Install Power Brake Reaction Disc Kit, No. 3204350, according to instructions in kit.

►*1962 STUDEBAKER VACUUM CHECK VALVE NOISE CORRECTION:* To correct, install new type check valve, Part No. 1556983.

DESCRIPTION: "Vacuum Suspended", disc reaction, diaphragm type power brake unit. Vacuum power chamber consists of a front and rear shell, vacuum power diaphragm, diaphragm return spring and a hydraulic pushrod. The mechanically actuated control, integral with vacuum power diaphragm, controls degree of brake application or release depending on pressure applied to valve operating rod through brake linkage. Control valve assembly consists of a single poppet valve with both atmospheric port and vacuum port.

LUBRICATION & SERVICE: No lubrication required. Clean air cleaner filter twice a year as follows: Slide rubber boot to rear to remove filter. Wash filter in cleaning solvent and let dry before reinstalling.

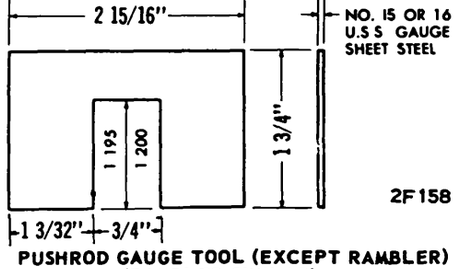
REMOVAL & INSTALLATION: Disconnect vacuum line from power unit and hydraulic lines from master cylinder. Disconnect power unit pushrod from brake pedal assembly. Remove power unit-to-firewall attaching bolts and remove power unit and master cylinder as an assembly. To install, reverse removal procedure. *NOTE - On Chevrol t Pass. Cars, adjust brake pedal height by turning cl vis on brake pedal pushrod at brake pedal. Pedal height should be 4 7/8" (Biscayne & Bel Air), 4 5/8" (Impala).*

DISASSEMBLY: 1) Remove master cylinder from power unit, then remove master cylinder filter, piston seal assembly and master cylinder pushrod from front shell. Remove rubber boot and retainer plate from rear shell. If equipped, remove air valve pushrod linkage and mounting bracket. Remove filter retainer from diaphragm plate extension, then remove air filter. *CAUTION - Us xtr me car when rem ving air filt r r - tain r so that plastic diaphragm plat is not chipped. Pry at several places around retainer until freed.* Scribe an alignment mark on both shells for mating at reassembly. Use holding Fixture J-9576-1 and Bar Wrench J-9504 and separate shells. *CAUTION - Use care when separating shells so that diaphragm spring pressure does not cause rear shell to fly off.* Remove power piston from rear shell and remove separating tools.

2) Disassemble power piston as follows: Remove diaphragm from diaphragm hub. Hold diaphragm plate with pushrod in horizontal position, depress pushrod slightly (about 1/16"), and rotate piston so air valve lock will fall out. Remove air valve pushrod assembly. Remove reaction disc from diaphragm plate bore (use pushrod or suitable tool to push disc from seat). *Do not chip diaphragm plate.*

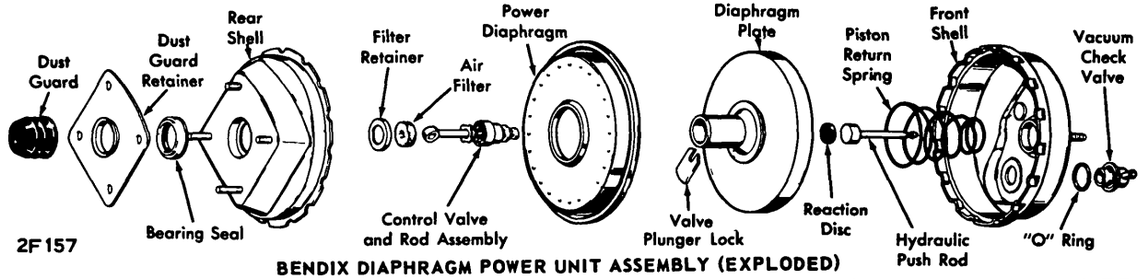
3) Remove rear shell bearing seal with a punch or thin screwdriver. *CAUTION - Remove seal only if a new one is available. DO NOT reuse seal if it has been removed.* Remove vacuum check valve and grommet.

CLEANING & INSPECTION: Use "Declene" or brake fluid to clean all metal, plastic and rubber parts. Blow out all passages, orifices, and valve holes with clean, dry air, and air dry all parts. Slight rust on inside of housing can be polished with crocus cloth or fine emery cloth. There should be no cuts, nicks or distortion of any rubber part. If in doubt about the condition of a part, replace the part.



REASSEMBLY: 1) Install vacuum check valve grommet (beveled edge on inside), then install check valve. Install Holding Fixture J-9576-1 on front shell. Install new rear shell bearing seal with Installer J-9540 (tool will bottom against shell when seal properly installed).

2) Assemble power piston as follows: Lubricate outer diameter of diaphragm plate and extension, valve and plunger bearing surfaces, and outer edge of valve poppet. Install valve and rod into diaphragm plate extension. Depress pushrod slightly and install air valve lock (lock must index and retain air valve). Install rolling diaphragm in diaphragm plate hub groove. Lubricate reaction disc and install disc (use master cylinder pushrod to seat disc in diaphragm plate bore). *NOTE - If disc not fully seated, pushrod height will be incorrect.*



3) Lubricate inside of bearing seal and diaphragm bead contact surface of rear shell. Install power piston return spring, and power piston, then lock shells together with Bar Wrench J-9504. Install air cleaner filter and retainer. Install boot retainer and rubber boot. If equipped, install air valve linkage and mounting bracket. Lubricate the hydraulic pushrod lightly and install pushrod into center bore of power piston until fully seated against reaction disc. Install seal and master cylinder filter (press seal into front shell until bottomed in shell recess). Make master cylinder pushrod adjustment (see below). Install master cylinder

PUSHROD ADJUSTMENT: *NOTE - No periodic adjustment of pushrod height is necessary. Check pushrod height if unit disassembled or if adjusting screw length is changed.* Place Pushrod Gauge J-9571 (Rambler), J-7723-01 (All Others) over end of pushrod with legs of gauge resting on face of power unit. Pushrod should just touch gauge at center. To adjust, hold pushrod at serrated end with pliers and turn adjusting screw

►*GAUGE TOOL & PUSHROD HEIGHT NOTE:* If Gauge J-7723-01 or J-9571 are not available, a suitable gauge can be made according to dimensions shown in illustration. Pushrod height should be 1.195-1.200" (Cadillac, Chevrolet, Chevy II, Pontiac, Studebaker).

PUSHROD GAUGE TOOL (EXCEPT RAMBLER) (RAMBLER SIMILAR)

BENDIX DIAPHRAGM POWER UNIT ASSEMBLY (EXPLODED)

MIDLAND ROSS DIAPHRAGM TYPE POWER BRAKE UNIT

Dodge & Dodge Dart (1962) Ⓒ
Ford Fairlane & Galaxie (1962)
Mercury Meteor & Monterey (1962)
Plymouth (1962) Ⓒ
Thunderbird (1962)

Ⓒ - Later cars. *For early cars, see "Bendix Tandem Diaphragm Power Brake Unit" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

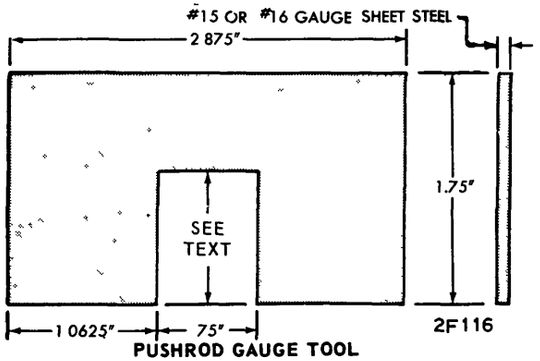
►*1962 FORD GALAXIE & MERCURY MONTEREY PUSH-ROD RATTLE OR LOOSENESS CORRECTION:* May be caused by broken plastic pushrod retainer. To correct, install new retainer, No. 376417-S.

►*1962 FORD MOTOR CO. MODELS NO INITIAL POWER ASSIST (AFTER STANDING FOR SEVERAL HOURS) CORRECTION & PRODUCTION CHANGE:* Caused by incomplete seating of atmospheric valve. To correct, install Atmospheric Valve Return Spring, No. C2AZ-2A157-A, between atmospheric valve and reaction load ring. *NOTE - This spring installed in production on later cars.*

►*1962 POWER BRAKE BOOSTER CHATTER CORRECTION:* Make sure there is no air in system (bleed brakes), and that master cylinder pushrod is properly adjusted.

DESCRIPTION: Self-contained vacuum actuated diaphragm type power unit similar in design and operation to previous models.

LUBRICATION: At 6000 mile intervals lubricate mechanical linkage lightly with SAE 10W engine oil.



TROUBLE SHOOTING: *See 1961 Final Data, Page 298.*

REMOVAL & INSTALLATION: *See 1961 Final Data, Page 298 and note the following:*

Brake Pedal Height Adjustment (Fairlane & Meteor): After power unit installed, adjust brake pedal height as follows: Turn eccentric bolt at brake pedal pushrod so so brake pedal is 1 7/16" above accelerator pedal.

OVERHAUL: *See 1961 Final Data, Page 298, and note the following:*

Pushrod Adjustment: Place a gauge made to the dimensions shown in illustration against master cylinder mounting surface of booster body. Pushrod adjusting screw should just touch inner edge of slot in gauge. If gauge not used, distance from master cylinder mounting surface on booster body to end of pushrod adjusting screw should be .910-.920" (Dodge & Plymouth), .995-1.005" (All Ford Motor Co. Models).

PUSHROD GAUGE TOOL

CHEVROLET TRUCK TWINPLEX BRAKES

Chevrolet Trucks, Series 40,50,60 (1962) Rear Only Ⓒ

Ⓒ-*For Front Brakes, see "Chevrolet-Bendix Hydraulic" in this section.*

DESCRIPTION: Two cylinder, four anchor type (each shoe anchored at each end and linked to wheel cylinder at each end). Brakes are radially self-centering.

ADJUSTMENT: Each shoe has one adjustment (adjusting screw at adjustable anchor end). Adjustment is same for both wear and for new or relined shoe clearance.

Brake Pedal Adjustment: *See "Chevrolet-Bendix Hydraulic" for data.*

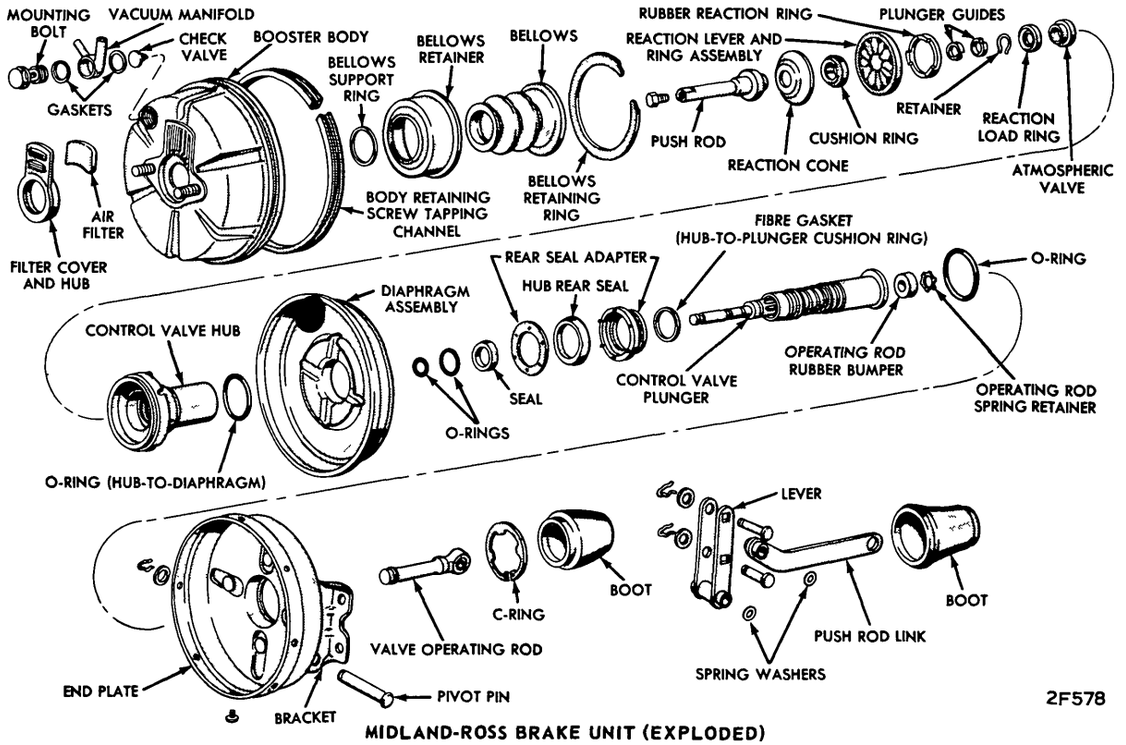
Brake Shoe Adjustment: Jack up both rear wheels, remove adjusting hole covers from backing plates (two holes at each wheel - one for each shoe). Use Tool J-4707 or screwdriver inserted through rear (lower shoe) adjusting hole and turn adjusting screw up (move outer end of tool toward center of wheel) until light brake drag is felt on wheel, then back off adjusting screw 3 notches for correct running clearance. Adjust upper shoe similarly by inserting tool through front adjusting hole.

Parking (Hand Brake) Adjustment: Parking brake is independent type mounted on propeller shaft at rear of transmission.

1½ & 2 Ton - Fully release brake lever. Loosen locknut on outer shoe adjusting screw then tighten to secure a clearance of .010" to .015" measured at point directly above screw. Tighten locknut. Loosen locknut on link between hand brake lever and shoe actuating lever. Tighten adjusting nut on link to secure a clearance of .010-.015" between shoe and drum. Tighten locknut.

Tilt Cab Over-Center Lever Adjustment - With lever fully released, turn adjusting knob until cable link pivot is at bottom of guide slot. *Adjust parking brake as detailed above.* Turn lever adjusting knob as required to obtain over-center locking position.

MASTER CYLINDER: Removal & Filling - *See "Chevrolet-Bendix Hydraulic" in this section.*



BLEEDING BRAKE SYSTEM: *See 1961 Final Data, Page 314.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

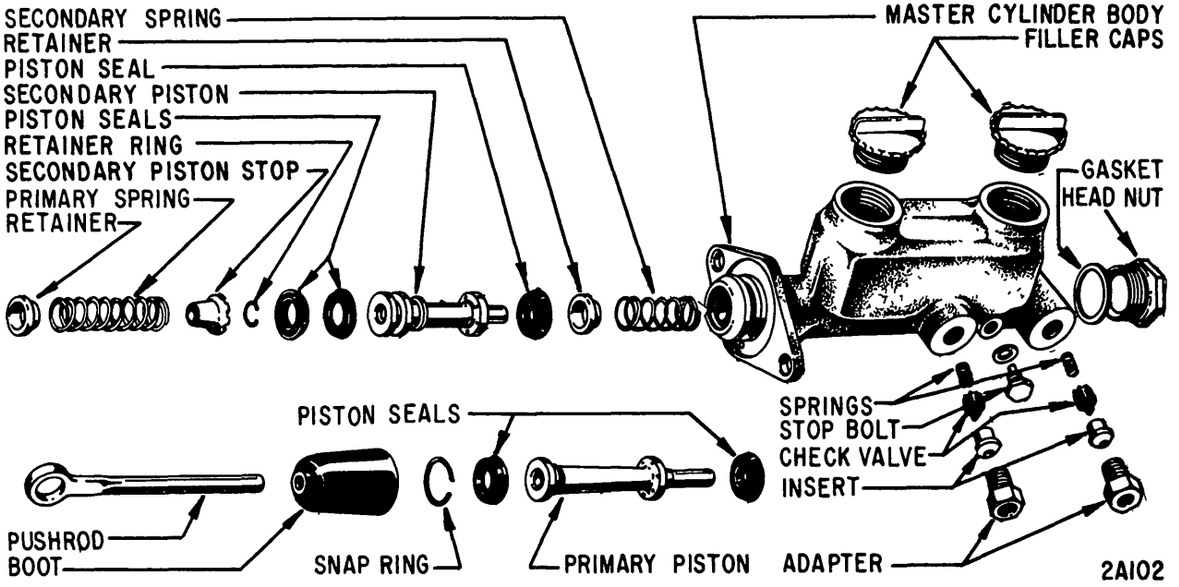
MIDLAND-ROSS BRAKE UNIT (EXPLODED)

BENDIX & MORAINE DUAL PISTON BRAKE MASTER CYLINDERS

Cadillac, All Series (1962)
Rambler, All Series (1962)

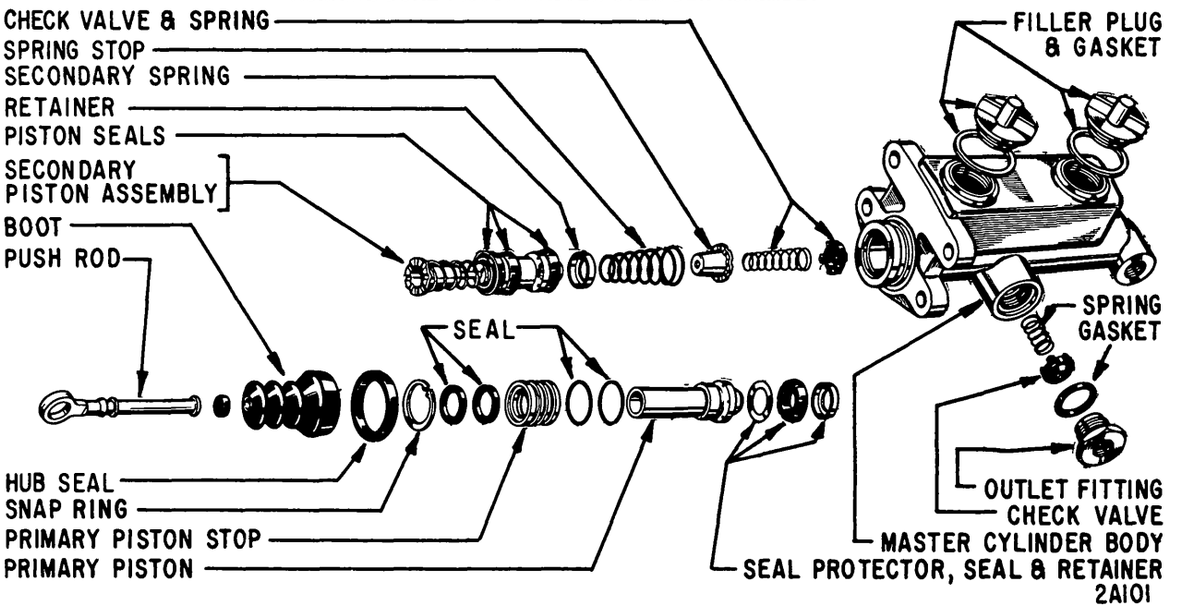
►*MASTER CYLINDER APPLICATION NOTE: Either Bendix or Morain units are used on Cadillac models. On Rambler models, Bendix units are used on all models with power brakes and on early models with manual brakes. Morain units are used on later models with manual brakes.*

DESCRIPTION: Dual piston master cylinder assemblies consist of a single cylinder in which two pistons operate in tandem, actuated by a single brake pushrod. Pressure spaces are provided at forward end of each piston with each pressure space having conventional inlet and outlet ports, check valve, and reservoir. Front wheel brakes are actuated by rear master cylinder piston and rear wheel brakes are actuated by front piston, providing two separate brake systems. A failure in one systemdoes not result in failure of both systems. Fluid reservoirs on Moraine units are separated from each other by a full partition that prevents fluid from one reservoir entering the other reservoir. On Bendix units, a baffle separates the two reservoirs and prevents a flow of fluid from one reservoir to the other except when both reservoirs are full. A vented filler plug is provided for each reservoir.



BLEEDING BRAKES: *NOTE - Master cylinder is self-bleeding and requires no bleeder fitting. Make sure car is level or front end is lower than rear.*

Bendix Brake Unit: Remove filler caps and connect bleeder hose to front reservoir. Install a solid (vent plugged) filler cap on rear reservoir. *NOTE - A solid filler cap can be made by plugging vent hole on any filler cap.* Attach drain hose to bleeder fitting on each wheel cylinder, then back fitting off 3/4 turn and bleed brake fluid into a partially filled bottle of clean brake fluid until bubbles stop, then close fitting.



Moraine Brake Unit: Connect bleeder hose to front reservoir, then build up pressure in bleeder. Attach a drain hose to bleeder fitting on each rear wheel cylinder. Back off fitting 3/4 turn and bleed brake fluid into a partially filled bottle of clean brake fluid until bubbles stop, then close fitting. Connect bleeder hose to rear reservoir and repeat procedure for front wheel cylinders.

►*CADILLAC MASTER CYLINDER BLEEDING NOTE:* If brake fluid lines have been disconnected at power brake mastercylinder forremoval of unit, mastercylinder can be bled after installation as follows: Install output lines to master cylinder and tighten nuts snugly, then back off one full turn. Completely fill both reservoirs, then pump brake pedal a minimum of five complete strokes and tighten brake lines at connections. If necessary, add fluid to both reservoirs. *CAUTION - If pedal is too low and spongy, or if some other part of hydraulic system has been disconnected, then entire system must be bled.*

►*CADILLAC SECONDARY PISTON OVERHAUL NOTE & CAUTION:* If secondary piston has been disassembled during overhaul, piston must be assembled and adjusted exactly as follows: Coat piston cups with brake fluid and install cups on spring end of secondary piston with cups back-to-back. Install cup retainer on outer cup. Stand piston on end opposite cups and install spring and spring retainer. Install spring adjusting screw into retainer and start screw into piston. Tighten screw until distance from end of spring retainer to surface that protector washer seats against is 3 35/64". *CAUTION - Spring adjustment must be correct or too much pedal travel before brakes apply (piston covering inlet port) will occur if screw adjust dt far; or piston will cover compensating port in master cylinder if screw not adjusted far enough.*

MORAINE DUAL PISTON MASTER CYLINDER ASSEMBLY

BENDIX DOUBLE SAFETY MASTER CYLINDER ASSEMBLY

CADILLAC & OLDSMOBILE AUTOMATIC ADJUSTER TYPE BRAKES

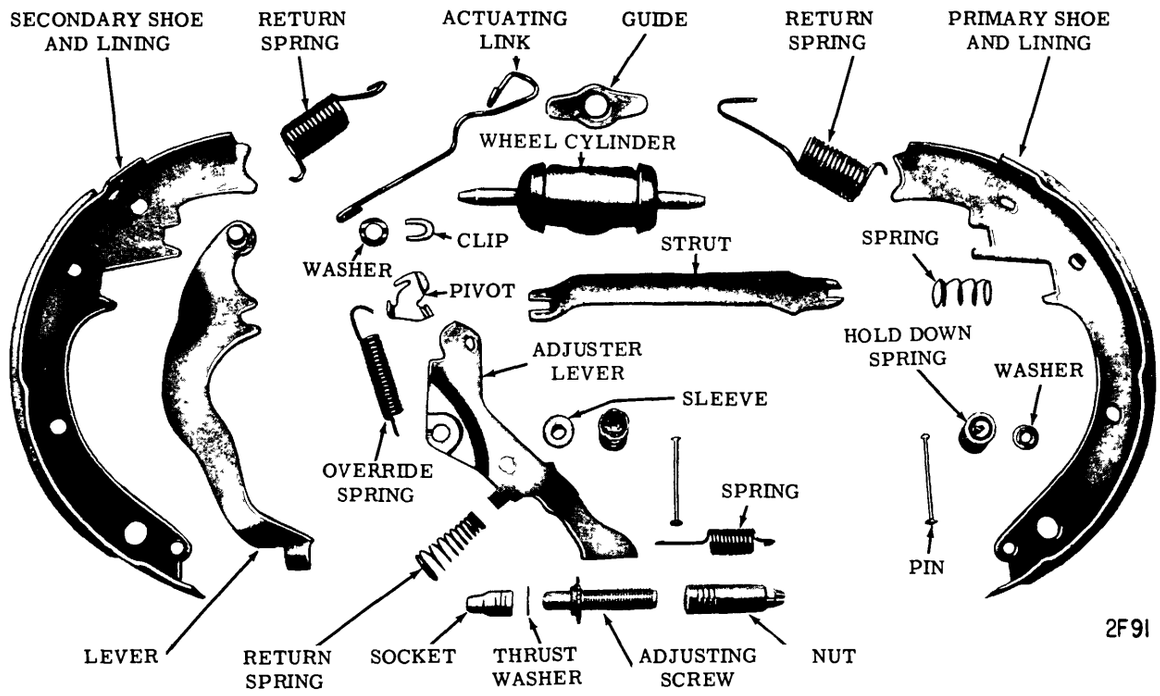
Cadillac, All Series (1962)
Oldsmobile 88, S88, 98 (1962) ℂ

ℂ - Cars with Power Brakes. *For cars without power brakes, see "Bendix Hydraulic Single Anchor Brakes" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1961-62 CADILLAC BRAKE SQUEAK OR MOAN CORRECTION:* When noise occurs as car comes to a stop, probable cause is vibration between brake linings and brake drums. To correct squeak, draw file lining to remove any glaze and install a Shoe Stabilizer Kit, Part No. 5461160, on each front brake. To correct moan, install two Drum-To-Wheel Clip Kits, Part No. 3632110 (Kelsey-Hayes Wheels), No. 3632111 (Motor Wheels).

DESCRIPTION: Hydraulic single anchor type brake (without eccentric) with Bendix type shoes. Brake shoe anchor pins are fixed in backing plate and require no adjustment. Moraine automatic adjusting mechanism consists of a link, actuating lever, pawl, and pawl return spring.

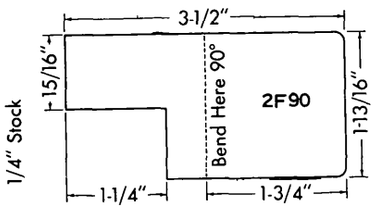


Master Cylinder (Cadillac) - "Split System" type master cylinder used, having a separate piston and fluid chamber for front and rear brakes respectively.

OPERATION (AUTOMATIC ADJUSTER): The adjusters operate only when brakes are applied as car is moving in reverse. As the brake drums move rearward, the wrap around action of the brake shoes forces upper end of primary shoe against anchor pin and the secondary shoe away from anchor pin. The link which holds top of actuating lever stationary, forces actuating lever to pivot on secondary shoe. This pivoting action forces pawl downward against end of a tooth on the star wheel adjusting screw. If lining-to-drum clearances are correct, the downward movement will stop before star wheel is turned. If clearances are too wide, the secondary shoe will move outward and the pawl will move downward far enough to turn star wheel one notch and take up the adjustment.

ADJUSTMENTS: Make adjustments as follows:

Brake Shoe Adjustment (Cadillac): *NOTE - Adjustment should be required only after shoe relining or replacement, or when length of star wheel has been changed.* Remove adjusting hole cover in drum and rotate star wheel to expand shoes until drum can just be rotated forward with a two-foot bar between the wheel mounting studs. Reach through adjusting hole and disengage adjuster pawl from star wheel (use a hooked tool) and back off star wheel **exactly 40 notches**. Drive car forward and backward and apply brakes moderately 5 or 6 times in each direction for final adjustment.



Brake Shoe Adjustment (Oldsmobile): *NOTE - Adjustment should be required only after shoe relining or replacement, or when length of star wheel has been changed.* Remove brake drum and place Brake Shoe Gauge BT-6211 over brake linings (gauge is offset for oversize linings). Rotate adjusting wheel to expand shoes until gauge is a snug fit on linings. Rotate gauge slightly to be sure that gauge contacts linings at largest diameter. Remove gauge. *NOTE - If necessary to back off adjustment, hold adjuster lever away from star wheel.*

AUTOMATIC ADJUSTER BRAKE ASSEMBLY (REAR SHOWN - FRONT SIMILAR)

Parking Brake Adjustment (Cadillac): *TOOL NOTE - Make a gauge tool from ¼" flat steel stock as shown in illustration.* With service brakes properly adjusted, lubricate parking brake linkage and check for free movement of cables in conduit and equalizer. Check rear relay lever spring and replace if necessary. With parking brake mechanism in fully released position, insert 15/16" part of gauge tool in gap between relay lever and end of slot in frame. Adjust intermediate cable at front clevis until gauge is a slip fit. Back off equalizer nut so relay lever can be moved forward to insert 1 13/16" end of gauge into frame slot. *NOTE - must be slack in rear cables when 1 13/16" end of gauge is in place.* Tighten equalizer nut to obtain a near lock-up drag on rear wheels when wheels are turned by hand in forward direction. Remove gauge. Parking brake pedal should now travel 1¾-2¾" with approximately 50 lbs. pressure on pedal.

Parking Brake Adjustment (Oldsmobile): With parking brake lever fully released, tighten equalizer adjusting nut until a heavy drag is felt at rear brakes, then loosen equalizer adjusting nut 10 turns and tighten locknut.

CADILLAC PARKING BRAKE GAUGE TOOL

BRAKE SHOE REPLACEMENT: *Removal - CAUTION - Note position and color of brake assembly springs for reinstallation in exactly the same locations.* Disconnect parking brake cables at rear wheels. Disconnect primary and secondary brake shoe retracting springs, and remove shoe hold-down cups, springs, pins, and sleeve. Remove pawl return spring, pawl and actuating lever. Disengage shoes from wheel cylinder and rotate shoes until link disengages from shoe plate (front), or anchor (rear).

Installation: 1) Install backing plates and torque attaching bolts to specifications listed in table below.

2) Place shoes on backing plate and install connecting spring and star wheel assemblies. *CAUTION - Do not interchange star wheel assembly between sides of car or shoes will retract instead of expand. Right hand threads are for left side of car; left hand threads are for right side of car.* Install parking brake parts on rear brake. Install link actuating lever, pawl spring, pawl, and shoe hold-down springs and other parts. Install retracting springs. Install brake drums. Make wheel bearing, service, and parking brake adjustments.

Brake Torque Specifications (Ft. Lbs.)

Part	Cadillac	Oldsmobil
Front Backing Plate	65	80-130
Anchor Pin (Front)		55-80
Rear Backing Plate	40 ℂ	45-60

ℂ - 70 Ft. Lbs. on Commercial Chassis.

CONTINUED ON NEXT PAGE

CADILLAC & OLDSMOBILE AUTOMATIC ADJUSTER TYPE BRAKES (Cont.)

PARKING BRAKE ASSEMBLY REPLACEMENT (CADILLAC): Disconnect cable at relay lever beneath car. Disconnect hose from vacuum diaphragm. Remove parking brake assembly-to-instrument panel mounting bolts then remove parking brake assembly-to-cowl mounting bolts and move assembly away from cowl. Push brake lever to fully depressed position (to expose clevis), then remove cable from clevis. Remove assembly.

Vacuum Unit Replacement: With parking brake assembly removed (see above), drill out diaphragm retaining rivets (Series 60, 62), straighten diaphragm retaining tangs (Series 75, CC). Disconnect link from manual release lever (retained by rivet on Series 60, 62), and remove diaphragm. When installing, secure diaphragm to parking brake assembly, then connect link and manual release lever.

MASTER CYLINDER: Service as follows:

Cadillac: Removal - Master cylinder is removed during disassembly of power unit.

Filling - Fluid should be within ¾" of top of each filler opening.

Ⓒ - *For Rear Brakes, see "Chevrolet Truck Twinplex" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

►*PASS. CAR & HALF-TON BRAKE SHOE GRINDING CAUTION:* If bench grinder used, grind shoes to .057-.087" smaller than drum size. If spindle grinder used, grind shoe to drum diameter.

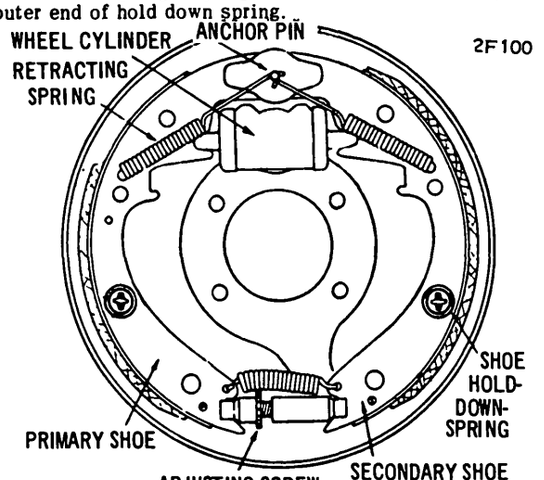
►*BRAKE DRUM REPLACEMENT CAUTION:* Use suitable volatile non-toxic greaseless type solvent to clean oil from braking surface of drum before drum is installed.

►*METALLIC BRAKE LINING CAUTION:* This special purpose optional type lining may be used with the old standard drums provided surface of drum is smooth. Service adjustments are the same as for standard brakes except as noted in data below.

►*BRAKE SHOE ANCHOR PIN INSTALLATION CAUTION:* Tighten brake shoe anchor pins to torque indicated in table below.

Anchor Pin Tightening Torque

Car Model	Ft. Lbs.
Chevrolet Pass. Car	65
Chevy II	60-90 (Front), 90-130 (Rear)
Corvair	60-85 (Front), Ⓒ 100-125 (Rear)
Truck, Series 10 (Front & Rear)	100-125
Truck, Series 20, 30 (Front & Rear)	150-175
Truck, Series 40, 50, 60 (Front)	150-175



Ⓒ - Anchor pin is fixed on Corvair Truck Rear Brake.

DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric adjustment.

►*METALLIC LINING SERVICE NOTES:* When servicing the special purpose optional type lining it is important that the items below are followed:

Pull Back Spring Installation - Heat resistant type springs used as follows; PINK' pull back springs must be used with front primary shoes and both rear shoes. YELLOW pull back springs must be used with front secondary shoes. Use GREEN hold down springs on all eight shoes. Paint on the springs will become blistered and burnt in operation but does **not** indicate that springs have been excessively hot.

Hold Down Spring Cup Installation - Install large hold down spring cup against web and small cup at outer end of hold down spring.

FRONT BRAKE ASSEMBLY

Drum Replacement - Blue heat discoloration is normal and drum should not be replaced if surface of drum is smooth.

Seating New Lining - After brakes properly adjusted, make six to eight stops from 30 MPH with moderate pedal pressure (aids seating and eliminates tendency to dive). Now make six to eight complete stops from maximum legal highway speed at approximately 1 mile intervals. Readjust brakes if necessary.

ADJUSTMENT: Make adjustments as follows:

Brake Pedal Adjustment: Before adjustments made, make sure pedal returns to fully released position freely, with no binding, and that pedal retracting spring (if used) has not lost its tension.

Chevrolet Pass. Cars, Chevy II, Corvair Cars - 1/8-3/8" (Chevrolet), 1/16-1/4" (Chevy II & Corvair) pedal movement before contact of pushrod and master cylinder piston. To adjust, loosen check nut on brake pedal pushrod and turn pushrod as necessary. Tighten check nut.

Corvair Trucks – With projection on head of pushrod pivot bolt toward front of truck, rotate bolt in either direction until 1/8" brake lever freeplay is obtained. Measure freeplay at bottom of pedal post underneath truck.

Trucks (With Eccentric Bolt Type Adjustment) - Rotate eccentric bolt (located at point master cylinder pushrod connects to brake pedal) to obtain a free pedal travel of 1/8" measured at center of pedal pad. *NOTE - Stop light switch should be adjusted to make electrical contact at approximately 13/16" pedal travel.*

Trucks (With Threaded Rod Type Adjustment) - Adjust pushrod so that pedal free travel measured at center of pedal pad is 1/8". *NOTE - Stop light switch should be adjusted to make electrical contact at approximately 13/16" pedal travel.*

CONTINUED ON NEXT PAGE

CHEVROLET-BENDIX HYDRAULIC BRAKES (Cont.)

Minor Adjustment (Front Wheels): Jack all wheels clear of floor. On passenger cars, loosen check nut at brake cable equalizer to remove tension from brake cable. On trucks, disassemble clevis of parking brake pull rod. On all cars and trucks, remove adjusting hole covers from flange plates. Expand brake shoes by turning adjusting screw with Tool J-4707 or J-9485 until a light uniform drag is felt on brake drum (move outer end of tool toward center of wheel to expand shoes). Now turn adjusting screw in opposite direction specified number of notches as listed in table below to relieve brake drag. Replace adjusting hole covers, reconnect and adjust parking brake.

Brake Shoe Adjustment Specifications

Car Model ①	Notches
Chevrolet Pass. Cars	12
Chevy II	12
Corvair (All Models)	12
½-Ton Truck	12
Other Trucks	7

① - Specifications apply to both conventional and sintered iron segmented lining.

►*MAJOR ADJUSTMENT NOTE: All brakes have "fixed" anchor pins and major brake adjustments are not required.*

HAND (PARKING) BRAKE: Passenger Cars and ½ & ¾ Ton Trucks adjusted differently. 1, 1½, 2 and some ¾ Ton Trucks have propeller shaft mounted parking brakes. *CAUTION* - Service brakes must be properly adjusted before making parking brake adjustment.

Adjustment (Chevrolet Pass. Cars): *NOTE - A spring loaded pedal return and a ratcheting mechanism to permit a second stroke of pedal, if necessary, is used. Parking brake application is assured even if rear service brakes are out of adjustment. Pedal returns to normal position after each stroke and will not indicate brake application. When parking brake is applied, the release handle will "pop out" about 2", indicating that brakes are applied. If more than two strokes are required to set brakes, check both service and parking brake adjustment.* Raise rear wheels and check location of idler lever with respect to swivel rod bracket on frame for correct front cable adjustment. To adjust front cable, disconnect equalizer and adjust check nuts on forward cable for correct clearance (clearance will be correct even after long periods of service). Depress parking brake pedal 6 notches from fully released position (release lever fully out) and adjust equalizer adjusting nuts for slight drag on both rear wheels. Tighten check nuts and release parking brake. No drag should be felt.

Adjustment (Chevy II): With parking brake lever pulled up 1 notch from fully released position, loosen equalizer forward check nut and tighten rear nut for a moderate drag on rear wheels. Tighten check nuts and release the lever. Wheel should rotate without drag.

Adjustment (Corvair): Raise rear of car and pull parking brake lever up 4 notches from fully released position. Loosen forward check nut on equalizer and tighten the rear one until a heavy drag is felt at rear wheels. Tighten check nuts securely. Fully release parking brake and rotate rear wheels; no drag should be felt.

Adjustment (Corvette): Pull hand brake out 7 clicks of pawl (not notches). Loosen check nuts on cable ends, then turn forward check nuts against clevis plates until a moderate drag is felt when rotating brake drums. Tighten check nuts and set parking brake lever to 2 notches from full released position. No drag should be felt.

Adjustment (Trucks Without Propeller Shaft Parking Brake): With service brakes properly adjusted, raise rear wheels and apply parking brake lever 4 notches from a fully released position. Loosen jam nut on threaded rod at end of forward cable. *NOTE - If threaded rod length is insufficient to obtain adjustment, move primary lever to next supplemental adjusting hole toward rear of truck.* Tighten rear nut on threaded rod until a light drag is felt at rear wheels, then tighten jam nut and lower truck to floor.

Adjustment (¾ & 1 Ton Trucks using propeller shaft mounted parking brakes): Adjust clevis on brake pull rod so distance from end of rod to center line of clevis pin hole is 1 7/16". Place the hand brake lever in fully released notch of ratchet sector. Loosen locknut on brake pull rod. Remove cotter pin from clevis pin holding brake rod to brake cam (leave loose). Set brake cam rest flat on upper brake band bracket. Back off adjusting nuts (at lower end of spring) and adjusting nut at top of adjusting bolt (bolt joins lower part of band to bracket). (*CAUTION* - Do not remove nuts, loosen only). Remove lock wire from anchor screw. Adjust anchor screw until there is .010-.015" clearance between lining and drum at anchor screw. Tighten adjusting bolt (bolt without spring) until there is .020" clearance between drum and lower end of brake band. Tighten locknut. Tighten adjusting nut at lower end of spring until there is .020" clearance between drum and upper end of brake band. Tighten locknut. Adjust brake pull rod so clevis pin can be installed while brake cam rests flat on upper brake band bracket. Install cotter pin in clevis pin of brake pull rod and tighten locknut on brake pull rod. Install lock wire on anchor screw. Recheck all points of facing for correct clearances.

Adjustment (1½ & 2 Ton Trucks): Propeller shaft mounted, shoe type. *See "Chevrolet Twinplex" for data.*

MASTER CYLINDER: Removal (Chevrolet Pass. Cars, Corvair Cars, Chevy II) - Disconnect hydraulic line and remove master cylinder attaching bolts. Remove master cylinder.

Filling (All Models): Fluid should be within ¼" of reservoir rim.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

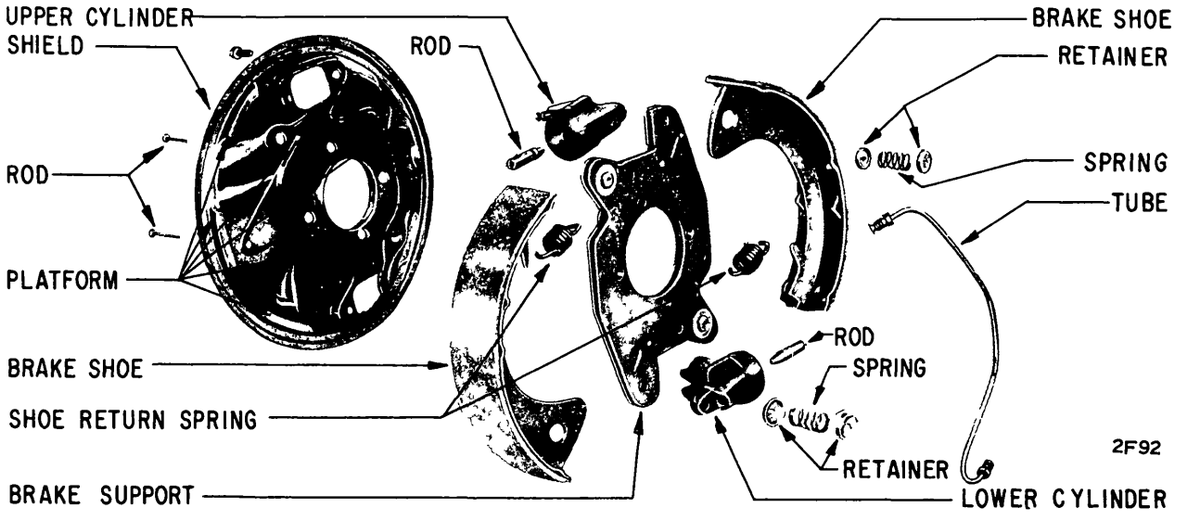
CHRYSLER, IMPERIAL, DODGE "THREE PLATFORM" TOTAL CONTACT HYDRAULIC TYPE

Chrysler (1962)
Imperial (1962)
Dodge Custom 880 (1962) ©



©-For other Dodge and Dodge Dart Models, *see "Bendix Automatic Adjuster Hydraulic Brakes" in this section.*

►*HEAVY DUTY LINING NOTE:* Heavy duty lining is available for use on Police, Ambulance, High Performance, and other heavy duty vehicles for increased lining life and to prevent brake fade.

►*BRAKE LINING REPLACEMENT CAUTION:* Use only a lining set with same color identification as used on opposite wheel.

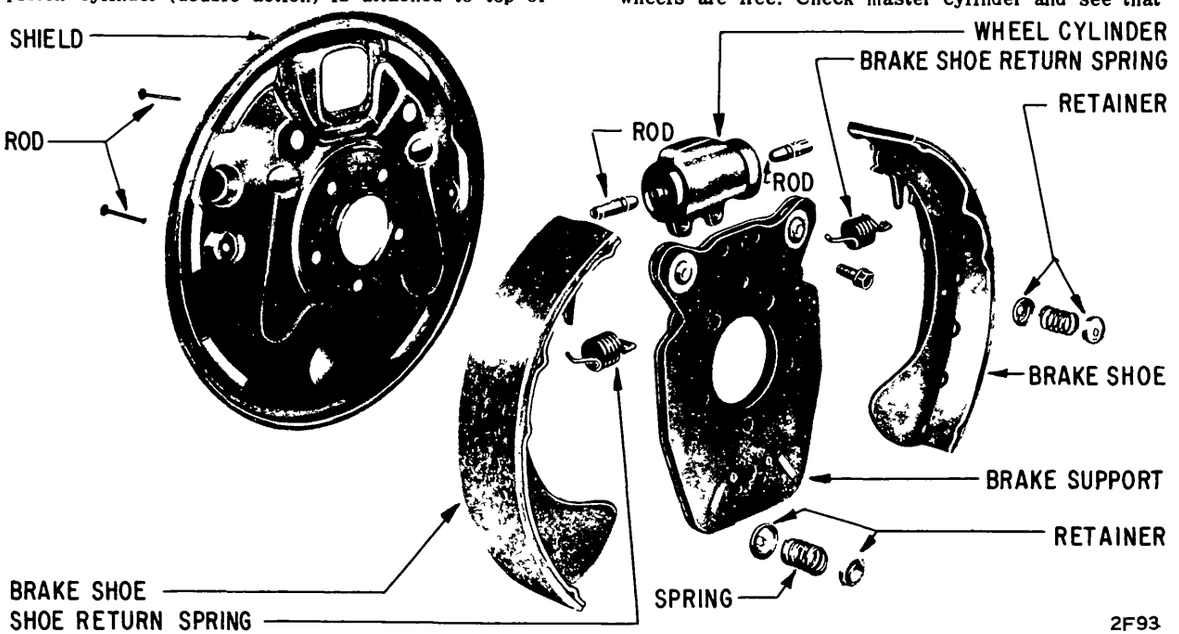
►*REAR WHEEL REMOVAL CAUTION:* **Do not apply service brake to hold shoes against drum while using wheel puller.** To hold hub and drum from turning while using wheel puller, back off brake shoes from drum with adjusting cams. Apply hand brake and allow one rear wheel to remain on floor, or block wheel in suitable manner.

DESCRIPTION: These hydraulic brakes have three raised platforms (for each shoe) pressed into dust shield and three contact loops on each brake shoe so that shoe will ride on the platforms. An additional loop in brake shoe is for the attachment of return spring. The platforms act as guides to maintain proper shoe alignment and to reduce vibration and noise. Return spring is hooked in center of brake shoe eliminating need for flat guide springs. On front wheel brakes, two single piston cylinders (single action) are attached to support plate assembly, the upper cylinder actuating the front shoe and the lower cylinder actuating the rear shoe. On rear wheel brakes one double piston cylinder (double action) is attached to top of support plate assembly and actuates both brake shoes. An anchor pin in support plate assembly holds spring link in fixed position at one end. The other end of link is positioned by brake shoe adjusting cam, providing constant-loaded spring length. Side rattle and twisting of shoe is controlled by shoe retainer spring which maintains a constant pressure against platforms.

THREE PLATFORM TOTAL CONTACT BRAKE ASSEMBLY - FRONT WHEELS

ADJUSTMENTS: Place car on stands, so that all four wheels are free. Check master cylinder and see that fluid level is not over ½" below top of cylinder. Place parking brake lever in fully released position.

Brake Pedal Adjustment: Not required. Pedal freeplay controlled by stop in master cylinder.



Front Wheel Adjustment: Turn each adjusting cam on both front shoes in the direction of FORWARD wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction (each cam a little at a time) until no drag is felt.

Rear Wheel Adjustment: Turn front shoe adjusting cam in direction of **forward** wheel rotation and rear shoe adjusting cam in direction of **reverse** wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction until no drag is felt.

►*RELINED OR NEW SHOE ADJUSTMENT NOTE:* Apply brake pedal prior to adjusting brakes to properly center shoes in brake drum and to assist in adjustment.

Hand Brake Adjustment (External Type): *NOTE - Free play between brake anchor bracket and brake anchor must not exceed .005" or brake band distortion will result.* With parking brake pedal and lever in fully released position, adjust anchor bolt for .015-.020" clearance between lining and drum, then install locking wire through anchor screw. *NOTE - Do not draw locking wire tight or brake band position may be distorted.* Adjust guide screw for slight drag on bottom half of brake band. Tighten adjusting nut for only a slight drag from top half of brake band. Apply parking brake several times and test for excessive drag when released.

Hand Brake Adjustment (Internal Type): With adjusting screw cover plate removed, turn adjusting nut until slight drag is felt on drum, then back off adjusting nut at least one full notch or until drum is free. *NOTE - Two raised shoulders on adjusting nut must be seated*

THREE PLATFORM TOTAL CONTACT BRAKE ASSEMBLY - REAR WHEELS

CONTINUED ON NEXT PAGE

CHRYSLER, IMPERIAL, DODGE "THREE PLATFORM" TOTAL CONTACT HYDRAULIC TYPE (C nt.)

in groove n adjusting sle ve. If brake pedal depresses more than 3½" from fully released position, readjust the brake.

BLEEDING BRAKE SYSTEM: Use compressed air refiller, Tool C-3496 attached to master cylinder to keep master cylinder filled. Back off adjusting cams all the way, then starting with right rear wheel cylinder, attach bleeder hose, Tool C-650 to valve, with other end in jar partially filled with brake fluid. Bleed intermittently, opening and closing valve (at wheel cylinder) until fluid runs out of bleeder hose in a solid stream without bubbles. Repeat this operation on left rear wheel, right front wheel and finally left front wheel. At front wheels (with two cylinders), bleed lower cylinder first to force air out of connecting line to upper cylinder, then bleed upper cylinder. Repeat bleeding operation if brake action indicates air still in lines. Readjust cams after completing bleeding operation.

BRAKE SHOE REPLACEMENT: Removal - 1) Remove wheel, hub and drum assembly using puller C-845 to remove drum assembly.

2) Insert wrench C-3462, in the inner support plate hole, with tool cam slot engaging the spring hook. Turn tool handle to disengage spring from spring link, and turn handle in opposite direction to release the spring. Remove both springs in this manner. *CAUTION* - Do not use brake spring pliers or damage to lining will result.

3) Turn brake shoe guide spring retainer 1/4 turn and remove (the lip on end of spring is for correct positioning on outer support assembly). Slide shoes from support assembly.

Installation: Position brake shoe in support plate and make sure wheel cylinder pushrods properly engage toe end of shoes and that shoes are in alignment. Check tension of shoe return springs by hooking a scale at toe of shoe and pulling in direction of piston movement. Scale should read 45-55 ft. lbs. (11" brakes) at instant toe of shoe moves. *NOTE - On 12" brakes, torque specifications are 15% greater.* Install guide rod and retainers (lip of guide rod must be properly positioned in spring retainer).

LINING REPLACEMENT: Drum diameter should not exceed .004" out of round at any point. Grind lining to specified clearance of .010"-.024" below drum diameter.

►*BRAKE BACKING PLATE & BRAKE SHOE LOOP NOTE:* Platforms for each shoe must be uniform in height and flatness (use surface gauge to check) and mating loops on brake shoes must be uniform and smooth. Replace backing plate when platform heights vary more than .010".

WHEEL CYLINDER & SUPPORT PLATE: Removal & Disassembly - 1) Disconnect flexible brake hose at wheel cylinder (upper cylinder on front), and remove wheel cylinder mounting screws and lockwashers at rear of brake shield.

2) Remove support plate mounting bolts and remove support plate with wheel cylinders and connector tube attached.

3) With assembly on bench, remove cylinder connector tube and wheel cylinders.

Assembly & Installati n: 1) Assemble wheel cylinders on support plate (Install connector tube on front assembly).

2) Position support plate on brake shield and install cylinder mounting screws and lockwashers, but do not tighten.

3) Install support plate bolts, lockwashers and nuts. Tighten to 35 ft. lbs. and cylinder mounting screws to 20 ft. lbs.

WHEEL CYLINDER OVERHAUL: Wheel cylinder pistons that are badly scored or corroded should be replaced. Use new piston cups when reconditioning cylinders. Cylinder walls that have light scratches, or show signs of corrosion, can usually be cleaned up with crocus cloth. Cylinders that have deep scratches or scoring, may be honed using Tool C-3080. Diameter of cylinder bore should not be increased more than .002". If a cylinder does not clean up at .002" it should be replaced (*NOTE* - Black stains on cylinder walls are caused by piston cups and will do no harm).

MASTER CYLINDER: Removal - Disconnect pushrod, brake tube, and remove attaching bolts. Remove master cylinder.

Filling - Fluid should be even with top edge of filler opening.

TROUBLE SHOOTING: *See "Hydraulic Brak Troubl Shooting" in Brake Section f Manual.*

① - Bendix Automatic Adjuster type may be used. *See "Bendix Automatic Adjuster Hydraulic Brakes" in this secti n.*
② - Cars Without Power Brakes. *For cars with pow r brak s, see "Cadillac & Oldsmobil (B ndix-Morain) Aut matic Adjuster Brak s" in this section.*
③ - With Dual Rear Wheels.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 LANCER & VALIANT PARKING BRAKE LACK OF ADJUSTMENT AT ADJUSTING SCREW CORRECTION:* Caused by cable conduit wires slipping in cable end fittings resulting in insufficient screw threads at equalizer yoke. To correct, install 1" tubular metal spacer or stack of washers between equalizer yoke and adjusting nut.

►*1962 LANCER & VALIANT SLOW BRAKE PEDAL RETURN, PEDAL BUILD-UP, OR ERRATIC STOP-LIGHT SWITCH OPERATION CORRECTION:* May be caused by burrs on pedal bracket, pedal pivot nylon bushings broken, pedal bracket mounting holes misaligned, or oversize pedal-to-pushrod cross bolts. To correct, remove burrs, replace bushings, and make other corrections to remove bind as necessary. *CAUTION - When grinding or polishing parts, d n t r m v any more metal than necessary.*

►*1962 TEMPEST PARKING BRAKE CABLE FREEZING CORRECTION:* May be caused by water entering seal at rear cable housing and freezing. To correct, dry seal, inside of cable housing and cable, and pack inside of seal with light grease or chassis lubricant.

DESCRIPTION: Single anchor, without eccentric, hydraulic type of same design used previously. Fixed anchor pins are used on all models except Pontiac Front Wheels. Fixed anchor pins are not adjustable

ADJUSTMENTS: Before attempting any adjustments, car should be placed on stands with all wheels free. Brake pedal should operate freely and there should be no bind in brake lever or cables.

CONTINUED ON NEXT PAGE

BENDIX HYDRAULIC SINGLE ANCHOR (C ntinu d)

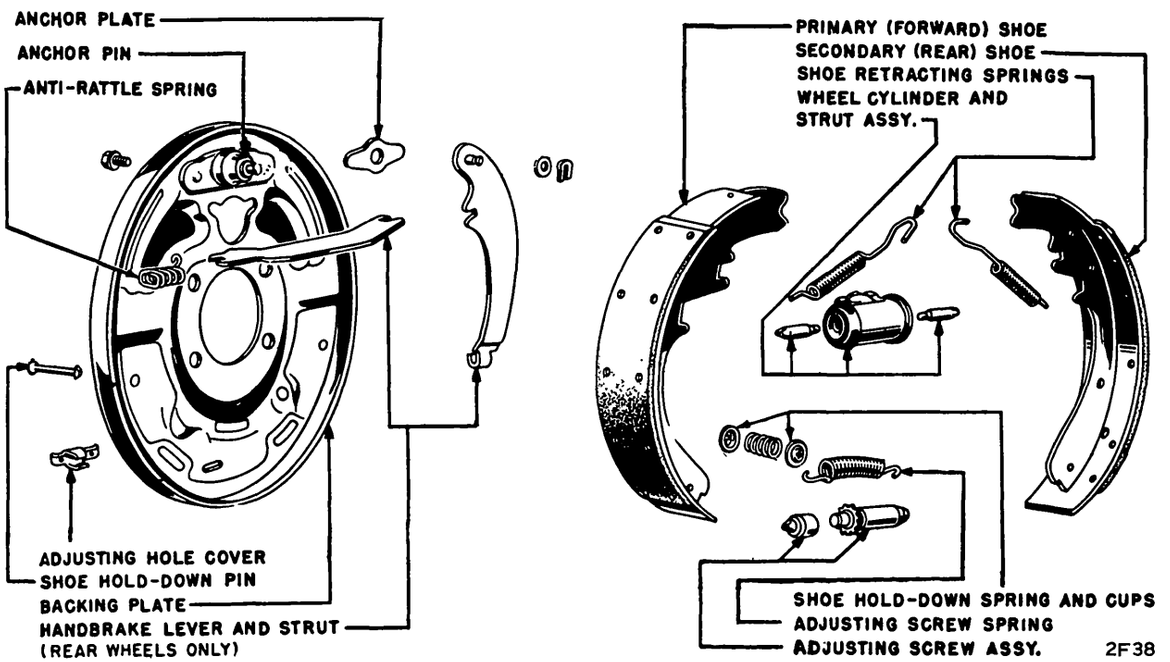
Brak P dal Adjustm nt: This adjustment should conform with recommendations before any other adjustment.

Buick & Buick Sp cial - *NOTE - Brake pedal height cannot b adjusted on ither manual or power brake cars.* A non-adjustable pushrod connects directly to brake pedal. External brake pedal return spring is not used and pedal return depends entirely on a spring within the cylinder. Make sure pedal returns completely when released slowly. If pedal does not return freely, check all pivot points for binding or lack of lubrication.

Lanc r - No adjustment provided. Freeplay controlled by stop built into master cylinder.

Oldsm bil - Two adjustments required. **Pedal Height** - Measurement should be as listed below. To adjust, loosen locknut and adjust stopscrew located on underside of brake pedal support. **Pedal Freeplay** - Push master cylinder pushrod until it contacts hydraulic piston, then turn pushrod until clevis pin can freely be installed into brake pedal. Shorten pushrod one full turn for proper freeplay. Tighten locknut and connect pushrod to brake pedal. *NOTE - If pedal height is chang d, adjust st p light switch.*

P dal H ight - 8"±1/8" from top of brake pedal pad to floor pan (carpet turned back).



Oldsm bil F-85 - Two adjustments required. **Pedal Height** - This measurement should be 6½"±1/8" from top of brake pedal pad to floor pan (carpet turned back). To adjust, loosen locknut and adjust stop bracket on underside of brake pedal bracket. **Pedal Freeplay** - Freeplay should be 3/16". To adjust, *see "Oldsmobile" abov .*

P ntiac & Pontiac T mpest - Adjust pedal stop bracket to provide 6-6¼" (Pontiac), 4½" (Tempest) pedal pad to floor mat. When pedal height changed, adjust stop light switch. *CAUTION* - Do not lower pedal more than specifications.

Valiant - No adjustment provided. Freeplay controlled by stop built into master cylinder.

Willys - Pedal freeplay should be at least ½". Adjust by rotating pushrod eccentric bolt. *CAUTION - Comp nsating port in mast r cylinder should be wide open when pedal is in fully rel ased position.*

Minor W ar Adjustm nt: Check and adjust brake pedal clearance (see Brake Pedal Adjustment), release hand brake lever, and see that cables are free and are not holding brake shoes against drum. At each wheel, expand brake shoes by turning adjusting screw up until wheel can just be turned by hand, adjust hand brake (cars where hand brake adjusted with shoes "expanded", see Hand Brake Adjustment), then back off adjusting screw the number of notches or "clicks" as shown in table below. Check wheel for freedom of drag. If drag noted, tap backing plate to assist centralization of shoes, then recheck. If drag still exists, anchor pin adjustment may be in order. See Major adjustment.

BENDIX HYDRAULIC SINGLE ANCHOR BRAKE ASSEMBLY

Major Adjustment (Cars with Adjustable Type Anchor Pins): *NOTE - Major adjustment not required on cars with fixed anchor pins.* Make this adjustment when new or relined shoes are installed or when minor adjustment is not satisfactory. Jack up all four wheels, loosen or disconnect parking brake cables at equalizer or intermediate lever, then remove adjusting hole covers on backing plate and inspection hole covers on drum (remove wheels for access). Check pedal clearance (see Brake Pedal Adjustment). Adjust each wheel brake as specified by car manufacturer (see below). *NOTE - If hand brake cables not disconnected or loosened, shoes may be held in on position by cabl .*

Pontiac (Front Wheels) - *NOTE - Pontiac rear wheels do not require a major adjustment as the anchors are "fixed" to backing plate.* Insert a .015" feeler gauge between lining and drum 1½" from adjusting screw end of secondary (rear) lining and expand shoes with adjusting screw until feeler gauge cannot be withdrawn. Back off adjusting screw until only a slight drag is felt on feeler gauge. *NOTE - This insures that sho s are against anchor pin and primary shoe is against drum.* Withdraw feeler gauge and insert it between lining and drum about 1½" from anchor pin end of secondary lining. This should give a slightly heavier drag (than near the adjustment screw). Adjust anchor pin to provide adjustment. Tighten anchor pin locknut to 60-90 ft. lbs. Complete adjustment as shown in minor adjustment above, and hand brake adjustment below.

Adjusting Screw Setting

Car Model	Setting
Buick & Buick Special	15 Notches
Lancer	10-12 Notches
Oldsmobile	16 Notches
Oldsmobile F-85	15 Notches

③ - 1 1/8" on cars with Power Brakes.

CONTINUED ON NEXT PAGE

BENDIX HYDRAULIC SINGLE ANCHOR (C ntinu d)

Hand (Parking) Brake Adjustment: *CAUTION - Brake shoes must be expanded on some cars when adjusting hand brake cables.* Adjust each car as follows:

Buick – *NOTE – Make Parking Brake Adjustment whenever cables disconnected, or if cables are stretched, or whenever service brake pedal has good reserve but parking brake pedal depresses more than 8 ratchet clicks.* Make Minor Adjustment (see above). With parking brake assembly fully released, there should be 3/8" distance from rear face of parking brake idler lever to end of its slot in the frame. Adjust front cable clevis to correct. Depress parking brake pedal **exactly 2 ratchet clicks.** Tighten rear cable adjusting nut to obtain a heavy two–hand drag at rear wheels. Release parking brake lever and check rear wheels for free rotation in either direction.

Buick Special - Make "Minor Wear Adjustment" above. Pull out parking brake lever exactly 8 ratchet clicks. Hold threaded end of intermediate parking brake cable (to prevent twisting of cable) and tighten adjusting nut until left rear wheel can just be turned backward using both hands. Release parking brake lever and pull out exactly 3 ratchet clicks. Both rear wheels must turn freely in either direction.

Lancer - Loosen parking brake cables and make "Minor Wear Adjustment" (see above). Loosen cable adjusting and lock nuts and adjust length of front cable for 1/8" slack or freeplay. Tighten locknut and check brake pedal and release handle for free operation.

Oldsmobile (1961-62) - Release parking brake and make "Minor Wear Adjustment" above if brake pedal total travel is less than 1 3/4" (1961 Power Brakes), 4" (All Standard Brakes). Adjust rear cables by first tightening equalizer adjusting nut until a heavy drag is felt at rear wheels, then loosen equalizer adjusting nut 10 turns and tighten locknut.

Oldsmobile F-85 - Make "Minor Wear. Adjustment" above if total service brake pedal travel exceeds 4". Adjust rear cables by first tightening equalizer adjusting nut until a heavy drag is felt at rear brakes, then loosen equalizer adjusting nut 9 turns and tighten locknut.

Pontiac - Apply hand brake at first notch and check equalization. Loosen adjusting screw of tightest brake if not equal. If more than a few notches are required, loosen clamp screws on spreader and pull downward on the tight side of cable. This should equalize cable. Tighten spreader clamp screws while parking brake lever is still in applied position. When lever fully released, wheels should turn freely with cable pulled down by gripping cable midway between conduit and and guide on frame. When adjusting rear end of front cable for close adjustment for tension, be sure to turn clevis on or off cable end but do not twist cable. Coarse adjustment is secured by selecting the correct hole in spreader.

P ntiac T mp st - Make "Minor Wear Adjustment" above. Parking brake cable is properly adjusted when a 30 lb. pull downward on cable 49" from front of torque tube places cable 2¼" below bottom of torque tube (parking brake lever fully released). Adjust cable at equalizer for proper tension, then tighten locknut to 5-10 ft. lbs. Make sure cable slides freely in equalizer and that rear wheels turn freely without drag.

Valiant - *Procedure is same as for Lancer (above).*

Willys (Transmission Mounted Type) - Release fully the parking brake handle. Make sure cable and linkage do not bind. Rotate drum so a pair of access holes in drum expose shoe adjusting screw wheels in brake. Rotate adjusting wheels until shoes are snug against drum then back off each wheel 7 notches for proper clearance.

MASTER CYLINDER REMOVAL & FILLING: *NOTE - Procedures below apply for standard brakes. For removal with Power Unit, see Power Brake Unit pages in this section.*

Buick - Remove connector from stop light switch and disconnect brake pipe from master cylinder. Remove locknut, shoulder bolt, and spring washer connecting brake pedal to master cylinder pushrod. Remove master cylinder-to-dash panel bolts and remove master cylinder.

Filling - Fluid should be 1/8" below lip of filler opening.

Buick Special - Remove stop light switch connector and disconnect brake pipe from master cylinder. Remove retainer pin, washer, and clevis pin holding brake pedal to master cylinder pushrod. Remove master cylinder-to-dash panel bolts and remove master cylinder.

Filling - Fluid should be 1/8" below lip of filler opening.

Lancer - Disconnect master cylinder pushrod from brake pedal and disconnect brake line from master cylinder. Remove master cylinder attaching bolts and remove master cylinder.

Filling - Fluid should be even with top edge of master cylinder.

Oldsm bile - Disconnect brake pipe from master cylinder. On Synchro-mesh cars, install gauge pin in frame side rail holes to hold clutch linkage in position and disconnect clutch linkage from clutch pedal bellcrank and remove bellcrank. Remove master cylinder attaching nuts and remove cylinder.

Filling - Fluid should be ¼" below bottom of filler opening.

Oldsmobile F-85 - Disconnect brake pipe from master cylinder, remove attaching nuts and remove cylinder. *NOTE* - Unnecessary to disconnect pushrod and clevis.

Filling - Fluid should be ½" below filler cap.

Pontiac & Pontiac Tempest - Disconnect brake pedal return spring. Disconnect master cylinder pushrod from brake pedal by removing cotter pin and clevis pin from clevis. Disconnect brake pipe from master cylinder, remove master cylinder-to-cowl attaching bolts and remove cylinder.

Filling - Fluid should be within 7/8" of top of gasket surface of filler opening.

Valiant - *Procedure and filling r c mmendation sam as for Lancer (above).*

Willys - Master cylinder located under instrument panel in front of steering column. Access hole for filling provided on instrument panel to right of speedometer.

Filling - Fluid should be ½" below top of filler hole.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brak Servicing" in Brake Section of Manual.*

BENDIX (LOCKHEED) SELF-CENTERING

Willys, All M dels (1962) Ⓒ
Ⓒ - For FC-170 with Dual Rear Wheels, s *"Bendix Hydraulic Singl Anchor Brakes" in this section.*

►*WILLYS FORWARD CONTROL MASTER CYLINDER*

NOTE: Master cylinder mounted on inside front panel of cab, just underneath instrument panel. Access to filler plug is through hole cover on panel to right of speedometer.

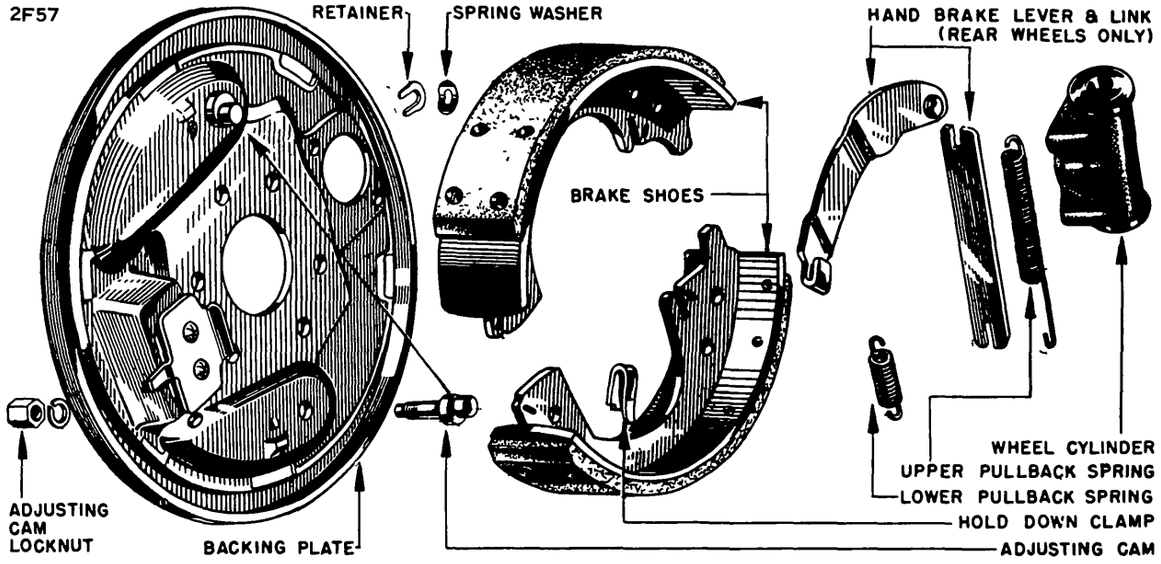
DESCRIPTION: "Self-Centering" hydraulic type with non-adjustable anchor ramps for each shoe. An eccentric adjusting cam is used for brake shoe adjustment.

ADJUSTMENT: Before making adjustments, jack up all four wheels, check brake pedal clearance or free travel (see below), fully release hand brake and make certain that rear wheels are free, then adjust each wheel as follows:

Brak Sh Adjustm nt (For Wear or New Linings):

►*CAUTION: Brak sh s must be "centralized" by s veral hard brak applications before adjusting.*

Ecc ntric Adjustm nt - Adjust eccentric for each brake shoe by turning eccentric up and out until brake shoe firmly applied and wheel is locked, then back eccentric off until wheel just rotates freely without drag. Shoe clearance will then be approximately .010".



Anch r Lip Adjustm nt - Pressure required to pull shoe outward from support plate should be 15 lbs. Measure with spring scale hooked in end of shoe. Adjust by bending anchor lip slightly toward brake support plate to obtain this 15 lb. coil spring pressure to hold shoes on support plate ledges.

Hand Brak Adjustm nt: Remove all slack from rear wheel brake cables as follows:

Willys (V hicl s with cable connected to rear wheel s rvic brak s) -Pull hand lever "on" three notches, loosen front nut on connecting link between intermediate lever on frame crossmember and rear cable equalizer, tighten rear nut on link until slight drag noted at each rear wheel, then tighten front nut to lock adjustment. .Release hand lever and check for freedom of drag.

Willys (Vehicles using propeller shaft mounted parking brak s). Fully release hand brake lever, check linkage for freedom from bind. Rotate brake drum so one pair of three sets of holes are over adjusting screws Use tool or screwdriver to rotate each adjusting screw away from drive shaft until shoes are snug against drum, then back off each screw 7 notches for running clearance.

Willys (V hicl s with Operator Adjustable Hand Brake L ver) – 1) Adjusting knob on hand brake lever handle compensates for lining wear or for unusual holding conditions. With lever in "off" position, turn adjusting knob clockwise while applying and releasing handle every ¼–turn of knob until definite "snap over center" action takes place. *CAUTION – Over adjustment caus s hard hand l v r action but does not incr as brak ffici ncy. F r maj r adjustment proceed as f ll ws:*

BENDIX (LOCKHEED) SELF-CENTERING REAR BRAKE (FRONT SIMILAR EXCEPT HAND BRAKE PARTS OMITTED)

2) With adjusting knob turned fully counterclockwise, place handle in "on" position. Tighten parking brake cables at equalizer adjusting nut until slight drag is felt at rear wheels. Tighten locknut. Release control handle. Rear wheels should be free. Turn adjusting knob clockwise for desired tension.

Brake Pedal Adjustment: Adjust master cylinder pushrod by loosening locknut and turning rod for following pedal travel with master cylinder piston and pushrod back against stop:

Brake Pedal Freeplay – ½" (All Models).

MASTER CYLINDER: Fluid Level – Maintain fluid level to ½" below top of filler opening.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brak Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Troubl Shooting" in Brake Section of Manual.*

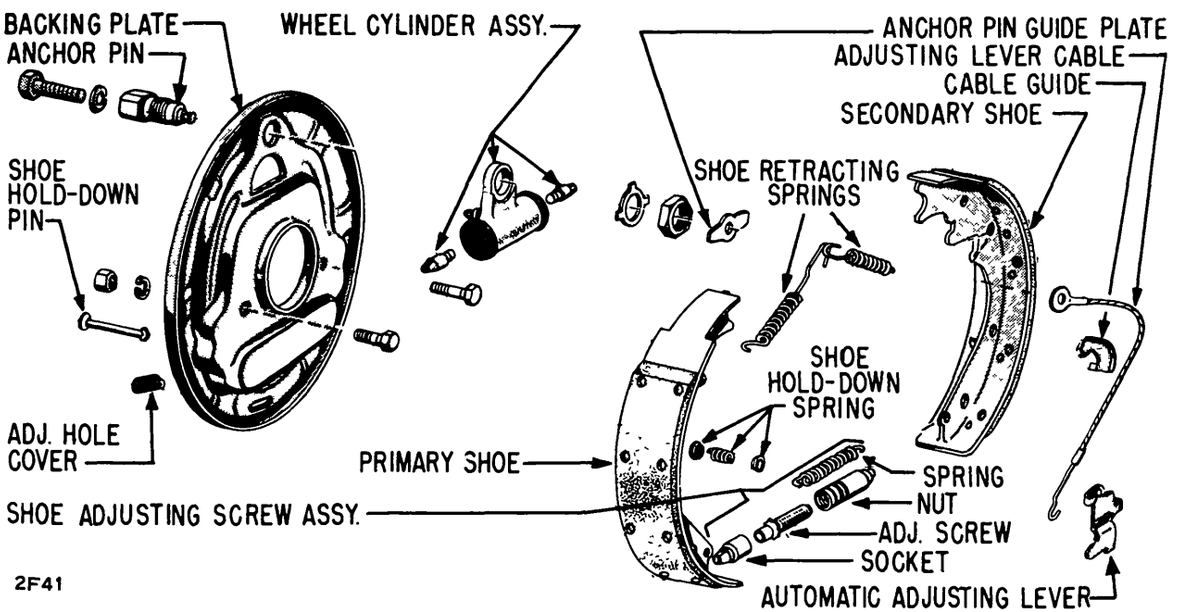
Lincoln Continental (1962)
Mercury Meteor & Monterey (1962)
Plymouth (1962)
Rambler American & Ambassador (1962)
Thunderbird (1962)

© - Except Dodge Custom 880. *For brakes used on this model, see "Chrysler, Imperial & Dodge Custom 880 Three Platform Total Contact Brakes" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 DODGE & PLYMOUTH SLOW BRAKE PEDAL RETURN, PEDAL BUILD-UP, OR ERRATIC STOP-LIGHT SWITCH OPERATION CORRECTION:* May be caused by burrs on pedal bracket, pedal pivot nylon bushings broken, pedal bracket mounting holes misaligned, or oversize pedal-to-pushrod cross bolts. To correct, remove burrs, replace bushings, and make other corrections to remove bind as necessary. *CAUTION - When grinding or polishing parts, do not remove any more metal than necessary.*



►*1962 DODGE & PLYMOUTH BRAKE SCRAPING NOISE CORRECTION (Early Cars):* If condition occurs in left rear brake on hard brake application, trouble may be caused by secondary shoe moving out toward drum. There may be an interference mark at adjuster end of secondary shoe and matching mark on inside of drum near junction of ring section and inside of drum. To correct, install additional Hold-Down Spring Retainer, Part No. 2260792, on secondary shoe hold-down spring (3 retainers total). Use second additional retainer on severe cases only if necessary. *NOTE - This additional retainer installed in production on later cars after approximately October 12, 1961.*

FORD MOTOR CO. REAR BRAKE ASSEMBLY (OTHERS SIMILAR)

►*1962 DODGE & PLYMOUTH ADJUSTER LEVER NOT ENGAGING STAR WHEEL CORRECTION (10" Brakes):* Make sure proper length adjuster cable is used. Cable should be 9 51/64-9 27/32" long.

►*1962 DODGE & PLYMOUTH PARKING BRAKE LACK OF ADJUSTMENT AT ADJUSTING SCREW CORRECTION:* Caused by cable conduit wires slipping in cable end fittings resulting in insufficient screw threads at equalizer yoke. To correct, install 1" tubular spacer or stack of washers between equalizer yoke and adjusting nut.

FORD & MERCURY FRONT BRAKE ASSEMBLY (OTHERS SIMILAR)

DESCRIPTION: Similar in design to previous Bendix Single Anchor (Without Eccentric) brakes and incorporating an automatic adjuster to maintain proper lining to drum clearance. The automatic adjuster uses movement of rear (secondary) shoe during a reverse brake application to turn brake adjusting screw a small amount after a predetermined amount of wear on front and rear linings. The adjuster consists of a steel cable with a hook and anchor fitting permanently attached, a cable guide, adjusting lever, adjusting screw, pivot nut, socket and spring.

Master Cylinder (Rambler) - Master cylinder used is "Double Safety" type having a separate piston and fluid chamber for front and rear brakes respectively.

OPERATION: When lining has worn enough to require adjustment (approximately .0005" on each shoe), secondary shoe on which adjuster is mounted moves far enough from shoe anchor during a reverse application to cause cable to lift adjuster lever into engagement with the next tooth in the adjusting screw. When brake is released, secondary shoe returns to the anchor. Movement of the adjusting screw is 1/24th of a revolution each time it is moved by the adjuster. In forward braking, adjusting parts move with secondary shoe as a unit, and there is no lifting of the lever to engage a new tooth in adjusting screw.

ADJUSTMENTS: Make adjustments with drums cool and contracted. If car raised on frame hoist, disconnect

CONTINUED ON NEXT PAGE

BENDIX AUTOMATIC ADJUSTER HYDRAULIC TYPE (Cont.)

parking brake cables. *NOTE – Anchor pins are fixed in backing plate and no major adjustment is required.*

Pedal Free play: Adjust brake pedal freeplay as follows:

Dodge & Plymouth - No adjustment. Freeplay controlled by stop built into master cylinder.

Ford, Lincoln, Mercury, Thunderbird - Pedal freeplay is not adjustable.

Rambler - Rotate brake pedal-to-pushrod eccentric bolt to obtain 1/8-3/8" pedal freeplay. Adjust for maximum pedal height on power brake equipped cars. Pedal height from top of pedal pad to floor mat should be 6¼".

Initial Adjustment After Overhaul: As follows:

Dodge & Plymouth - Make sure parking brake is fully released, then raise car. Remove adjusting hole covers from brake backing plates. Insert an adjusting wrench (C-3784) into star wheel and tighten brake until wheel turns with a slight drag. Hold adjusting lever away from star wheel (icepick or other suitable tool) and back off star wheel 10-12 notches. Wheel should turn without drag.

Ford, Lincoln, Mercury, Thunderbird - Raise car and disconnect parking brake cables. Remove access hole cover plate from backing plate and turn adjusting screw upward with Tool 2018 or screwdriver to expand shoes against drum until a slight drag is felt. Remove brake drum. Hold adjusting lever away from adjusting screw and back off adjusting screw ¾-turn with fingers. *NOTE - If screw cannot be turned with fingers, screw must be freed or adjusting lever will not turn screw.* Install wheel and drum, then back car in reverse and make 5 or 6 brake applications to complete adjustment.

Rambler - Lengthen adjusting screw to expose 3/8" of adjusting screw threads, then install drum. Drive cars cautiously in reverse, making 10 brake applications before road testing. Make sure pedal height is correct (see above).

Parking Brake Adjustment: Adjust as follows:

Dodge & Plymouth - With parking brake lever fully released, loosen cable adjusting and lock nuts and adjust length of front cable for 1/8" slack or freeplay. Tighten locknut and check brake pedal and release handle for free operation.

Ford Galaxie & Thunderbird - With parking brake cables fully released, loosen locknut on equalizer rod and turn adjusting nut several turns forward. Turn locknut forward against equalizer until cables are just tight enough to remove slack. *CAUTION - Excessive tightening of cables may pull brake shoes off anchors.* Tighten both nuts against equalizer. Remove all slack from cable between parking brake pedal and equalizer lever without moving equalizer lever.

Ford Fairlane & Mercury Meteor - With parking brake cables fully released, pull up on parking brake handle until third notch is engaged. Loosen locknut on equalizer rod and turn adjusting nut several turns forward. Turn locknut forward against equalizer until cables are just tight enough to stop forward rotation of rear wheels. Tighten both nuts against equalizer and release the handle.

Lincoln - Fully release parking brake and raise car. Loosen cable at equalizer lever, then depress parking brake pedal 1¾" from normal released position. Adjust cable until there is a slight drag at rear wheels. Tighten equalizer rod locknut. Release brake and make sure brake shoes return to fully released position. Depress parking brake pedal 2". Car should be held satisfactorily under normal conditions.

Mercury Monterey - Release parking brake pedal, raise car, then loosen parking brake cable at equalizer lever. Depress parking brake pedal 1¾" from fully released position. Adjust front and rear cables until a slight drag is felt when turning rear wheels. *NOTE – The adjustment should be evenly divided between the two cables to maintain proper equalizer lever action.* Equalizer lever will be properly positioned when distance from rear cable clevis pin on equalizer bar to rear face of crossmember (to which parking brake bracket is attached) is 5½", with parking brake pedal fully released. Tighten locknut on equalizer rod, then release parking brake and check to make sure that shoes return to fully released position. Depress parking brake pedal 2". Under normal conditions, this should hold car satisfactorily.

Rambler (Hand Operated Type) - Pull handle from fully released position to fifth notch and tighten cable at equalizer until rear wheels are locked in forward rotation. Release handle and make sure wheels rotate without drag.

Rambler (Foot Operated Type) - Set brake lever on first notch from fully released position and tighten cable at equalizer until rear wheels are locked in forward rotation. Release foot lever and make sure wheels rotate without drag.

Automatic Adjuster: Removal - Disengage adjusting lever from adjusting screw by pulling backward on lever. Move outboard side of adjusting screw upward and back up pivot nut as far as possible. Pull adjusting lever, cable and adjusting spring down toward rear to unhook pivot hook from large hole in secondary shoe. *CAUTION - DO NOT pry pivot hook out of hole.* Remove anchor springs and unhook cable anchor. Remove shoe guide plate. Remove cable guide from secondary shoe and remove shoe hold-down springs, shoes, adjusting screws, pivot nut and socket.

Installation - Install brake shoes on backing plate with hold-down spring pin, springs and cups. Install parking brake link and spring. Connect parking brake cable. Install shoe guide plate on anchor pin. Place cable anchor over anchor pin with crimped side toward backing plate. Install primary and secondary shoe to anchor springs. *CAUTION - Be sure that cable end is not cocked or binding on anchor pin.* Install cable guide on secondary shoe web with flanged hole fitted in hole in web. Thread cable through guide groove, not between guide and shoe web. Turn adjusting screw in to limit of threads then back off ½ turn. *CAUTION - Place left hand screw on right side of car, right hand screw on left side of car.* Install adjusting socket on screw, place assembly between shoe ends with adjusting screw nearest secondary shoe. Hook cable hook into hole in adjusting lever from backing plate side. Place pivot hook into large hole in secondary shoe web. Place

BENDIX AUTOMATIC ADJUSTER HYDRAULIC TYPE (C nt.)

hooked end of adjuster spring into large hole in primary shoe web and loop end of spring to adjuster lever. Check action of adjuster by pulling cable toward secondary shoe to lift lever past tooth. Spring will pull lever to original position (when cable released) advancing screw one tooth (1/24 revolution). Lever should contact adjusting wheel 3/16±1/32" above centerline of screw. Cable guide groove should be parallel with shoe web and body of guide should be flat against web. Pivot hook surfaces should be square with body of lever. Adjusting screw must be seated properly in shoe web. Replace damaged or incorrect parts. Follow adjustment procedures given above.

MASTER CYLINDER: Remove as follows:

Dodge & Plymouth - Disconnect pedal return spring and pushrod. Disconnect brake tube at master cylinder. Remove attaching bolts and remove master cylinder.

Filling - Fluid should be even with top edge of master cylinder.

Ford, Lincoln, Mercury, Thunderbird - Disconnect speed control linkage at exterior arm (remove cotter pin). Disconnect rubber boot, brake line, and stop light switch wires from master cylinder and stop light switch. Remove master cylinder attaching bolts and remove master cylinder.

Filling - Maintain fluid to within 3/8" (Ford & Thunderbird), 1/4" (Lincoln & Mercury) of top of master cylinder.

Rambler - Disconnect pipes from master cylinder, remove attaching bolts and remove master cylinder.

Filling - Fluid *in each res rv ir* should be within ½" of top of filler openings.

FORD TRUCK BENDIX UNI-SERVO

Ford Trucks, F-250, P-350 (1962) Front & Rear
Ford Trucks, F-350, P-400 (1962) Front Only Ⓒ
Ford Trucks, F-500, 600; B-500, 600; P-500; C-550, 600 (1962) Front Only ②

Ⓒ - "Ford Bendix Hydraulic" type used on Rear.
② - "Ford Truck Self-Centering" type used on Rear.

DESCRIPTION: Bendix "Uni-Servo" single anchor, hydraulic type with single-acting wheel cylinder mounted on the backing plate and actuating the primary shoe through a strut (no direct connection to secondary shoe). Brake shoes are conventional Bendix type.

ADJUSTMENTS: Make adjustments with brake drums at normal temperature and with wheels either jacked up or contacting road (if wheels on road so they cannot be checked for drag, make this check by striking drum with a hammer - sound will be deadened if shoes contacting drum).

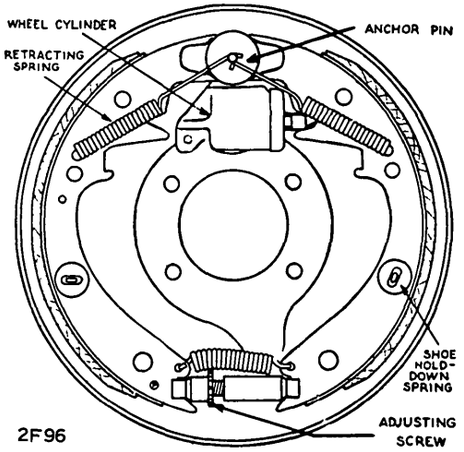
Minor Adjustment: Remove adjustment hole cover from brake carrier plate. Rotate adjusting screw, with a suitable tool, until shoe begins to drag, then back off shoe 10-12 notches until drum can be turned without drag.

Major Adjustment: Rotate drum until feeler slot is at lower end of Secondary (rear) shoe, then insert a .010" thick feeler gauge between brake shoe and drum. Rotate drum and feeler gauge up along secondary shoe until feeler is wedged between secondary shoe and drum. Turn adjusting screw (star wheel) to expand shoes until a heavy drag is felt against drum, then back off adjusting screw just enough to give clearance of .010" between shoe and drum at a point 1½" from each end of secondary shoe. *NOTE - This clearance will give operating clearance for both primary and secondary shoes.* When this clearance cannot be obtained, anchor pin must be adjusted.

Anchor Pin Adjustment - Loosen anchor pin nut just enough so anchor pin can be moved up or down (by tapping with soft hammer) centering shoes in drum and providing the .010" operating clearance at above positions. Tighten anchor pin nut to 80-100 ft. lbs. Check other brake assembly.

Brake Pedal Adjustment: Brake pedal free travel should not be less than 3/16" nor more than 3/8" before pushrod touches master cylinder piston. Adjustable at master cylinder pushrod.

Parking Brake Adjustment (Rear Wheel): *See "Ford Bendix Hydraulic" in this section.*



Parking Brake Adjustment (Propeller Shaft): *See "Ford Truck Self-Centering" in this section.*

MASTER CYLINDER: Removal (F & B Series) – With all air pressure or vacuum removed from system, disconnect stop light switch wires and brake line from master cylinder. Force as much fluid as possible from master cylinder, then disconnect rubber boot from end of master cylinder, remove attaching bolts, and remove master cylinder.

Removal (C Series) – Procedure is same as for F & B Series with access to master cylinder under floor plate.

Removal (P Series) – Procedure is same as for F & B Series after turning front wheels all the way to the left and removing fender apron for access to master cylinder.

Filling (All Series) – Maintain fluid to within ½" of top of filler neck.

BENDIX UNI-SERVO BRAKE ASSEMBLY

BRAKE SPECIFICATIONS: *Se "Brake Sp cification Table" in "Ford Truck Self-C nt ring" data in this section.*

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brake S rvicing" in Brak Section of Manual.*

TROUBLE SHOOTING: *Se "Hydraulic Brak Troubl Shooting" in Brake Section of Manual.*

FORD TRUCK SELF-CENTERING

Ford Trucks F-500, 600; B-500, 600; P-500; C-550, 600 (1962) Rear Only Ⓒ

Ⓒ - "Ford Bendix Uni-Servo" used on Front.

DESCRIPTION: Two cylinder, two shoe, four anchor type hydraulic brakes. Each shoe is anchored at each end and linked to wheel cylinder at each end so that all shoes are self–energizing for both forward and reverse motion. All shoes are radially self–centering.

ADJUSTMENT: Wear Adjustment – With wheels raised, remove adjusting slot covers. Turn rear (secondary shoe) adjusting screw until brake shoe drags against drum. Back off adjusting screw so drum rotates freely. Depress brake pedal to center the shoes, then back off adjusting screw one additional notch. Repeat procedure for primary shoe.

Brak P dal Adjustm nt: 3/16–3/8" pedal freeplay. On F, B & C Series, loosen locknut on eccentric bolt connecting master cylinder pushrod to brake pedal and rotate bolt as necessary. On P Series, turn hex head on master cylinder pushrod to obtain proper adjustment. Tighten locknut to 30–35 ft. lbs.

Parking Brake Adjustment: Ext rnal Band Typ – On cable controlled type, move parking brake lever to fully released position. On rod type linkage, set lever at first notch. Flat part of adjusting rod cam must rest on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, then adjust clevis rod as necessary. Install clevis pin and cotter pin. Remove lock wire from anchor adjusting screw,

CONTINUED ON NEXT PAGE

FORD TRUCK SELF-CENTERING (C ntinued)

turn adjusting screw clockwise to obtain .010" clearance between brake lining and brake drum at anchor bracket. Loosen locknut on adjusting screw for lower half of brake band, adjust screw to obtain .010" clearance between lining and drum at lower half of band. Tighten locknut. Turn upper band adjusting nut for same .010" clearance. Be sure to install lock wire in anchor adjusting screw.

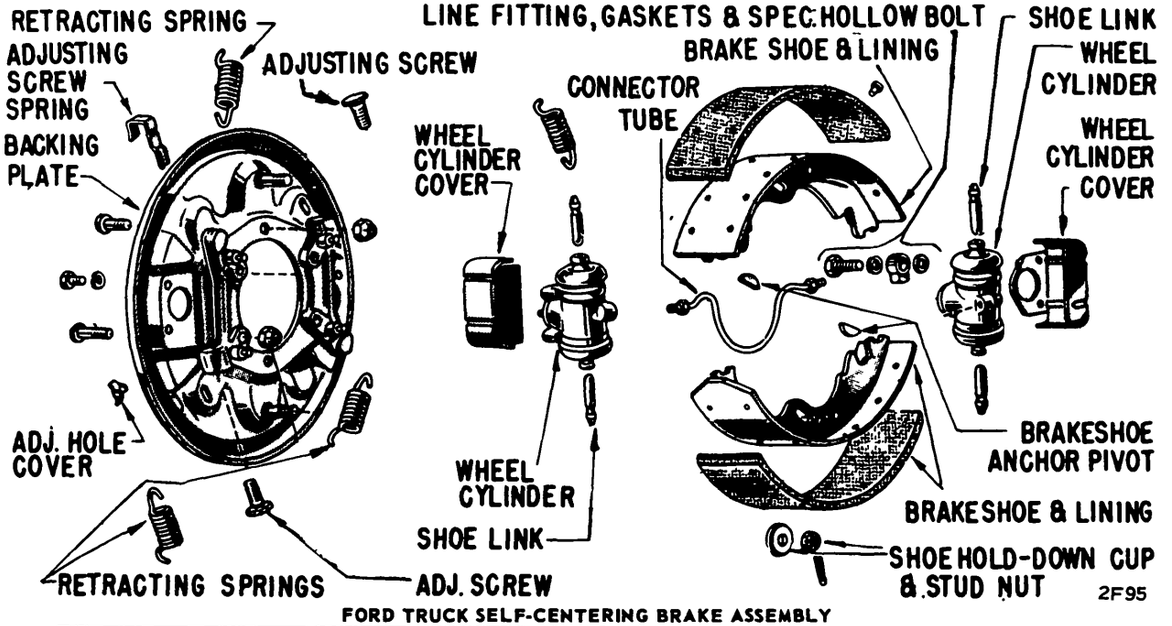
Int rnal Sh (9" Diam t r) Type – With parking brake lever fully released, remove linkage adjusting clevis pin. Lengthen adjusting link by turning clevis until shoes seat against drum with clevis pin installed. Remove clevis pin and shorten linkage to obtain .010" clearance between shoes and drum measured at all points around drum with clevis pin installed. Install clevis retaining cotter pin.

Int rnal Sh (12" Diam ter) Type – Remove pin from adjusting rod clevis, loosen nuts on adjusting rod, and turn clevis so there is 1/4–3/8" free play on brake operating lever. Tighten clevis nuts and install clevis pin.

DISASSEMBLY: Make sure there is no vacuum or air pressure in system. Remove wheel and drum or hub and drum assembly. Proceed as follows:

1) Un qual Length R tracting Springs – Clamp boots against cylinder, note location of retracting springs and remove with Tool 2035–N. Remove brake shoe guide bolt lock wire, nut, washer, and bolt from both shoes, then remove shoes from carrier plate.

2) Equal L ngth R tracting Springs – Clamp boots against cylinder and remove retracting springs with Tool 2035–N. Remove brake shoe guide bolt cotter pin, nut, washer, and bolt from both shoes, then remove shoes from carrier plate.



REASSEMBLY: 1) Un qual Length Retracting Springs – Position adjusting wheel, slide adjusting screw through anchor pin support and index adjusting wheel tab in slot on adjusting screw. Install and tighten adjusting wheel lock. Place brake shoes in anchor pin slot on support bracket and engage other end of shoe in cylinder link. Install shoe guide bolt, washer, and nut. Tighten nut finger tight, then back off 1 full turn and install lock wire. Install retracting springs with Tool 2035–N, making sure springs are installed in original locations.

2) Equal L ngth R tracting Springs – Thread adjusting screw and wheel into anchor pin support and install adjusting wheel lock. Thread adjusting wheel into support so shoe will rest against wheel end. Install brake shoe over both retracting spring anchor pins, insert ends in cylinder links and install shoe guide bolt, washer and nut. Tighten nut finger tight, then back off 1 full turn and install cotter pin. Install retracting springs with Tool 2035–N.

MASTER CYLINDER: R moval & Filling – *See "Ford Truck B ndix Uni–S rvo" brakes in this section.*

BLEEDING BRAKE SYSTEM: Bleed **top** wheel cylinder **first,** then lower. If power unit used, unit must be bled before wheel cylinders, with engine off and no vacuum in power unit system. *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "H,draulic Brak Troubl Shooting" in Brake S ction of Manual.*

FORD-BENDIX HYDRAULIC

Ford Falcon, All Models (1962)
Econoline Trucks, All Models (1962)
Mercury Comet, All Models (1962)
Ford Trucks, F & P-100 (1962) Front & Rear
Ford Trucks, F-350, P-400 (1962) Rear Only ①

① - "Ford Truck Bendix Uni-Servo" type used on Front.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 COMET & FALCON WHEEL CYLINDER HONING CAUTION:* Front wheel cylinders having orificed baffle **cannot** be honed. If honing required, replace cylinder. *Use care when bleeding system so no air is trapped by orificed baffle.*

►*1962 COMET & FALCON BRAKE SHOE ADJUSTER INSULATOR NOTE & CAUTION: NOTE - Insulator not used on production cars having later type "O" ring wheel cylinder pistons (see below).* 1) To prevent damage and freezing of insulator, coat insulator with a light film of lubriplate when assembling adjuster. *This supersedes previous "no lubrication" recommendation.*

2) There must be 1/16-1/8" clearance maintained between end of socket and near edge of adjusting screw star wheel when assembly installed in the brake (add or remove 1 insulator as necessary).

►*1960-62 COMET & FALCON BRAKE SQUEAL CORRECTION & 1962 WHEEL CYLINDER PISTON PRODUCTION CHANGE:* To correct brake squeal, new front wheel brake cylinder pistons, No. C2DZ-2196-A, installed in 1962 production. These pistons have an "O" ring in an annular groove on outer diameter of each piston. These pistons may be installed on 1960-62 cars to reduce brake squeal. *NOTE - Replace "O" rings whenever wheel cylinders are serviced. "O" ring type pistons may be used along with brake shoe adjuster insulators, but insulators will not be used on production cars having "O" ring type pistons.*

DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric. Anchor pins are fixed and are not adjustable.

ADJUSTMENTS: Before making any adjustments, jack up all four wheels, check brake pedal clearance (see below), fully release hand brake lever and make certain that all wheels turn freely. Parking brake cables should be disconnected when car raised on frame hoist.

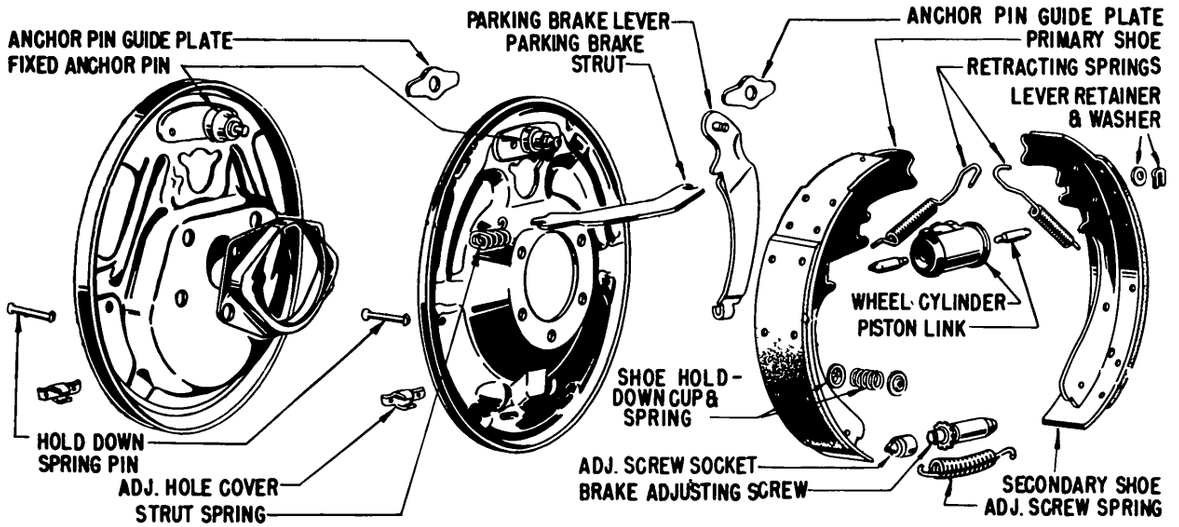
Brake Pedal Adjustment: Adjust as follows:

Comet, Falcon, Econoline – 1/4–7/16" (Falcon & Econoline), 5/16–7/16" (Comet) pedal freeplay. Loosen master cylinder pushrod–to–brake pedal eccentric bolt locknut and rotate bolt until freeplay is within specifications.

Ford Trucks – 3/16–3/8" pedal freeplay. On F Series, loosen locknut on eccentric bolt connecting master cylinder pushrod to brake pedal and rotate bolt as necessary. On P Series, turn hex head on master cylinder pushrod to obtain proper adjustment. Tighten locknut to 30–35 ft. lbs.

Parking Brake Adjustment: With service brakes properly adjusted, adjust parking brake as follows:

Comet & Falcon – Pull release handle 3 notches from fully released position. Turn front nut on equalizer several turns forward, then turn rear nut forward until cables prevent forward rotation of rear wheels. Tighten front nut against equalizer. Release the handle.



Econoline – Pull release handle 1 notch from fully released position. Turn front nut on equalizer forward several turns, then turn rear nut forward until there is a medium drag at rear wheels. Tighten front nut against equalizer. Release the handle.

Ford Trucks - With parking brake handle fully released, turn nut on front of equalizer several turns forward. Turn rear nut forward until cables are just tight enough to remove all slack. Tighten front nut against equalizer. *NOTE – For propeller shaft mounted parking brakes, see "Ford Truck Self-Centering" brakes in this section.*

Minor (Wear) Adjustment: Comet & Falcon – Remove adjusting hole cover and turn adjusting screw until there is a slight drag on the drum, then back off adjusting screw until wheel turns freely.

Econoline – Remove adjusting hole cover and turn adjusting screw until there is a moderate drag on the drum, then back off adjusting screw 10 notches to allow wheel to turn freely.

Ford Trucks – Remove adjusting hole cover and turn adjusting screw until the shoes drag against the brake drum, then back off adjusting screw 10–12 notches so wheel turns freely.

FORD TRUCK FRONT AND REAR BRAKE (OTHERS SIMILAR)

MASTER CYLINDER: Removal (Comet & Falcon) – Disconnect rubber boot, brake lines, and stop light switch wires from master cylinder. Remove attaching bolts and remove master cylinder.

Filling – Maintain fluid to within 3/8" (Falcon), 1/4" (Comet) from top of reservoir.

Removal (Econoline) – Remove forward splash shield and disconnect brake pedal return spring. Remove pushrod eccentric bolt. Remove snap ring from brake pedal pivot pin. Remove brake pipe outlet fitting bolt and washers (outlet fitting will be disconnected from master cylinder). Remove mounting bolts and remove master cylinder (swing down and remove from brake pedal pivot pin).

Filling–Maintain fluid to within ½" of top of reservoir.

Removal (Ford Trucks) – *See "Ford Bendix Uni-Servo" brakes in this section.*

Filling – Maintain fluid to within ½" of top of filler neck.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

1962 COMET, FALCON & ECONOLINE HYDRAULIC BRAKE & LINING SPECIFICATIONS
►*FOR FORD TRUCK LINING SPECIFICATIONS, SEE "FORD TRUCK SELF-CENTERING" DATA.*

WAGNER AUTOMATIC ADJUSTER (PRIMARY SHOE ACTUATION)

Rambler Classic Six, Series 6210 (1962) ①

① - Used on cars before Serial Nos. E-51962 and W-54336. *For brakes used on later cars, see "Wagner Automatic Adjuster Hydraulic Brakes (Secondary Shoe Actuation)" in this section.*

DESCRIPTION & OPERATION: Similar in design and operation to previous models. Adjuster is actuated by movement of primary shoe on forward brake application. Master Cylinder is "Double Safety" type having a separate piston and fluid chamber for front and rear brakes respectively.

ADJUSTMENT: Place car on stands so that all four wheels are free. Check master cylinder and see that fluid is ½" below top of filler opening of each reservoir Place parking brake handle in fully released position, then adjust as follows:

Brake Pedal Freeplay Adjustment: Rotate brake pedal-to-pushrod eccentric bolt to obtain 1/8-3/8" pedal freeplay. Adjust for maximum pedal height on power brake equipped cars. Pedal height from top of pedal pad to floor mat should be 6¼".

Brake Shoe Adjustment: Adjustment not normally required, however, if a manual adjustment is necessary (after installation of new lining or shoes), proceed as follows: Remove access hole cover and use a screwdriver to rotate star wheel. To tighten, rotate backing plate side of star wheel toward axle. To back off star wheel, it may be necessary to insert a second tool, past the star wheel, to force automatic adjusting lever off of star wheel. Back off star wheel to eliminate drag.

Parking Brake (Foot Operated Lever): Set brake lever on first notch from fully released position and tighten cable at equalizer until rear wheels are locked in forward rotation. Release foot lever and make sure wheels rotate without drag.

BRAKE SHOE REPLACEMENT: *See "Wagner (Lockheed) Self-Centering" and note the following:*

Automatic Adjuster Installation: With shoes installed on backing plate, install anchor block on anchor pin with convex side facing primary shoe (arrow on block should point in direction of forward drum rotation), then install shoe guide plate. Install **red** secondary shoe return spring with long hook end flat against shoe guide plate. Install **blue** primary spring **last** with short hook end flat against shoe table when hooked on tab of primary shoe. Slip anchor pin cable guide down in slot on anchor pin and install adjuster guide on primary shoe (do not tighten guide screw). Install adjuster lever into larger hole near end of primary shoe and connect adjuster lever spring between small hole in secondary shoe and slot in lever. Thread adjusting cable through shoe hold—down springs and over cable guide on anchor pin, hooking eye end of cable over secondary shoe return spring hook. Route cable around cable guide and swivel lever upward and engage barrel fitting end of cable in lever slide. With brake released, push primary shoe cable guide out to pull cable taut until bottom edge of adjusting lever is engaging star wheel tooth and parallel to star wheel shank. Tighten cable guide screw and test action by pulling cable.

MASTER CYLINDER: Removal - Disconnect pipes from master cylinder, remove attaching bolts and remove master cylinder.

Filling - Fluid **in each reservoir** should be within ½" of top of filler openings.

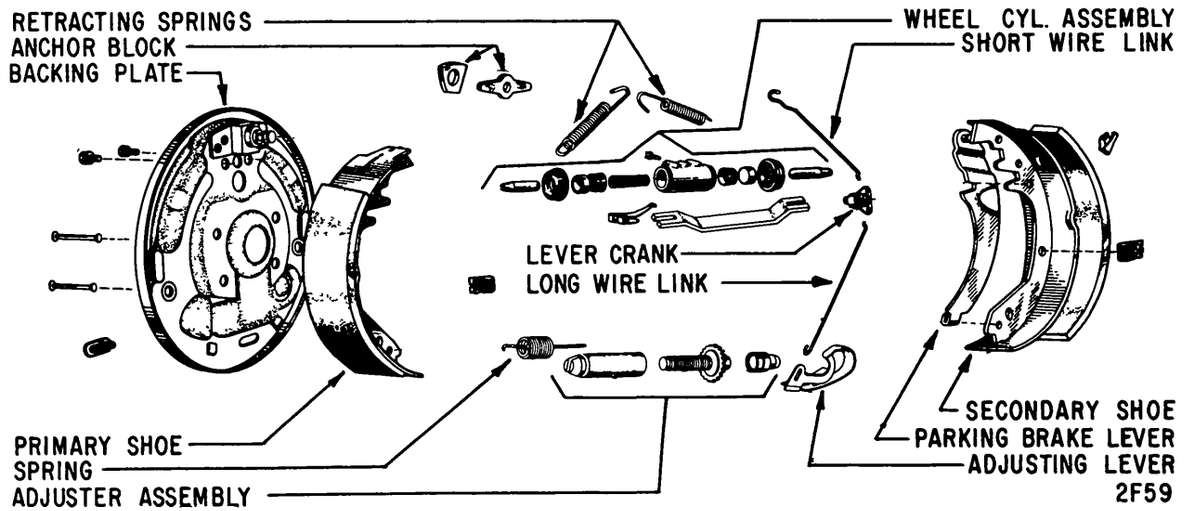
Overhaul: *See "Bendix & Moraine Dual Piston Brake Master Cylinders" in this section.*

BRAKE SPECIFICATIONS: *See "Wagner Automatic Adjuster Hydraulic Brakes (Secondary Shoe Actuation)" in this section.*

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Bendix & Moraine Dual Piston Brake Master Cylinders" in this section.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

WAGNER AUTOMATIC ADJUSTER (SECONDARY SHOE ACTUATION)



Rambler Classic Six, Series 6210 (1962) ①

① - Used on cars after Serial Nos. E-51962 and W-54336. *For brakes used on early cars, see "Wagner Automatic Adjuster Hydraulic Brakes (Primary Shoe Actuation)" in this section.*

DESCRIPTION: Hydraulic, self-centering and self-energizing type with Bendix type brake shoe assemblies similar in design to Wagner (Lockheed) Self-Centering Brakes and incorporating an automatic adjuster to maintain proper lining to drum clearance. The automatic adjuster uses movement of **rear (secondary) shoe** during brake applications to turn brake adjusting star wheel a small amount as determined by lining wear. The adjuster consists of an adjusting lever, a lever crank on secondary shoe, and two adjusting wire links. Master Cylinder used is "Double Safety" type, having a separate piston and fluid chamber for front and rear brakes respectively.

OPERATION: After lining wears enough to require adjustment, adjusting links will lift adjusting lever into position to engage with next tooth of star wheel when brakes are applied during **reverse** rotation. When brake is released, shoes return to brake shoe anchor. This action will repeat on subsequent brake applications, if necessary, until lining-to-drum clearance is reduced to a point where shoe movement is not enough to cause links to lift lever to next tooth. The automatic adjuster is located on the rear (secondary) shoe, and the adjusting action, when required, occurs when applying brakes during reverse movement of car.

ADJUSTMENT: Place car on stands so that all four wheels are free. Check master cylinder and see that fluid is ½" below top of filler opening of each reservoir. Place parking brake lever in fully released position, then adjust as follows:

WAGNER AUTOMATIC ADJUSTER BRAKE ASSEMBLY (SECONDARY SHOE ACTUATION)
REAR SHOWN - FRONT SIMILAR

Brake Pedal Freeplay Adjustment: Rotate brake pedal-to-pushrod eccentric bolt to obtain 1/8-3/8" pedal freeplay. Adjust for maximum pedal height on power brake equipped cars. Pedal height from top of pedal pad to floor mat should be 6¼".

Brake Shoe Adjustment (Initial Adjustment After Overhaul): With 3/16-1/4" of star wheel threads exposed during installation procedure, install drum and rotate star wheel toward axle until wheel is in locked position. Back off star wheel at least 15-20 notches. *CAUTION - DO NOT insert a tool past star wheel to lift or pry adjusting lever off star wheel teeth.*

Parking Brake Adjustment (Foot Operated Lever): Set brake lever on first notch from fully released position and tighten cable at equalizer until rear wheels are locked in forward rotation. Release foot lever and make sure wheels rotate without drag.

CONTINUED ON NEXT PAGE

WAGNER AUTOMATIC ADJUSTER (SECONDARY SHOE ACTUATION) (Continued)

BRAKE SHOE REPLACEMENT: Automatic Adjuster Removal - Remove long wire link from adjuster lever and lever crank, then remove upper (short) wire link. Remove star wheel spring, star wheel, and adjusting lever. Unscrew lever crank from secondary shoe.

Brake Unit Assembly: Place shoes on backing plate and secure with hold down pin and clip. Install adjuster lever on secondary shoe web (slot in lever must engage completely with slot in shoe web). *NOTE - Adjuster levers are painted red for right side, blue for left side. DO NOT INTERCHANGE.* Install star wheel and adjust so approximately 3/16-1/4" of threads are exposed between star wheel and star wheel nut. *CAUTION - Make sure star wheel is installed over adjusting hole in backing plate. If star wheels are interchanged between sides of car, brake shoes will retract instead of expand.* Install spring at lower end of shoe webs (long hook end in small hole of secondary shoe **under** shoe web; and short hook end in small hole of primary shoe web). Spring should not interfere with either adjusting lever or star wheel. Install anchor block with arrow pointing in direction of drum forward rotation. Install guide plate over anchor pin and install shoe return spring (lock hook end flat against guide plate). Install lever crank into secondary shoe web. *NOTE - Cranks are makred "L" and "R" for identification. Lever must rotate freely on hexagon head screw.* Install short (upper) wire link as follows: Insert "S" shape offset end into lever crank hole closest to hexagon head, then snap hook end of link in top groove of anchor pin. Install long (lower) wire link as follows: Insert "S" shaped end into lever crank, then lift adjuster lever up to hook link into slot of adjusting lever. Adjusting lever should now engage star wheel teeth at centerline of star wheel assembly ±1/16". Install wheel and drum, then make brake shoe adjustment (see above).

MASTER CYLINDER: Removal - Disconnect pipes from master cylinder, remove attaching bolts and remove master cylinder.

Filling - Fluid **in each reservoir** should be within ½" of top of filler openings.

Overhaul: *See "Bendix & Morain Dual Piston Brake Master Cylinders" in this section.*

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Bendix & Morain Dual Piston Brake Master Cylinders" in this section.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

1962 RAMBLER BRAKE SPECIFICATIONS

Lining Length (Sec.)	9 53/64" Front, 9 31/32" Rear
Lining Thickness	3/16" Front & Rear

① - Primary Shoe. 2½" Secondary Shoe.

Checker Superba (1962)
Studebaker, All Models (1962)

DESCRIPTION: Hydraulic, self-centering and self-energizing type with Bendix type brake shoe assemblies.

ADJUSTMENTS: Place car on stands so that all four wheels are free. Check master cylinder and see that fluid level is ½" below top of cylinder. Place parking brake handle in fully released position. Adjust as follows:

Studebaker Brake Pedal Free Travel Adjustment: Turn adjustable pedal stop on pedal bracket to obtain ¼–3/8" pedal free travel (measured from brake pedal pad) before pressure stroke starts.

Brake Shoe Adjustment: Remove adjusting hole cover from backing plate, insert screwdriver or special adjusting tool through adjusting hole and turn adjusting screw to expand shoes until drum is just locked (pivot tool on edge of slot, move handle upward to expand shoes). Then back off the adjusting screw 8 notches (used lining), 10 notches (new lining), or more if necessary until drum is free of any drag. Replace adjusting hole cover, adjust parking brake.

PARKING BRAKE ADJUSTMENT: As follows:

Studebaker - Set control handle four notches from fully released position. Adjust rear wheel cables at equalizer on frame side rail by backing off front nut until all slack is removed from cables and a heavy drag noted when rotating rear wheels by hand. Tighten front adjusting nut. Release control handle fully and see that wheels are free of any drag.

BRAKE SHOE REMOVAL & INSTALLATION:

Removal: Install wheel cylinder clamp to prevent hydraulic system leakage. Unhook the two shoe return springs at anchor. On rear brakes, swing the hand brake lever on the secondary shoe toward the axle to slacken cable. Lift cable from lever slot. Compress and remove hold-down spring clip on each shoe. Spread shoes and lift off brake support plate. On rear brakes, remove parking brake link and anti-rattle spring. Separate shoes by removing star wheel adjusting assembly and spring. On rear brakes, pull clip from parking brake lever mounted on secondary shoe and remove lever from shoe. Anchor plate and anchor block may now be lifted from anchor pin.

WAGNER (LOCKHEED) SELF-CENTERING

Installation: Reverse removal procedure. *NOTE* - On Studebaker Taxi and all 8 cylinder models, the parking brake lever is mounted on inner side of rear shoe. On other models, parking brake lever is mounted on outside of shoe.

WHEEL CYLINDER: Removal & Disassembly - Disconnect flexible hose from cylinder. Remove screws attaching cylinder to backing plate. Remove cylinder.

Assembly & Installation: Reverse disassembly and removal procedures.

MASTER CYLINDER: Remove as follows:

Removal (Studebaker) – Disconnect pushrod from brake pedal, remove shoulder bolt from pushrod, and nylon bushings from pushrod. Disconnect stop light switch wire and hydraulic line. Remove attaching bolts and remove master cylinder.

Filling – Maintain fluid to within ½" of top of cylinder.

BLEEDING BRAKE SYSTEM & OVERHAULING OF MASTER CYLINDER & WHEEL CYLINDERS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

RAMBLER "E-STICK" AUTOMATIC CLUTCH

Rambler American, Series 6201 (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING CAR BY TOWING NOTE:* To start car by towing, proceed as follows: With "Tow Start" handle all the way in, place shift lever in 2nd gear, pull overdrive handle all the way out, and turn on ignition switch. When speed reaches 10 MPH, pull "Tow Start" handle all the way out and hold in position. Clutch will now be engaged. As soon as engine starts, push "Tow Start" handle all the way in and move shift lever to neutral position. *"Tow Start" handle must be pushed all the way in at all times when driving the car.*

►*PARKING CAR IN GEAR NOTE:* Use REVERSE gear ONLY as follows: With ignition off, place transmission in reverse gear and pull "Tow Start" all the way out and turn handle ¼-turn clockwise to lock in position. Clutch will now be engaged. *"Tow Start" handle must be pushed all the way in at all times when driving the car.*

►*CLUTCH DISC STICKING TO FLYWHEEL OR PRESSURE PLATE CORRECTION:* Higher asbestos yarn content of clutch facings may induce sticking to flywheel if clutch left in engaged condition for any length of time. If car parked for 48 hours or more, use parking brake instead of "Tow Start" handle to hold car.

►*ROAD WASH ENTERING CLUTCH HOUSING CORRECTION:* Be sure throw-out lever boot is placed behind throw-out lever adjusting nut (on front side of throw-out lever).

►*CONTROL VALVE BODY REMOVAL NOTE & CAUTION:* If wheelhouse inner panel interferes with valve body removal, proceed as follows: Remove both lower capscrews and loosen top capscrew. Pull oil pump and valve body from engine approximately ¼" and rotate pump and valve body clockwise (to front of car) until capscrew and valve body can be removed from pump. *CAUTION - On "L" head engines, do not pull oil pump more than ¼" from engine or distributor shaft will disengage from driven gear and put engine out of time.* When installing valve body, torque capscrews to 13-15 ft. lbs. Overtightening will distort valve body.

DESCRIPTION: Fully automatic clutch operating mechanism using engine oil pressure to apply the clutch and which eliminates the need for a clutch pedal on cars with synchro-mesh transmission (with or without overdrive). Unit consists of the following components:

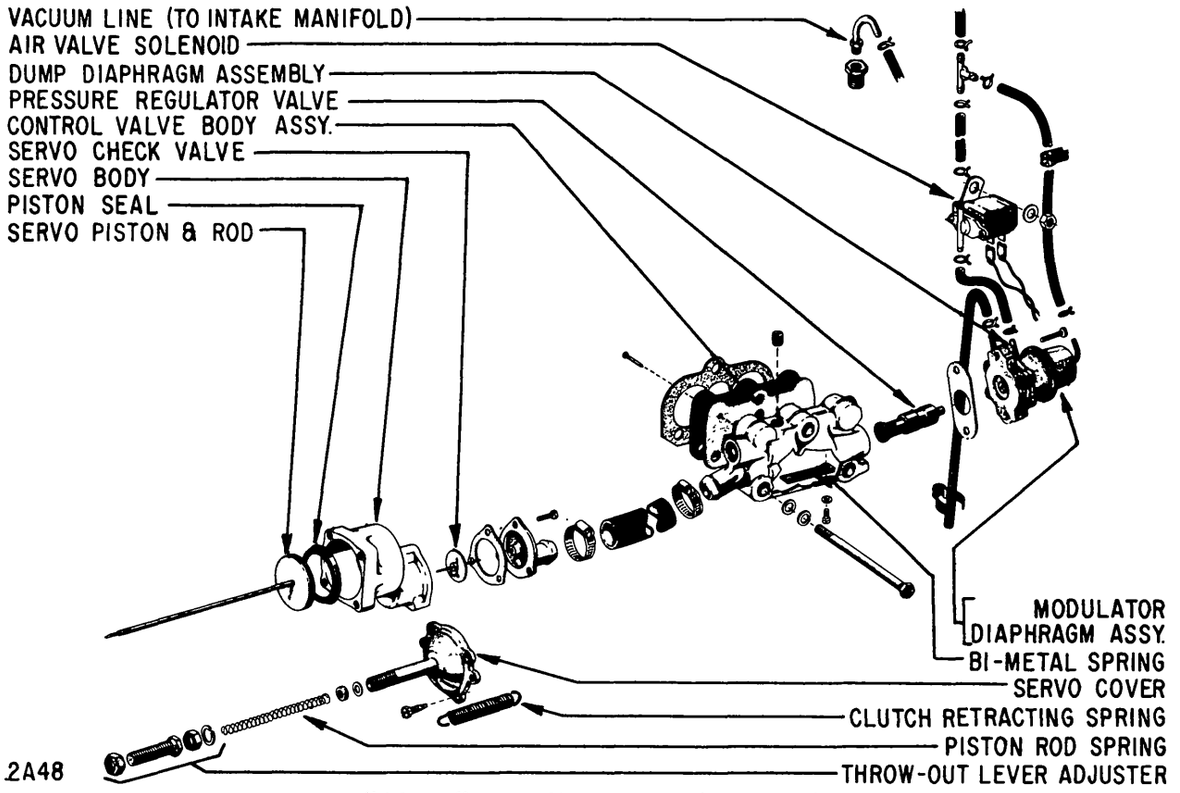
Clutch - Single plate, dry disc type of conventional design but with clutch pressure plate springs eliminated and release levers arranged to engage driven plate to flywheel instead of releasing it (clutch is disengaged at rest or in neutral). Some units may have a ball spring on driven plate hub to prevent driven plate contact with pressure plate when clutch is disengaged. Ball type clutch throw-out bearing rotates constantly when car is moving in gear. A retracting spring attached to outer end of throw-out lever holds clutch disengaged until applied by engine oil pressure.

Oil Pump - Gear type with larger gears for increased oil capacity. Engine oil pressure relief valve specification is increased to 55-60 lbs. at 2200 RPM, and an additional minimum lube pressure relief valve is installed in control valve body to insure that engine oil pressure requirements are met before oil is diverted for clutch operation. This valve opens at 10 lbs. pressure.

Dashpot - Because it is possible to leave transmission in gear at idle speed (clutch engaged), a dashpot is installed in throttle linkage for time delay purposes when throttle is closed rapidly.

Control Mechanism - Consists of a control valve body mounted on engine oil pump and serving as the pump cover, a vacuum modulator diaphragm and a vacuum dump diaphragm connected in series with each other and to intake manifold, an air valve solenoid in dump diaphragm line, and a neutral safety switch on steering column.

Servo - Conventional hydraulic power cylinder with a piston and seal, and piston rod contacting clutch throw-out lever. Hydraulic pressure in servo pushes piston rod against throw-out lever to engage clutch. A check valve with a metered orifice in line between servo and control valve body permits a large amount of oil under high pressure to enter servo for fast partial clutch engagement. Remaining oil needed for full engagement enters servo at a slower rate to insure smooth clutch engagement and operation.



►*MANUAL CONTROL NOTE:* A "Tow Start" handle on instrument panel connected by an adjustable cable linkage to throw-out lever is provided for manual engagement of clutch.

OPERATION: In Neutral At Idle Speed - With gear shift lever in neutral, neutral safety switch contacts are closed, energizing air valve solenoid which pulls in to open vacuum line from intake manifold to dump diaphragm. Combined vacuum in dump and modulating diaphragms (modulating diaphragm connected directly to intake manifold) plus atmospheric pressure on underside of modulating diaphragm pulls springs in both diaphragms up to hold pressure regulator valve open so there is no oil flow from engine oil pump to servo, and clutch is disengaged.

In Gear At Idle Speed: When transmission is placed in gear, neutral safety switch contacts open to release air valve solenoid which shuts off vacuum supply to dump diaphragm. Atmospheric pressure in dump diaphragm lets full diaphragm spring pressure close pressure regulator valve. *NOTE - Spring-loaded ball check in regulator valve maintains a 7 lb. minimum pressure in valve body and servo. This pressure is just enough to overcome slightly the clutch retracting spring tension and produce a slight drag on clutch to take up drive line backlash and to initiate coasting engagement for engine braking.* With regulator valve closed, servo pressure will be regulated by main orifice from oil pump discharge side until servo oil pressure begins to overcome dump diaphragm spring pressure (17 lbs. approx.).

In Gear At Road Load: As servo oil pressure under load increases, dump diaphragm spring pressure is not sufficient to hold regulator valve closed. But at the same time, engine manifold vacuum is dropping off because

CONTINUED ON NEXT PAGE

"E-STICK" CONTROL MECHANISM (EXPLODED)

RAMBLER "E-STICK" AUTOMATIC CLUTCH (Continued)

of increased engine speed. When vacuum drops, modulating diaphragm spring pressure is allowed to combine with dump diaphragm spring pressure to hold pressure regulator valve closed. This combined pressure is approximately 45 lbs. and is sufficient to keep clutch engaged.

Gear Shifting Sequence: The above sequence of operations takes place when shifting through various transmission gears because releasing accelerator pedal causes manifold vacuum to increase to maximum, and moving the gear shift lever through neutral position for each shift allows air solenoid valve to introduce vacuum into dump diaphragm, thereby releasing the clutch.

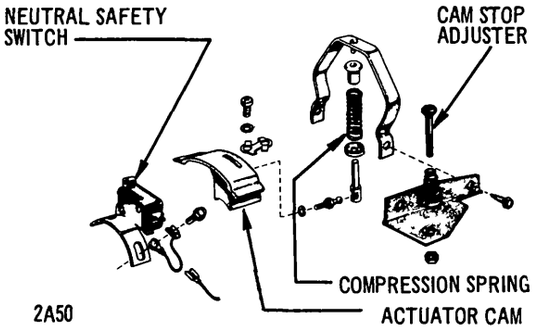
TROUBLE SHOOTING & DIAGNOSIS

► *TROUBLE SHOOTING NOTE: When diagnosing clutch troubles, check for the usual clutch malfunctions such as bent or distorted driven and pressure plates, worn or oil soaked facings, misalignment, etc., in addition to the following special points.*

EXCESSIVE SLIP: Low servo oil pressure; Throw-out lever improperly adjusted or improperly installed; Engine oil level low; Air valve solenoid faulty, Check valve orifice in servo plugged; Diaphragm pushrod stuck in valve and diaphragm assembly; Diaphragm vent plugged; Minimum lube pressure valve stuck partially open.

EXCESSIVE CREEP: Engine idle speed too high; Clutch retracting spring too light or broken; Servo oil pressure too high; Retractor straps broken.

NO CLUTCH RELEASE: Diaphragm cover bent or damaged; Vacuum line leak; Control valve stuck in valve body; Neutral safety switch faulty or not adjusted properly; Wiring to air valve solenoid faulty; Air valve solenoid faulty; Throw-out lever or "Tow Start" cable improperly adjusted; Servo piston binding; Servo body air vent plugged; Diaphragm leak in diaphragm assembly.



ENGINE OVERSPEEDS WHEN CLUTCH ENGAGES: Throw-out lever improperly adjusted; Servo piston binding; Servo body air vent plugged; Oil regulator valve not seating; Servo check valve sticking on shaft; Check valve orifice in servo plugged.

NO CLUTCH ENGAGEMENT: Neutral safety switch faulty or improperly adjusted; Air valve solenoid or wiring faulty; Minimum lube pressure valve stuck; Servo piston binding; Dump diaphragm spring broken; Pressure regulator valve stuck open; Engine oil level low.

EXCESSIVE GEAR CLASH ON ENGAGEMENT (1ST OR REVERSE): Throw-out lever improperly adjusted; Engine idle speed not correct.

ADJUSTMENT

Anti-Stall Dashpot Adjustment ("L" Head Engine - Carter Carb.): Turn idle speed screw out so throttle valve is tightly closed, fully depress dashpot plunger, turn dashpot in or out to obtain 1/8" clearance between end of plunger and throttle lever. Tighten locknut.

NEUTRAL SAFETY SWITCH & ACTUATOR CAM ASSEMBLY

Anti-Stall Dashpot Adjustment (Overhead Valve Engine - Holley Carb.): With engine idling at normal operating temperature, depress dashpot plunger fully, and turn adjusting screw on throttle lever to obtain a clearance of 9/64" between adjusting screw and dashpot plunger.

Neutral Safety Switch & Actuator Cam Stop Adjustment: Adjust neutral safety switch in mounting bracket so there is the same amount of gear shift lever movement when coming out of 2nd gear as there is when coming out of 3rd gear before neutral switch "clicks". Place gear shift lever in high gear and adjust actuator cam stop nut (upper nut at small end of spring) to take up approximately ½ of lever free movement (will center slot in 2nd and 3rd operating lever over selector key to remove any tension)

Throw-Out Lever Adjustment: With parking brake firmly set, engine idling at 550 RPM, and transmission shift lever in neutral, loosen locknut on throw-out lever adjusting screw. Turn adjusting screw so throw-out lever moves to rear of car until slight transmission gear clash is heard when moving shift lever **slowly toward 1st gear.** *CAUTION - DO NOT engage in gear.* Back off adjusting nut 2 turns and tighten locknut. Make "Tow Start" cable adjustment (see below).

"Tow Start" Cable Adjustment: After throw-out lever adjusted (see above), loosen locknut on "Tow Start" cable and turn adjusting sleeve so pivot clears throw-out lever by 1/8", then tighten locknut.

TESTING

STALL TEST: Method 1) is preferred method, but method 2) may be used as follows:

1) Bring engine to normal operating temperature and install an electric tachometer. Drive car on level ground in 3rd gear at 10 MPH. Move throttle to wide open position (apply brakes to hold at 10 MPH) and note tachometer reading. Engine speed should be 975-1125 RPM.

2) Bring engine to normal operating temperature and install an electric tachometer. Set parking brake and place transmission in 3rd gear. Apply brakes and open throttle fully. Engine speed should settle to 975-1125 RPM. *CAUTION - DO NOT hold throttle open for more than 2 seconds and DO NOT race at this test until ½ hour has elapsed.*

Test Conclusions - If engine RPM is higher than specified, refer to "Excessive Slip" under TROUBLE SHOOTING above for possible causes. If engine RPM is lower than specified, engine is not developing full power or servo oil pressure is too high.

OIL PRESSURE TEST: Bring engine to normal operating temperature and install pressure gauge at pipe plug fitting on control valve body assembly (use Adapter Fitting J-9622). Place transmission in neutral and set engine speed to 550 RPM. Remove vacuum hose at intake manifold and plug **manifold** opening (do not plug loose end of hose). Install an electric tachometer. Oil pressure should be as listed in table below for various engine speeds. *Be sure to check at all three speeds.* If pressure less than 45 lbs. at 2200 RPM, and diaphragm vent is not plugged and regulator valve is not stuck in valve body, replace diaphragm assembly. If pressure below 4.5 lbs. at 550 RPM, or below 24 lbs. at 1100 RPM, free pressure regulator valve or replace valve body.

Control Pressure Specifications

Engine Speed	Control Pressure
550 RPM	4.5-6.5 lbs.
1100 RPM	24.0-28.0 lbs.
2200 RPM	45.0-49.0 lbs.

AIR VALVE SOLENOID: Remove solenoid from mounting bracket, disconnect vacuum hoses, but leave wiring connected. With ignition off, solenoid is not energized, and you should not be able to blow through port "V". This checks vacuum part of solenoid in closed position. Now turn ignition on. Solenoid should be energized and you should be able to blow through port "V". This checks vacuum valve in open position. With ignition on, and solenoid energized, close port "D" with a finger. You should not be able to blow through port "V". This checks atmospheric end of valve for proper seating. Replace air solenoid valve if any of above conditions not met.

SERVO & CHECK VALVE: Engage clutch manually with "Tow Start" handle. Move servo pushrod back and forth to check for binding. If oil leaks at rear of servo, check servo piston seal and cylinder bore. If oil leaks at front of servo, check hose clamp and servo gasket.

CLUTCH

CLUTCH: Removal - Remove transmission, flywheel housing lower cover, and disconnect retracting spring and "Tow Start" cable from throw-out lever. Remove clutch. *NOTE - Mark cover, pressure plate and flywheel for reassembly in same positions.*

Disassembly: Clutch may be disassembled by removing the three pressure plate attaching screws.

Inspection: Inspect all parts for wear, damage, distortion, etc. Replace parts as necessary. Replace cover if any drive straps are broken. *CAUTION - Do not wash release bearing in gasoline or any solvent. Unnecessary and impossible to lubricate bearing as it is packed for life.*

Reassembly: Reverse disassembly procedure and apply small amount of lubriplate to release lever fulcrums.

Installation: Reverse removal procedure and use Aligning Tool J-1625 or J-5442 to insure correct clutch alignment. *NOTE - Before removing aligning tool, attach "Tow Start" cable and pull handle all the way out to hold clutch in place to aid transmission installation.*

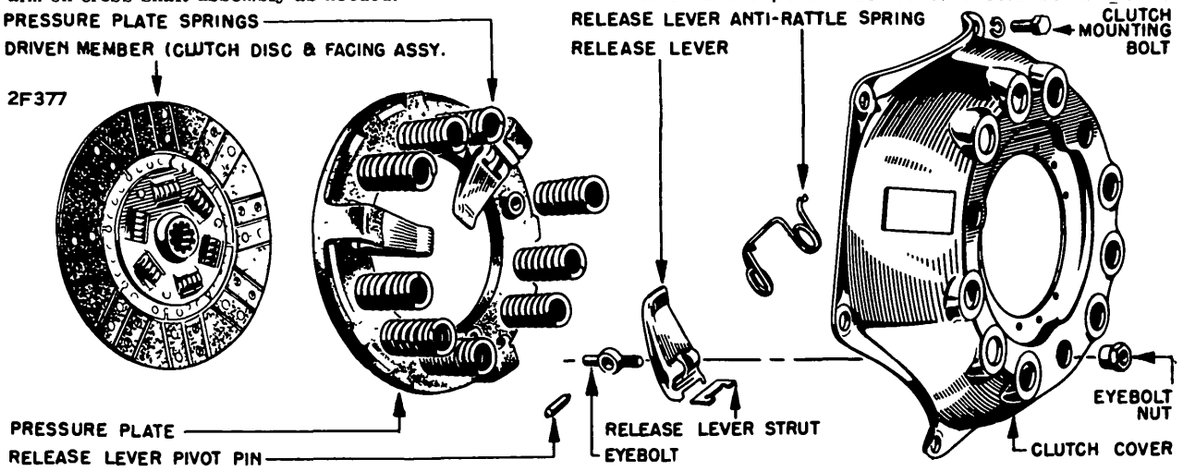
►CHANGES, CAUTIONS, CORRECTIONS

►*1962 RAMBLER GEAR CLASH ON ENGAGEMENT CORRECTION:* Make sure clutch pedal total travel and freeplay are correctly adjusted (see below).



DESCRIPTION: Single plate, dry disc type. Three release levers, mounted on bolts piloted in pressure plate and retained in clutch cover, actuate clutch struts which provide "knife-edge" action. *NOTE - Some models may have four release levers.*

►*SEMI-CENTRIFUGAL CLUTCH NOTE:* These clutches ("W" or "WW" suffix in model number) have three roller assemblies in grooves in pressure plate directly under clutch cover. Centrifugal action on these rollers increases the pressure plate load as the engine speed increases.

CLUTCH PEDAL & LINKAGE ADJUSTMENTS: As follows:

Chevrolet Pass. Cars: Free travel should be 7/8-1 1/8". To adjust, remove pedal return spring and back off pedal pushrod lower locknut (at swivel end) about ½". Hold pushrod so pedal is against bumper stop, and hold cross shaft lever so throw-out bearing is against clutch fingers. Adjust pushrod upper locknut so there is 3/16-1/4" clearance between this locknut and upper edge of swivel. Release pushrod and cross shaft lever, tighten lower locknut to lock swivel against upper locknut, and install return spring.

Corvette: Free travel should be approximately 1". To adjust, disconnect lower pushrod swivel from cross shaft lever and hold pushrod in direction of clutch release (throwout bearing against release levers). Adjust swivel so it freely enters hole in cross shaft lever (to remove all lash), then shorten pushrod 2 full turns of swivel and connect swivel to cross shaft lever. Recheck pedal free travel. Clutch pedal total travel should be 6½" (4½" on fast release position cars). To increase travel, trim rubber bumper as necessary; to decrease travel, adjust pedal free travel as necessary. Clutch over-center spring load should require 6-9 lbs. force to push pedal away from bumper. To adjust, disconnect clutch fork pushrod and adjust arm on cross shaft assembly as needed.

BORG & BECK CLUTCH ASSEMBLY (TYPICAL)

Chevrolet Trucks: 1) Adjust pedal height so pedal pad is even with brake pedal pad by moving clutch pedal bumper as necessary. Disconnect clutch fork return spring, bottom slave cylinder pushrod and piston (push to front of truck as far as possible), and pull clutch fork to rear of truck until throw-out bearing touches clutch release levers. Clearance between slave cylinder pushrod fulcrum ("V" block) pivot and clutch fork should be 5/32" (use 5/32" diameter drill rod to measure). To adjust, turn adjusting nut behind pushrod fulcrum.

2) Clutch pedal free travel should be 1/8" before clutch pushrod touches master cylinder piston. To adjust, turn adjustable pushrod on master cylinder as necessary.

Chrysler Corp. Models: Shorten or lengthen clutch release fork rod by turning adjusting nut until there is 5/32" free movement of clutch fork outer end. *NOTE - This adjustment will provide correct 1" pedal freeplay.*

Pontiac (Except Tempest): Make following adjustment to maintain clutch pedal free travel at ¾". *NOTE - Following procedure supersedes previous recommendations.* Loosen clutch fork rod adjusting nut and adjust silencer bumper (if equipped) so countershaft is lifted .015-.020" off stop. With throw-out bearing just touching clutch release levers, turn adjusting nut until nut just seats in fork, then back off nut 4¼ turns (3/16"), recheck adjustment and tighten locknut to 8 ft. lbs. Install adjusting rod to fork spring and and install cotter pin. Pedal height should be 6¾-7" above floor mat. To adjust, loosen pedal nut upper trunnion jam nuts and adjust as necessary. Tighten jam nuts to 8 ft. lbs.

Rambler: 1) Clutch pedal total travel should be 7¼-7¾" from top face of pedal (cushion removed) to **bare** floor pan measured at 90° to clutch pedal face. If less than 7¼", pull up on pedal against stop for proper dimension.

2) Free travel should be ½-¾" (½" preferred). To adjust, turn throw-out lever-to-inner release idler lever assembly connecting link as necessary.

Studebaker: *CAUTION - Brake pedal must be properly adjusted as follows before making clutch pedal adjustments. Brake pedal free travel should be 1/4-3/8". Adjust by turning adjustment screw at pedal bracket.* With brake pedal properly adjusted, turn clutch pedal stopscrew so that the clutch pedal is at the same height as brake pedal. *NOTE - On power brake cars, adjust so clutch pedal height is 6¼-6½" from top of pedal pad to floor mat.* Turn adjusting nut on clutch over-center spring so spring length is 10", then adjust clutch pedal-to-bellcrank rod so there is ½" clearance between top end of bellcrank and body flange on front side of firewall. Now turn clutch operating rod adjusting nuts as necessary for ½-1" pedal free travel measured at pedal pad.

►*HILL HOLDER NOTE:* Check setting whenever clutch pedal adjusted and adjust operating rod so Hill Holder releases at same time clutch is engaged.

Tempest: Back off silencer bumper so it does not touch pedal, then adjust pedal stop bracket assembly for pedal height of 4½-4¾" from lower edge of pedal pad to floor mat. Place silencer bumper so it just contacts pedal arm when clutch fully released. Disconnect rear end of clutch fork rod and pull clutch fork to rear of car until throw-out bearing solidly contacts clutch release levers, turn adjusting nut back against fork, then turn

CONTINUED ON NEXT PAGE

BORG & BECK (Cont.)

nut forward 5 turns and tighten locknut. *This supersedes previous settings.* Connect clutch fork rod. *NOTE - Clearance between throw-out bearing and release levers with clutch fully released should be .060" minimum.*

CLUTCH REMOVAL: As follows:

Chevrolet Pass. Cars: Remove transmission *(see Transmission Section).* Remove throw-out bearing and tension spring from clutch fork, then disconnect fork from pushrod. Disconnect fork from ball stud by forcing to center of car. *NOTE - On V8 engines only, ball stud can be removed from clutch housing with an allen wrench.* Remove clutch assembly attaching bolts and remove clutch.

Corvette: Remove transmission *(see Transmission Section).* Remove flywheel underpan and throw-out bearing from clutch fork. Support clutch assembly and mark cover and flywheel for reassembly. Remove clutch assembly attaching bolts and remove clutch. *NOTE - To hold release levers down during clutch removal, place nut or spacers between release levers and clutch cover.*

Chevrolet Trucks: Remove transmission *(see Transmission Section).* Disconnect slave cylinder from clutch fork and remove throw-out bearing. Press clutch fork away from mounting with a screwdriver until fork snaps loose from ball, or remove ball stud from clutch housing. *NOTE - Remove retainer from fork by prying with a small screwdriver.* Support clutch assembly and mark cover and flywheel for reassembly. Remove clutch assembly attaching bolts and remove clutch. *NOTE - To hold release levers down during clutch removal, place nuts or spacers between release levers and clutch cover.*

Chryxler Corp. Models: Remove transmission *(see Transmission Section).* Remove clutch housing pan and dust seal, and disconnect release fork rod at fork. Remove retracting spring. Remove release fork, dust seal, sleeve, and throw-out bearing. Mark flywheel and pressure plate for reassembly, remove attaching bolts and remove clutch assembly.

Rambler: Remove transmission *(see Transmission Section).* Disconnect linkage and remove clutch housing and pan. Mark flywheel and clutch for reassembly and take out clutch fork. Remove clutch attaching bolts and remove clutch assembly.

Pontiac (Except Tempest): Disconnect battery, then remove transmission and propeller shaft *(see Transmission Section).* Remove throw-out bearing and clutch fork pushrod, then disengage pedal pushrod from countershaft. Remove over-center spring (rotate countershaft assembly), then remove countershaft. Remove starter and flywheel housing front shield. Remove flywheel housing. Mark flywheel and clutch for reassembly, remove attaching bolts, and remove clutch.

Studebaker: Disconnect battery. On 6 Cyl., remove oil level gauge and tube, and disconnect starter and tie out of way (unnecessary to disconnect cables). On V8, remove starter completely. Remove clutch operating shaft and transmission *(see Transmission Section).* Disconnect engine rear support from crossmember and raise engine sufficiently to take weight off crossmember. Remove crossmember (and clutch housing cover plate on V8 cars). Remove clutch housing. Mark flywheel and clutch for reassembly, remove attaching bolts, and remove clutch assembly.

Tempest: Disconnect stabilizer bar from frame side rail, disconnect exhaust pipe, and disconnect front of torque tube from clutch housing *(see "Propeller Shafts" in Rear Axle Section).* Disconnect clutch rod from clutch fork, and linkage link from clutch housing, then remove clutch housing assembly. Mark flywheel and clutch for reassembly, then remove clutch assembly from flywheel.

OVERHAUL: Mark all parts before dismantling clutch and reassemble in same position to maintain clutch balance. Replace grooved, checked or warped pressure plates. Replace springs when pressure plate discolored from heat.

►*PONTIAC & TEMPEST OVERHAUL NOTE: Car manufacturer does not recommend overhaul of clutch assembly.*

Disassembly: Place clutch on fixture or arbor press (support pressure plate under release levers), place block across cover resting on spring bosses, compress cover slightly, remove metal staking in adjusting nuts by running hacksaw blade through slot, remove nuts. Release pressure slowly, remove cover and springs. Remove release levers by grasping lever and eyebolt between thumb and forefinger, so that inner end of lever and upper end of eyebolt are pressed together, lift strut over ridge in end of lever (press lower end back against lug), lift lever and eyebolt out.

	6-Black	223-237 at 1 1/2"

Reassembly: Place pressure plate on fixture or arbor press supporting plate under release lever lugs. Install lever, eyebolt and strut assemblies by reversing removal procedure. On semi-centrifugal models, install roller assemblies in pressure plate grooves. Install clutch springs on pressure plate. Install anti-rattle springs on release levers in cover. Place cover on pressure plate. Make certain that springs are seated in cover recesses and anti-rattle springs in place on release levers. Compress cover slowly and guide eyebolts through holes in cover. If assembly made in fixture, use clamps to clamp cover flange to plate at mounting holes. Install eyebolt nuts and turn nuts down flush with head of bolt. Compress and release clutch several times to seat all working parts. Then adjust release lever heights.

Clutch Springs: Note spring color and install in same relative position (groups of two different springs used on some clutch models). Springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

Release Lever Setting
(Borg-Warner Fixtures UF-300 & UF-400)

Clutch Assy.	℄ Lever Height	Clutch Assy.	℄ Lever Height
926	2 3/16"	361558	2 1/8"
361360	2 1/4"	361559	2 3/8"

361531	2 9/32"	361595	2 7/32"
361545	2 1/4"	361596	2 7/32"
361555	2 1/16"		

℄ - Using three 3J lands and 3X indicating plate.

Release Lever Adjustment (With Borg-Warner Universal Fixtures UF-300, 400): Special lands must be installed on fixture under pressure plate lever lugs. Set adjusting arm on adjusting sleeve so that height of lower side arm above bottom of sleeve is correct for each model (see table below). Install indicating plate on levers. Adjust each lever so that it just contacts indicating plate or adjusting arm, lock lever adjusting nuts by peening nut against notches in eyebolt.

Release Lever Adjustment (Using Gauge Plate): Install clutch on flywheel in car, or on dummy flywheel on bench, with Borg & Beck Gauge Plate installed in place of regular driven member *(CAUTION* - Machined lands on gauge plate should be directly under release levers). Depress each lever several times to seat all parts, then place straightedge or sheet metal height gauge on gauge plate boss directly above release lever and adjust lever height until lever tip contacts lower edge of height gauge ("Flush" setting).

CHEVROLET (OWN)

DESCRIPTION: Single plate dry disc type with a diaphragm spring (replacing conventional clutch release springs and release levers). Diaphragm is shaped like a dished washer, with inner rim slotted to form 18 release fingers and is pivoted on inner and outer pivot rings mounted on 9 bolts in clutch cover. *NOTE* - Clutches used on 235" engine, 283" engine with 2-Bbl. Carb., and Corvair engine all have straight-finger clutches. All other models using this type clutch, have six of the fingers (18 total) bent upward with weights at outer ends to provide centrifugal action for increased clutch pressure at higher clutch speeds.

Clutch Linkag Adjustm nt: Chevrolet Pass. Cars - Free travel should be 7/8-1 1/8". To adjust, remove pedal return spring and back off pedal pushrod lower locknut (at swivel end) about 1/2". Hold pushrod so pedal is against bumper stop, and hold cross shaft lever so throw-out bearing is against clutch fingers. Adjust pushrod upper locknut so there is 3/16-1/4" clearance between this locknut and upper edge of swivel. Release pushrod and cross shaft lever, tighten lower locknut to lock swivel against upper locknut, and install return spring.

Ch vy II - Free travel should be 3/4-1" measured at pedal pad. To adjust, loosen locknut on clutch fork pushrod and shorten or lengthen pushrod as necessary, then tighten locknut. Recheck pedal free travel. *NOTE - 1/8" cl aranc between pushrod and pushrod s at in clutch f rk will give proper pedal free travel.*

C rvair Pass. Car - 1) Attach return spring to clutch lever control cable cross-shaft outboard lever lower hole. *NOTE* - Clutch fork pull rod must be disconnected from cross-shaft lever.

2) Adjust clevis swivel until outboard lever on clutch lever control cable cross shaft has a clearance of 1/8" to 3/4".

3) Hold pull rod to remove all slack at bearing and align swivel with upper hole of outboard lever, then back off swivel 3 complete turns and assemble swivel to lever and install clip.

Corvair Truck & Greenbrier - *NOTE* - Pedal should have at least 3/4" travel before release bearing engages diaphragm.

1) Disconnect **rear** clutch return spring. *CAUTION* - **Fr nt** spring must be in operation to hold pedal bumper in contact with toe-board.

2) Remove retainer clip, clevis pin and washer from clutch control idler lever and remove rear cable clevis.

3) Let idler lever hang free to furnish guide for correct line of action of cable clevis.

4) Pull cable clevis rearward to remove all slack forward of this point, then pull clutch fork pull rod until all slack is taken up at clutch fork.

5) With cable clevis and pull rod in this position, adjust pull rod clevis to align holes in both clevises.

6) With pull rod clevis position established, unscrew clevis 3½ turns (lengthen rod 5/32"). Tighten jam nut.

7) Line up holes in cable clevis, pull rod clevis, and clutch fork pull rod idler lever and insert clevis pin and retainer clip. Install return spring.

Trucks - Adjust pushrod so as to obtain free travel between master cylinder pushrod and piston. This will amount to 1/8" free travel measured at center line of pedal pad, just before pushrod contacts piston. *NOTE* - This insures piston uncovering port in reservoir.

Pedal Adjustment (Total Travel): Trucks - 1) Adjust clutch pedal bumper so clutch pedal pad (fully released) is even with brake pedal, then disconnect return spring.

2) Push slave cylinder pushrod forward as far as possible and pull clutch fork rearward until all slack is removed at throwout bearing, then turn adjusting nut behind slave cylinder pushrod fulcrum ("V" block) to obtain 5/32" clearance between fulcrum pivot and clutch fork (use shank of 5/32" drill).

Removal: Pass. Cars - Remove transmission. Remove clutch throwout bearing from fork, then remove clutch fork tension spring from fork. Remove clutch fork by forcing it forward and toward center of vehicle. Install Clutch Pilot Tool J-5824 to support clutch assembly. Loosen clutch attaching bolts one at a time until tension of spring is released. Remove tool, then remove clutch assembly from vehicle. When installing clutch, align "X" mark on cover and flywheel.

Chevy II - Raise and support car and remove transmission (see Transmission Section). Disconnect return spring from clutch fork and remove throw-out bearing from fork. Remove clutch housing (cover plate will hang from starter gear housing). Remove clutch fork from ball stud and dust boot. Support clutch assembly with Tool J-5824, then remove clutch assembly by loosening attaching bolts a little at a time until all clutch spring tension is relieved.

►*CHEVY II CLUTCH DISC INSTALLATION CAUTION:* Extended end of hub with damper springs must be installed toward flywheel.

Corvair - *See "Engine" in Corvair Special Data.*

Trucks - Remove transmission, then disconnect slave cylinder at clutch fork and remove bearing from fork. Press fork away from ball mounting (use screwdriver), or remove ball stud from rear of clutch housing. *NOTE - Pry retainer out of fork with small screwdriver.* Install Tool J-5824 to support assembly. Loosen clutch attaching bolts gradually to release spring tension then remove tool and remove clutch assembly.

Bleeding System: (Trucks) - Same as for brake system. Bleed clutch hydraulic line at clutch slave cylinder bleed holes.

OVERHAUL: 1) Remove three drive strap-to-pressure plate bolts and retracting springs, then remove pressure plate from cover. *NOTE* - When disassembling, note position of grooves on edge of pressure plate and cover for reassembly to maintain balance.

2) Inspect spring, rings and cover for excessive wear or damage. If defect found, replace assembly.

ℂ - Woven. ℭ - Molded.

AUBURN

Car Model	Clutch No.
Checker	
Dodge Dart & Plymouth	
170" Engine	100306-1
225" Engine	100300
Willys 4 & 6 Cylinder	Ⓒ

Ⓒ - 3-spring and 6-spring types used. Rockford clutches also used on some models.

DESCRIPTION: Single plate, dry disc type of same design used on corresponding previous models.

PEDAL ADJUSTMENT

Dodge Dart & Plymouth: Freeplay Adjustment - Adjust self-locking nut on clutch fork rod to provide 5/32" free movement at fork-to-pushrod pin. This will provide correct 1" pedal freeplay.

Willys Freeplay Adjustment: 4 Cyl. (Jeep & Jeep Dispatcher) - 1½" pedal freeplay. To adjust freeplay, loosen yoke locknut on cable between throwout lever and cross shaft lever and turn yoke as required.

4 Cyl. (Trks. and Sta. Wgn. Exc. FC-150) - 1" pedal freeplay. To adjust, loosen control rod locknut and screw adjusting nut (on threaded connection between clutch control lever and control tube lever) in or out. Retighten locknut.

6-226 Models (Exc. FC-170) - 1" pedal freeplay. To adjust, loosen locknuts on pedal adjusting rod. Turn nuts forward to increase or backward to decrease freeplay. Tighten both locknuts against trunnion (without changing adjustment).

FC-150 & FC-170 Models - ½" pedal freeplay. To adjust, change cable length so pedal has ½" free movement from fully engaged position before resistance is felt.

REMOVAL

Dodge Dart & Plymouth 6 Cyl.: Remove transmission. Pull out release bearing and sleeve. Mark cover and flywheel for reassembly. Loosen clutch attaching bolts in succession a few turns at a time to release spring tension. Remove clutch assembly.

Willys: Jeep & Jeep Dispatcher - Remove transmission or transmission and transfer case. Remove engine from chassis (labor will be saved if engine is removed without bell housing). Mark pressure plate and flywheel for reinstallation of clutch. Remove clutch cover screws (turn all screws out evenly to reduce spring pressure) and remove cover assembly and clutch disc from flywheel.

Forward Control Models - Remove transmission or transmission and transfer case. On FC-150 models, remove bell housing from engine. On FC-170 models, remove flywheel housing pan from bottom of housing. On all models, mark pressure plate and flywheel for reinstallation. Loosen attaching screws evenly (to release spring pressure and prevent distortion of bracket), then remove clutch assembly from flywheel.

Utility Models - On 6-226 models (with split bell housing), disconnect both front and rear propeller shafts and pull transmission to rear sufficiently to clear transmission main driveshaft from clutch, then remove bottom pan from bell housing. Mark both pressure plate and flywheel for reassembly. Loosen pressure plate to flywheel screws evenly in sequence a little at a time to prevent distortion of clutch bracket. Remove assembly from vehicle.

OVERHAUL: *See 1959 Final Data, Page 332, or later Manual edition and note the following:*

►*OVERHAUL TOOL NOTE: Use Tool C-585A (Dodge Dart & Plymouth 6 Cyl.). C-585-C (Willys).*

Clutch Springs: Use correct springs (see table below). Replace all springs that are burned or do not meet specifications.

Comet & Falcon H.D.	280214	C1DD-7550-C
Fairlane & Meteor 6 Cyl. Ⓒ	280461	C2OZ-7550-E
Econoline Trucks	280214	C1UU-7550-A

Ⓒ - Standard Clutch. 6 Cyl. H.D. & V8 clutch is Long CF (semi-centrifugal) type. *See "Long CF & NC Clutches" in this section.*

DESCRIPTION: Single plate, dry disc type. Three flat release levers extend through slots in cover and engage slots in pressure plate bosses. Pressure plate springs are installed between pressure plate and cover between the release levers.

PEDAL ADJUSTMENT

Comet & Falcon: Assist Spring Adjustment - Adjust retainer in link so distance from inside radius of spring hook to front face of link is 1 3/16"

Total Travel Adjustment - Move bumper and bracket as required to secure 6-6½" of travel. Make this adjustment prior to making Freeplay Adjustment.

Freeplay Adjustment - Loosen pedal-to-equalizer rod nuts and move equalizer bar as required to obtain 7/8-1 1/8" movement of pedal from fully released position until release fingers contact release bearing, then tighten nuts against trunnion without altering adjustment.

Fairlane & Meteor: Pedal Linkage & Height Adjustment - Disconnect interlock shift rod at interlock shift lever, then measure total travel of clutch pedal. *NOTE - Measure distance from steering wheel to clutch pedal with pedal fully released, then again with pedal fully depressed.* If travel not within specifications, move clutch pedal bumper and bracket up or down until travel is correct (6 5/8-6 7/8"). *CAUTION - Always check and adjust total travel before checking free travel.* With clutch pedal against its bumper (fully released) distance between assist spring eye centers should be 10". Adjust spring retainer hook length as necessary. With engine idling, depress clutch pedal just enough to take up free travel and note reading on tape (distance between steering wheel and clutch pedal). Difference between this reading and reading where pedal is released should be 15/16-1 1/16". If not within specifications, adjust clutch pedal-to-equalizer rod. To increase free travel, loosen rearward adjusting nut and tighten forward nut. To reduce free travel, loosen forward nut and tighten rearward nut. Tighten both nuts against trunnion after adjustment. With transmission in neutral and interlock pawl snugly engaged, connect interlock rod. As a final check, measure pedal free travel with transmission in neutral and engine running at 3000 RPM. If free travel at this speed is not ½", readjust clutch pedal-to-equalizer rod as necessary. *CAUTION - Free travel must be exactly as specified.*

►*FAIRLANE & METEOR INTERLOCK LINKAGE NOTE:* If interlock shift linkage does not operate correctly, or if disturbed during clutch linkage and height adjustment, adjustment must be made on interlock linkage. *See "Ford & Mercury 3-Speed Synchro-mesh Transmission" in Transmission Section.*

Econoline: Freeplay Adjustment - Loosen nut on turnbuckle on release rod and rotate turnbuckle to obtain freeplay or travel of 7/8-1 1/8", measured from fully released position until release fingers contact release bearing. Tighten nut. *NOTE - When freeplay is correct, total travel (6-6½") will be correct.*

REMOVAL & INSTALLATION: All Models - Remove transmission (see Transmission Section), then remove starter motor and dust seal. Disconnect retracting spring, then disconnect pedal from equalizer rod at equalizer bar. Remove release bearing and hub. Remove flywheel housing and inspection or dust cover. Remove clutch assembly from flywheel.

OVERHAUL: *CAUTION - Parts are not furnished and manufacturer recommends that clutch not be disassembled.* Replace pressure plate and cover assembly if release levers do not operate freely or if lever heights not equal. *See Release Lever Checking below.*

Release Lever Checking: Assemble pressure plate and cover assembly on flywheel with a .250" shim installed in place of regular driven member. Use depth gauge or dial indicator to measure height of inner end of each release lever. All levers must be equal within .031". If lever variation greater than .031" replace pressure plate and cover assembly.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 BUICK SPECIAL CLUTCH LINKAGE BINDING CORRECTION:* Lubricate all pivot points, then realign linkage as necessary to eliminate bind at any point. Adjust equalizer perpendicular to engine.

►*1962 BUICK SPECIAL CLUTCH FAILURE TO RELEASE CORRECTION:* May be caused by equalizer lever separating from equalizer shaft because of insufficient weld. To correct, install new type equalizer assembly, Part No. 1354402.

DESCRIPTION: Single plate, dry disc type. Model CF is semi-centrifugal type. Model NC is not centrifugal.

CLUTCH LINKAGE & PEDAL ADJUSTMENT: Buick Special - Pedal free travel should be 7/8-1". To adjust, pull outer end of clutch fork rearward until throw-out bearing contacts clutch release levers. Free movement at outer end of clutch fork should be 3/16". Remove clevis pin from rear of clutch release rod and rotate rod as necessary for proper clutch fork free movement. Install clevis pin and check pedal free travel.

Ford & Mercury (Except Trucks): Disconnect interlock shift rod at interlock shift lever, then measure total travel of clutch pedal. *NOTE - Measure distance from steering wheel to clutch pedal with pedal fully released, then again with pedal fully depressed.* If travel not within specifications, move clutch pedal bumper and bracket up or down until travel is correct (6 5/8-6 7/8"). *CAUTION - Always check and adjust total travel before checking free travel.* With clutch pedal against its bumper (fully released), distance between assist spring eye centers should be 10". Adjust spring retainer hook length as necessary. With engine idling, dpresss clutch pedal just enough to take up free travel and note reading on tape (distance between steering wheel and clutch pedal). Difference between this reading and reading where pedal is released should 15/16-1 1/16". If not within specifications, adjust clutch pedal-to-equalizer rod. To increase free travel, loosen rearward adjusting nut and tighten forward nut. To reduce free travel, loosen forward nut and tighten rearward nut. Tighten both nuts against trunnion after adjustment. With transmission in neutral and interlock pawl snugly engaged, connect interlock rod. As a final check, measure pedal free travel with transmission in neutral and engine running at 3000 RPM. If free travel at this speed is not ½", readjust clutch pedal-to-equalizer rod as necessary. *CAUTION - Free travel must be exactly as specified.*

►*FORD & MERCURY INTERLOCK LINKAGE NOTE:* If interlock shift linkage does not operate correctly, or if disturbed during clutch linkage and height adjustment, adjustment must be made on interlock linkage. *See "Ford & Mercury 3-Speed Synchro-mesh Transmission Section.*

Ford Trucks: F & B Series - Pedal total travel should be 8 1/16-8 5/16". Adjust pedal stop as necessary. Pedal free travel should be 1 3/8-1 1/2". To adjust, back off jam nut on release pushrod and turn spherical nut as necessary. There should be 1/4" clearance between spherical nut and release lever. *NOTE - Make adjustment with r tracting spring in plac* . Tighten jam nut.
C Series - Initial pedal free travel before master cylinder pushrod contacts piston should be 5/32-1/4". Adjust eccentric bolt and pedal stop as necessary. Disconnect retracting spring and push slave cylinder pushrod as far to front of truck as possible, then pull release lever to rear of truck until release bearing touches pressure plate release fingers. Clearance between slave cylinder pushrod spherical nut and release lever should be 1/4". Loosen jam nut and turn spherical nut as needed. Final free travel should be approximately 2".
P Series - Initial pedal free travel should be 1/16-1/4". Adjust master cylinder pushrod extension as necessary (with pedal retracting spring attached). Now disconnect retracting spring and adjust clearance between slave cylinder pushrod spherical nut and clutch release lever to 1/4" by loosening jam nut and turning spherical nut. Final free travel should be approximately 2".

Oldsmobile F-85: Pedal height should be approximately 6½". Pedal free travel should be 7/8-1". To adjust free travel, disconnect clutch lower control rod from equalizer and turn rod in or out of trunnion nut as necessary. Reconnect control rod and check free travel.

Oldsmobile 88, S88, 98: Install a ¼" gauge pin in gauging holes in frame side rail, then disconnect pedal bellcrank-to-release bellcrank rod at pedal bellcrank. Loosen lock and adjusting nuts on release bellcrank rod until rod is free. Adjust pedal stopscrew at upper end of pedal until pedal is 8" from floor pan (turn back carpet). Adjust upper clevis on pedal bellcrank-to-release bellcrank rod until gauge pin is free in frame holes (rod connected to pedal bellcrank), then lock rod to clevis and bellcrank. Adjust release bellcrank rod (clutch release rod) for 1-1¼" pedal free travel, tighten locknut and remove gauge pin.

CLUTCH REMOVAL: Buick Special - Remove transmission *(see Transmission Section)*, then remove flywheel lower housing and throw-out bearing. Disconnect release rod from fork and unhook fork boot from flywheel housing opening. Free release fork from ball stud (push inward on fork) and remove fork from bottom of housing. Mark all clutch parts and flywheel for reassembly and remove clutch assembly. *NOTE - Install metal spacers (¼" nuts) between release levers and inner edge of cover to aid removal and installation.*

Ford & Mercury (Except Ford Trucks): Remove transmission *(see Transmission Section)*, then remove starter motor and dust seal. Disconnect retracting spring, then disconnect pedal from equalizer rod at equalizer bar. Remove release bearing and hub. Remove flywheel housing and inspection or dust cover. Remove clutch assembly from flywheel.

Ford Trucks: Remove retracting spring and pushrod at release lever. Remove slave cylinder attaching bolts. Remove transmission *(see Transmission Section)*. Remove dust cover from clutch housing and remove release bearing and hub from lever. Mark pressure plate and cover assembly and flywheel for reinstallation in same position. Loosen cover bolts uniformly to relieve spring tension, then remove clutch assembly through opening in bottom of clutch housing.

Oldsmobile F-85: Remove transmission *(see Transmission Section)*. Remove lower flywheel housing and release bearing. Mark flywheel and clutch cover for reassembly, and remove clutch assembly.

Oldsmobile 88, S88, 98: Remove transmission *(see Transmission Section)*. Remove transmission bearing retainer sleeve and right and left lower flywheel housing bolts. Disconnect adjustable rod at yoke. Support rear of

CONTINUED ON NEXT PAGE

LONG "CF" & "NC" (C nt.)

engine, then remove rear frame crossmember. Remove clutch housing and release yoke from flywheel housing. Mark flywheel and clutch cover for reassembly, then remove clutch assembly.

OVERHAUL: *NOTE - Car manufacturers (Buick, Ford, Mercury & Oldsmobile) do not recommend Clutch Cover & Pressure Plate Assembly overhaul. On these models, if lever height does not meet specifications shown in "Release Lever Setting" table or if levers do not operate freely without bind, replace the assembly.* Mark all parts for disassembly and reassemble in same relative positions.

Clutch Fixture Note: Manufacturer recommends use of Borg-Warner Universal Clutch Fixture UF-300 or UF-400 for all servicing and rebuilding operations.

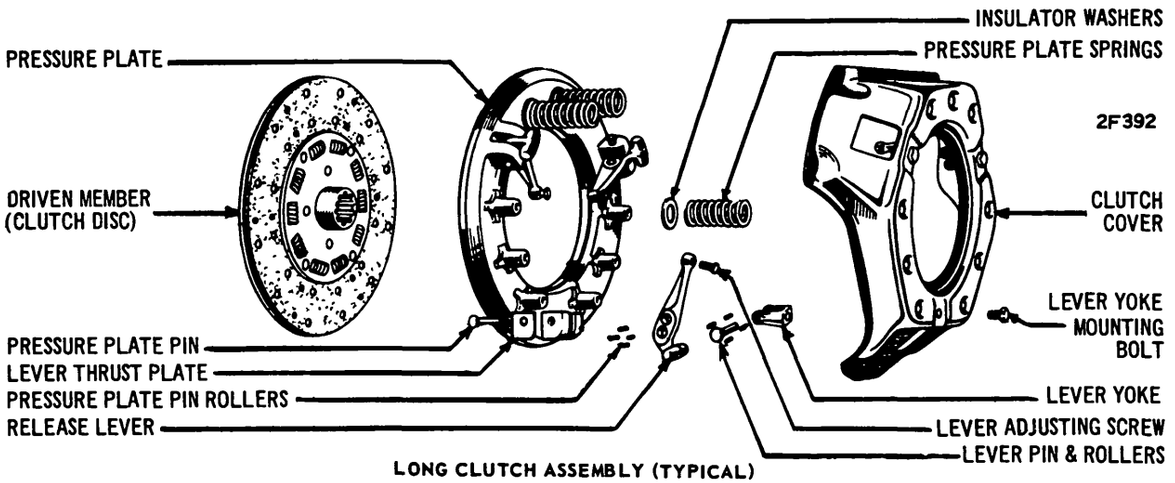
Disassembly: Place clutch on fixture (supporting pressure plate on special lands under lugs) or arbor press. Compress cover plate slightly, take out assembly screws (lever yoke mounting screws) on cover. release pressure on cover plate slowly, lift off plate. Note whether washers used on yokes under assembly screws (these washers must be reinstalled if old pressure plate used again). See special directions below on removing and reinstalling release levers.

Clutch Springs: Pressure springs should check with table below.

Clutch Spring Specifications

Cover Assy.	Springs(No. & Color)	Lbs. Pressure
260093	12-Purple	140-150 at 1.677"
260154	6-Aluminum	200-210 at 1.751"
260162	9-Pea Green	170-180 at 1.762"
260174	9-Aluminum	200-210 at 1.751"
260186	3-Pea Green	170-180 at 1.762"
	6-Brown & White	154-164 at 1.736"
260245	6-Aluminum	200-210 at 1.751"
260251	9-Buff (Bronze)	137-147 at 1.747"
260259	9-Buff (Bronze)	137-147 at 1.747"
260294	6-Aluminum	200-210 at 1.751"
260295	9-Buff (Bronze)	137-147 at 1.747"
260296	9-Pea Green	170-180 at 1.762"
267371	9-Buff (Bronze)	137-147 at 1.747"

R lease Lever Assembly: Mount lever yoke on release lever, fasten by inserting flat-sided lever pin (flat side out or toward cover) and roller (place roller on flat side of pin). Insert lever in pressure plate lug, use roller pin sawed off to length of lever width as a guide and insert needle bearings, insert roller pin, pushing guide pin out, lock both lever pins with cotter pins. Thread release lever adjusting screws in ends of levers, turning screws down completely.



Assembly: Place pressure plate on fixture or arbor press. Assemble pressure springs, locator washers or insulator washers on plate, place washers on lever yokes (if washers used previously and old pressure plate being used). Place cover plate in position (lining up marks made before dismantling), compress cover slowly guiding lever weights through holes in cover and lining up yokes under cover plate holes. See that pressure springs are seated, insert cover screws in yokes, using lockwasher under screw head, tighten screws securely. Compress and release clutch several times (using weight on release levers) to seat all parts. Then adjust release lever heights.

Release Lever Adjustment (on Fixture): Place special lands on fixture under pressure plate lugs, assemble lever adjusting arm and sleeve setting bottom of adjusting arm correct distance as shown in table (all figures plus or minus 1/32") above bottom of sleeve and lock the adjusting arm with the thumbscrew. Swing arm over each release lever in turn, back off adjusting screw on tip of lever until rounded screw head just contacts arm, lock screws by inverting clutch so that screw head is supported and stake or peen lever into adjusting screw slot. Do not disturb lever yoke screws when making this adjustment.

R l as Lev r Ch cking & Adjustm nt (With ut Fixtur):

Ford Motor Co. Models: Mount clutch assembly on spare flywheel with three .250" thick spacers (drill rod or precision washers may be used) in place of regular driven member. *NOTE - Plac spac r under ach r - lease lever.* Use dial indicator to measure lever heights. All levers must be equal within .031". Replace pressure plate and cover assembly if greater variation noted.

Oldsmobile 88, S88, 98: Install special lever setting Gauge J-1048 on flywheel in place of driven member. Mount pressure plate assembly on flywheel tightening screws one or two turns at a time (to prevent distortion of cover). Lay short straightedge across center boss of the gauge as a guide for positioning levers. Bearing surfaces of all lever adjusting screws should be from .000-.062" below level of gauge center boss, and each lever should be within .015" of the other two levers. *NOTE* - If levers are not more than .025" out of plane, lightly tap release yoke mounting screw heads with 8 ounce hammer to bend pressure plate cover to bring levers within .015" of same plane. When levers are more than .031" out of plane, or do not lie within .000-.062" below center boss, adjust levers as directed under "Release Lever Adjustment (On Fixture)" above.

LONG CLUTCH ASSEMBLY (TYPICAL)

BUICK (EXCEPT SPECIAL) HYPOID

Buick L Sabr , Invicta, El ctra (1962)

►*REAR AXLE HOUSING CAUTION:* When housing replaced, readjust pinion nose angle. *See "Propeller Shaft Alignm nt" in this s ction.*

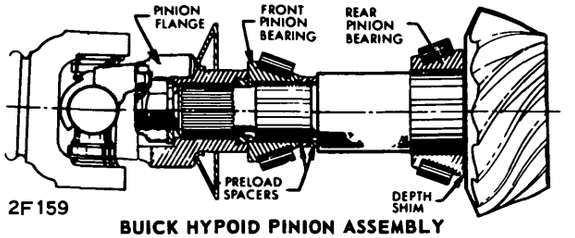
►*AXLE SHAFT INSTALLATION CAUTION:* Coat axle shaft lightly with rear axle lubricant from sealing surface to six inches inboard before installation to prevent damage to lip of wheel seal. *See "Rear Axle Lubricant Not " b l w for proper lubricant.*

►*REAR AXLE LUBRICANT NOTE:* Flushing and seasonal lubricant changes are not recommended for either Conventional or "Positive Traction" axles. Maintain fluid level at ¼" below filler opening. Use only lubricants listed as follows: **Conventional Axle–** Factory Hypoid Lubricant (under 1000 miles operation), SAE 80 or 90 Multi–Purpose Gear Lubricant (over 1000 miles operation), **P sitiv Traction Axle –** Special Positive Traction Lubricant, Part No. 531536 (any other lubricant must conform to Buick Specification No. 723).

DESCRIPTION: Hypoid gear, semi–floating type with drive from axle housing through one upper and two lower control arms.

►*AXLE RATIO & IDENTIFICATION NOTE:* Ratio number stamped on bottom of axle housing. The numbers one above the other indicate axle ratio, for example: 3 over 2 is 3.23–1; 2 over 78 is 2.78–1. Positive Traction axle identified by a cross in a circle on bottom of differential carrier flange, and by a lubrication caution tag on filler plug. Following ratios are available: 2.78 (14–39), 3.07 (14–43), 3.23 (13–42), 3.36 (14–47), 3.58 (12–43), 3.91 (11–43), 4.45 (11–49).

Axle Shaft R moval: Place stands under rear axle so wheels clear floor, then remove wheel and drum. Remove wheel bearing retainer plate-to-backing plate nuts (leave bolts in place to support backing plate). *NOTE - Left sid wh l bolts have left hand threads.* Use Puller J-6176 with Slide Hammer to pull axle assembly. Replace two backing plate nuts finger tight to hold plate in place.



Carri r Ass mbly R moval: Place jacks under rear axle housing and raise car. Mark rear universal joint for proper alignment for reassembly, then disconnect rear joint "U" bolts. Push rear propeller shaft forward and wire it to upper control arm bracket out of way. Remove axle shafts, see above, then back off two opposite carrier to axle housing nuts to last few threads and remove all other nuts. Place drain pan under carrier and pull carrier forward to drain lubricant. Place transmission jack under carrier and remove from housing.

Wh l B aring Adjustment: None required.

OVERHAUL: Positiv Traction Differential – *See "P w r–L ck Diff rential (Plate Clutch Type with B ll vill Springs)" in this section.*

Conv nti nal Axl : *S 1956 Final Data, Page 331, or later Manual editi ns, and note the following:*

Diff r ntial B aring Supp rt Removal (With Tool J–6553): This tool should be used to pull bearing supports on 1960–62 models as follows: Retract pins in tool by turning expander screw in puller body counterclockwise, then insert puller body into bearing support until reference line on tool is flush with end of support and punch mark on tool is in general direction of hole in support. Expand tool a slight amount by turning expander screw clockwise until a slight drag on pins is felt, then move tool as required to engage pins with holes in support. Fully expand pins. Place tool sleeve over tool and install draw bolt, thrust washer, thrust bearing, and small washer, then thread draw bolt in tapped hole in puller body. Apply a reasonable amount of torque to draw bolt, then strike carrier pedestal with a solid hammer blow.

BUICK HYPOID PINION ASSEMBLY

Wheel Bearing & Seal Replacement: Notch wheel bearing retaining rings in 3 or 4 places with a chisel to expand ring and slide ring off shaft. Press wheel bearing off with Remover J-6525 either in a press or with use of Ram and Yoke Assembly J-6180 and Adapter J-6258. Install new retainer plate. Press new bearing against shoulder with Installer J-6257 either in press or by using Ram and Yoke Assembly J-6180 and Holder J-6407 with Ring J-6407-2. Press new retaining ring against bearing in same manner. Remove old seal by inserting Puller J-6199 through seal and expanding it so it can be removed with a slide hammer. Coat outside diameter of seal with sealer, position seal over Installer J-9194 and drive seal straight into housing until installer bottoms against wheel bearing shoulder.

Drive Pinion & Bearing Removal: Install Holder J-8614-01 on pinion flange with two 5/16" - 18 x 2" bolts with flat washers. Remove pinion nut and washer. Use Puller J-8614-02 in Holder J-8614-01 to pull pinion flange. *NOTE - Hold pinion while flange is being removed to prevent falling out of carrier.* Remove pinion carefully to prevent damage to bearing races.

Pinion Bearing Preload Adjustment: Place original shim pack against head of pinion, and use bearing Replacer J-6377 and Holder J-6407 with Ring J-6407-2 in press to install bearing on pinion shaft. *NOTE - Original shims used only as a starting adjustment.* For starting pinion preload bearing adjustment, use original preload spacers. Place spacers on pinion, and hold pinion in carrier. Oil front bearing and place in position on pinion. Hold pinion in position and use Installer J-8913 to drive bearing into fully seated position. Install new "O" ring seal with sealing compound using Installer J-8913. Fill space between lips of oil seal with wheel bearing grease and apply thin coat of same grease to seal surface of pinion flange. Install pinion flange sufficiently to add washer and start nut. Hold flange with Holder J-8614-01 and torque nut to 80 ft. lbs. with wrench J-1313 on outer end of Handle J-6246 (this amounts to 250 ft. lbs. torque at nut). Rotate pinion 3-4 times to seat bearings. Preload should be 15-35 inch-lbs. including drag on new seal. When preload too low, reduce total spacer thickness .001" for each added 10 inch-lbs. preload needed; if too high, increase total pinion spacer thickness .001" for each 10 inch-lbs. to be subtracted. Spacers are furnished in pairs to supply thickness range from .400" to .470" by thousandths.

BUICK SPECIAL & OLDSMOBILE F-85 HYPOID

Buick Sp cial, All S ri s (1962)
Oldsm bil F–85, All Seri s (1962)

►*BUICK SPECIAL REAR AXLE LUBRICANT NOTE:* Flushing and seasonal lubricant changes are not recommended for either Conventional or "Positive Traction" axles. Maintain fluid level at ¼" below filler opening. Use only lubricants listed as follows: **Conventional Axle –** Factory Hypoid Lubricant (under 1000 miles operation), SAE 80 or 90 Multi–Purpose Gear Lubricant (over 1000 miles operation). **Positiv Traction Axle –** Special Positive Traction Lubricant, Part No. 531536 (any other lubricant must conform to Buick Specification No. 723).

►*OLDSMOBILE F–85 REAR AXLE LUBRICANT NOTE:* Flushing and seasonal lubricant changes are not recommended. Maintain fluid level at filler plug level. Use only Special Lubricant, Part No. 531536 (small amounts of SAE 90 Multi–Purpose Gear Lubricant may be used to replenish differential).

DESCRIPTION: Hypoid gear, semi–floating type, with drive from axle housing through two upper and two lower control arms.

►*1962 BUICK SPECIAL AXLE RATIO & IDENTIFICATION NOTE:* Axle ratio or a code letter stamped on right side of axle housing cover. Letter indicates axle ratio, number indicates day axle was built. Positive Traction axle identified by a cross in a circle on bottom of differential carrier flange, and by a lubrication caution tag on filler plug. Following ratios are available:

Ratio	Code	Ratio	Cod
3.08 (13–40)	A	3.90 (10–39)	F
3.23 (13–42)	B	4.30 (10–43)	G
3.36 (11–37)	C	3.63 (11–40)	
2.78 (14–39)	D		

►*1962 OLDSMOBILE F–85 AXLE RATIO & IDENTIFICATION NOTE:* Letter prefix of axle ratio code number stamped on right side of axle housing cover near axle housing cover near axle shaft tube as follows: **A** 3.08 (40–13), **B** 3.23 (42–13), **C** 3.36 (37–11).

Axle Shaft Removal: Remove wheel and brake drum. *NOTE – Left hand wheel bolts have left hand threads and nuts are marked "LF".* Remove four axle bearing retainer nuts. Attach Puller J–2619 and Adapter J–8617 and pull axle shaft from housing. *CAUTION – Support axle shaft carefully while pulling shaft out to prevent cutting seal lip.* Left shaft is shorter than right shaft.

OVERHAUL: Positive Traction Differential – *See "Power–Lock Differential (Plate Clutch Type With Belleville Springs)" in this section.*

Conventional Axle: *See 1961 Final Data, Page 325, and note the following:*

Pinion Bearing Preload Spacers – Pinion bearing preload spacers furnished in sizes from .200–.260" in thousandths to provide possible combined thickness ranges from .400–470" in thousandths.

►*1962 BUICK SPECIAL DIFFERENTIAL CASE & RING GEAR OVERHAUL NOTE & CAUTION (3.90 & 4.30 RATIOS):* A special differential case is used on some cars with above axle ratios. However, to permit use of standard differential case with these ratios, a spacer is used between ring gear and differential case. If spacer used, it **must** be reinstalled when gear is assembled to case. If no spacer used (special differential case), none is necessary and spacer furnished in ring gear and pinion service package should not be used. If axle ratio changed to 3.90 or 4.30, use spacer in service package to use existing differential case.

CHEVROLET HYPOID (PASS. CAR. & ½ TON TRUCK)

Chevrolet Pass. Cars (1962)
Chevy II (1962)
Chevrolet Corvette (1962)
Chevrolet ½-Ton Truck (1962)

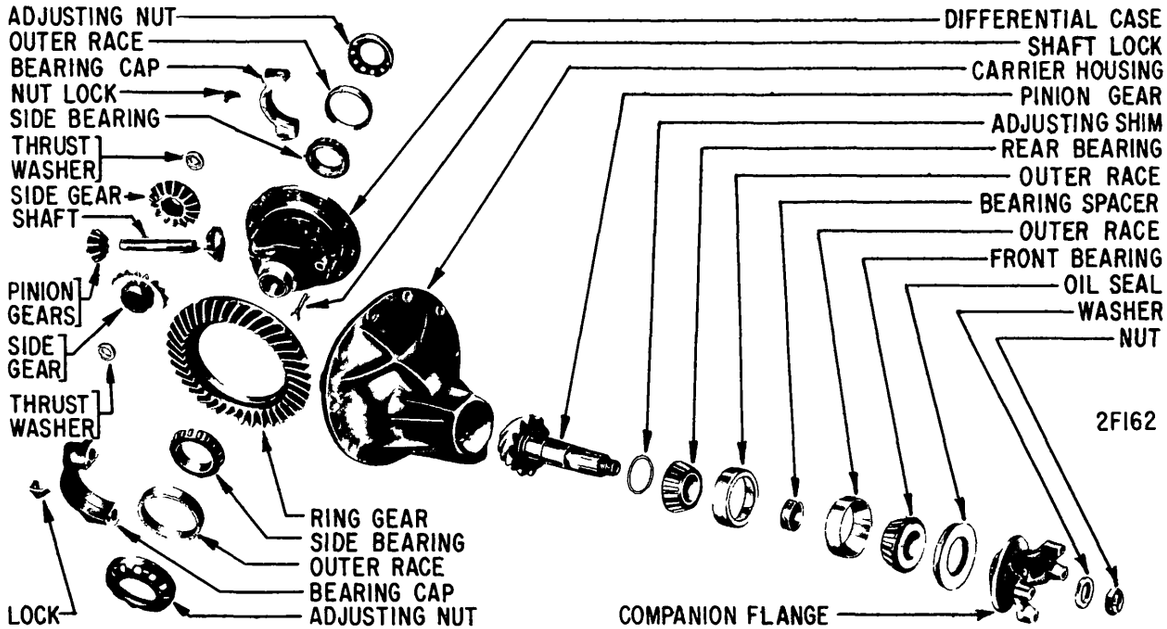
►CHANGES, CAUTIONS, CORRECTIONS

►*1962 LUBRICANT LEAK AT COMPANION FLANGE NUT CORRECTION:* To correct, pack cavity between hypoid pinion shaft, pinion flange and pinion nut washer with sealant.

►*PINION BEARING PRELOAD CAUTION:* Rear universal joint companion flange nut controls rear axle pinion bearing preload. Before loosening nut, note torque required to turn pinion through several revolutions and tighten to same torque when nut installed. *See "Pinion Bearing Preload Adjustment" below.*

►*REAR AXLE LUBRICANT NOTE:* Flushing or seasonal changes are not recommended for either Conventional or Positraction axles. Maintain fluid level at filler opening (axle warm), ½" below filler opening (axle cold). Use SAE 90 Multi-Purpose Gear Lubricant for Conventional axle. Use **only** Positraction Gear Lubricant, G.M. No. 3758790 or 3758791, for Positraction axle.

DESCRIPTION: Semi-floating, hypoid type with separate carrier and Hotchkiss drive. Design similar to previous models. On ½-Ton Truck, axle shaft spacer block has been eliminated so that end of axle shaft rides against differential pinion shaft.



►*AXLE RATIOS & IDENTIFICATION NOTE:* Serial number stamped on right front side of differential carrier identifies axle ratio. Letter prefix of serial number is axle ratio code as listed in table below. Positraction axle identified by letter "P" on front side of differential carrier and also by a lubrication caution tag on filler plug.

Axle Ratio Code Table

Axle Ratio	②Chevrolet Pass.	①Serial No. Prefix
3.08–1 (37–12)	AW, BW, AX, BX, AJ, AR, AV	
3.36–1 (37–11)	AB, BB, AD, BD, AM, BM, AG, AQ, AY	
3.55–1 (32–9)	AA, BA, AK, BK, AE, AN, AZ	
3.70–1 (37–10)	AC, BC, AH, BH, AF, AP	
4.11–1 (37–9)	AL, AT	
4.56–1 (41–9)	AS, AU	
Axle Ratio	**Chevy II**	**①Serial No. Prefix**
3.08–1 (37–12)	DB, DF, DJ, DK	
3.36–1 (37–11)	DA, DE, DL, DM	
3.55–1 (32–9)	DC, DD, DN, DP	
Axle Ratio	**Corvette**	**①Serial No. Prefix**
3.08–1 (37–12)	CT, CU, CV, CW	
3.36–1 (37–11)	CA, CB, CH, CK	
3.55–1 (32–9)	CC, CL	
3.70–1 (37–10)	CD, CM, CQ, CX, CY	
4.11–1 (37–9)	CE, CN, CR	
4.56–1 (41–9)	CF, CP, CS	
Axle Ratio	**½-Ton Truck**	**①Serial No. Prefix**
3.38–1 (44–13)	MB, ME, MZ	
3.90–1 (39–10)	MA, MC, MD, MF, MG, MW, MY	
4.11–1 (37–9)	MT, MU	

①–Stamped on right front side of differential carrier.
②–Positraction may also be available in following ratios: 4.88–1, 5.14–1, 5.43–1.

Axle Shaft Removal: Raise and support car, remove tire, wheel, and brake drum assembly. Remove bearing retainer bolts from axle housing flange. Use Adapter Plate J–5748 or J–8617 and suitable slide hammer and remove axle shaft and bearing assembly, using care not to disturb backing plate inner gasket. Fasten backing plate to prevent falling. If bearing retainer and parking brake strut interfere, raise strut slightly for clearance. *CAUTION – When removing axle shaft from housing, do not damage lip of axle shaft seal.*

CHEVROLET HYPOID REAR AXLE ASSEMBLY (EXPLODED)

Axle Shaft Bearing Removal & Installation: Install Tool J–5741 (and Adapter Plate J–9439 for Chevy II) between axle flange and bearing with land of plates against bearing and inside the retainer. Install bolts in plates. *NOTE – Necessary to remove retainer plate attaching bolts to allow installation of tool between retainer and bearing.* Press bearing from shaft with press plate parting line resting on press bed. *NOTE – This operation may damage bearing retainer so that it must be replaced.* Install new bearing with Tool J-9436 (Chevy II), J–6661 (Others), pressing it on until bearing bottoms on shaft against shoulder. *NOTE – New bearing retainer must be on shaft before bearing is installed.* Install new axle shaft bearing retainer ring on shaft and use installing tool in arbor press to seat ring against bearing.

Companion Flange, Oil Deflector, or Oil Seal Replacement: Raise and support one corner of car (to lock one wheel and to provide clearance). Disconnect rear universal joint and support propeller shaft. Install an inch–pound torque wrench on companion flange nut and rotate pinion through several revolutions and note torque required to keep pinion moving. Hold drive flange with Tool J–2637 or J–8614–1 and remove companion flange nut and washer. Discard nut. Remove drive flange with Tool J–8614–1–2 or J–0820 bolted over J–2637. Pry out oil seal. Make sure drive flange oil seal surface is smooth and that there are no worn drive splines. Install new deflector with Tool J–5749 or J–9491. Soak new seal in light engine oil for 10 minutes before installation, then coat O.D. of seal with sealer (G.M. Sealing Compound, Part No. 987266). Install new oil seal with Tool J–5154 or J–9451. Install drive flange (pull flange on shaft with Tool J–5780 or J–9458 if necessary). *CAUTION – Do not hammer flange on pinion shaft or bearings will be damaged.* Install washer and new companion flange nut. Tighten nut to remove endplay, then tighten in small increments while checking preload torque until torque is same as before nut was removed. Connect propeller shaft.

Differential Carrier Removal: Raise and support car, remove rear wheels and pull axle shafts out far enough to clear differential side gears. Disconnect rear universal joint and support propeller shaft. Remove carrier attaching locknuts and pull carrier out far enough to drain lubricant. Remove differential carrier assembly.

OVERHAUL (POSITRACTION DIFFERENTIAL): **Passenger Cars** – *See "Power-Lock Differential (Plate Clutch Type With Bellevill Springs)" in this section.*
Trucks – *See 1960 Final Data, Page 361, Rear Axle Manual edition.*

OVERHAUL: (CONVENTIONAL AXLE): Proceed as follows:

DISASSEMBLY: Mark bearing caps and carrier for reassembly. Remove adjusting nut locks and bearing cap bolts, then remove bearing caps and adjusting nuts. *CAUTION – Do not use screwdriver to pry cap off.* Remove differential and ring gear assembly from housing. *CAUTION – Do not drop bearing cups.* Remove differential pinion gear shaft from differential case. Remove differential pinion, side gears, and thrust washers. Hold companion flange from turning (Tool J–2637 or J–8614–1) and remove companion flange nut and washer, then remove companion flange (Tool J-0820 or J-8614-2 bolted to the flange with holding tool in place). Remove pinion from carrier. Remove pinion shaft oil seal, pinion front bearing, and bearing spacer (discard 1/16" shim, if found, behind spacer). **CONTINUED ON NEXT PAGE**

CHEVROLET HYPOID (PASS. CAR. & ½ TON TRUCK) (C nt.)

INSPECTION: Wash all parts thoroughly in solvent. Inspect bearing cups, races and rollers for scoring, chipping or excessive wear. Inspect large end of rollers for wear. *NOTE – Pini n bearings are preloaded type and natural w ar patt rn is a frosted condition with possibl slight scratch s on races or rollers. This do s not indicate a d f ctive bearing.* Inspect oil seal for wear or damage. Inspect ring gear and pinion teeth for scoring, cracking, or chipping. Inspect differential case for cracks, or scores on side gear and pinion gear thrust faces. Inspect side gear thrust washers for wear, scoring, cracks or any other damage. Check fit of side gears in case and fit of side gear and axle shaft splines. Inspect pinion shaft for wear, scoring, or damage. Inspect carrier for cracks or crossed threads on bearing caps and bosses.

DRIVE PINION BEARING REPLACEMENT: Remove bearing cups with brass drift. Install new bearing cups in carrier with Tool J–0270–6 or J–7817 on front cup, and J–0270–14 or J–7818 on rear cup. Bearing cups should seat against shoulders of carrier. Remove pinion rear bearing with Tool J–8331 or J–7028 and note size of shim between bearing and gear.

PINION GEAR SETTING: *NOTE – If original ring gear and pinion, pini n r ar b aring assembly and differential carri r will all b r installed, the original shim or n f th sam thickness may be used. If the ring g ar and pinion, pini n rear bearing assembly or differential carri r ar to b r placed, the correct thickness of the pinion depth shim may be determined as follows:*

►*PINION MARKING NOTE:* The number marked on pinion shaft will indicate in thousandths the pinion mounting distance.

1) Lubricate pinion bearing cone and roller assemblies with rear axle lubricant. Position rear bearing in its cup in carrier. Rotate bearing several times to make sure it is seated. Position gauge plate part of Tool J–6266 on bearing so that chamfered corner is toward pinion side and top of differential as installed in car.

2) While holding front cone and roller assembly in its cup with the clamp plate, insert clamp screw part of Tool J–6266 through gauge plate, both bearings and clamp plate. Tighten only sufficiently to center bearings in cup. Check that neither gauge block nor clamp plate tough housing. Oscillate gauge plate and bearings several times to be sure bearings are seated and then draw up hex nut until 20 inch–pounds of torque are required to oscillate plate and bearings. *NOTE – 60 ft. lbs. t rqu may b r quired to tighten nut on clamp bolt to btain simulat d preload on bearings. After tight ning clamp bolt nut, measure turning torque with an inch–pound t rqu wrench.*

3) Install body assembly part of Tool J–6266 across differential bores. Plunger on body must point inward toward center of pinion rear bearing. Mount a dial indicator on tool body post with indicator button on top of tool plunger. Swing body so that plunger **does not** touch gauge plate, and set dial indicator at zero.

4) Slowly swing inner end of tool plunger across gauge plate until highest indicator reading is obtained. Record this measurement and recheck to see that it is correct. Record factory marking on pinion. **Subtract** measurement obtained with tool from marking on pinion. The **diff r nc** between these two figures determines thickness of pinion depth shim to be installed with particular pinion and ring gear, and rear bearing and carrier being checked. Shims are available in different thicknesses as follows: .021", .024", .027", .030", .033", and .036". Use shim closest to difference in measurement.

5) Remove indicator tool. Install shim selected on pinion and install new bearing cone and roller assembly on pinion with Tool J–5590 (press cone against shim and rear face of pinion).

DIFFERENTIAL BEARING REPLACEMENT: Remove bearings with Tool J–8107 and Adapter Plug J–8107–4 (J–7112 on Positraction). Install new bearing on hub with thick side of inner race toward case and drive into place with Tool J–5768 or J–9537. *NOTE – Tool is counterbored and has a pilot for proper installation and seating of bearing.*

RING GEAR OR DIFFERENTIAL CASE REPLACEMENT: Remove ring gear from case (tap with a soft hammer). Make some guide pins from 3/8"–24 x 1½" capscrews with heads cut off and ends slotted to ring gear. With back face of ring gear and face of case free of dirt and burrs, mount case on "V" blocks placed at side bearings and check face runout. Runout should not exceed .003". Place ring gear over pilot diameter of case and install every other ring gear bolt and lockwasher and draw up evenly and snugly until gear face is flush with face of case. Remove guide pins and install remaining bolts, then torque all bolts evenly to 40–60 ft. lbs.

REASSEMBLY: Lubricate pinion bearings and install pinion in carrier. Install **new** pinion bearing spacer with large end toward gear, then install front pinion bearing cone and roller assembly on pinion shaft. Soak new seal in light engine oil for 10 minutes and then coat O.D. of seal with sealer (G.M. Sealing Compound, No. 987266). Install new seal with Tool J–5154 or J–9451. *NOTE – Install seal so top of seal is 3/16" + 1/32", –0" from front of differential carrier. Seal must bottom.* Install companion flange and deflector assembly with Tools J–8614–1 and J–9458 or J–5780 and J–2637. Install special washer and a **new** self–locking companion flange nut. *Adjust pinion bearing preload (see below).* Install differential assembly in carrier and install outer races and adjusting nuts. *CAUTION – Install adjusting nuts carefully so threads on nuts and carrier mate.* Install bearing caps, making sure that alignment marks on caps and carrier mate. Tighten capscrews snugly. Lubricate differential side gear hubs and thrust washers and install into case. Roll both differential pinions into position and install pinion gear shaft and pinion gear shaft lockscrew.

PINION BEARING PRELOAD ADJUSTMENT: Tighten companion flange nut (hold companion flange from turning) until torque required to turn pinion is 15–25 inch–pounds (new bearings), 5–15 inch–pounds (old bearings). *NOTE – If spring scale used to determine preload, hook scale at an 8" radius from notches f Holding Tool J–8614–1. Scale should read 1-7/8 – 3-1/8 lbs. (new bearings), 5/8–1-7/8 lbs. (old bearings).*

RING GEAR & PINION BACKLASH ADJUSTMENT: Back off right adjusting nut and tighten left adjusting nut (Tool J–0972) while turning ring gear. Tighten left nut until all lash is removed, then lock left nut (torque bearing cap bolts to 70–75 ft. lbs.). Tighten right adjusting nut to force left bearing firmly into contact with left adjusting nut. Now loosen right nut and again tighten snugly against bearing. *NOTE – Bearing rollers begin to move when contact made.* Tighten right adjusting nut a minimum of 2 additional notches to a maximum of 3 notches to a locking position (this preloads differential bearings). Mount dial indicator on carrier and check backlash. Backlash should be .003–.010" (.005–.008" preferred). Tighten right bearing cap bolts to 70–75 ft. lbs. and recheck backlash. Install both adjusting nut locks.

RING GEAR & PINION TOOTH CONTACT PATTERN: Check tooth contact pattern before installing carrier assembly into housing. If there is toe contact (insufficient backlash), move ring gear away from pinion by loosening left hand differential adjusting nut and tightening right hand nut **one notch at a time.** If there is heel contact (too much backlash), move ring gear toward pinion by loosening right hand nut and tighten left hand nut **one notch at a time.** *Backlash must remain within limits after either of above adjustments.* If there is face contact, increase pinion depth shim .003" or more as necessary. If there is flank contact, decrease pinion depth shim thickness .003" or more as necessary. *If correction made for face or flank contact, readjust backlash.*

CHEVROLET TRUCK HYPOID

Chevrolet Truck, ¾–Ton (1962) ①
Chevrolet Truck, 1, 1½, 2–Ton (1962) ②
① – Torque–arm Drive. ② – Hotchkiss Drive.

DESCRIPTION: Full–floating, hypoid gear type, with straddle mounted pinion shaft. Similar in design to previous models.

Axle Ratio Identification

Axle Ratio	①Serial No. Prefix
4.57–1	MH, MJ, MP, MQ, MK
5.14–1	ML, MN, MR, MS, PA, PB, PL, PN, PC, PK, PM
5.43–1	PS
6.17–1	RP, RU
6.60–1	RA
7.20–1	RB, RD, RF, RG, RH, RJ, RQ

① – Serial number stamped on forward upper surface of differential carrier.

Axle Shaft Removal (Series 20,30): Remove eight capscrews and lockwashers in axle shaft flange, install two ½"x13" screws in special threaded holes in flange (between regular mounting screw holes), turn these screws up evenly to loosen the shaft, withdraw shaft from housing, remove and discard gasket. *Us new gask t wh n installing shaft.*

►*CAUTION:* Thoroughly clean all lubricant from axle shaft flange and end of wheel hub before installing axle shaft. *Grease at this point will cause loosening of axle shaft flange capscrews.*

►*AXLE SHAFT NOTE:* Shafts unequal length (right shaft longer than left) Install in correct position.

Axle Shaft Removal (Series 40,50,60): Remove hubcap, then thread Tool J-1436-1 into hole in axle shaft and use slide hammer to remove shaft.

NOTE - When reinstalling axle shaft, tap flange splines into engagement with wheel hub splines (if necessary, rotate wheel slightly to align splines on shaft with both wheel hub and differential side gear splines), use new hub gasket.

►*AXLE SHAFT NOTE:* Some models have different length axle shafts. Install longer shaft on right side.

Wheel Bearing Adjustment: Remove wheels and axle shafts see above, bend back lip of lock in locknut notch, remove locknut and adjusting nut lock. Tighten inner adjusting nut to 50-65 ft. lbs. (Series 20 & 30), 75-100 ft. lbs. (Series 40,50,60), with special wrench J-2222 (Series 20 & 30), J-870 (Series 40), J-5670 (Series 50 & 60) while turning hub, then back off nut 1/8 turn. Check

CONTINUED ON NEXT PAGE

CHEVROLET TRUCK HYPOID (Cont.)

hub for free turning, install adjusting nut lock with tangs aligned with adjusting nut slots, bend tang into adjusting nut slot. Install outer locknut and tighten securely, then bend lock tang down into notch in locknut.

DIFFERENTIAL CARRIER: Removal - Drain lubricant, remove axle housing cover and axle shafts, see axle shaft removal above. Remove two trunnion bearing "U" bolts from rear yoke and split rear universal joint (hold bearings on trunnion with tape). Remove bolts and lockwashers holding carrier to axle housing, support carrier on floor jack and roll from under car.

OVERHAUL: "No-Spin" Differential – *See "Chevrolet Truck No-Spin Differential" in this section.*

Conventional Axle: *See 1960 Final Data, Page 350, or later Manual edition and note the following:*

On ¾ Ton & 1 Ton, the bearing spacer has been eliminated and a double row ball bearing used in place of tapered rollers. Same tool used to remove bearing. Replace double row bearing with a press and 2" pipe of suitable length, pressing against inner race. **On 1½-ton & 2-ton,** press oil seal into retainer with seal lip toward pinion bearing, until it is a minimum of .12" below top of seal bore. This compresses and spreads felt packing to assure proper sealing around pinion drive flange.

CADILLAC HYPOID

Cadillac, All Series (1962)

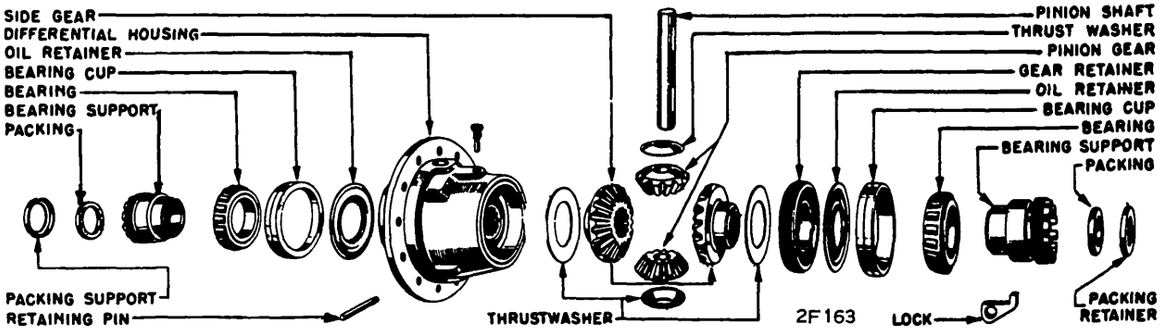
►CHANGES, CAUTIONS, CORRECTIONS

►*REAR AXLE SERVICE CAUTION:* Manufacturer recommends that all service on Standard or Controlled Differential Assembly other than oil seal or universal joint yoke replacement (and necessary pinion bearing preload adjustment) be handled by replacement of complete assembly. *No disassembly or adjustment of these units should be attempted in the field.*

►*REAR AXLE IDENTIFICATION MARKS:* Gear ratio of axle is indicated by a letter stamped on bottom side of carrier on flange adjacent to rear axle housing; or by a number stamped on front face of carrier assembly at end of oil return passage. A Controlled Differential is identified by letter "G" following axle code letter, or letter "G" preceding axle code number. *See "Axle Ratios" below.*

►*PINION BEARING ADJUSTMENT CAUTION:* Pinion bearing adjustment (preload) controlled by rear universal yoke nut which compresses spacer or sleeve between pinion bearings.

►*CAUTION:* Loosening or removal of the pinion shaft nut (for oil seal or yoke replacement) will disturb pinion bearing preload so that the detailed procedure, given below, must be followed to avoid overloading bearings or collapsing bearing spacers.



DESCRIPTION: Hypoid gear with torque arm drive (coil spring rear suspension, except commercial) of same design used on previous models.

Axle Ratios

Model	Ratio	Ⓒ Code
60, 62 Series (No Air Cond.)	2.94-1	2 or T
60, 62 Series (With Air Cond.)	3.21-1	1 or W
75 Series	3.36-1	6 or X
Commercial (Optl. on 75)	3.77-1	7 or Y

Ⓒ - Letter "G" following code letter or preceding code number indicates Controlled Differential.

Axle Shaft & Bearing (Exc. Comm. Chassis): Removal - Raise car and remove wheel and brake drum. Remove four bearing retainer and backing plate nuts and use Puller J-8131 and Slide Hammer J-2619 to pull axle shaft. Groove spacer with chisel and hammer, but do not split spacer. Drive chisel into spacer until spacer can be slipped off shaft. Assemble rear axle shaft and bearing assembly to "U" shaped piece of Bearing Plate and Pin Assembly J-2986-1 and place on press. Assemble Bearing Holding Tool J-2986-3 around bearing and dowels (to keep bearing from exploding while under arbor press load) and press shaft through bearing. **Reassembly** - Install new bearing on shaft so bearing seal is toward flange end of axle shaft. Place assembly through ring of Installer Tool J-6257 and position in press. Press bearing on shaft until distance from outer surface of axle shaft flange to inner end of wheel bearing inner race is 3.180". Remove shaft from tool and assemble new spacer on shaft and reinstall assembly on tool. Press shaft through spacer until spacer just touches bearing. Install oil ring seal on bearing. **Installation** - Lubricate wheel bearing bore in housing. Place new "O" ring seal on wheel bearing and install axle shaft (shorter shaft on left side), but do not damage seal. Install backing plate and bearing retainer, retainer nuts, brake drum and wheel.

CADILLAC REAR AXLE ASSEMBLY

Rear Axle Oil Seal (Comm. Chassis): Replacement - New oil seal must be installed whenever old seal removed. Fashion a plate with oblong center hole so it fits behind seal and remove seal with slide hammer. Coat surface of sealing lip with lubricant and outside diameter of seal with non-hardening gasket sealer before installation. Press seal squarely into its bore

Differential Carrier: Removal - Disconnect rear universal joint at pinion yoke. Remove rear axle lubricant with suction gun. Remove axle shafts, see above, and remove carrier to axle housing nuts and washers. Remove entire assembly with gasket. **Installation** - *NOTE* - If carrier was removed because of failure, inspect axle housing and rear wheel bearings for metal chips and thoroughly clean as required. Reverse removal procedure and note the following: On Controlled Differential carrier be sure internal splines of differential side gears and cone clutches are aligned by inserting axle shaft splines in each side approximately 4" until they bottom on differential pinion shaft.

Pinion Oil Seal & Yoke: Removal - Raise rear of car and remove both rear wheels and brake drums to eliminate drag when measuring torque readings. Use suction gun to remove approximately 1½ pints of lubricant. Disconnect rear universal joint from pinion yoke. Use a 50 inch pound torque wrench and Socket J-2571-1 with Adapter J-2571-2 to measure inch pounds required to rotate shaft (2 full turns). Record torque reading. Mark pinion shaft and yoke with punch mark for reinstallation. Install Holding Tool J-6544 on yoke, and install Socket J-2571-1 on pinion nut through hole in holding tool and remove nut using 3/4" drive socket wrench. Remove yoke from pinion shaft with Tool J-6295-01. Pry out old seal and remove staking marks on shaft **Installation** - Coat outer edge of seal with non-hardening gasket sealer and lubricate sealing lip with rear axle lubricant. Position seal in carrier and place Seal Installer J-8436 against seal and secure with pinion nut and washer. Install Socket J-2571-1 on pinion nut and press seal into carrier by tightening nut with socket wrench. Remove socket tool, pinion nut and washer, and seal installer. Install yoke on pinion shaft splines with punch marks up. Install pinion nut, holding flange of yoke with Pinion Yoke Holding Tool J-6544. Tighten pinion nut until proper preload is attained. Preload is attained when inch pounds torque required to rotate pinion shaft is 2 to 5 lbs. greater than the torque required to rotate shaft prior to seal and yoke removal above. *NOTE - It is necessary to remove Yoke Holding Tool J-6544 to install 50 inch pound torque wrench.* Tighten nut approximately ½ flat and check torque. Repeat this operation until proper torque is obtained but do not overtighten or back off nut to reduce preload. Maximum allowable torque on an assembly with over 1,000 miles is 15 inch lbs. (used seal) or 20 inch lbs. (new seal). The torque of a new assembly is 50 inch lbs.

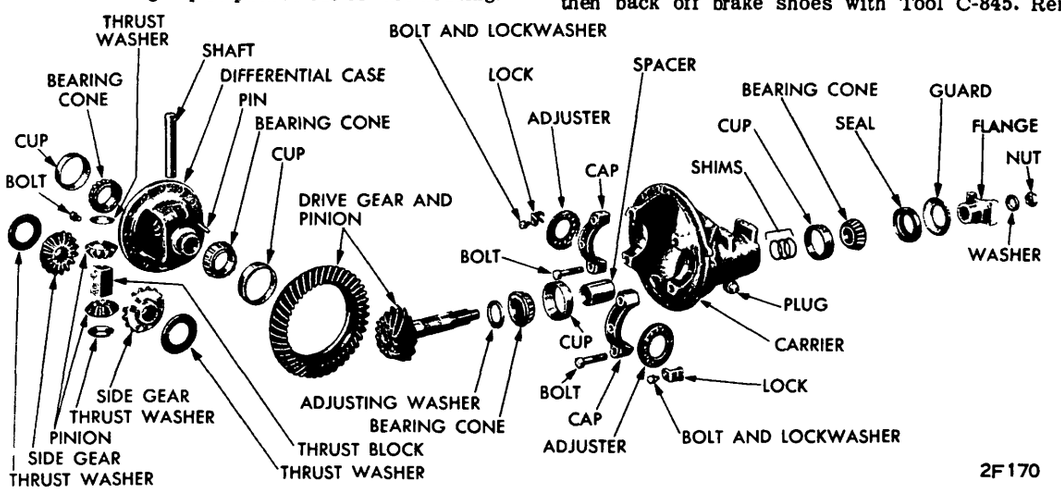
Rear Axle Backlash: To measure rear axle assembly backlash, raise car on hoist and fasten one end of piece of bar stock to yoke on pinion shaft and the other end to frame side rail by means of a "C" clamp, to prevent rotation of drive shaft. Apply brake cable at one wheel to hold wheel stationary, and measure movement of outer circumference of opposite tire tread. A stiff wire pointer fastened to fender of car will aid in this measurement. Maximum backlash at tire tread should not exceed ½".

CHRYSLER CORP. HYPOID

Chrysler & Imperial (1962)
Dodge & Dodge Dart (1962) ①
Plymouth (1962) ①
① – For Lancer & Valiant models, see "Lancer & Valiant Hypoid" in this section.

DESCRIPTION: Semi–floating, hypoid gear type of same design used previously.

►*AXLE RATIO & IDENTIFICATION NOTE:* Ratio identification number stamped on identification pad on carrier housing. "Sure–Grip" differential identified by letter "S" stamped on this pad and by a lubrication caution tag attached to a carrier housing bolt. Both conventional and "Sure–Grip" differentials available with same ratios. Following Ratios are available:
Std. Ratios – 2.76 (17–47), 2.93 (14–41), 3.23 (13–42), 3.31 (13–43), 3.55 (11–39), 3.58(12–43), 3.91(11–43).
High Perf. Ratios – 3.15 (13–41), 3.36 (11–37), 3.42 (12–41), 3.73 (11–41), 4.10 (10–41), 4.30 (10–43), 4.56 (9–41), 4.89 (9–44), 5.12 (8–41), 5.38 (8–43), 5.57 (7–39), 5.83 (6–35), 6.17 (6–37).



AXLE SHAFT REPLACEMENT & ENDPLAY ADJUSTMENT: Loosen brake shoe cams and remove rear hub and drum assemblies with Puller, Tool C-845. *(NOTE - Do not attempt to remove brake drums by hammering on end of axle drive shaft as damage to bearings and thrust block will result).* Disconnect brake line at each cylinder and remove brake support plates and dust shields as assemblies. Remove axle shaft keys and install Tool C-745 to protect outer axle seal. Remove shim pack between brake backing plate and axle housing flange. Pull axle shaft with Puller C-499. Remove shaft bearings with Puller C-293-13, inner oil seals with Puller C-637, and brake dust shield outer seal with Driver C-3565. Clean all parts and inspect for wear or distortion. To install, reverse removal procedure, then adjust axle shaft endplay (see below).

Endplay Adjustment (8¼" Ring Gear): Push both axle shafts in toward center as far as possible. Now push one shaft in as far as it will go. Measure amount opposite shaft bearing cup is pushed out of axle housing. If distance less than .040", no shims needed on that side. If distance more than .040", subtract .040" from distance and add shims equal to this result to side just measured, then install brake support plate. Now push opposite shaft and bearing cup in as far as possible. Add .018" to distance bearing cup is out of housing and add shims to this total to the side being measured. Install brake support plate. Total axle shaft endplay should be .013–.023". If not within specifications, change shims as necessary **on side assembled last.**

Endplay Adjustment (8¼" Ring Gear): Install shims totaling .040" at one end of axle housing (shims available in .005", .0125", .015", .030" thicknesses). Lubricate bearing and install axle shaft, bearing and cup, then using Tool C-413, drive bearing cup into axle housing until tool bottoms tightly against the shims. Remove tool and install dust shield, lockwashers and nuts. Tighten nuts to 30-35 ft. lbs. Working from opposite side of axle housing, install other axle shaft with bearing until inner end of shaft contacts the axle shaft thrust block. Lightly tap end of axle shaft with a fibre mallet to insure shaft is contacting the thrust block (opposite shaft will be forced away from thrust block to its full travel). Install bearing carefully until no axle shaft endplay exists without preloading the bearing (rotate shaft during bearing installation to check against preload). At this point the bearing cup will protrude beyond face of axle housing flange. Hold Tool C-413 firmly against bearing cup and measure the distance between end of tool and flange with a feeler gauge. To obtain the correct endplay of .013-.018", add .013" shims to the above measurement *(NOTE - If this gives a total thickness of shims that cannot be built up from the existing shims, use the next larger shim combination).* Remove tool and install total shim pack and brake dust shield. Tighten nuts to 30-35 ft. lbs.

DIFFERENTIAL CARRIER ASSEMBLY REMOVAL & INSTALLATION: Raise car and block brake pedal so it cannot be depressed. Drain differential housing, then back off brake shoes with Tool C-845. Remove axle shafts (see above). *(NOTE - Retain shims found at each end of rear axle housing and mark them for reassembly in the same location).* Disconnect rear universal joint and drop the propeller shaft. Remove bolts attaching carrier to housing and remove the carrier assembly. To install, reverse removal procedure.

OVERHAUL: *"Sure–Grip" Differential – See "Power–Lock Differential (Plate Clutch Type With Belleville Springs)" in this section.*
Conventional Axle: *See 1957 Final Data, Page 320, or later Manual edition and note the following:*
Pinion Side Gear Clearance – .001–.012".
Ring Gear Attaching Bolts – 60 ft. lbs. torque.
Ring Gear & Pinion Backlash – .006–.008".
Pinion Rear Bearing Removal – To remove rear pinion bearing, use Tool C–293 and four No. 37 Adapters (pinions without spacers), four No. 36 Adapters (pinions with spacers).
Pinion Bearing Preload – Preload should be 20–30 inch–pounds (new bearings), 0–15 inch–pounds (old bearings). Torque on companion flange attaching nut should be 240 ft. lbs.
Pinion Setting & Bearing Preload Adjustment (Cars Without Spacer on Pinion Shaft) – Adjustment procedures for this type rear axle assembly are the same as for Chrysler New Yorker and Imperial as indicated in 1957 Final Data or later Manual edition.

CHRYSLER CORP. HYPOID REAR AXLE ASSEMBLY (EXPLODED)

LANCER & VALIANT HYPOID

Lancer (1962)
Valiant (1962)

DESCRIPTION: Semi–floating, hypoid gear type with differential carrier integral with rear axle housing.

Axle Ratios: The following axle ratios are available: 2.93–1 (41–14), 3.23–1 (42–13), 3.55–1 (39–11), and 3.91–1.

Axle Shaft & Bearing Removal: Remove wheel and drum. Disconnect brake line at wheel cylinder. Work through axle shaft flange to remove retainer nuts and use Puller C–3725 to pull axle shaft and rear brake assembly. Carefully remove brake assembly from axle shaft without damaging seal contact area. Remove seal from housing. Use same tool to remove bearing from axle shaft (when necessary to replace bearing). Bearing is made unfit for reuse during removal. *NOTE – If bearing retainer interferes with proper positioning of Tool C–3725, saw through retainer and remove, then split bearing collar to relieve interference fit between collar and axle shaft. Tool can now be positioned.*

Rear Axle Assembly Removal: Raise car and support body at front of rear wheels. Block brake pedal up. Remove rear wheels and disconnect hydraulic flex line. Disconnect parking brake cable at transmission, and propeller shaft at yoke. Remove spring clips (U–bolts) and shock absorbers. Remove assembly.

OVERHAUL: *See 1960 Final Data, Page 358, or later Manual edition and note the following:*
Differential Case Reassembly: Torque ring gear attaching bolts to 55 ft. lbs.
Differential Side Bearing Preload Adjustment: Select two new spacer washers having a total thickness equal to the two spacers installed for trial, plus thickness of feeler gauge, **plus .010".**
Pinion Setting (With Tool C–3715): Tighten tool nut to produce 15–25 inch–pounds of turning torque.
Pinion Bearing Preload Adjustment: Pinion bearing preload should be 15–25 inch–pounds (new bearings), 0–13 inch–pounds (used bearings).
Driven Gear & Pinion Backlash Adjustment: Backlash should be .004–.007".

FORD & MERCURY "DEEP-OFFSET" HYPOID

Ford Fairlane & Galaxie (1962)
Ford F & P-100 Trucks (1962) Ⓒ
Mercury Meteor & Monterey (1962)
Thunderbird (1962)
Ⓒ – Spicer Model 44 used with Equa–Lock Differential.

►CHANGES, CAUTIONS, CORRECTIONS

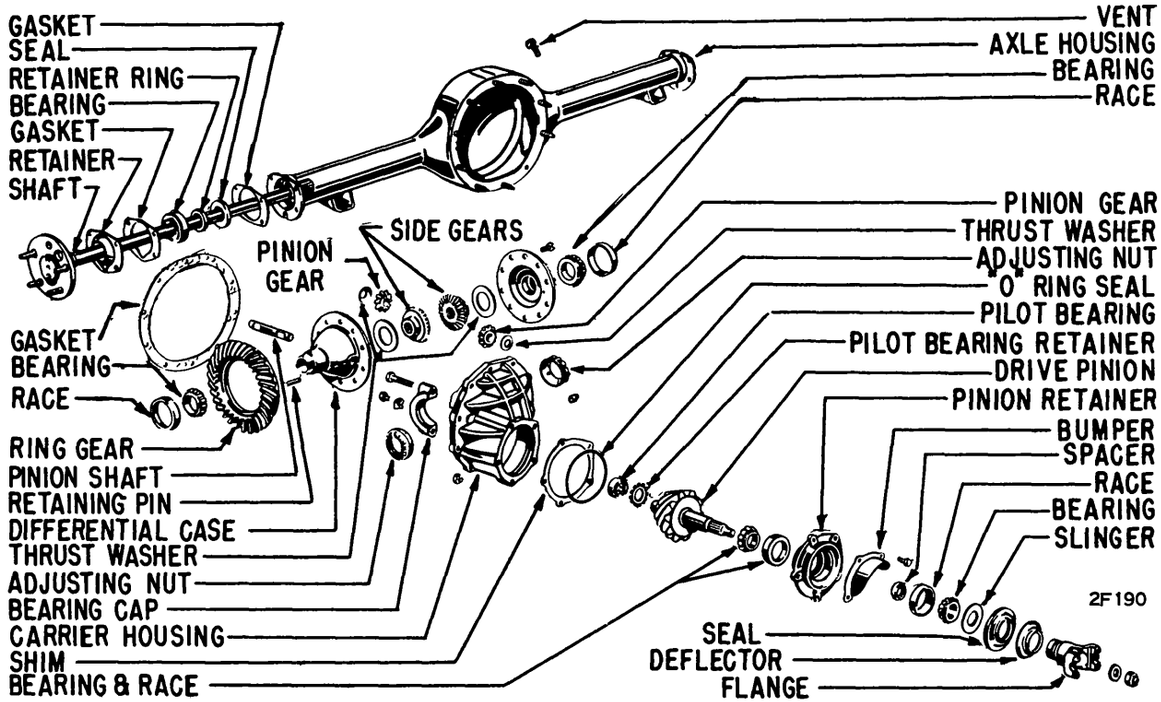
►*1962 DIFFERENTIAL CASE ASSEMBLY PRODUCTION CHANGE:* For improved lubrication of differential pinion shaft, new differential case with oil feed holes and a sheet metal oil scoop used in production approximately the end of November, 1961. Differential side gears have four opposing spline teeth omitted (90° apart) to complete oil flow circuit. These parts are interchangeable with previous units.

►*REAR AXLE LUBRICANT CAUTION:* On 390" and 406" Engine cars, and all Equa–Lock differentials, use only Axle Lubricant, Ford & Mercury No. C1AZ-19580-E or F, with 4 ozs. Additive, No. No. C1AA-19B546-A per axle fill on Equa-Lock units.

DESCRIPTION: Banjo type housing, semi–floating type with "deep–offset" straddle mounted drive pinion, with separate differential carrier assembly. Design similar to previous models.

►*AXLE RATIO & IDENTIFICATION NOTE:* Ratio code stamped under AXLE on car patent plate on left front door hinge pillar. Axle ratio may also be stamped on a tag under a carrier attaching bolt.

Axle Ratios & Code Identification



Axle Ratio	ⒸRatio Code
3.00–1 (39–13)	A or 1
3.20–1 (32–10)	3
3.22–1④	10
3.25–1 (39–12)	4
3.50–1 (35–10)	5
3.56–1 (32–9)	②F, ③B or 6
3.70–1 (37–10)④	11
3.80–1	7
3.89–1 (35–9)	②H, ③F, ⑤ 8,④12
4.11–1 (37–9) ④	13

Ⓒ – Number indicates Conventional Differential. Letter indicates Equa–Lock Differential.
②–Galaxie. ③–Monterey. ④–Trucks. ⑤–Pass. Cars.

►*HIGH PERFORMANCE AXLE RATIO NOTE:* Following special high performance axle ratios are available: 3.40 (34–10), 4.11 (37–9), 4.29 (30–7), 4.57 (32–7), 4.71 (33–7), 4.86 (34–7), 5.14 (36–7), 5.43 (38–7), 5.67 (34–6), 5.83 (35–6).

Axle Shaft Removal: Remove wheel and tire assembly, then remove brake drum. Work through hole in axle shaft flange to remove wheel bearing retainer nuts. Pull axle shaft with Adapter 4235–C and a slide hammer. Install one backing plate nut to hold plate in position.

Axle Shaft Seal & Bearing Replacement: *NOTE – Tool Set T60K–1225–A is available to remove and install bearing and retainer.* Nick bearing retainer with a chisel to loosen it for removal from shaft. Remove bearing by pressing or pulling it from shaft. Install bearing and retainer with same tools used for removal. *CAUTION – Bearing must seat firmly on axle shaft retainer. DO NOT press bearing and retainer on shaft at the same time.* Remove seal with suitable tool which will grip inside of seal. Install seal with suitable tool which will bear around outside diameter of seal. Use oil resistant sealer on outside of new seal.

FORD MOTOR CO. "DEEP-OFFSET" HYPOID REAR AXLE ASSEMBLY (EXPLODED)

►*SPECIAL TOOL NOTE:* When servicing axle assemblies, use suitable pullers, adapters, supports, and other tools which will properly remove and install axle parts without distortion or damage.

OVERHAUL: Equa–Lock Differential – *See 1959 Final Data, Page 336, or later Manual edition.*

Conventional Axle: *See 1957 Final Data, Page 322, or later Manual editions and note the following:*

Rear Axle Torque Specifications (Ft. Lbs.)

	Fairlane & Meteor	All Others
Diff. Bearing Capscrews	55–65	70–80
Diff. Bearing Adjusting Locknuts	12–20	15–20
Carrier–to–Housing Bolts	30–40	30–40
Pinion Retainer–to–Carrier Bolts	30–40	30–40
Ring Gear Attaching Bolts	65–75	75–85
Axle Shaft Retainer Bolts	30–40	Ⓒ30–40

Ⓒ – 55–65 ft. lbs. on Heavy Duty axle.

Ring Gear & Pinion Backlash: .008–.012" (Galaxie, Monterey, Fairlane, Meteor); .004–.009" (Thunderbird and Trucks).

Drive Pinion Depth Setting: Nominal pinion depth setting is .020" (.020" shim required).

Drive Pinion Retainer Seal Installation: Soak new seal in SAE 10W engine oil for ½–hour before installation.

Differential Case Assembly: On units having sheet metal oil scoop on differential case, be sure oil holes in scoop and feed holes in case are aligned during reassembly.

Four Pinion Differential: Disassembly – Same as for two pinion differential except as follows: After removing differential assembly from carrier, drive out three differential pinion shaft retainers with drift and separate. Drive out long pinion shaft from end opposite retainer hole. Remove two short pinion shafts, driving each from center outward. Lift out center block and remove gears and thrust washers.

Reassembly – Place a thrust washer and side gear in differential case bore. Install four thrust washers and place pinion gears on side gear. Align washers and pinion gears with pinion shaft holes in case. Install center block so its four small diameter holes are aligned with holes in pinion gears and case. Use brass drift to drive in two short pinion shafts from outside of case. *NOTE – Align shaft retainers as each shaft is driven in place.* Drive long pinion shaft into place from retainer hole end of case (align shaft retainer hole with that in case). Place second side gear and thrust washer on top of four pinion gears, then install differential case cover so that the three shaft retainer holes in cover align with their corresponding holes in case. Install the three shaft retainer pins with a drift. A pinion or axle shaft can be inserted in the side gear spline to check free movement of gears.

FORD ECONOLINE TRUCKS, COMET & FALCON HYPOID

Comet (1962)
Falcon Cars & Trucks (1962)
Ford Econoline Trucks (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*RING GEAR & PINION INSTALLATION CAUTION:* Some ring gear and pinion assemblies may be of the "non-hunting" type (pinion gear teeth mesh with the same ring gear teeth). It is important that marked tooth on pinion gear be meshed with marked tooth on ring gear if marks are found on assembly.

►*AXLE SHAFT REMOVAL NOTE:* To prevent corrosion due to moisture in rear axle housing wheel bearing bores, lightly coat bearing bores with ball joint lubricant, No. C1AZ-19590-A, any time rear axle shafts are removed.

►*DRIVE PINION BEARING PRELOAD CAUTION: Rear universal joint companion flange nut controls pinion bearing preload. If this nut is loosened, pinion bearing preload must be adjusted.*

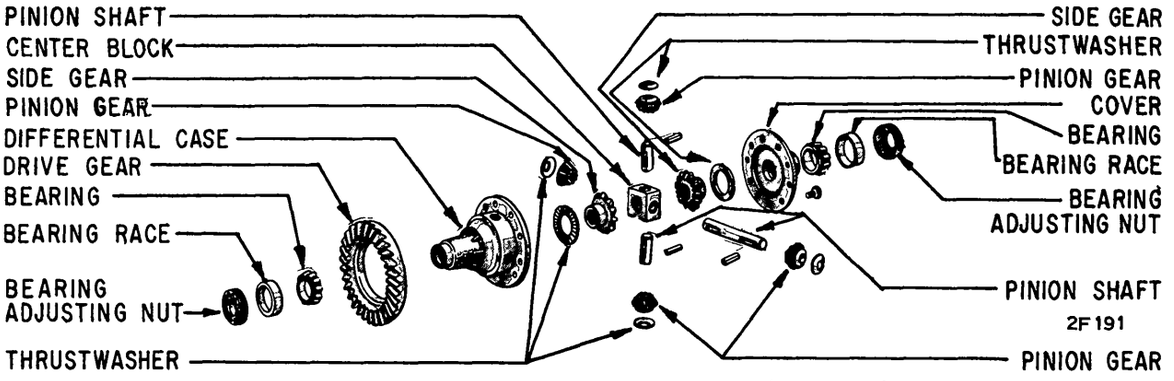
DESCRIPTION: Semi-floating, hypoid gear type with an integral type housing and Hotchkiss drive. Design is similar to that used on previous models.

►*AXLE RATIO & IDENTIFICATION NOTE:* Ratio code stamped under AXLE on car patent plate, and may also be stamped on a tag under a housing cover bolt.

Axle Ratios & Code Identification

Axle Ratio	Ratio Code
3.10-1 (31-10)	2
3.20-1 (32-10)	3
3.50-1 (35-10)	5 (Comet & Falcon), 01 (Econoline)
4.00-1 (36-9)	9 (Comet & Falcon), 02 (Econoline)

AXLE HOUSING ASSEMBLY: Removal – Raise vehicle and support it on the underbody, then loosen carrier rear cover and drain lubricant. Disconnect drive shaft at pinion flange and shock absorbers at axle housing. Remove both axle shafts (see below). Remove hydraulic brake "T" connection from axle housing (do not open hydraulic brake system line), then remove brake line from retainer clip on housing. Remove both brake backing plates from housing and support them out of way with wire. *CAUTION – Be careful not to damage brake lines or cables.* Support axle housing on a jack, then remove spring plates and "U" bolts. Remove axle assembly from under car.



Installation: Reverse removal procedure and tighten spring "U" bolt nuts to 13-20 ft. lbs.

AXLE SHAFT: Removal – Remove wheel assembly from brake drum, then back off rear brake shoe adjustments. Remove brake drum-to-axle shaft flange nuts and remove. Working through hole in axle shaft flange, remove nuts securing wheel bearing retainer, then remove axle shaft from axle housing using a suitable "sliding hammer" type puller. *CAUTION – Do not dislodge brake backing plate. Use a single nut to hold plate in position after removal of axle shaft.*

Bearing & Seal Replacement – Remove seal from axle housing with a suitable puller. To remove bearing from shaft, nick bearing retainer deeply with a chisel, using care not to damage shaft, and remove retainer. Press bearing from axle shaft using an arbor press and a suitable tool to hold and support bearing. When installing seal in axle housing, coat outside edges of new seal with sealing compound, then install seal in housing with Tool 1177-B (Comet), T62P-1177-A (Falcon), T61E-1190-B1 (Econoline) making sure sealing lips point inward and that seal is seated against shoulder in housing. Install outer bearing race on shaft, then press new bearing on shaft, seating it firmly against shoulder. Press a new bearing inner retainer on shaft, seating it firmly against bearing. *CAUTION – Do not attempt to press bearing and inner retainer on shaft at the same time.*

Installation: Reverse removal procedure and tighten bearing retainer mounting nuts to 30-35 ft. lbs.

OVERHAUL: *See 1960 Final Data, Page 352, or later Manual edition, and note the following:*

FORD ECONOLINE TRUCK DIFFERENTIAL CASE (EXPLODED)
(COMET & FALCON SIMILAR)

Rear Axle Torque Specifications

Item	Ft. Lbs.
Housing Cover Bolts	10-17
Differential Bearing Capscrews	40-50
Differential Bearing Adjuster Locknuts	12-20
Ring Gear Attaching Bolts	40-50

Ring Gear & Pinion Backlash: .006-.010" (Comet & Falcon), .008-.012" (Econoline).

Pinion Depth Setting: Nominal pinion depth setting is .018" (.018" shim required). Shims furnished from .008-.024" thick.

Pinion Bearing Preload: Minimum torque on pinion flange nut should be 140 ft. lbs. to obtain pinion bearing preload of 17-27 inch-pounds (new bearings), 6-12 inch-pounds (used bearings).

Drive Pinion Seal Installation: Soak new seal in SAE 10W engine oil for ½-hour before installation.

Differential Bearing Preload: 2-3 notches tight (Falcon & Econoline), 1-2 notches tight (Comet with Light Carrier), 1-1½ notches tight (Comet with Heavy Carrier).

Differential Case (Two-Piece Type): Disassembly – Use a suitable puller and remove differential side bearings, then remove bolts attaching drive gear to differential case. Press drive gear from case or tap it off with a hammer. On passenger cars, drive out the single pinion shaft retainer and separate two-piece differential case. Drive out pinion shaft with a brass drift and remove gears and thrust washers. On Trucks, drive out the three pinion shaft retainers and separate differential case. With a brass drift, drive out long pinion shaft (drive from end opposite retainer hole), then remove two short pinion shafts (use a brass drift and drive from center outward). Lift out center block, then remove gears and thrust washers.

Reassembly – Place a thrust washer and side gear in differential case bore. *NOTE – Lubricate all parts with rear axle lubricant as they are assembled.* On passenger cars, drive pinion shaft into case with a soft hammer far enough to support a pinion thrust washer and pinion gear, then install thrust washer and slide pinion gear onto shaft and mesh with side gear. Place second pinion gear and thrust washer in position, and drive pinion shaft all the way into position. *NOTE – Be sure to align shaft retainer holes as shaft is being driven in.* Place second side gear on top of two pinion gears, then position thrust washer and install differential cover so shaft retainer hole in cover is aligned with hole in case. On truck models, install four pinion thrust washers, and place pinion gears on side cover, then align washers and pinion gears with pinion shaft holes in case. Install center block so that its four small diameter holes are aligned with holes in pinion gears and with holes in case. Use a brass drift and drive the two short pinion shafts into center block, being sure to align shaft retainer holes as each shaft is driven into place. Drive long pinion shaft into place from retainer hole end of case, being sure to align retainer hole with hole in case. Place second side gear and thrust washer on top of the four pinion gears and install differential case cover so that the three shaft retainer holes are aligned with holes in case. On all models, install shaft retainer pins with a drift (one on passenger cars and three on truck models). *NOTE – A pinion or axle shaft spline can be inserted in side gear spline to check for free rotation of differential gears.* Place drive gear on differential case and tighten bolts to 40-50 ft. lbs.

FORD TRUCK "BANJO HOUSING" HYPOID

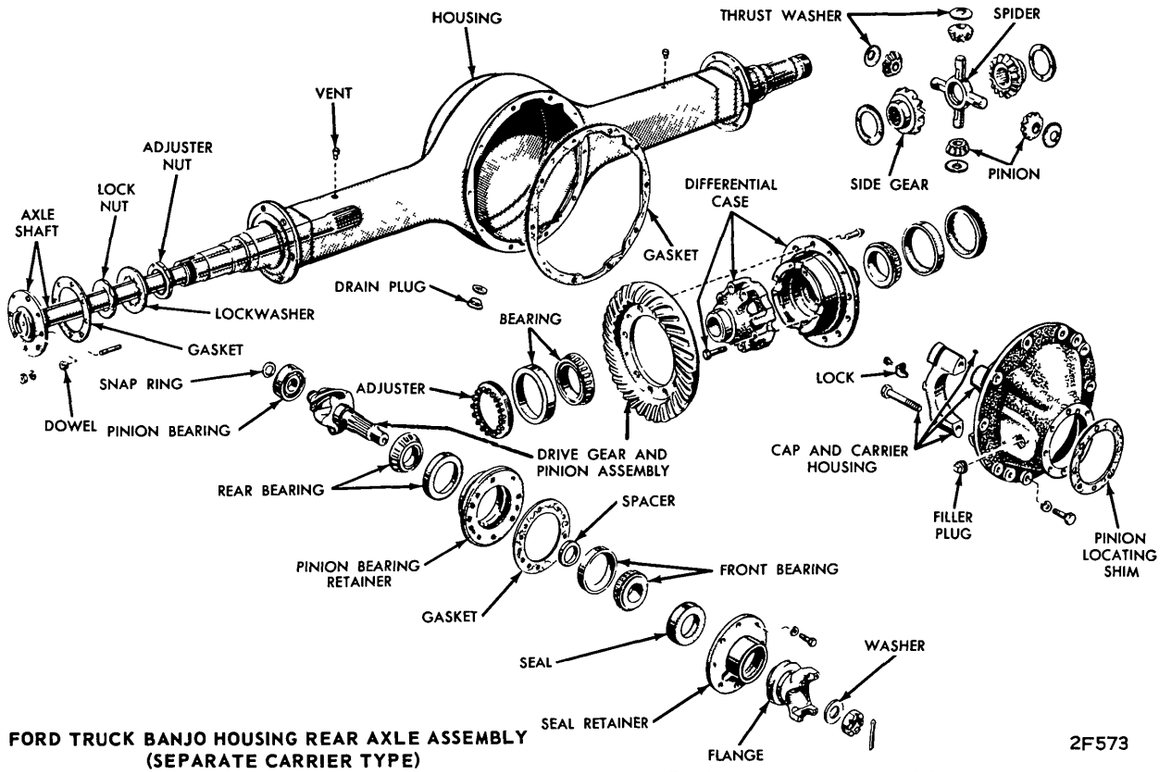
F, B, P–500, 600; C550, 600 (1962) Std. Equipm nt

►CHANGES, CAUTIONS, CORRECTIONS

►*REAR AXLE LUBRICANT NOTE:* Rear axle lubricant should be changed after first 8,000 miles (on or off highway), and at each 32,000 mile interval thereafter.

DESCRIPTION: Full floating, hypoid gear type with Hotchkiss drive. Differential carrier is multiple casting type having a separate drive pinion carrier.

►*AXLE RATIO & IDENTIFICATION NOTE:* Ratio code stamped under AXLE on truck patent plate. On Timken axles, ratio (and model information) stamped on Rockwell Standard Serial No. Plate on right rear face of axle housing above brake line. On Eaton axles, ratio (and carrier assembly number) stamped on pad on top surface of carrier housing.



Axle Application, Ratios, & Ratio Code

Truck Model	Axle Model	Code	Ratio
F, B, P–500	Timken C–100	32	6.20
		34	6.80
F, B–500; C–550	Timken D–100	41	5.83
		42	6.20
		44	6.80
C–600	Timken F–104	52	6.20
		54	6.80
F, B, C–600	Timken F–106	62	6.20
		64	6.80
		66	7.20
F, B, C–600	Eaton 1614–15	73	6.50
		75	7.17

Axle Shaft Replacement: Remove axle shaft stud nuts and lockwashers. Strike center of axle shaft flange with a hammer and drift to loosen tapered dowels, then remove dowels. Pull axle shaft from housing. To install, place gasket in position on housing and install axle shaft. Install tapered dowels, lockwashers and nuts on studs. Tighten nuts to 50–70 ft. lbs.

Carrier Removal: Remove axle shafts (see above), disconnect drive shaft at rear joint flange. Support carrier assembly and remove carrier attaching bolts. Tighten puller screws (if provided) to loosen carrier from housing. Remove carrier.

Wheel Bearing Adjustment: Remove axle shafts (see above). Torque adjusting nut to 50–80 ft. lbs. while rotating wheel in both directions. When bearing rollers

FORD TRUCK BANJO HOUSING REAR AXLE ASSEMBLY (SEPARATE CARRIER TYPE)

are firmly seated, back off adjusting nut 3/8–turn and install lockwasher. *If adjusting nut has a locking dowel, dowel must enter lockwasher hole closest to dowel. If lockwasher has tabs, bend a tab over adjusting nut.* Torque locknut to 100–150 ft. lbs. Wheel must still rotate freely and with .001–.010" endplay. Bend a lockwasher tab over locknut (if equipped), then install axle shaft.

OVERHAUL: *See 1956 Final Data, Page 337, or later Manual editions, and note th following:*

Ring Gear & Pinion Backlash: .006–.012" (Timken), .008–.015" (Eaton).

Differential Bearing Preload Adjustment: 2 notches (Timken), 1½–2 notches (Eaton) tight from zero endplay position.

Pinion Bearing Preload: 5–15 inch–pounds (Timken), 15–35 inch–pounds (Eaton).

Pinion Shaft Nut Torque: 300–400 ft. lbs. (Timken), 325–450 ft. lbs. (Eaton).

FORD TRUCK 2-SPEED

F, B, P–500, 600; C–550, 600 (1962)

DESCRIPTION: Two–speed planetary differential assembly with either a spiral bevel or hypoid ring gear and pinion. Spiral bevel pinion shaft is piloted at rear by a roller bearing. Shift control is electrically operated.

Truck Model	Axle Model	Code	Ratio
P,B,C–500	Eaton 1350	D1	5.83/8.11
C–600	Eaton 13800	E1	5.83/8.11
	Eaton 13800	E2	6.33/8.81
F,B,C–600	Eaton 13802	F1	5.83/8.11
	Eaton 13802	F2	6.33/8.81
F,B,C–600	Eaton 16802,03	G3	6.50/9.04

►*AXLE IDENTIFICATION CODE & RATIO NOTE:* Code (type of axle used) is located on Rating Plate on left front cab pillar or glove door, see table above. Axle ratio stamped on top of carrier housing below carrier assembly number.

AXLE SHAFT & WHEEL BEARING REPLACEMENT: Loosen axle shaft stud nuts, then raise truck and place jacks under rear axle housing. Remove axle shaft stud nuts. Loosen dowels by striking drift at center of flange and remove dowels and axle shaft. Remove seal assembly from studs and wiper from housing (if so equipped). Remove locknut, lock washer and adjusting nut. Plate wheel type jack under wheels and relieve load on bearings. Remove outer bearing cone and pull wheel off axle. Use hard wood block to drive outer bearing cone and inner seal out of hub. If bearing cups are to be replaced, drive them out with a drift. Use Tool T53T–1239–A and Detail 17 to replace cups. *NOTE – Pack b aring gr ase on both sides of ach cup.* Place each bearing and roller assembly into wheel hub, then install new inner seal with Tool T54T –1175–E(F,B,C–600). Adjust wheel jack height so wheel will be installed straight on housing without damage to inner seal. Install outer bearing cone and adjusting nut. Torque adjusting nut to 50–80 ft. lbs. while rotating wheel in both directions, then back off nut 3/8 turn and install lockwasher. *NOTE – Wh n adjusting nut has locking dow l, dow l must nter lock washer hole closest to dow l. Wh n quipp d with tabs, run locknut against lockwash r and b nd tab of nut.* Torque locknut to 100–150 ft. lbs. Wheel will rotate freely with .001–.010" endplay. Reinstall wiper in tube, seal assembly and gaskets on axle shaft flange studs (same number of gaskets removed). Install axle shaft.

OVERHAUL: *S e R ar Axle S ction of Manual.*

AXLE SHAFT & WHEEL BEARING REPLACEMENT: Loosen axle shaft stud nuts, then raise truck and place jacks under rear axle housing. Remove axle shaft stud nuts. Loosen dowels by striking drift at center of flange and remove dowels and axle shaft. Remove seal assembly from studs and wiper from housing tube (if so equipped). Remove locknut, lock washer and adjusting nut. Place wheel type jack under wheels and relieve load on bearings. Remove outer bearing cone and pull wheel off axle. Use hard wood block to drive outer bearing cone and inner seal out of hub. If bearing cups to be replaced, drive them out with a drift. Use Tool T53T-1239-A and Detail 17 to replace cups. *NOTE – Pack bearing grease on both sides of each cup.* Place each bearing cone and roller assembly into wheel hub then install new inner seal with Tool T53T-1175-D (F-250, P-350), T53T-1175-B (F-350). Adjust wheel jack height so wheel will be installed straight on housing without damage to inner seal. Install outer bearing cone and adjusting nut. Torque adjusting nut to 50-80 ft. lbs. while rotating wheel in both directions, then back off nut 3/8 turn and install lockwasher. *NOTE – When adjusting nut has locking dowel, dowel must enter lock washer hole closest to dowel. When equipped with tabs, run locknut against lockwasher and bend tab of nut.* Torque locknut to 100-150 ft. lbs. Wheel will rotate freely with .001-.010" endplay. Reinstall wiper in tube, seal assembly and gaskets on axle shaft flange studs (same number of gaskets removed). Install axle shaft.

REMOVAL OF REAR AXLE ASSEMBLY: Loosen wheel stud nuts and axle shaft nuts. Disconnect rear shock absorbers from spring seat caps. Raise rear end of vehicle frame to remove weight from springs and place stands under frame. Disconnect hydraulic line at frame, parking brake cable (if so equipped) at equalizer and remove cables from support brackets. Disconnect drive shaft at universal joint and remove nuts from "U" bolts and remove spring seat caps. Roll axle from truck and drain lubricant.

OVERHAUL: Power-Lock Differential – *See "Power-Lock Differential (Plate Clutch Type With Bellevill Springs)" in this section.*

Conventional Axle: *See 1957 Final Data, Page 324, r later Manual editions, and note the following:*

Ring Gear & Pinion Backlash – .008-.013" (Model 44 & 60), .005-.010" (Model 70) and must not vary more than .002" (Model 44 & 60), .003" (Model 70) between positions checked.

Pinion Depth Setting – After pinion is installed in housing and preload is within limits, check depth setting (actual assembly dimension) with Depth Gauge, using small discs for Model 44 and large discs for Model 60 and 70. Place dial indicator on high step. Nominal setting is 2.625" (Model 44), 3.125" (Model 60 & 70).

Pinion Bearing Preload Shim Pack – When original shim pack is lost or questionable, use a .065" shim pack for trial build-up.

Pinion Flange Nut Torque – 200-220 ft. lbs. (Model 44 & 60), 250-270 ft. lbs. (Model 70).

LINCOLN CONTINENTAL HYPOID

Lincoln Continental (1962)

DESCRIPTION: Semi-floating hypoid gear type with integral carrier housing and Hotchkiss drive. Similar in design to previous models.

► *AXLE RATIO & IDENTIFICATION NOTE:* Ratio code number or letter stamped under AXLE on car patent plate. Ratio also stamped on tag attached to a housing cover bolt. Directed Power differential also identified by additional tag on housing cover.

Axle Ratio & Identification

Model Year	Conventional – Code – Dir. Power	Ratio
1961	7 G	2.89-1
1962	1 A	2.89-1

AXLE SHAFT REPLACEMENT: *See 1959 Final Data, Page 337, or later Manual edition, and note Tool No. Table below.*

REAR WHEEL BEARING & SEAL REPLACEMENT: *See 1959 Final Data, Page 377, or later Manual edition, and note Tool No. Table below.*

DRIVE PINION SEAL & COMPANION FLANGE REPLACEMENT: *See 1959 Final Data, Page 337, or later Manual edition, and note Tool No. Table below.*

AXLE ASSEMBLY REMOVAL: Raise and support car, then drain lubricant by loosening housing cover bolts. Mark drive shaft, universal joints, slip yoke and companion flange for reinstallation in original position to maintain drive line balance. Remove two "U" bolts at rear universal joint and slide drive shaft forward to remove shaft. Cover output shaft with Tool 7657-J to stop oil leakage from transmission. Remove wheels, brake drums, wheel bearing retainer nuts and pull axle shafts and bearings. Disconnect rear shock absorbers, then remove brake line to axle clips and bolt holding junction block to axle housing. Remove parking brake cable retainers from "U" bolts then remove backing plates and brake lines (wire them to body). Remove axle "U" bolt nuts, bolts and spring insulator retainers. Remove axle housing assembly.

OVERHAUL: Directed Power Differential – *See "Power-Lock Differential (Plate Clutch Type With Bellevill Springs)" in this section.*

Conventional Axle: *See 1959 Final Data, Page 337, or later Manual edition, and note Tool No. Table below.*

OLDSMOBILE (EXCEPT F-85) HYPOID

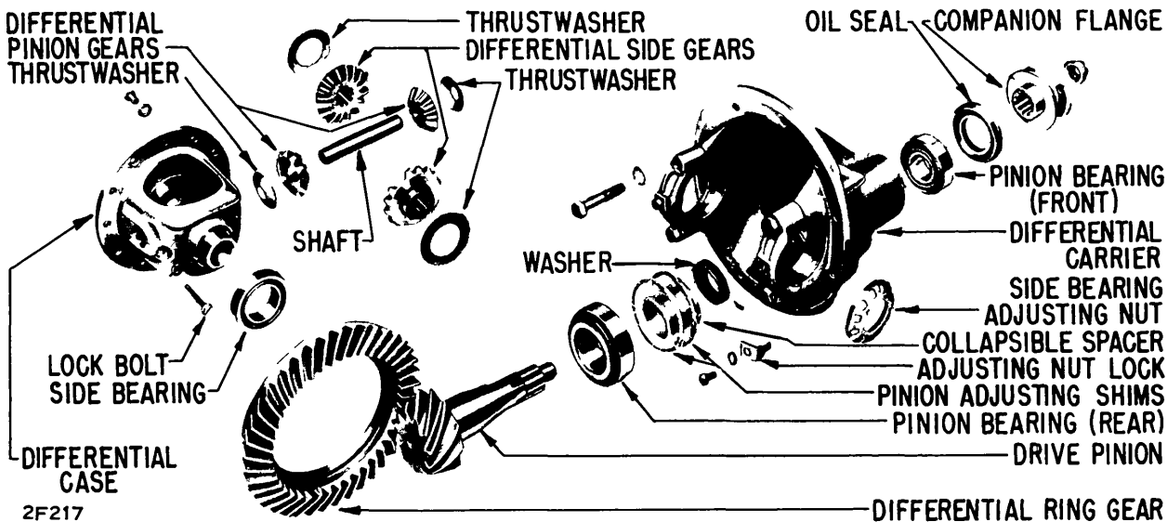
Oldsmobile 88, S88, 98 (1962)

DESCRIPTION: Semi-floating, Hypoid gear type of own design similar to previous models.

►*REAR AXLE RATIO & IDENTIFICATION NOTE:* Axle ratio code number stamped on lower right side of differential carrier flange. "L" in addition to code number indicates "Anti-Spin" Differential.

Axle Ratios & Identification Code

Axle Ratio	Code Number	Axle Ratio	Code Number
2.69-1 (43-16)	2	3.42-1 (41-12)	8
2.56-1 (41-16)	3	3.23-1 (42-13)	9
2.87-1 (43-15)	7	3.08-1 (40-13)	0



►*REAR AXLE LUBRICATION CAUTION:* Use only Special Lubricant, Part No. 531536, in both conventional and "Anti-Spin" axle assemblies.

AXLE SHAFT: Removal - Remove wheel (left wheel has left hand threads) remove drum by removing two Tinnerman nuts from wheel studs If nuts removed by turning off threads, they can be reused If nuts damaged, new nuts must be used Loosen backing plate nuts and loosen bearing retainer (do not move backing plate or brake line may be damaged) Pull shaft and bearing with Puller J-942 (do not allow shaft to drag on oil seal) Replace one nut to hold backing plate in position

WHEEL BEARING & OIL SEAL REPLACEMENT: *(NOTE-* Wheel bearings have .012-.015" endplay between balls and the races. Do not reject bearing unless endplay is greater than 020" or if there is definite roughness between ball and race). With axle shaft removed, remove bearing retainer collar after splitting with a cold chisel. *(CAUTION* - Do not damage axle when removing collar). Using Tool J-947-2 and J-947-1, press off bearing in an arbor press. To install bearing, use Tool J-947-3 and Plate J-947-1 with an arbor press and press bearing over axle shaft, being sure that pressure is being applied to inner race of bearing. After bearing has been pressed firmly against axle shaft shoulder, press new bearing retainer collar on shoulder of shaft against bearing. Be careful not to damage shaft surface on which oil seal runs.

Oil Seal: With axle shaft removed, remove seal. Before installing a new seal, apply sealer around its outside diameter then install seal in housing with Tool J-5818. *CAUTION* - When installing axle shaft, be careful not to damage seal.

PINION SHAFT OIL SEAL REPLACEMENT: Mark pinion shaft nut before loosening so that it may be retightened to the exact same location. This will avoid necessity of resetting pinion bearing preload. Remove companion flange nut and washer, then remove companion flange with Tool 6295-01. Remove seal by driving it out of housing with a blunt chisel. Lubricate new seal and coat outer diameter with sealing compound. Tap seal into place using Tool J-5395. Apply seal lubricant, Part No. 567196 to outer diameter of flange and to lip of new seal. Install flange and tighten nut to marked position, then tighten nut 1/16" beyond alignment mark.

OLDSMOBILE & PONTIAC REAR AXLE ASSEMBLY (TYPICAL)

OVERHAUL: *"Anti-Spin" Differential - See "Power-Lock Differential (Plate Clutch Type With Belleville Springs)" in this section.*

Conventional Axle: *See 1957 Final Data, Page 326, or later Manual editions, and note the following:*

Drive Pinion Bearing Preload: 24-32 inch-pounds (new bearings), 10-15 inch-pounds (used bearings).

Differential Side Bearing Preload: 2-3 notches tight.

Ring Gear Backlash & Differential Side Bearing Adjustment: If backlash is not within limits of .005" minimum, .009" maximum, adjust backlash to 007" to .008" (preferred setting)

Pinion Gear Setting Shims: Pinion shims are furnished in the following sizes and are identified (other than by thickness) as follows 004" (no notch), .005" (1 notch), 006" (2 notches), 007" (no notch), 010" (no notch), 013" (1 notch), 014" (2 notches), 015" (no notch), 016" (1 notch), 017" (2 notches).

PONTIAC HYPOID

Pontiac (1962)

DESCRIPTION: Semi-floating, hypoid gear type with Hotchkiss drive. Similar in design to previous models.

Axle Ratios & Identification

Axle Ratio	①Code	②③Color
2.56-1 (41-16)	3	Gray
2.69-1 (43-16)	2	Red
2.87-1 (43-15)	7	Orange
3.08-1 (40-13)	0	Yellow
3.23-1 (42-13)	9	Brown
3.42-1 (41-12)	8	White
3.64-1 (40-11)	6	Blue
3.90-1 (39-10)	4	No Color

① - Stamped on lower right side of differential carrier attaching flange. ② - Color mark on end of axle shaft. ③ - Safe-T-Track Differentials also have color Green and lubrication tag next to oil filler plug.

AXLE SHAFT REMOVAL: Raise body to provide clearance and remove wheel Clean dirt from end of housing to protect wheel bearing and remove brake drum Remove bearing outer retainer bolt nuts Use Puller J-942-1, if necessary, to remove axle shaft *CAUTION - DO NOT dislodg backing plate or brak pip may be damag d.*

►*AXLE SHAFT CAUTION* Axle shaft with left thread on wheel bolts must be installed on left side of car

PINION SHAFT OIL SEAL REPLACEMENT: Mark position on companion flange, pinion nut, and pinion shaft to insure reassembly in the same location. *NOTE - If companion flange is to b r plac d, it will not be necessary to mark the abov parts as pini n bearing preload will have to b r adjust d.* Measure pinion bearing preload with an inch-pound torque wrench and note reading. Remove drive pinion nut and washer using Holding Tool J-6289, then remove companion flange with Puller J-6295. Remove oil seal by prying it out of carrier with a blunt tool. Oil lip of new seal and coat outer diameter with a suitable sealer. Install seal by tapping into place with Tool J-5395. Install companion flange, then install washer and nut. Tighten nut until it and the companion flange are in the same position as marked at disassembly, then tighten nut an additional 1/32" beyond locating marks. *CAUTION - Do not exceed 1/32" additional tightening.* Recheck pinion bearing preload. Preload should be same as noted at removal.

OVERHAUL: Safe-T-Track Differ ntial - *S "P w r-Lock Differential (Plate Clutch Typ With B llevill Springs)" in this section.*

Conv nti nal Axle: *Se 1957 Final Data, Pag 328, r lat r Manual editions, and n te th foll wing:*

CONTINUED ON NEXT PAGE

PONTIAC HYPOID (C nt.)

Wheel Bearing & Oil Seal Replac m nt: With axle shaft removed, remove oil seal from axle housing with Tool J–943. To remove bearing from shaft, install axle shaft in Tool J–947–P so tool engages outer race of bearing and ring enclosing bearing, then press bearing and retainer from shaft with an arbor press. To install bearing, install outer bearing retainer on shaft (if removed), then install bearing on shaft with Tool J–947–P (tool should bear only on inner race), pressing it into position with an arbor press. Press a new bearing inner retainer ring in place against bearing with Tool J–947–P. *CAUTION – Do not press bearing and inner retain r on in on op rati n as edge radius of retainer will climb ver corner of bearing inn r rac and forc grease seals into balls.* To install seal in housing, coat new seal lip with oil and coat outside of seal retainer with Permatex No. 3 or similar compound, then install seal with Tool J–5818. Install axle shaft. *NOTE* – If both axle shafts removed, shaft with left hand threads on wheel bolts must be on left side of car. Install bearing outer retainer and gasket and tighten self-locking retainer nuts to 30–45 ft. lbs.

Ring Gear Backlash & Differential Side Bearing Adjustment: Backlash should be between .005"-.009". Tighten bearing-cap bolts to 65–85 ft. lbs.

Carrier Oil Gallery Plug Replacement: *NOTE - This plug is l cated at forward nd of diff r ntial carri r h using lower reinforcing web.* Mark position of companion flange, pinion nut and pinion shaft so all parts may be installed in exactly the same positions to maintain proper pinion bearing preload. Remove companion flange from pinion shaft, then thread a ½" bottom tap into plug until plug starts to turn. Remove plug by turning tap and pulling at the same time. To install plug, apply a light coat of permatex No. 3 to hole in carrier and to plug, then install plug, making sure that it does not enter drain hole. *CAUTION - Do not attempt to drill a hole in plug for removal as shavings will fall into drain hole.*

►CHANGES, CAUTIONS, CORRECTIONS

► *1962 STUDEBAKER HOUSING COVER GASKET INSTALLATION NOTE:* New type laminated cover gasket (double thickness from center of bolt holes to inner edge) **must** be installed with smooth side of gasket next to axle housing.

► *1962 STUDEBAKER MODEL 27 AXLE PINION SHAFT OIL SLINGER PRODUCTION CHANGE & OVERHAUL NOTE:* Early type axles have 2 pinion shaft oil slingers. Later type have slinger between pinion gear and rear bearing cone omitted and a .030" shim (Part No. 1557102) installed between rear bearing cone and axle housing along with pinion depth shim pack. Manufacturer recommends that when servicing axle assemblies having two oil slingers, that the second slinger (between pinion gear and rear bearing cone) be eliminated and the above .030" shim installed instead.

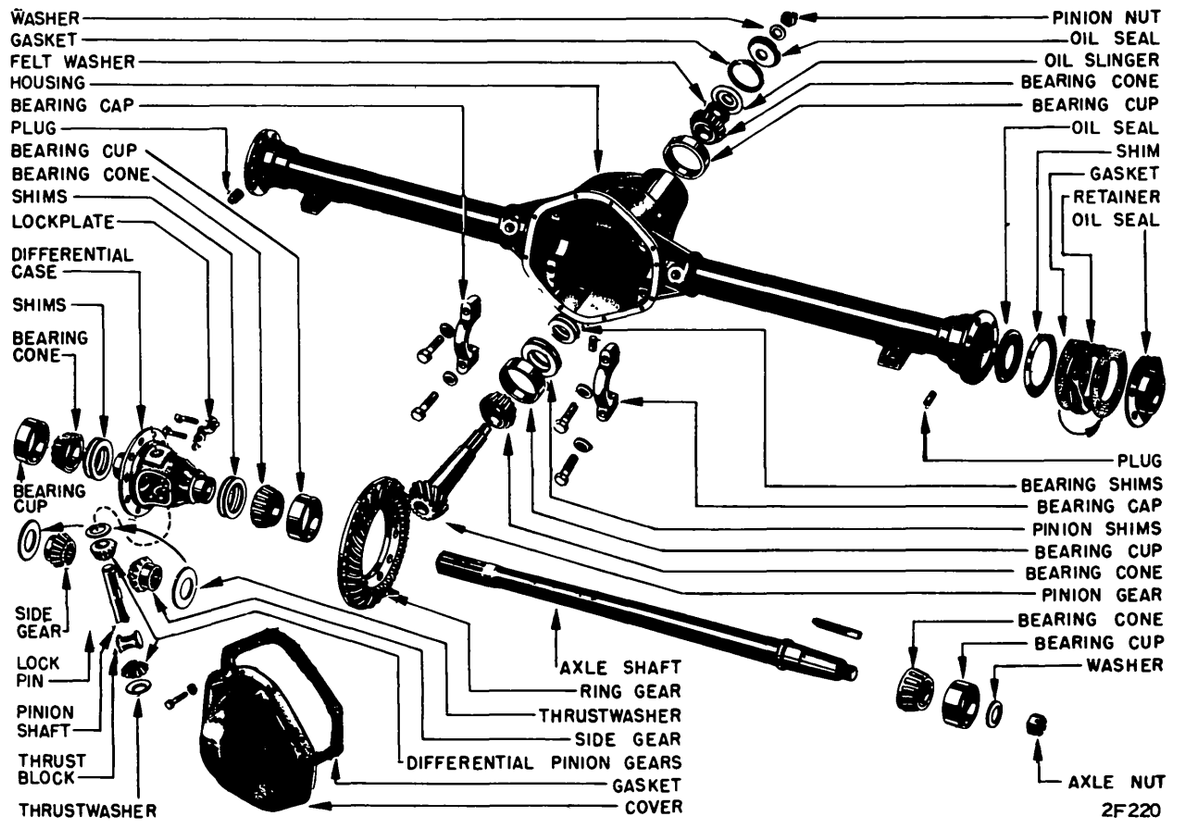
► *1962 WILLYS FC–170 (DUAL REAR WHEELS) AXLE BEARING NUT LOCKWASHER PRODUCTION CHANGE & REPLACEMENT NOTE:* New type lockwasher, Part No. 929721, used on later trucks. New washer is thicker and has wider keyway tab. Also, two washers used at each bearing. Install one washer between bearing and adjusting nut, and second washer between adjusting nut and locknut. Use new lockwasher whenever replacement necessary.

DESCRIPTION: Hypoid gear type with semi–floating axles on Models 27, 44, 44–1, 53, 53–2. Full–floating axles used on Model 70. Rear wheel bearings are "roller type" on all semi–floating axles. Model 70 axle differential case is "split type" and has four differential pinions.

► *AXLE RATIO & IDENTIFICATION NOTE:* Axle ratio stamped on metal tag attached to an axle housing cover bolt. Power–Lock differential identified by "45" or "T" on a second metal tag attached to an axle housing cover bolt; and also by a lubrication caution tag attached to filler plug. Following axle ratios are available:

Checker – 3.73 (41–11), 3.31 (43–13), 4.09 (45–11), 3.54–1, 4.55–1.

Studebaker – 3.07–1, 3.31–1, 3.73–1, 4.09–1, 4.10–1, 4.55–1, 4.56–1.



Willys – **Model 27 Axle** – 4.27 (11–47), 4.56 (9–41) 5.38 (8–43).

Model 44 & 44–1 Axle – 4.56 (9–41), 4.89 (9–44) 5.38 (8–43).

Model 53 & 53–2 Axle – 4.27 (11–47), 4.88 (8–39), 5.38 (8–43).

Model 70 Axle – 4.88 (8–39), 5.87 (8–47).

CONTINUED ON NEXT PAGE

SPICER HYPOID REAR AXLE ASSEMBLY

SPICER HYPOID (C nt.)

AXLE ASSEMBLY REMOVAL: Proceed as follows:

Studebak r (All Mod ls) Remove the nub caps, loosen wheel nuts and remove axle shart nut. Raise rear of car and support on stands under frame just ahead of rear springs. Remove wheels, hubs, and drums. Disconnect brake line at each rear wheel cylinder, remove brake pipe clamps and free brake line from rear axle housing. Take out backing plate bolts, pull backing plate out over end of axle shaft and tie up out of way. Remove adjusting shims located beneath backing plate. *(CAUTION – Save for reinstallation).* Disconnect propeller shaft by removing rear universal joint U-bolts and nuts (wire caps together). Remove rear spring U-bolts from axle housing, disconnect rear shock absorbers. Remove rear axle assembly from beneath car.

Willys - Raise rear end of vehicle with hoist and support frame ahead of rear springs. Remove wheels and disconnect propeller shaft at rear universal joint companion flange. Disconnect brake hydraulic hoses, remove spring to axle "U" bolt clips and slide assembly from under vehicle.

AXLE SHAFT REMOVAL: Proceed as follows:

Studebaker (All Models) - Remove wheel and hub using Puller J-1644-A. Remove backing plate retaining bolts and remove outer washer, retainer, reinforcing plate and felt washer (discard this washer). Free, hand brake cable from equalizer and frame guides and disconnect hydraulic brake line at wheel cylinder. Pull backing plate out over end of axle shaft and tie it up out of way. Remove endplay adjusting shims *(CAUTION - Save for reinstallation).* Use Puller J-7935 with Hammer J-2619 to remove axle shaft.

Willys - Jack up wheel and remove hub cap, axle shaft nut. Use Puller C-319 to remove wheel hub. Remove screws attaching brake dust shield, grease and bearing retainers and brake assembly. Remove wheel shield and retainer. Pull axle shaft out but DO NOT lose adjusting shims.

AXLE SHAFT ENDPLAY ADJUSTMENT (SEMI-FLOATING AXLES): Total endplay for both axle shafts should be .001–.006" (Studebaker), .003–.007" (Willys). Endplay is controlled by shims located between backing plate and axle housing flange. Adjust endplay to proper specifications by adding or removing shims. *NOTE – Adjusting shims may be found on one side only or on both sides.*

WHEEL BEARING ADJUSTMENT (FULL-FLOATING AXLES): Bend lip of nut lockwasher so locknut and lockwasher can be moved, then raise wheel so it can be rotated. While rotating wheel, tighten adjusting nut (Tool DD–1241) until wheel binds, then back off nut about 1/6–turn or more if necessary until wheel rotates freely without side shake. Replace lockwasher and locknut and bend over lockwasher lip. If adjustment still satisfactory, install axle shaft.

AXLE SHAFT OIL SEAL REPLACEMENT: *See 1959 Final Data, Page 341, or later Manual dition.*

OVERHAUL: **Power–Lock Diff r ntial** – *S "Pow r–Lock Differential (Plate Clutch Type With Bell vill Springs)" in this section.*

Conventional Axle: *See 1959 Final Data, Page 341, or later Manual edition, and not th following:*

RAMBLER HYPOID

Rambler, All Series (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 6 CYLINDER AXLE SHAFT OUTER SEAL PRODUCTION CHANGE & INSTALLATION NOTE:* Later production cars have a one–piece seal and retainer assembly, and rear wheel bearing gasket is not needed with new type seal. *NOTE* – Previous sealing recommendation of applying sealer to axle tube flange and to brake support plate mounting area is applicable to new seal also.

DESCRIPTION: Own hypoid gear type. Semi–floating with Hotchkiss drive (American), Torque Tube drive (Classic & Ambassador).

Available Axle Ratios

6 Cylinder		V8	
Ratio	No. of Teeth	Ratio	No. of Teeth
2.87–1	15–43	2.87–1	15–43
3.31–1	13–43	3.15–1	13–41
3.78–1	9–34	3.54–1	11–39
4.11–1	9–37	4.10–1	10–41

REAR AXLE ASSEMBLY REMOVAL: American - Drain lubricant, raise car and support rear of body. Remove wheels then remove hubs. Disconnect hand brake cables at brakes. Use wrench J-4486 to remove propeller shaft coupling nut. Disconnect rear shock absorbers, rear brake line at bracket on floor pan and rear springs from body. Remove axle and springs as an assembly and remove springs.

Classic & Ambassador – Remove cover and drain lubricant. Raise car and support it at rear of body. Disconnect parking brake at equalizer and housing at torque tube bracket. Disconnect torque tube from transmission, brake hose at bracket on body pan, shock absorbers at brackets, stabilizer bar at axle tube. *NOTE - Rear springs held in position in seats by car weight and shock absorber travel limits.* Roll axle from chassis and disconnect truss rods, torque tube, and propeller shaft from axle. "Slip" or "Union" type couplings used which can be slipped off pinion shaft.

Axle Shaft Removal: *CAUTION - Hub and axle shaft are serrated to mate and fit together and are marked to insure correct reassembly whenever hub removed.* To remove axle shaft, pull hub with Puller J-1644-B or J-736-B. Disconnect brake line and cable. Remove brake support plate by sliding plate, oil seal, and shims off axle shaft. Use special Puller J-2498-B to remove shaft from housing.

Axle Shaft Installation: Reverse removal procedure and note the following: *CAUTION* - Marks on outer face of hub and end of axle shaft must be aligned to insure proper mating of serrations. Tighten axle shaft nut to 250 ft. lbs. torque.

►*REPLACEMENT HUB & AXLE SHAFT CAUTION:* New hubs are not serrated and serrations will be cut in hub when it is assembled on axle shaft. New hub may be installed on old shaft (if serrations in shaft are in good condition) but an old hub must NOT be installed on a new shaft (serrations will not match). Tighten axle shaft nut to 250 ft. lbs. torque and check distance from outside face of hub to end of taper on shaft (hub overhang on threaded portion of shaft). This distance must be 3/16". Punch mark new hub in line with mark on shaft.

OVERHAUL: **"Twin–Grip" Diff r ntial (6 Cyl.)** – *Se 1959 Final Data, Page 340, r later Manual editi n.*

CHEVROLET TRUCK (4-WHEEL DRIVE)

Chevr l t ½ & ¾–T n Trucks, 4–Wh l Driv (1962)

DESCRIPTION: Spicer Model 44-5F. Full-floating, integral housing, hypoid gear type with yoke and trunnion type axle shaft universal joints. Differential assembly is similar to differential assembly used in Spicer 44 rear axle.

Axl Rati & Id ntification Note: Axle model stamped on front left face of center section, ratio tag attached to cover bolt.

Model	Ratio
½-Ton	3.91-1 (47-12)
¾-Ton	4.55-1 (50-11)

AXLE ASSEMBLY REMOVAL: Disassemble propeller shaft from front axle differential. Raise front end of truck to remove weight from springs and support truck on stands placed behind front springs. Disconnect connecting rod from steering arm and brake hoses from frame fittings, shock absorbers from axle brackets and disconnect U-bolts from axle and roll front axle from under truck.

AXLE SHAFT REMOVAL: Support vehicle with front wheel free. Place drain pan under wheel and remove hub grease cap. Remove axle shaft snap ring and remove drive shaft as follows: On K14 models, pull splined drive flange from shaft and hub and remove spacer from hub. On K25 models, remove stud nuts and washers, remove drive flange and gasket. On all models, remove bearing lock nut and lock ring and remove adjusting nut. Remove wheel, hub and drum as an assembly. Remove bolts and lock washers holding brake flange plate and spindle to steering knuckle. Remove flange plate from steering knuckle and support the plate so brake hose will not be damaged. Slide spindle from shaft and remove axle shaft and joint assembly.

WHEEL BEARING ADJUSTMENT: Adjust bearings by tightening nut using "T" handle wrench (12" long on each side). Rotate drum and tighten snugly. Loosen nut 45° and assemble lock washer by loosening nut to nearest hole then assemble outer nut. Tighten nut to 40 ft. lbs.

STEERING KNUCKLE: Removal – With axle shaft assembly removed (see above), disconnect steering connecting rod from steering arm, then disconnect tie rod from steering knuckle. Remove 2–piece seal retainer from knuckle. Remove felt seal, rubber seal, and seal ring from knuckle (let these pieces hang on axle housing so they can be kept in proper order). Remove upper and lower bearing retainers and shims from knuckle. Remove steering knuckle from axle housing, then remove bearing cones from axle housing.

Bearing Cup R placement – If new bearings installed, remove cups from axle housing, then press new cups firmly to bottom of counterbore.

Seal Replac ment – If new seals and retainer being installed, hang them on axle housing in same order as old parts (felt seal inboard, rubber seal, then seal ring outboard).

Installation & Knuckle Bearing Adjustment: Install bearing cones in axle housing cups, then install steering knuckle and bearing retainers. Use same number and size shims as removed (or equivalent) and tighten bearing retainer bolts or nuts to 25 ft. lbs. Check bearing preload as follows: Install an inch–pound torque wrench on upper bearing retainer nut and note knuckle turning torque. Torque should be 120–180 inch–pounds (or 18–27 lbs. pull with spring scale hooked in tie rod hole). If preload not correct, adjust shim pack as necessary. Install seal ring, rubber seal and felt seal against inboard face of steering knuckle, then install 2–piece retainer. Connect steering connecting rod and tie rod. Install axle shaft assembly and make wheel bearing adjustment (see above).

DIFFERENTIAL OVERHAUL: Power–Lock Differential – *See "Power–Lock Differential (Plate Clutch Type With Belleville Springs)" in this section.*

Conventional Differential: *See 1959 Final Data, Pag 341, or later Manual edition.*

FORD TRUCK (4-WHEEL DRIVE)

F rd Truck F–100 & F–250 4–Wheel Drive (1962)

DESCRIPTION: Spicer Models 44–6F & 44–6HDF. Full-floating, hypoid gear type with Spicer "Cross Type" universal joints. Differential assembly is similar to differential assembly used in Spicer Model 44 rear axle.

► *AXLE RATIO & IDENTIFICATION NOTE:* Ratio code is last digit stamped under AXLE on truck patent plate. Ring gear and pinion tooth combination stamped on ratio tag on axle housing cover.

Axl Rati	Ratio Code
3.92–1 (47–12)	A
4.55–1 (50–11) Standard	B
4.55–1 (50–11) Heavy Duty	D

Axl Shaft: R m val - Remove hub grease cap, hub retaining snap ring, slide driving hub from between axle shaft and wheel hub and remove driving hub spacer. Remove locknut, washer and wheel bearing adjusting nut from spindle and remove wheel, hub and drum assembly (outer bearing will also come out). Remove inner bearing. Remove oil baffle from brake carrier plate. Remove brake carrier plate and spindle from spindle arm (unnecessary to disconnect brake line). Support carrier plate. Remove axle shaft assembly.

Installati n & Wh l Bearing Adjustment - Install axle shaft assembly. Install spindle and brake carrier plate on spindle arm, tighten retaining screws and install oil baffle. Install wheel inner bearing on spindle, driving hub spacer, and wheel outer bearing and adjusting nut. While rotating wheel forward and rearward, tighten bearing adjusting nut with Tool T59T-1197-A until bearings are firmly seated and then back off adjusting nut 1/8 turn (45°). Install lockwasher on spindle (locking dowel on adjusting nut must enter lockwasher hole most closely aligned with dowel). Torque locknut to 40 ft. lbs. Install driving hub, snap ring and grease cup. Fill spindle arm with proper lubricant.

Spindle Arm: Removal - With axle shaft removed (see above), disconnect steering drag link from spindle arm and spindle connecting rod at both spindle arms. Remove 2-piece seal retainer from spindle arm, felt, rubber and steel rings from spindle arm (place on axle housing). Remove upper and lower spindle arm bearing caps and shims and remove spindle arm. Remove upper and lower spindle bearings with Tool T58L-101-A inserted in bearing and Puller Tool T50T-100-A.

Installation - Make sure felt and rubber seals and steel retainer are placed on axle housing in same order as removed (felt seal toward center of truck, then rubber seal and steel retainer). Install upper and lower spindle bearing cups in axle housing with Handle T53L-200-A and Driver T57P-4625-A and place bearings in cups (retain lower bearing with wheel bearing grease). Install spindle arm on axle housing and install upper and lower bearing caps (use old shims for a trial pack). Torque bearing cap bolts and stud nuts to 25 ft. lbs. Check bearing preload by rotating spindle arm with an inch-pound torque wrench installed on one of the bearing cap bolt heads. Turning torque should be 50-70 inch-pounds. Adjust shim pack at bearing caps to obtain correct preload. Install steel retainer, rubber and felt seals and 2-piece retainer. Connect spindle connecting rod and drag link. Install axle shaft assembly and adjust wheel bearing (see above).

Axle Housing Removal: Raise truck so front axle hangs freely. Remove axles and spindle arms (see above). Disconnect shock absorbers at lower end and front drive shaft at pinion flange. Support axle and remove spring clip (U-bolt) nuts and spring seats. Remove axle housing assembly.

DIFFERENTIAL ASSEMBLY OVERHAUL: Power–Lock Differential – *See "Power–Lock Differential (Plat Clutch Type With Belleville Springs)" in this section.*

Conventional Differential: Procedures and specifications are the same as for Spicer Model 44 rear axle. S *"Ford Truck Integral Housing Hypoid" in this section and note the following:*

Axle Shaft Guide & Seal Replacement – Drive guide and seal out toward inside of housing. Install guide and seal from inside of housing.

WILLYS JEEP, UTILITY & FORWARD CONTROL (4-WHEEL DRIVE) FRONT AXLE

Willys CJ-3B, 5, 6 (1962) ①
Willys FC-150, FC-170 (1962) ①
Willys Utility & Truck (1962) ①
① – For Rear Axle, See "Spicer Hypoid" in this section.

DESCRIPTION: Spicer Models 25, 44–1F, and 44F. Full-floating, integral housing, hypoid gear type with Spicer "Cardan Cross", "Bendix", or "Rzeppa" constant velocity universal joints. Differential assembly is similar to differential assembly used in rear axle.

►*AXLE RATIO & IDENTIFICATION NOTE:* Spicer model number stamped in center section of housing. Axle ratio tag is attached by a housing cover bolt. Power-Lock differential identified by "T" on cover ratio tag and by a lubrication caution tag on filler plug. Available axle ratios are as follows:
Model 25 – 4.27 (11–47), 4.88 (8–39), 5.38 (8–43).
Model 44-1F & 44F – 4.27 (11–47), 4.89 (9–44), 5.38 (8–43), 5.89 (9–53).

Removal: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage (at idler lever on frame front cross member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower springs, remove axle assembly from beneath car.

Axle Shaft & Universal Joint Assy. Removal: Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange cap screws and remove flange with puller. Bend lip of bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly. *(CAUTION–*Use care not to damage oil seal). Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing.

►*INSTALLATION CAUTION:* Adjust front wheel bearings and bleed brakes after installation completed.

Wheel Bearing Adjustment: Tighten inner adjusting nut until there is a slight drag on the bearings as the hub is turned, then back off nut 1/6 turn and install locking washer and nut. Tighten locknut securely and bend lockwasher over the locknut.

Steering Knuckle Bearings: Steering knuckle assembly is mounted on two "stub" kingpins with taper roller bearings seated in ball end of axle housing at inner end of each kingpin. Upper bearing cap has shim pack for bearing adjustment. Disassemble bearings as follows:

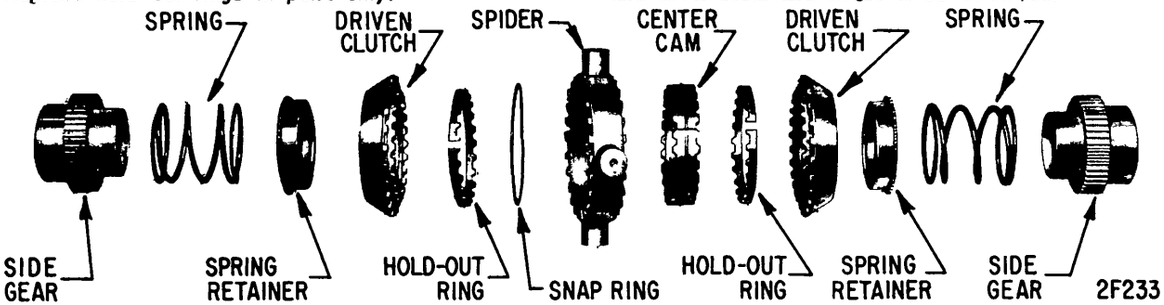
Disassembly – First remove hub and brake drum assembly, wheel bearings, axle shaft and universal joint assembly, wheel spindle, and steering tie rod socket. Remove screws holding oil seal retainer halves, remove screws retaining upper and lower bearing caps. Withdraw bearing cap and stub shaft assemblies. *(CAUTION – Do not lose bearing adjusting shims under top bearing cap).* Lift steering knuckle off axle housing. If necessary to remove bearing cups from axle housing, use special driver, Tool W–138. Wash all parts in cleaning solution and inspect bearings and races for wear, scores, or cracks.

Reassembly & Bearing Adjustment – Reverse disassembly procedure and note the following: Install one each .003", .005", .010", .030" shims at the top only. *NOTE – A shim pack of .058" thickness is added at bottom face of kingpin boss on steering knuckles at production. Maintain this shim pack at bottom and make adjustments at the top only.* Install bearing caps, lockwashers, and screws and tighten securely. Check preload on bearings by hooking a spring scale in hole in knuckle arm for tie rod socket. Take a reading when knuckle has just started its sweep. King pin bearing preload should be 12–16 lbs. with seal and axle shaft removed. Remove or add shims to secure this preload. A washer may be added between end of cap and bearing when removal of all shims does not correct preload, then reinstall and adjust shims.

Oil Seal Assembly – Before installing oil seal felt, make a diagonal cut across top side of felt so it may be slipped over axle. Install assembly as follows: Split oil seal, backing ring assembly, oil seal felt and the two seal retainer plate halves. Install eight retaining screws.

DIFFERENTIAL OVERHAUL: Power-Lock Differential – *See "Power-Lock Differential (Plate Clutch Type With Belleville Springs)" in this section.*
Conventional Axle: *See 1959 Final Data, Page 341, or later Manual edition.*

CHEVROLET TRUCK "NO-SPIN" POWER-LOCK DIFFERENTIAL



Chevrolet ½ & 1-Ton Trucks (1962)

DESCRIPTION: Limited slip type differential assembly consisting of a cross shaft and center drive cam assembly, two dog type driven clutches, hold-out rings, springs, retainers, and two side gears with straight external splines.

DISASSEMBLY: Make alignment marks on differential case. Install a long retainer bolt and nut with large washers through unit to hold assembly together until case halves are opened. *CAUTION – Use of retainer bolt is very important as unit is under spring tension and damage and serious injury could result if unit not held together during removal of case bolts.* Remove case and cover bolts, separate case halves carefully, then remove "No Spin" unit. *NOTE – Do not remove ring gear unless necessary.* Remove side gears, spring, retainers, and driven clutches. Remove split hold-out rings with snap ring pliers. *NOTE – Do not disassemble spider, center cam, and snap ring assembly as parts are not furnished separately.*

Inspection: Wash all parts. Check side gear and driven clutch splines for excessive wear or fracture. Check spider, center cam, hold-out rings and driven clutch dog teeth for chipping or burring. *Minor chips or burrs may be stoned smooth.* Check spring retainer seat and splines for fractures. Spring free height should be 2½" + 1/8". Replace parts as necessary. *NOTE – Replace hold-out rings in pairs only.*

REASSEMBLY: Lubricate all teeth. Install split hold-out rings into center cam and spider assembly (align spider key with slot in hold-out ring). Install driven clutches, spring retainers, springs, and side gears into spider assembly. *NOTE – Make sure springs ends are positioned inside spring retainer cups.* Compress assembly with retainer bolt used at disassembly. Install case and cover bolts and torque to 85–90 ft. lbs.

CHEVROLET TRUCK "NO SPIN" DIFFERENTIAL ASSEMBLY (EXPLODED)

POWER-LOCK DIFFERENTIAL (PLATE CLUTCH TYPE WITH BELLEVILLE SPRINGS)

Buick & Buick Special (1962)
Chevrolet Passenger Cars (1962)
Chevy II (1962)
Chrysler & Imperial (1962)
Dodge & Dodge Dart (1962)
Ford F-100 & F-250 Trucks (1962)
Lincoln Continental (1962)
Oldsmobile 88, S88, 98 (1962)
Plymouth (1962)
Pontiac (1962)
Rambler V8 (1962) ①
Studebaker (1962)
Willys (1962)

① – *For Rambler 6 Cyl. Cars, see 1959 Final Data, Page 340, Chrysler Manual edition.*

DESCRIPTION: This assembly replaces conventional differential assembly and consists of a multiple disc type clutch pack with Belleville type plates located between each side gear and differential housing.

AXLE IDENTIFICATION & RATIOS: *See appropriate Conventional Rear Axle data for each car model.*

LUBRICATION: *NOTE – To insure proper operation of unit and to prevent differential chatter, some manufacturers recommend that only the special lubricants listed below be used in Power-Lock axle assemblies.*

Buick & Buick Special – Special Lubricant, Part No. 531536. Any other lubricant must conform to Buick Specification No. 723.

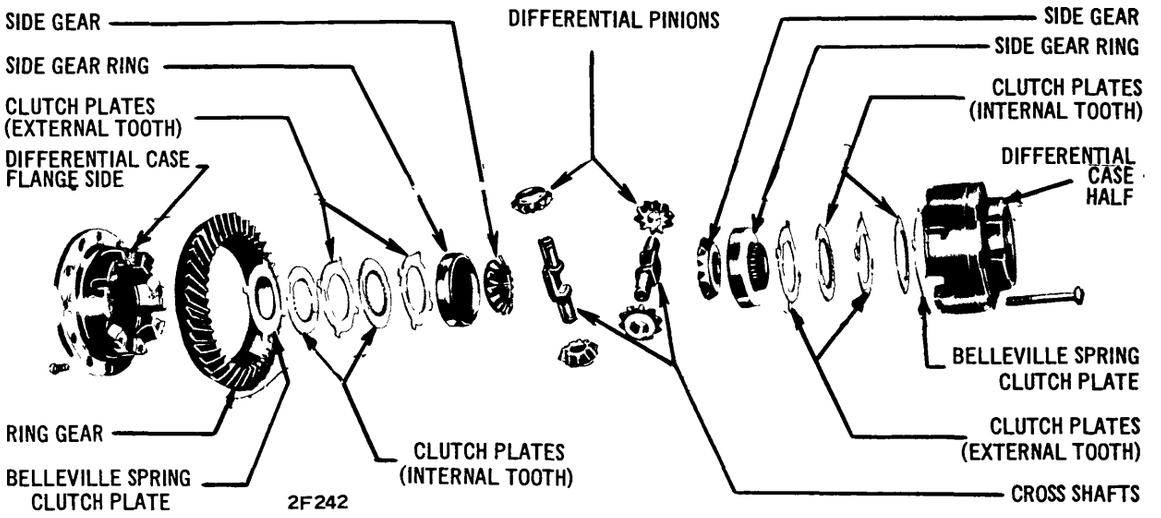
Chevrolet & Chevy II – Positraction Lubricant, G.M. No. 3758790 or No. 3758791.

Chrysler Corp. Cars–Sure-Grip Lubricant, No. 1879414.

Lincoln Continental – Special Lubricant, Part No. COLY-19A508-B.

Oldsmobile – Special Lubricant, Part No. 531536.

Pontiac – Multi-Purpose Hypoid Gear Lubricant.



Rambler – American Motors "Twin-Grip" Lubricant.

Studebaker – Studebaker-Packard "Twin Traction" Lubricant.

Willys – Willys Powr-Lok Differential Oil, Part No. 94557.

DIFFERENTIAL OR AXLE ASSEMBLY REMOVAL: *See appropriate Conventional Rear Axle data for each car model.*

OVERHAUL: *NOTE – Procedures below are for Power-Lock Differential assembly only. For other axle components and for specifications and checking, see appropriate Conventional Rear Axle Data for each car model.*

POWER-LOCK DIFFERENTIAL ASSEMBLY WITH BELLEVILLE SPRINGS (EXPLODED)

Disassembly: Remove ring gear from case if either ring gear or case are to be replaced. Remove differential bearing outer race from case if bearing is to be replaced. Scribe mark both case halves for proper alignment at reassembly, and note cross shaft markings for proper reassembly. Remove bolts holding assembly together and separate case halves. Remove case cover half cross shaft, pinions, side gear, side gear ring, clutch plates and discs. Remove same parts from flange half of case. *NOTE – Keep parts for each case half together.*

► *DISASSEMBLY CAUTION: Note exact sequence, position, and number of plates and discs in each clutch pack so that parts may be reassembled in identical arrangement. "Belleville" (dished) type plate and/or disc must have convex side away from center of differential.*

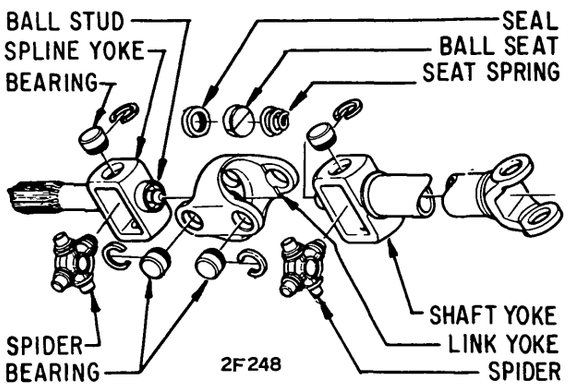
Cleaning & Inspection: Clean and dry all parts. Inspect for worn, pitted, or scored parts and replace as necessary. *NOTE – Case halves must be replaced in pairs only.* Replace clutch packs if any clutch disc or plate worn, cracked, or distorted.

Reassembly: Install ring gear and new differential bearing outer race if these parts were removed. On flange half of case, install clutch pack on side gear, install side gear ring in case half, then install side gear and clutch pack into case. Install pinion gear and cross shafts (beveled sides of cross shafts must match ramps on case). Install other side gear, clutch pack, and retaining ring, aligning clutch plate lugs with slots in case. Place other case half on assembly with scribe marks in alignment, then install assembly bolts and torque to 35–45 ft. lbs. (60–70 ft. lbs. on Model 60 or 70 axles). Check that metal-to-metal contact exists between pinion cross shafts and case "V" ramps. If more than .002" clearance exists, clutch pack may have to be replaced.

CONSTANT VELOCITY UNIVERSAL JOINTS

Buick (1962)
Buick Special (1962)
Lincoln Continental (1962)
Oldsmobile F-85 (1962)

► *1961-62 BUICK & BUICK SPECIAL TOOL KIT NOTE:* Tool Set J-9522 for use with a 12-ton press ram, is available to service constant velocity universal joints.



► *PROPELLER SHAFT HANDLING CAUTION: To prevent damage to constant velocity universal joint center metal ball when removing shaft assembly from car or when handling the assembly after removal, care must be taken to support shafts at both sides of constant velocity joint if shaft is moved horizontally. Do not allow one end of shaft to hang free or allow universal joint to bend at a sharp angle. Shaft assembly may be carried in a vertical position without damage to constant velocity joint.*

DESCRIPTION: Constant velocity type universal joint consists of two single joints connected with a special link yoke with a center ball and socket between joints to maintain relative position of the two units. This center ball causes each of the two joints to operate through exactly one half of the complete angle between front and rear propeller shafts, resulting in both shafts turning at a constant velocity.

LUBRICATION: Buick - *NOTE - Universal joints are lubricated for life and require no additional lubrication except as follows:* Center metal ball must be lubricated every 5000 miles with Multi-purpose Grease E.P. No.1. Fitting in universal joint is accessible through rear hole of frame tunnel (rotate drive line to line up fitting with hole). A special nozzle, Alemite Part No. 326375, or equivalent, is required to apply lubricant to fitting.

Lincoln: Lubricate three fittings on universal joint with chassis lubricant every 6000 miles.

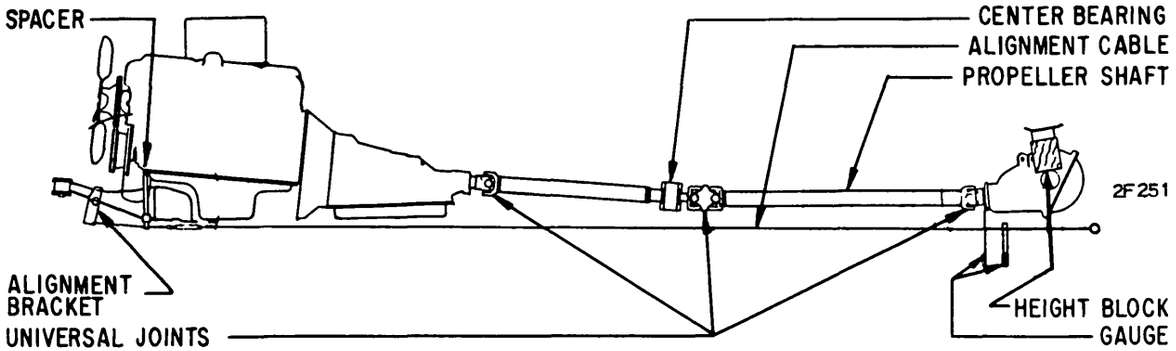
Oldsmobile : Every 20,000 miles, disassemble and clean universal joint, then repack with sodium soap, fine fibre grease (Marfak Heavy Duty or equivalent).

CONSTANT VELOCITY UNIVERSAL JOINT

BUICK, CADILLAC, OLDSMOBILE PROPELLER SHAFT ALIGNMENT

Buick (1962)
Buick Special (1962)
Cadillac (1962)
Oldsmobile (1962)
Oldsmobile F-85 (1962)

►CHANGES, CAUTIONS, CORRECTIONS



►*1962 BUICK (EXCEPT SPECIAL) LIGHT DRIVELINE SHUDDER ON LIGHT ACCELERATION CORRECTION:* If propeller shaft rear universal joint angle correctly adjusted, slight deviations from specifications may correct the trouble. *CAUTION – If rear joint angle decreased, part throttle shudder will be decreased, but full throttle shudder may be increased. If rear joint angle increased, part throttle shudder will be increased, and full throttle shudder decreased. If rear joint angle too large, it may cause roughness at 25–30 MPH.* If varying rear joint angle does not correct shudder, use Buick Special type lower control arm adjusting shims and shim between transmission mounting pad assembly and transmission support crossmember. Do not shim in excess of 1/4" and make sure there is no less than 5/8" clearance between transmission case and underbody. If transmission raised more than 1/8", install longer mount attaching bolts.

►*OLDSMOBILE F-85 DRIVE LINE SHUDDER WHEN STARTING CORRECTION:* Caused by too high nose angle setting. Check nose angle and reset to specifications.

►*PROPELLER SHAFT HANDLING CAUTIONS: To prevent damage to constant velocity universal joint center metal ball when removing shaft assembly from car or when handling the assembly after it is removed, care must be used to support shaft on both sides of constant velocity joint if shaft is moved horizontally. Do not allow one end of shaft to hang free or allow universal joint to bend at a sharp angle. Shaft assembly may be carried in a vertical position without damage to constant velocity universal joint.*

DESCRIPTION: Measurement of rear universal joint angle (for correct propeller shaft alignment) is accomplished by the use of a spring loaded steel cable stretched between front of chassis and rear axle carrier, on centerline of propeller shaft. When rear universal joint angle is adjusted correctly, the steel cable will clear underside of pinion flange by a definite amount.

CHECKING & ADJUSTING PROPELLER SHAFT ALIGNMENT: Buick (Exc. Buick Special) - Use Alignment Set, J-8973 as follows: Raise rear of car body and install Rear Tubular Spacers, J-8973-19 with upper end over head of rear compression bumper mounting bolt (at each side of car) and with lower ends of spacers resting on axle housing, then lower car body onto spacers. Remove nut from differential carrier mounting stud on each side of lowest stud. Thread Extensions, J-8973-17 on these two studs and attach Bracket J-8973-16 with bent lip toward rear, using original stud nuts. Attach hook of Bracket J-8973-15 over center of front frame crossmember, then with shallow slot of Engine Height Plate J-8973-14 down, place wide upper end against flange of engine oil pan being certain plate rests on **flat** portion of pan flange. With cable in notch in spacer, pull clamp tight and hook it through a slot in rear bracket so one of the stops is to rear of bracket. Measure distance from centerline of cable to machined surface immediately in front of slinger on pinion flange. Distance should be 3 1/4" ± 1/32" on 4400 & 4600 Series, 3 3/8" ± 1/32" on 4800 Series. If measurement is not within specifications, remove adjusting bolt (through two holes) and loosen two clamping bolts (through hole and slotted hole) and adjust arm until universal joint angle is correct. Install adjusting bolt through set of holes that most nearly coincide. Tighten bolts to 60 ft. lbs. Recheck measurement.

PROPELLER SHAFT ALIGNMENT GAUGE TOOL INSTALLATION

Buick Special: Use Alignment Set, J-8973 as follows: Raise rear of car body and install spacer blocks J-8973-20 (Station Wagons), J-8973-21 (Sedans) so slots straddle rubber bumpers. Hold spacer block up against bumper mounting straps and allow car to settle until axle housing contacts blocks. Remove differential cover bolt on each side of lowest cover bolt, then using these two bolts, attach Rear Bracket J-8973-16 so slotted portion of bracket is vertical. Tighten bolts securely. Engage Front Attaching Bracket J-8973-13 in front crossmember assembly using hole immediately to rear of front mount. Hook slot of bracket into rear of hole. **On V8,** place Engine Height Rod J–8973–3 (notched end down) through round hole in front crossmember assembly so upper end of pin bears against engine oil pan between front oil pan bolts. **On V6,** place Engine Height Rod J–8973–31 so that upper end bears against engine oil pan between two **rear** oil pan bolts. **On all cars,** place cable in notch of height rod, pull cable tight and hook into rear bracket so one of stops on cable is to rear of bracket slot. Measure perpendicular distance from cable to machined surface immediately in front of slinger on rear flange. This distance should be 3 3/16" ± 1/32". If measurement is not within specifications, shims must be added or subtracted between lower control arm forward mounting brackets and underbody side rail. *Add or remove shims in equal amounts on both sides of car.*

Cadillac Vertical Alignment: Use Propeller Shaft Alignment Gauge Set J-8905 as follows Place car on a level surface or on a suitable hoist. *NOTE - Gasoline tank must be full.* Remove two bolts from bottom front face of flywheel cover and install Bracket J-8905-20, securing it in place with the two bolts removed from cover. Remove two nuts and washers from two lower studs on front face of differential carrier assembly and install Rear Bracket J-8905-7, securing it in place with nuts. Measure and record standing height (direct vertical distance between top of rear axle housing and frame). *NOTE - Use average of right and left hand measurements.* Install Spacer Rods, J-8905-16, between top of rear axle housing and lowest underside surface of frame on both sides, then load down or raise car to hold spacers securely. Install spring end of Alignment Cable, J-8905-2 in slot in Front Bracket and other end of cable in Rear Bracket. *CAUTION - Propeller shaft must be checked at rear, center, and front before any adjustment is made. When checking, make certain that gauges are held as vertically as possible, and all gauge readings should be taken with marked side of gauges facing front of car.* Check propeller shaft height at rear by placing end of Gauge J-8905-21, on bottom of propeller shaft, ½" forward of weld at rear yoke. Note propeller shaft height by checking relation of gauge notch "R" to cable. Check propeller shaft height at center by inserting end of Gauge J-8905-21, in hole in bottom of frame tunnel until gauge rests against bottom of propeller shaft. Note propeller shaft height by checking relation of gauge notch "C" to cable. Check propeller shaft height at front by placing end of Gauge J-8905-6 against machined surface of transmission slip yoke (rounded surface of shaft that enters transmission extension) Note propeller shaft height by checking relation of notch in gauge arm to cable. If propeller shaft was not within specifications as indicated by gauges and cable, adjust as indicated in table below.

Propeller Shaft Adjustment

Checking Location	Shaft Too High ①	Shaft Too Low ①	Adjusting Location
Rear	Add	Remove	②
Center	Remove	Add	③
Front	Remove	Add	④

① - Add or remove shims.
② - Rear Lower Control Link. See adjusting procedure below.
③ - Propeller shaft center mount. See adjusting procedure below.
④ - Engine rear mount. See adjusting procedure below

Adjustment (Rear Lower Control Link) - Add or remove shims between front mounting brackets for lower control arm links and the No. 4 outriggers. Shims are available in thicknesses of 1/32" and 1/16" *CAUTION - Shims of equal thickness must be added or removed from right and left control links.*

CONTINUED ON NEXT PAGE

BUICK, CADILLAC, OLDSMOBILE PROPELLER SHAFT ALIGNMENT (Continued)

Propeller Shaft Center Mount - Add or remove shims between bottom of center bearing support bracket and frame tunnel. Shims are available in thicknesses of 1/8" and 1/16".

Engine Rear Mount - Add or remove washers between engine rear mount and engine rear support crossmember. Washers of equal thickness must be added or removed at both legs of mount.

►*CADILLAC ADDITIONAL ADJUSTMENT TO COMPENSATE FOR INCORRECT STANDING HEIGHT:* In the event standing height at rear of car was not within specifications of 5¾"-6" as measured and recorded before checking propeller shaft alignment (see above), variations must be made in propeller shaft alignment as follows: If standing height was 5½-5¾", add 1/16" shim at center mount. If standing height was 6-6¼", remove 1/16" shim at center mount. *NOTE - If there are no shims at center mount, remove 1/16" shim from both lower control link brackets, and add 5/64" washers to both engine rear mount legs.* If standing height was 6¼-6½", remove 3/32" shim thickness from both lower control link brackets and remove 1/16" shim from center mount. *NOTE - If there are no shims at center mount, remove 1/8" shim thickness from both lower control link brackets, and add 5/32" washer to both engine rear mount legs.*

Cadillac Horizontal Adjustment: After checking vertical alignment, proceed as follows: Hang plumb bobs, J-8905-14 over both front and rear of propeller shaft so they hang free and clear any obstruction, then hang Alignment Gauge, J-8905-17, on cable at rear of propeller shaft between plumb bob lines. Move cable in slot in rear bracket until extended arm of gauge (upper part) is centered between plumb bob lines. Hang Horizontal Alignment Gauge, J-8905-17 on cable at front of propeller shaft between plumb bob lines. Move cable in slot in front bracket until arm of gauge (lower part) is centered between plumb bob lines. *NOTE - If it was necessary to align cable at either end, recheck cable alignment at opposite end.* Hang gauge on cable (using proper slot) with printed side of gauge facing front of car. Position gauge just under center bearing support mounting bolts. Check alignment of bolt head centers in relation to marks on gauge. Bolt heads should align with marks on gauge within 1/16". If shaft is out of horizontal alignment, it will be necessary to move center bearing support either to right or left as required. *NOTE - In some cases, bolt mounting holes may have to be slotted with a rat-tail file. Slide front of propeller shaft toward rear of car to provide clearance for filing bolt holes.*

Oldsmobile (Std.): Use Tool BT-30-1 and BT-30-2. Connect cable at front frame crossmember, see diagram. Install rear bracket on the two lower right studs on differential carrier. Hook cable in upper hole on rear bracket, then install spacer between cable and bottom of front engine mount. Install hold down clamps around axle housing (lower hook end should point toward front end of car). Install upper hook into 3/4" hole in frame immediately above axle housing. Adjust turn buckles on clamps until wooden blocks fit snugly between axle housing and rubber bumpers. *NOTE - It may be necessary to lift car to install wooden blocks.* Position gauge, see diagram, and check differential nose angle alignment. If cable is not within limits of gauge notch, the nose angle can be corrected by lengthening or shortening the lower suspension arm.

Oldsmobile F-85: Use alignment tool BT-30-2 and install on car in the same manner as for Buick Special (above), including special spacer block between axle housing and rubber bumpers. With indicator of Tool Set BT-30-2 placed against differential pinion companion flange cable must be in correct notch, see Tool Modification below. If necessary to adjust, remove shims from front of rear lower suspension arm (cable below notch); add shims (cable above notch. *NOTE* - The same amount of shims must be added or removed from both sides of car. 1/8" shim will raise or lower nose angle of differential assembly approximately 1/16".

►*F-85 TOOL KIT BT-30-2 CHECKING GAUGE MODIFICATION NOTE:* Remove Plastic handle. Cut two new 1/8" notches (opposite sides) exactly 3 31/64" (Station Wagon), 3 27/64" (Sedan) from center of notch to end of tool from which you removed handle. Reinstall handle on opposite end and scribe the words "Station Wagon" and "Sedan" on respective side of tool.

CHRYSLER CORP. PROPELLER SHAFT ALIGNMENT

Chrysler Imperial (1962)
Dodge & Dodge Dart (1962)
Plymouth (1962)
Lancer & Valiant (1962)
ALL MODELS (EXCEPT IMPERIAL)

REAR UNIVERSAL JOINT OPERATING ANGLE: Check and adjust as follows:

►*CHECKING CAUTION:* Car weight must be on wheels (use drive-on type hoist or platform) and there must be no extra weight in trunk.

Checking Rear Universal Joint Angle: 1) Remove rebound plate and bumper from top of differential carrier housing. Place spirit level protractor on machined surfaces of rebound plate bosses. Level bubble and note reading. *NOTE - Carrier housing should incline downward slightly. To adjust, install a tapered shim between rear spring and seat on axle housing with thick end toward rear of car.* Recheck angle.

2) Place protractor on underside of propeller shaft near rear universal joint. Center bubble and note reading. Add this reading and pinion angle reading (above). Total should be 1–3°. Add or remove shims as above to obtain this angle. Tighten rebound plate assembly bolts to 200 inch–pounds, and rear spring U–bolt nuts to 70 ft. lbs.

IMPERIAL

PROPELLER SHAFT: Removal - Remove front universal joint clamps from transmission yoke (unnecessary to remove bushings if retainer strap used). Remove rear universal joint clamp in same manner. Remove center bearing housing bolts and shims from under housing. Remove front and rear propeller shaft and center bearing as an assembly.

Installation: Insert front propeller shaft over body crossmember and tighten front universal joint-to-transmission yoke bolts to 170 inch-lbs. Connect rear universal joint to rear axle pinion yoke and tighten bolts to 170 inch-lbs. Place same number of shims as removed under center bearing housing, install housing and tighten bolts to 35 ft. lbs.

CENTER BEARING: Disassembly - After propeller shaft assembly removed, clean bearing housing and note the index marks on rear of front shaft and shoulder of sliding yoke. Straighten tab of star washer and unscrew cap from front shaft. Slide star washer and slinger from center bearing housing. Pull sliding yoke, cap, and seal from front shaft. Remove bearing housing from front shaft and press bearing from housing.

►*BEARING SERVICE NOTE:* Bearing is permanently sealed and no lubrication or service required except replacement.

Reassembly: Repack internal splines of front shaft with multi-purpose grease and install slinger on shaft. Press bearing into housing and install on front shaft. Install slinger and star retaining washer. Lubricate inside of seal and install cap and seal on sliding yoke using care not to damage seal on splines of yoke. Align index marks of front shaft and yoke and install yoke. Tighten retaining cap enough to compress seal firmly on shaft of yoke but free enough to permit free back and forth movement of yoke in front shaft. Lock retaining cap by bending tab of washer into notch in cap.

PROPELLER SHAFT ALIGNMENT: *NOTE - Make sure fuel tank is full and check shaft indexing by unscrewing cap seal retainer. "O" mark on splined yoke should line up with keyway in shaft.* With car level and weight of car on the wheels, remove differential carrier rebound bumper plate. Remove shims from both rear axle control strut frame brackets. Place Aligning Gauge J-6845 on machined pads of differential carrier and center the bubble. *NOTE - Level of gauge must be on same side of propeller shaft each time gauge is used.* Place gauge on rear propeller shaft near rear universal joint. Entire bubble should be within three graduations from center of gauge. If edge of bubble is ahead of the third graduation, change rear axle pinion angle as follows: Install 2° tapered shims between both rear springs and axle housing pads with thick edge of shim toward front of car. Tighten spring U-bolt nuts and install shims behind control strut brackets so space is filled. Tighten brackets. Install differential carrier rebound bumper plate.

CENTER BEARING HEIGHT ADJUSTMENT: Install Gauge Adapter part of Tool J-6845 on front propeller shaft near front universal joint. Place gauge of tool on rear propeller shaft at rear universal joint and adjust gauge to center bubble. Attach gauge to pins on adapter. For each graduation leading edge of bubble is forward of center, add one shim under center bearing housing bracket. For each graduation trailing edge of bubble is to rear of center, remove one shim from under center bearing housing bracket.

CHEVROLET (PASS. CAR) PROPELLER SHAFT ALIGNMENT

Chevr l t Pass. Cars (1962)

►*PROPELLER SHAFT SHUDDER CORRECTION:* Correct propeller shaft angle as indicated below.

PROPELLER SHAFT ANGLE CHECK & ALIGNMENT: Front shaft angle "A", rear shaft angle "B", pinion shaft angle "C" and frame riding height "D" must be within limits as shown in table below. *NOTE* - When vehicle driven continuously at maximum load conditions, angle "B" may be increased approximately ¼-½° (in negative direction).

Angle "A" - Is relation of engine angle to front propeller shaft angle. Place protractor on rocker arm cover for engine angle, up against front propeller shaft for front shaft angle. *NOTE* - DO NOT lean on front fender when taking engine angle.

Angle "B" - Is relation of front and rear propeller shaft angles. To determine rear propeller shaft angle, place protractor up against rear propeller shaft.

Angle "C" - Is relation of rear propeller shaft angle to pinion shaft angle. To determine pinion shaft angle, rotate rear universal joint to bring machined surface down parallel with floor and place protractor on this surface.

Riding Height "D" - Is distance from top of axle housing to frame kick-up. This measurement must be equal within ¼" on each side.

NOTE - Support car on tires, ramp or twin post hoist (not on frame hoist) when making angle checks.

Determining Angles - Angles "A", "B", "C" are the result of subtracting rearmost of the two angles from preceding one (example - Engine angle minus front propeller shaft angle), except when second angle is "up at rear" (Higher at rear of protractor than at front), the second angle should be added to first one.

Correcting Angles - Std. Procedure - 1) When angle "A" is not correct, change number of shims under transmission support. Adding shims reduces angle, reducing shims increases angle.

2) When angle "C" is incorrect, change number of shims at upper arm attaching point. Adding shims reduces angle, reducing shims increases angle.

NOTE - Correcting angles "A" and "C" should automatically correct angle "B". See Optional Procedure below for correcting angles "A" and "C".

Optional Procedure - For correcting angles "A" and "C", loosen or remove frame center bearing support bolts (under center section) and insert transmission shims between frame section and the support inside driveshaft tunnel. *CAUTION* - Always recheck angles "A" and "B".

Vibration Note - If objectional vibration exists when joint angles are within specifications, readjust angle toward opposite limit (high toward low or low toward high limit).

Angles & Height Specifications

Angle "A"	Angle "B"	Angle "C"	Height "D"
Pos. 2½-3°①	Neg. 1-1½°②	Pos. 2¾-3¼°③	Pos. 6¼ ± 3/8"

① - Pos. 2¾° desired. ② - Neg. 1¼° desired.
③ - Pos. 3° desired.

LINCOLN CONTINENTAL PROPELLER SHAFT ALIGNMENT

Lincoln Continental (1962)

PROPELLER SHAFT ANGLE: *NOTE* - Vibration or "shudder" upon fast acceleration, or when coasting using engine as a brake, may be caused by either rear axle being loose in springs or by excessive propeller shaft angle. Propeller shaft angle is the result of Pinion Nose Angle in relation to Riding Height with "U" bolt nuts tight.

Pinion Nose Angle - Place vehicle on known level surface that will allow access to rear axle pinion nose. Drill a small hole in common protractor at exact center of base (0°) line, and insert a line through hole with a light weight attached for bob. Place base of protractor vertically against front face of pinion housing and read where lines crosses scale.

Riding Heights - Place vehicle on smooth level floor. Inflate tires to 24 lbs. with full fuel tank and all loading removed from passenger and luggage compartment. Push rear bumper down (at center) 1" and release slowly. Measure distance from top center of axle housing to top of frame kick-up at rear of bumper bracket. Raise center of bumper 1" and release slowly and again measure distance. Average of two readings is true riding height. Riding height should be 7.2-8.5" with 8" normal.

Riding Height	①Pinion Nose Angle
6 inches	4° Down
7 inches	3½° Down
8 inches	3° Down
9 inches	2½° Down

① - Tolerance ±¼°.

Check Pinion Nose Angle with Riding Height as shown in table above. When Nose Angle does not correspond with Riding Height, remove rear axle "U" bolt nuts and install appropriate wedges (½, 1, & 1½°), between each spring insulator upper retainer and axle housing mounting pad, with no more than one wedge to be used on a side. Install "U" bolts and torque to 50-60 ft. lbs. *NOTE - Be sure lower insulator retainer contacts upper retainer.*

STUDEBAKER PROPELLER SHAFT ALIGNMENT

Studebaker, All Models (1962)

►*1962 PROPELLER SHAFT-FLOOR PAN INTERFERENCE CORRECTION (Daytona Hardt p & R gal Cruiser With V8 Eng. & 4-Sp d Trans.):* If propeller shaft interferes with floor pan with rear springs in full jounce position, make sure there are no ¼" spacers between engine rear insulators and clutch housing.

DRIVE LINE ALIGNMENT: Raise rear wheels off floor and put transmission in neutral. Clean shaft with sandpaper. With dial indicator, measure runout of propeller shaft at front, center, and rear, while turning shaft slowly by hand. *NOTE – Mak nd measurem nts about 1½" back from weld j int.* Maximum runout should be .010" at front or rear and .015" at center. If not within limits check flanges of transmission and differential. Measure shaft runout and end nearest flange and mark flange at highest runout. Disconnect universal joint, rotate flange 180° and reassemble. Check runout again. If high side of runout is still on same side, flange is at fault. If rotating flanges does not correct runout, replace shaft and/or flanges.

DRIVE LINE ANGLE CHECKING & ADJUSTMENT: Check angles with level gauge or protractor. *NOTE – Manufacturer recommends us of Sp cial Protractor Gauge J–7181 for best results.* Raise car on drive—on hoist with weight on wheels and frame level. Bounce body up and down several times to normalize spring position and DO NOT DISTURB this position when taking angle checks.

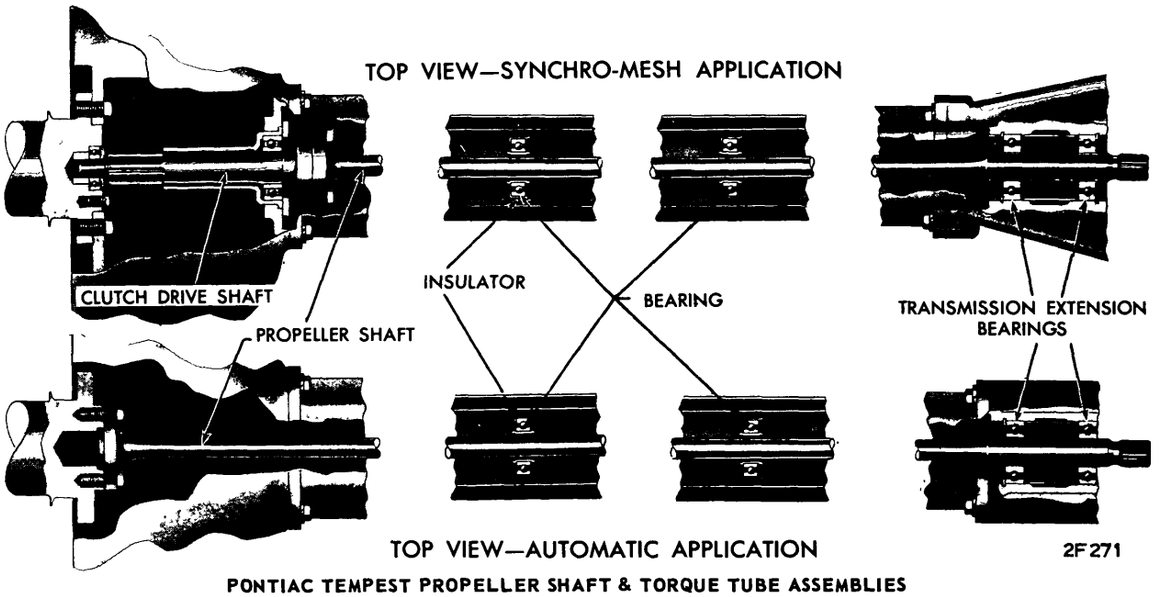
Front Universal Joint Angle: Place gauge against clean surface of propeller shaft near front universal joint, so pendulum or pointer is free to swing. Move protractor scale so pointer is set at 90° mark. Remove gauge (do not disturb setting) and place it on clean bottom surface of starter housing. When pointer comes to rest, read degrees indicated from 90° mark. This reading represents front universal joint angle. Angle should be 4–5°.

Rear Universal Joint Angle: Proceed as for Front Universal Joint Angle Check except in second operation, place adjusted gauge vertically against forward edge of differential housing in back of universal joint. *NOTE – Gauge must not contact pinion b aring oil s al.* When pointer comes to rest, read degrees indicated from the 180° mark. This reading represents rear universal joint angle. Angle should read 4½–5½°.

CAUTION – For best results th r should b approximately ½° greater angle at r ar than at front.

ADJUSTMENTS: To change fr nt universal joint angle, add or remove shims or spacer washers at engine rear support insulators. To change r ar universal joint angle, add or remove wedge type caster shims at axle pad and rear springs.

PONTIAC TEMPEST PROPELLER SHAFT & TORQUE TUBE



Pontiac Tempest (1962)

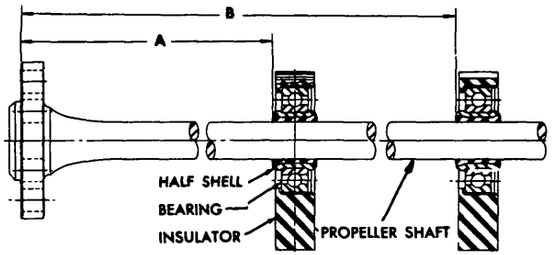
DESCRIPTION: Flexible type propeller shaft enclosed within rigid torque tube and ball bearing assembly similar to previous models. Rubber insulator assemblies, pressed on ball bearings, support bearings in torque tube.

REMOVAL: Synchro-mesh Transmission Cars – Remove parking brake cable from torque tube, then remove complete exhaust system (break at engine and slide system off). Remove gearshift housing, and flywheel housing bottom cover. Remove torque tube access cover. Remove bolts from propeller shaft flange and place a piece of rag or rubber hose between propeller shaft and torque tube to prevent damage to coating on shaft, then disconnect torque tube from flywheel housing. Support torque tube and pry away and down from housing. Put a 2" square wood block between transmission extension and car floor to position transmission for reassembly. Remove torque tube–to–transmission bolts. *CAUTION – Torque tube and propeller shaft are now held in place only by bearings in transmission extension and must be supported to prevent bearing or shaft damage.* Remove torque tube and shaft as an assembly by pulling on propeller shaft flange. *CAUTION – Pull propeller shaft straight out of transmission so that shaft will not bind in transmission or transmission extension.* Place assembly on a bench and pull propeller shaft out of torque tube. *CAUTION – DO NOT damage coating on propeller shaft.*

Automatic Transmission Cars: Remove parking brake cable and vacuum line from torque tube, then remove stabilizer bar. Remove exhaust system (break at engine and slide system off). Remove flywheel bottom cover, then disconnect propeller shaft from flywheel. Back out about half–way, bolts holding torque tube to flywheel housing. Place a rag or rubber hose between propeller shaft and torque tube to prevent damage to coating on shaft, then pry propeller shaft flange to rear sufficiently for pilot to clear recess in flywheel. Disconnect torque tube from flywheel housing and put a 2" square block of wood between transmission extension and car floor to position transmission for reassembly. Remove torque tube–to–transmission bolts. *CAUTION – Torque tube and propeller shaft are now held in place only by bearings in transmission extension and must be supported to prevent bearing or shaft damage.* Remove shaft and torque tube assembly by pulling on shaft flange. *CAUTION – Pull shaft straight out of transmission so shaft will not bind in transmission or extension.* Place assembly on a bench and pull propeller shaft out of torque tube. *CAUTION – DO NOT damage coating on propeller shaft.*

PROPELLER SHAFT BEARINGS: Removal – Use Tool Set J–9528, Parts 3 & 4, to pull bearing off half-shell, then remove half–shells from propeller shaft. Support insulator with J–7022 or suitable tool and press bearing from insulator using a socket.

PONTIAC TEMPEST PROPELLER SHAFT & TORQUE TUBE ASSEMBLIES



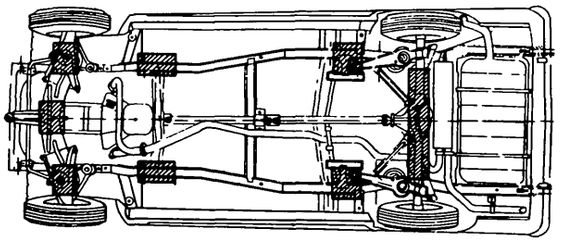
Installation: Place half–shells on shaft at dimensions indicated in illustration and clamp in position with Tool Set J–9528, Parts 1 & 2. Place bearing and insulator on shaft between arrows on tool parts 1 & 2, install tool part 4 on shaft and install bolts through tool parts 1 & 2 and into tool part 3. Tighten bolts evenly so tool does not cock and tighten until tool is completely closed (this will locate bearing on half–shell). Remove tool from shaft and inspect for centering (nibs on each side of I.D.). Also make sure shells are not cocked or edge damaged (will cause rubber–to–metal bond failure).

INSTALLATION: Synchro–mesh Cars – With propeller shaft installed in torque tube, place rag or rubber hose between shaft and tube to protect shaft. Coat spline with axle oil and install shaft into extension seal. *CAUTION – DO NOT let shaft rest on seal.* Engage spline into transmission and journal diameter into transmission extension bearings (do not damage journal surface). *CAUTION – Check spline alignment into transmission extension, and if absolutely necessary, tap front flange lightly with a soft rubber hammer. Be sure splines are completely engaged in transmission.* Tighten torque tube–to–transmission extension bolts to 30–45 ft. lbs., then remove wood block from between transmission and car floor. Tighten torque tube–to–flywheel housing bolts finger tight, then tighten propeller shaft–to–clutch drive shaft bolts finger tight. Remove rag or rubber protector. Tighten propeller shaft flange bolts and torque tube–to–flywheel bolts to 30–45 ft. lbs. Install torque tube access cover and tighten bolts to 40–80 inch–pounds. Install gearshift housing and exhaust system.

Automatic Transmission Cars: Installation procedure is same as for synchro–mesh cars (above). Install stabilizer bar before installing exhaust system, then install parking brake cable and vacuum line.

USAGE	DIM. A	DIM. B
AUTOMATIC	27 1/32"	54 1/32"
3 SPEED S.M.T.	20 7/8"	47 5/8"
4 SPEED S.M.T.	20 7/8"	47 5/8"

2F272



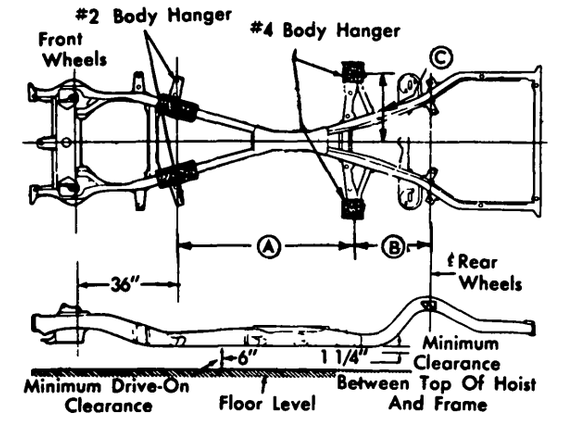
CENTER BEARING LOCATING DIMENSIONS

BUICK & BUICK SPECIAL

Jacking & Hoisting: All Cars - *CAUTION - When lifting at lower control arm, lifting pad must not contact steering arm or linkage or damage will result.*

Buick Special - Jack or lift car at points shown in illustration.

Buick - Jack car at spring seat on front lower control arms or center of front crossmember (front), and along entire length of rear axle housing (rear). Lift car at front frame side rails just forward of body floor pan (front), and rear of frame side rails at lower control arm front pivot (rear).



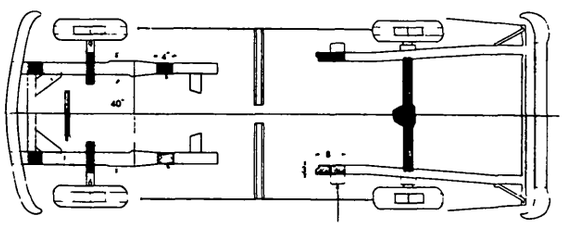
BUICK (SPECIAL) FRAME CONTACT POINTS 2A88

CADILLAC

Hoisting: Hoisting equipment that engages suspension, axle, or wheels is preferred. With this type equipment, use caution to prevent damage to shock absorber mounts, exhaust pipe and mufflers. When using a frame contact type hoist, special adapters must be used on hoist rails to assure engagement with car frame at locations indicated by shaded areas in illustration. Take care to prevent hoist adapters contacting any part of the No. 2 body hanger. Hoist contact at rear should be at outer ends of No. 4 body mounting brackets. In no case should rear contacts be less than 32½" apart. *CAUTION - Hoist should not contact rear lower control link front mounting bracket. DO NOT lift Series 75 or Commercial Chassis cars on frame contact hoist as severe stress and misalignment will result due to length of frame and car.*

Cadillac Frame Dimensions

Series	Dimension A	Dimension B	Dimension C
60 & 62	64.50"	29.50"	16.25"

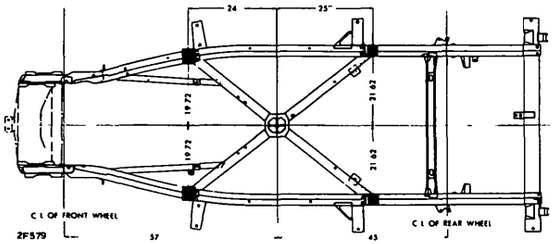


CADILLAC FRAME CONTACT POINTS 2A89

CHEVY II

Jacking (Bumper Jack): Locate bumper jack under bumper at point of attachment to support. *See diagram.*

Jacking (Floor Jack): Floor jack can be located under lower control arms, rear axle housing, forward ends of rear frame members, both ends of front frame members and front crossmember (located just forward of oil pan). *See diagram.*

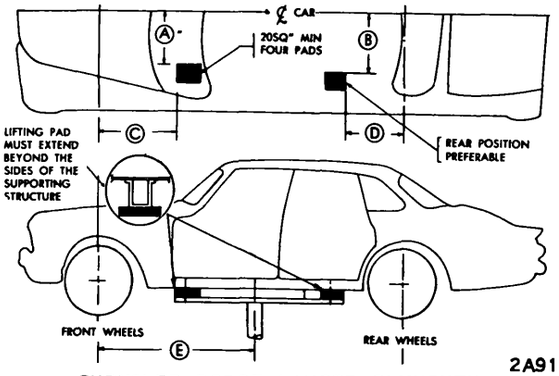


Hoisting (Frame Contact Hoist): Position hoist so contact is made at forward end of rear frame members and rear ends of front frame members. *See diagram.*

CHEVY II FRAME CONTACT POINTS 2A87

CHEVROLET CARS & CORVETTE

Hoisting: Equipment engaging suspension, axle, or wheels is preferred. With this type equipment, use caution to prevent damage to shock absorber mounts, exhaust pipes and mufflers. When using a frame contact hoist, special adapters must be used on hoist rails to assure engagement with car frame at locations indicated by shaded areas in illustration.



CORVETTE FRAME CONTACT POINTS

CHRYSLER, DODGE, DODGE DART, LANCER, PLYMOUTH, VALIANT

Hoisting (Frame Contact Hoist): This type hoist must be equipped with proper adapters so car will be supported in correct places as shown in illustration, and to specifications listed below.

	A	B	C	D	E
Chrysler SC1, 2	16.50"	17.25"	24"	22"	54"
Chrysler SC3	16.50"	17.25"	28"	22"	59"
Dodge	16"	17.50"	26.5"	20"	53"-58"
Lancer	14:20"	16.20"	20.3"	23.7"	48"
Plymouth	16"	17.50"	26.5"	20"	53"-58"
Valiant	14.20"	16.20"	20.3"	23.7"	48"

2A91

CHRYSLER, DODGE, LANCER, PLYMOUTH & VALIANT FRAME CONTACT POINTS

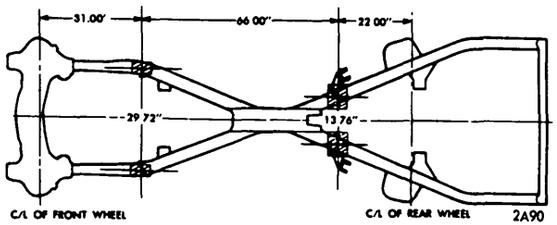
CHEVROLET TRUCKS

Jacking: Following list of jacking points will assist wheel and tire assembly changes with vertical type emergency jacks supplied with trucks.

Front

10, 20, 30 Models - Lower arm pivot or torsion bar socket.

40 Models - Frame side rail ahead of steering gear or idler support.



50, 60 Models - Frame side rail behind front crossmember. Use hardwood block between front crossmember and upper control arm to reduce jack travel.

Rear

10, 20, 30 Models - Axle housing.

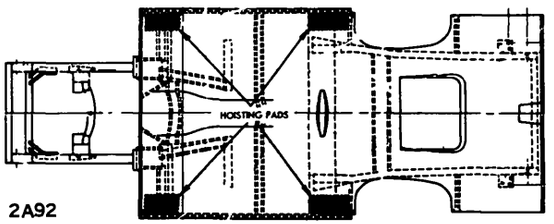
40 Models - Spring, ahead or behind axle.

50, 60 Models - Spring, in front of axle housing.

2A90

CHEVROLET FRAME CONTACT POINTS

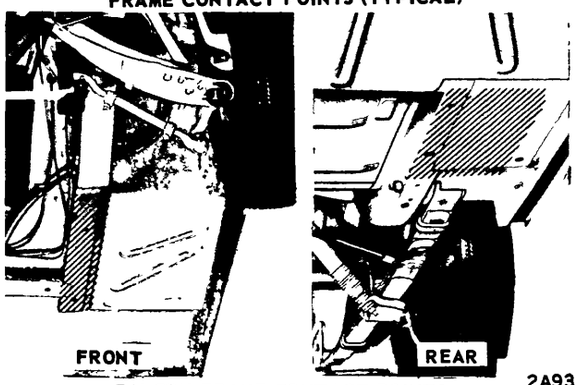
COMET, FALCON, FAIRLANE, METEOR & THUNDERBIRD



Jacking (Exc. Thund rbird): Either side of car may be raised at front by jack contact at lower control arm strut connection. Either side of car may be raised by jack contact on front crossmember, or on crossmember to which stabilizer is connected. Either side of rear end of car may be raised by jack contact on rear crossmember.

Jacking (Thund rbird): Either side of car may be raised at front by jack contact at either lower control arm. *CAUTION - Mak sur jack saddle is large enough to acc mm date control arm securely.* Either side of front end may be raised by jack contact on front crossmember or on crossmember to which stabilizer is connected. Either side of rear end may be raised by jack contact on rear crossmember.

H isting: Check all drive-on type hoists for possible interference with car underbody. Modify hoist and approach ramps as necessary to provide clearance.



Rail & F rk Lift (Twin Post) Hoists - Front adapters or hoist plates must be carefully positioned to contact lower suspension arms and must be large enough to cover entire spring seat area. Rear adapters or forks must be positioned under rear axle (forks must not contact axle at points more than 1" outboard from circumference welds near differential housing). *CAUTION* - Raise car slowly and make certain that rear shock absorbers are not damaged.

Fram Contact Hoist (All Models) - Frame contact hoist adapters are necessary to lift car. Hoist adapters should cover at least 12 square inches (Comet, Falcon, Fairlane & Meteor); 24 square inches (Thunderbird) of underbody area shown in illustration.

2A92

FAIRLANE, METEOR & THUNDERBIRD FRAME CONTACT POINTS (TYPICAL)

2A93

FALCON FRAME CONTACT POINTS

CORVAIR CARS & TRUCKS

SEDANS, STATION WAGONS, GREENBRIER, TRUCKS

Jacking: Sedans & Station Wagons - Jack at lifting areas shown in illustration. *CAUTION* - Jack tab must catch outer body flange to prevent jack sliding too far under car.

Greenbrier & Trucks - Use jack pads between front and rear wheels as shown in illustration. Pin on load rest of jack must engage in hole in jack pad.

Hoisting (Frame Contact Hoist): All Models - Hoist must contact shaded lifting areas shown in illustrations.

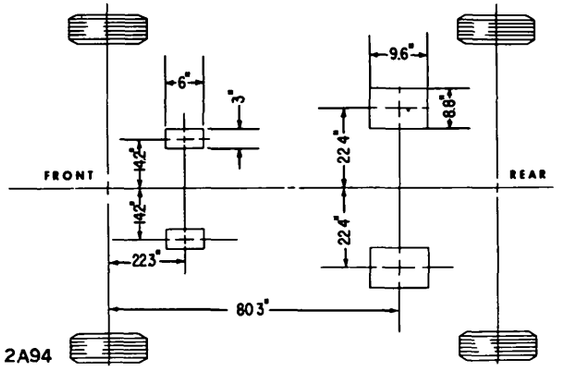
OLDSMOBILE

Jacking: Support car at suspension points only. Do not support car at extreme ends of frame or at center of frame side rails.

Hoisting (Frame Contact Hoist): Lift car at shaded areas shown in illustration.

OLDSMOBILE F-85

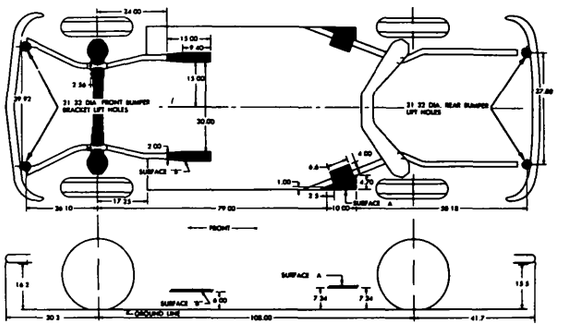
Hoisting (Frame Contact Hoist): Place contact pads of hoist at circled lifting points shown in illustration. Lift arms must not interfere with hand brake intermediate lever.



PONTIAC

Hoisting (Frame Contact Hoist): Lifting pads must be positioned at shaded areas shown in illustration to prevent damage to other parts. Ground clearance is 7½" front, 6" rear.

PONTIAC TEMPEST



Lifting: Lift car at any accessible point on frame side rail, at front crossmember, or front or rear lower control arms. *CAUTION* - 1) Avoid rear shock absorber brackets. 2) DO NOT lift at bumpers, torque tube, axle shafts, transaxle or engine. 3) Torque tube and exhaust system are lower than frame side rails and adapters must be used to provide clearance.

Towing: Tow **only** at front or rear crossmembers. DO NOT tow by bumpers, axle shafts, or steering linkage.

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT

►*WHEEL ALIGNMENT NOTE:* Before checking and adjusting wheel alignment, car must be at normal curb weight with the items listed below properly checked and adjusted. Also make sure that looseness in front suspension components not excessive.

Trim Height - Must be within limits specified for both front and rear. *See Individual Car Model Suspension Data in this section.*

Tire Inflation - Tires must be at correct pressure. *See Data below.*

Wheel Bearings - Must be properly adjusted. *See "Front Wheel Bearing Adjustment" in this section.*

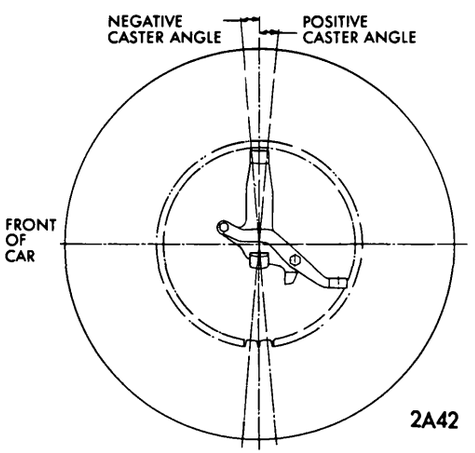
AMERICAN MOTORS

RAMBLER AMERICAN

ADJUSTMENT: Caster and camber adjustments are made by installing or removing shims between lower control arm mounting pivot bar and mounting bracket on underbody. *NOTE - Lower control arm pivot bar brace must be loosened before making caster and camber adjustments. When installing, tighten bolts to 70-80 ft. lbs.*

Tire Inflation (Cold): 24 lbs. front and rear.

Caster: Adjust caster by increasing or decreasing the thickness of shims at either front or rear mounting bolts as necessary.



Camber: Adjust camber by increasing or decreasing the thickness of shims equally at both front and rear mounting bolts as necessary.

RAMBLER CLASSIC & AMBASSADOR

ADJUSTMENT: Caster and camber adjustments are made by turning lower control arm mounting bolts which are provided with eccentric washers. After adjustment, tighten eccentric bolt nut to 50-55 ft. lbs.

Tire	Tire Inflation Pressure (Lbs.) Front	Rear
6.50, 6.70, 7.50	24	24
8.00	22	20
Captive Air ℂ	29	29
Captive Air ℂ	24	24

ℂ - Inner Chamber. ℂ - Outer Chamber.

CASTER ANGLE

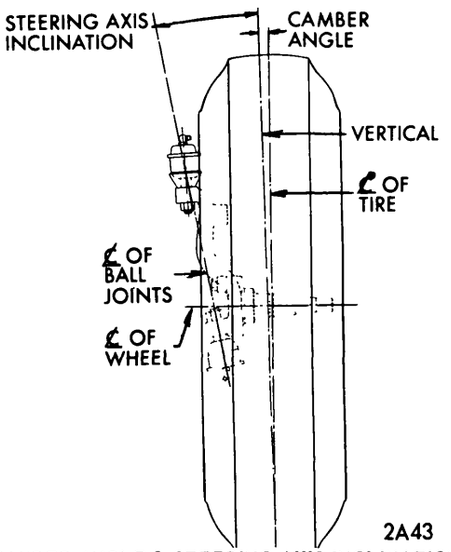
Caster: Loosen attaching bolt nut and turn with rear front or rear eccentric bolt as necessary for correct caster.

Camber: Loosen attaching bolt nut and turn both front and rear eccentric bolts equally to obtain correct camber.

CHRYSLER CORPORATION

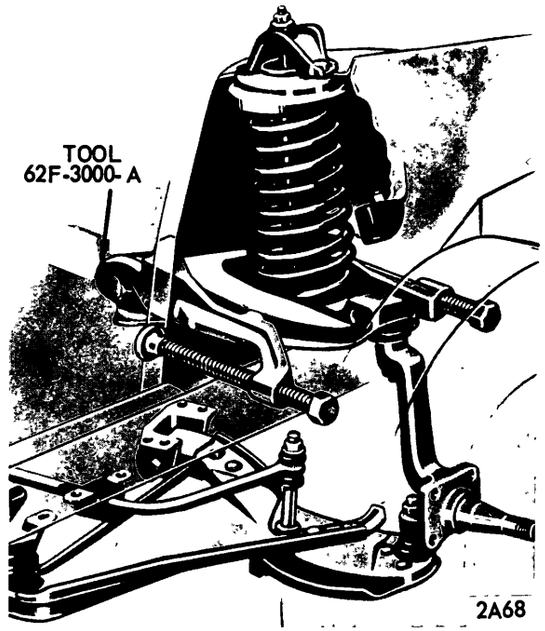
CHRYSLER, DODGE, LANCER, PLYMOUTH & VALIANT

ADJUSTMENT: Caster and camber adjustments are made by rotating eccentric cam assemblies at inner end of upper control arm front and rear legs. *NOTE - On all models, except Chrysler, access holes to loosen upper control arm cam bolt nuts have been provided in fender side shields. Front access hole is covered by a splash shield.*



Car Model	Tire Inflation (Cold) Pressure (Lbs.) Front	Rear
Imperial & Chrysler 300H	24	24
Chrysler, Others (Except Sta. Wagon)	24	22
Chrysler Station Wagon	22	ℂ 24
Dodge, Dart 6 Cyl. (Except Sta. Wagon)	24	24
Dodge, Dart V8 (Except Sta. Wagon)	24	22
Dodge, Dart Station Wagon (Except 880)	24	ℂ 26
Dodge Custom 880 Station Wagon	22	ℂ 24
Plymouth 6 Cyl. (Except Sta. Wagon)	24	24
Plymouth V8 (Except Sta. Wagon)	24	22
Plymouth Station Wagon	24	ℂ 26
Lancer & Valiant	24	24

ℂ - With station wagon fully loaded, increase cold pressure to 28 lbs.



ℂ - With station wagon fully loaded, increase cold pressure to 30 lbs.

Caster: Adjust by turning one eccentric bolt at a time as necessary to obtain correct setting. *NOTE - Turning both eccentric bolts in opposite directions affects caster with a minimum amount of change in camber.*

Camber: Adjust camber by turning both eccentric bolts equally in same direction as necessary to obtain correct setting. *NOTE - Turning both eccentric bolts equally in same direction affects camber with a minimum amount of change in caster.*

CAMBER ANGLE & STEERING AXIS INCLINATION

MERCURY METEOR & FORD FAIRLANE WHEEL ALIGNMENT TOOL

FORD MOTOR CO.

FALCON, COMET, GALAXIE & MONTEREY

ADJUSTMENT: Caster and camber adjustments are made by adding or removing shims from between upper control arm inner shaft and frame member at shaft mounting bolt locations. After adjustments are completed, tighten control arm inner shaft mounting bolts to 65-90 ft. lbs. (Falcon & Comet); 65-85 ft. lbs. (Galaxie & Monterey).

Car Models	Tire Inflation (Cold) Pressure (Lbs.) ℂ Front	ℂ Rear
Comet		
Sedans	24	24
Sta. Wagon (Pass. Load)	22	26
Sta. Wagon (Cargo Load)	24	30
Falcon		
Sedans	24	24
Sta. Wagon (Pass. Load)	22	26
Sta. Wagon (Pass. & Cargo)	22	30
Sta. Wagon (With Snow Tires)	22	30
Galaxie & Monterey	24	ℂ 24

ℂ - Add 4 lbs. for heavy loads or high speed driving.
ℂ - 28 lbs. for station wagon.

Caster: Remove or install shims at either front or rear mounting bolt. Removal of shims at front bolt or installation of shims at rear bolt will move ball joint forward. Removal of shims at rear bolt or installation of shims at front bolt will move ball joint to rear. A 1/32" (Falcon & Comet); 1/16" (Galaxie & Monterey) shim change at either bolt will change caster ½°.

Camber: Remove or install shims of equal thickness at both bolts. The removal of shims will move upper ball

CONTINUED ON NEXT PAGE

►*FOR ALIGNMENT SPECIFICATIONS, SEE ALIGNMENT SPECIFICATION TABLE ON PAGE 364.*

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (Cont.)

joint inward. Installation of shims will move ball joint outward. A 1/16" shim change at both bolts will change camber 1/3° (Falcon & Comet); ¼° (Galaxie & Monterey). *NOTE* - Total shim pack thickness at each bolt should not exceed 9/16" (Falcon & Comet); 5/8" (Galaxie & Monterey).

FAIRLANE & METEOR

►*1962 UPPER CONTROL ARM SHAFT HARD MOVING CORRECTION:* If control arm shaft hard to move for making caster and camber adjustments, trouble may be due to shaft frozen to its mount by the action of serrations on shaft and nut. To correct, rap head of retaining bolt sharply after bolt has been backed out two or three turns. This should drive nut away from sheet metal. If necessary, lift cross shaft from serrations with a pry bar.

►*1962 MERCURY METEOR ALIGNMENT TOOL MODIFICATION:* If fender shield will not permit Tool 3000-1 to be installed properly for wheel aligning, modify tool by removing adjusting screw from tool and grinding length of threaded end of tool to 3/4" minimum.

ADJUSTMENT: Caster and camber adjustments are made by moving upper control arm assembly in or out in elongated bolt holes. To control movement of upper control arm after upper control arm-to-underbody attaching bolts are loosened, install Tool 62F-3000-A (see illustration). *NOTE - Do not install tool from underneath car. For proper installation, face outside of wheel and r ach behind each end of wheel under fender with each half of tool. Turn both tool adjusting screws until tool is snug between upper control arm and lower corners of front suspension housing. Loosen upper control arm inner shaft bolts two or three turns, then turn wheels to extreme right and left positions to free upper control arms. Turn whe ls to straight ahead position, and turn upper control arm inn r shaft bolts snug (not tight).*

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (Continu d)

After adjustments are completed, tighten upper control arm attaching bolts to 115-135 ft. lbs. (Fairlane), 150-160 ft. lbs. (Meteor).

Tire Inflation (Cold): 24 lbs. front and rear. For high speed driving or heavy loads, add 4 lbs.

Caster: To increase positive caster or decrease negative caster, turn front screw on tool clockwise or rear screw counterclockwise. To decrease positive caster or innegative caster, turn front screw on tool counterclockwise or rear screw clockwise.

Camber: To increase positive camber or decrease negative camber, turn front and rear screws clockwise an equal number of turns. To decrease positive camber or increase negative camber, turn front and rear screws counterclockwise an equal number of turns.

THUNDERBIRD

ADJUSTMENT: Caster adjustment is made by repositioning the strut on lower control arm. End of strut and surface on lower control arm are serrated and mounting holes in strut are elongated. Camber adjustment is made by adding or removing shims between pivot bracket of lower control arm and mounting bracket on underbody in engine compartment. After adjustments are completed, tighten strut-to-lower control arm nuts to 85-115 ft. lbs. Tighten shim retaining nut securely.

Tire Inflation: 24 lbs. front and rear.

Caster: Loosen nuts and bolts attaching strut to lower control arm and lift strut so serrations are free of serrations on lower control arm. To decrease caster, lengthen distance between strut forward mount and side of control arm. To increase caster, shorten distance between strut forward mount and side of control arm.

Camber: To move lower ball joint inward, remove shims between mounting and pivot brackets. To move ball joint outward, install shims between mounting and pivot bracket. A 1/16" change in shim thickness will change camber angle 1/3°. *NOTE - Total shim thickness should not exceed 11/16".*

LINCOLN

ADJUSTMENT: Caster and camber adjustments are made by moving the serrated upper control inner shaft assembly in elongated slots in front suspension crossmember bracket. When adjustments are completed, tighten upper control arm inner shaft-to-crossmember bracket attaching bolts to 100-125 ft. lbs.

Tire Inflation (Cold): 24 lbs. front and rear.

Caster: Loosen bolts securing upper control arm shaft to bracket, then with aid of a pry bar, move control arm assembly at **either of the two bolt locations** as necessary. Inboard movement of front bolt or outboard movement of rear bolt will change caster in negative direction. Outboard movement of front bolt or inboard movement of rear bolt will change caster in positive direction. *NOTE - A movement of 3/32" at either front or rear bolt location will change caster ½°.*

Camber: Inboard movement of control arm shaft **equally at front and rear bolts** will change camber in negative direction. Outboard movement of upper control arm shaft equally at front and rear bolts will change camber in positive direction. *NOTE - A movement of 3/64" f ntir shaft will chang camb r ¼°.*

GENERAL MOTORS CORP.

BUICK (EXCEPT SPECIAL)

ADJUSTMENT: *NOTE - Correct alignment height must be maintained while checking camber and caster. Install an Alignment Height Tool, J-8973-23, at each side of car between frame and front lower control arm, locating tool between coil spring and rebound bumper with long lip at upper end of tool pointing outboard. Install an Alignment Height Tool, J-8973-19, at each side of car between frame and rear axle housing, locating top of tool over rear attaching bolt of rear axle housing bumper. Lower end of tool must rest on axle housing. Weight of car will hold tools in position.*

►*CASTER & CAMBER ADJUSTING NOTE:* Shims located between upper control arm inner shaft and brackets on frame. Do not exceed a thickness of .500" in any one shim pack. After adjustments are completed, tighten upper control arm mounting bolt nuts to 90-110 ft. lbs.

Tire Inflation (Cold): 24 lbs. front and rear (28 lbs. rear on station wagons). *NOTE - For temperatures below freezing, add 2 lbs.*

Caster: To **increase** caster, increase amount of shims at front bolt and decrease by an equal amount at rear bolt. To **decrease** caster, decrease amount of shims at front bolt and increase by an equal amount at rear bolt.

Camber: To **increase** camber, remove an equal amount of shims at front and rear bolt. To **decrease** camber, add an equal amount of shims at front and rear bolt.

►*NOTE:* To increase camber and caster simultaneously, remove shims at **rear bolt only.** To decrease camber and caster simultaneously, add shims at **rear bolt only.**

BUICK SPECIAL

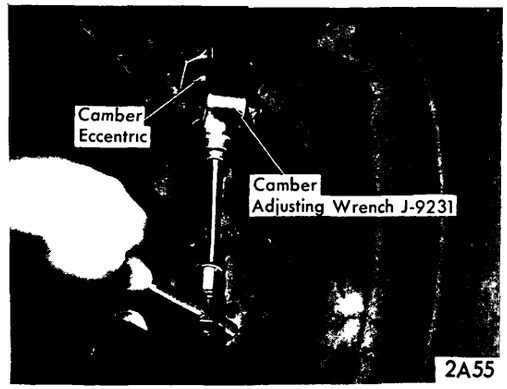
ADJUSTMENT: *NOTE - Correct alignment height must be maintained while checking camber and caster. Install an Alignment Height Tool J-8973-22 at each side of car between frame and front lower control arm, locating tool between coil spring and rebound bumper with long lip at upper end of tool pointing outboard. Raise rear of car slightly and place Spacer Block J-8973-20 (station wagon) or J-8973-21 (all others) at each rear wheel, positioning cutout in block over rubber bumper with bottom of block resting on axle housing. Weight of car will hold tools in position.*

►*CASTER & CAMBER ADJUSTING NOTE:* Shims located between upper control arm inner shaft and brackets on frame. Do not exceed a thickness of .380" in any one stack. After adjustments are completed, tighten upper control arm mounting bolt nuts to 60-85 ft. lbs.

Tire Inflation (Cold): 22 lbs. front and rear (26 lbs. rear on station wagons). *NOTE - For temperatures below freezing, add 2 lbs.*

Caster: Adding shims at front bolt location will change caster toward negative. *NOTE - This will also change camber toward negative.* Adding shims at rear location will change caster toward positive. *NOTE - This will also change camber toward negative.*

Camber: Adding equal amounts of shims at both front and rear bolts will change camber toward negative. *NOTE - Caster will not be changed.*



CADILLAC

►*TOE-IN ADJUSTMENT NOTE* Before checking toe-in, make sure drag link height is correct. *Se "St ring Linkage" in St ering Section.*

ADJUSTMENT: Caster adjustment is made by turning retaining nuts on forward ends of tie-struts at front frame crossmember. *NOTE - To gain acc ss to r taining nuts, it is n c ssary to remov splash shi ld.* Camber adjustment is made at the camber eccentric located in steering knuckle upper support. Upper spherical joint stud fits through camber eccentric and knuckle. Turning the camber eccentric repositions upper spherical joint stud.

Series	Tire Inflati n (C ld) Pr ssur (Lbs.) Fr nt	R ar
60 & 62	24	24
75	28	28
Commercial Chassis	24	32

Caster: For increased negative caster, lengthen struts by loosening front bushing retaining nuts and tightening rear bushing retaining nuts. One turn of retaining nuts provides approximately ½° change in caster. For more positive caster, shorten struts by loosening rear bushing retaining nuts and tightening front bushing retaining nuts. After proper adjustment, tighten front retaining nuts to 35 ft. lbs. *NOTE - Wh n tight ning front retaining nut, hold r ar nut s cur ly to pr v nt changing caster setting.*

CADILLAC CAMBER ADJUSTING TOOL

Camber: Loosen spherical joint stud one turn and tap bottom of stud with a soft hammer to loosen camber eccentric in knuckle. *NOTE - If cc ntric will not break loose in the above mann r, it may b n c ssary to loosen stud nut on turn and install a plain nut halfway on stud. Then us a 7/16" diam t r st el rod approximately 20" long, ins rt d insid nut and resting on stud. Tap stud with a h avy h a m m r to loosen eccentric.* Use Camber Adjusting Wrench, Tool J-9231, and turn camber eccentric to obtain correct setting. *NOTE - Final position of ball joint should b in the rear position of camb r cc ntric in ord r to keep steering arm angle corr ct.* After proper camber adjustment is obtained, tighten spherical joint stud nut to 60 ft. lbs.

CHEVROLET PASS. CARS

ADJUSTMENT: Camber and caster adjustments are made by adding or removing shims between upper control arm inner shaft and bracket on frame. After adjustments are completed, tighten upper control arm inner shaft attaching bolts to 45-55 ft. lbs.

CONTINUED ON NEXT PAGE

►FOR ALIGNMENT SPECIFICATIONS, SEE ALIGNMENT SPECIFICATION TABLE ON PAGE 364.

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (Cont.)

Tire Inflation (Cold): 24 lbs. front and rear (28 lbs. rear on station wagons). *NOTE - For improved station wagon handling under heavy loads, decrease front pressure 2 lbs. and increase rear pressure 2 lbs.*

Caster: To decrease positive caster, add shims at front attaching bolt or remove shims from rear attaching bolt. A 1/32" shim at one bolt will change caster ¼°.

Camber: To decrease positive camber, add shims at both front and rear attaching bolts. A 1/32" shim will change camber 1/6°.

CHEVROLET TRUCKS

ADJUSTMENT: On all models, camber adjustment is made by adding or removing shims between upper control arm spacer and bracket (Series 10, 20, 30, 40); or between upper control bracket and support (Series 50, 60) equally at both front and rear attaching bolts. On Series 10, 20, 30, 40, caster adjustment is made by adding or removing shims at either front or rear attaching bolts. On Series 50, 60, caster adjustment is made by changing location of lower control arm shafts with reference to notched plates welded to crossmember. After adjustments completed, tighten upper control arm attaching bolts to 70-90 ft. lbs. (Series 10, 20); 90-120 ft. lbs. (Series 30, 40); 125-165 ft lbs. (Series 50, 60). Tighten lower control arm attaching bolts to 180-240 ft. lbs. (Series 50, 60 Std.); 315-420 ft. lbs. (Series 50, 60 Hvy. Duty).

Caster (Series 10, 20, 30, 40): One .299" shim added to rear bolt changes caster Neg. 24' (and camber, Neg. 1'). One .0299" shim removed from rear bolt changes caster Pos. 24' (and camber Neg. 2').

Caster (Series 50, 60): *NOTE - If there is insufficient adjustment to obtain the preferred setting of Neg. ½° (Left Side), set left side as close as possible to this desired negative angle. Caster on right side should then be set 1° greater than caster at left side without exceeding caster limits. In any event, right wheel caster should be at least ½° more positive than left wheel caster.* To adjust, check caster to determine amount of change required to obtain proper caster, then mark location of lower control arm shaft with reference to notched attaching plates, then move shaft rearward to decrease caster or forward to increase caster. *NOTE - Moving shaft a distance of one notch changes caster approximately ½°. Tighten bolts and recheck adjustment.*

Camber (All Models): Adding shims equally at both front and rear attaching bolts increases camber. Removing shims decreases camber. One .0299" shim added or removed at both bolts changes camber 10'38" (Series 10, 20, 30, 40); ½° (Series 50, 60).

►*CASTER & CAMBER ADJUSTING SHIM NOTE: In addition to .0299" shims, .0598" and .1196" shims are available to reduce number of shims in pack. DO NOT exceed 5/8" shim pack at each bolt location. Total difference in shim pack thickness at front and rear bolt should not exceed .330".*

CHEVY II

ADJUSTMENT: Caster adjustments are made by lengthening or shortening the lower control arm strut at front underbody connection. Camber adjustments are made by rotating eccentrically mounted washers located on lower control arm inner pivot bolt.

Tire Inflation (Cold): 24 lbs. front, 26 lbs. rear (28 lbs. rear on station wagons). *NOTE - For improved station wagon handling under heavy loads, decrease front pressure 2 lbs. and increase rear pressure 2 lbs.*

Caster: Turn the two nuts at front end of lower control arm strut as necessary. Shortening the strut rod increases caster. Lengthening the rod decreases caster. When adjustment completed, tighten nuts to 100-125 ft. lbs.

Camber: Loosen lower control arm pivot bolts and rotate cams on pivot as necessary to move control arm in or out for correct camber. Tighten pivot to 60-95 ft. lbs.

CORVAIR

(FRONT WHEELS)

ADJUSTMENT: Caster adjustments are made by lengthening or shortening lower control arm strut (All except 1200 Series); by adding or removing shims between upper control arm inner shaft and mounting bracket at **either** front or rear mounting bolts (1200 Series). On all models, camber adjustments are made by adding or removing shims between upper control arm inner shaft and mounting bracket **equally** at front and rear mounting bolts.

Tire Inflation (Cold): 15 lbs. front, 26 lbs. rear.

Caster: Series 500, 700, 900 - Adjust caster by turning nuts at rear of strut rod. Lengthening rod increases caster. Shortening rod decreases caster. *NOTE -* Because of manufacturing tolerances, it is possible to run out of threads on strut rod or cause front spring to be cocked in its seat and rub spring tower. Only when this happens is it permissable to shim unevenly at upper control arm. If shims are changed, check camber.

Series 1200: To adjust, loosen upper control arm support shaft-to-crossmember bolts and add or remove shims at either front or rear bolt to obtain correct caster adjustment. *NOTE - To adjust right side, direct air heater front duct must be removed for access to upper control arm shaft attaching bolts.*

(REAR WHEELS)

Caster: Pos. 1½°-2° at curb load (Series 500, 700, 900). Neg. 1°±½° at design load (Series 1200). Not adjustable.

Camber: Pos. ½°±½° at curb load (Series 500, 700, 900). Pos. 1½°±½° at curb load (Series 1200). Not adjustable. If camber is not within limits, either the crossmember is out of alignment or has become distorted due to collision.

Toe-In: 1/8-3/8" (All Models). *NOTE - If drive-on type equipment is used, reverse car and back into position. Toe-in (overall) will be read as toe-out (readings taken from rear of tires rather than front).* To adjust, add or remove shims equally at each side of front edge of transmission case, with engine rear support loosened. *CAUTION - Shims must be added or removed equally from each side. DO NOT attempt to adjust one wheel at a time.* A shim added to each side will decrease toe-in. Removal of shim from each side will increase toe-in. *NOTE - Because of manufacturing tolerance and parts "stack-up" it is possible to have toe-out on one wheel and toe-in on opposite wheel. In this case, adjust the wheel with toe-out as close as possible to specifications, but not letting opposite wheel go out of specification. If for example, one wheel toes-out by ¼", the opposite wheel must toe-in enough to give overall specified toe-in.*

CORVETTE

ADJUSTMENT: Caster and camber adjustments are made by rotating upper control arm-to-steering knuckle eccentric bolt.

Tire Inflation (Cold): 24 lbs. front and rear (Normal Driving), 36 lbs. front and rear (Sustained High Speed Driving).

Caster: Loosen clamp bolt in upper end of steering knuckle support, then remove lubrication fitting at outer end of upper control arm. Insert an Allen wrench through hole and turn pivot until correct caster setting is obtained. *NOTE - Pivot pin must be turned in full turns only for caster setting, otherwise camber will be changed.*

Camber: After adjusting caster, rotate pivot pin not more than 1/2 turn in either direction to secure correct camber. Entire range of adjustment is obtained in 1/2 turn of pivot pin.

►*TOE-IN ADJUSTMENT NOTE:* Adjust toe-in at right hand tie rod only.

OLDSMOBILE 88, SUPER 88, 98, & F-85

ADJUSTMENT: Camber and caster adjustments are made by removing or adding shims between upper control arm inner shaft and bracket on frame. After adjustments are completed, tighten upper control arm attach-bolts to 85-110 ft. lbs. (Series 88 & 98); 60-85 ft. lbs. (F-85).

Tire Inflation (Cold)

Model	Pressure (Lbs.) Front	Rear
F-85 Without Air Cond.	22	22
F-85 With Air Cond.	① 24	① 24
88 & S88 (8.00 tires)	24	② 22
88 & S88 (8.50 tires)	22	② 22
98	③ 22	22

① - 22 lbs. with 7.00 x 13 tires.
② - 24 lbs. on station wagon.
③ - 24 lbs. with 8.50 tires and Air Cond.

Caster: To decrease positive caster (increase negative caster), add shims at front bolt. To increase positive caster (decrease negative caster), remove shims at front bolt. Removal or installation of .020" shim will change caster 3/8°.

Camber: To increase positive camber, remove shims at both front and rear bolts. To decrease positive camber, add shims at both front and rear bolts. Removal or installation of .020" shim at both bolts will change camber 1/8°.

PONTIAC (EXCEPT TEMPEST)

ADJUSTMENT: Caster and camber adjustments are made by removing or adding shims between upper control arm inner shaft and bracket on frame. After adjustments are completed, tighten upper control arm attaching bolt nuts to 80-95 ft. lbs.

Tire Inflation (Cold)

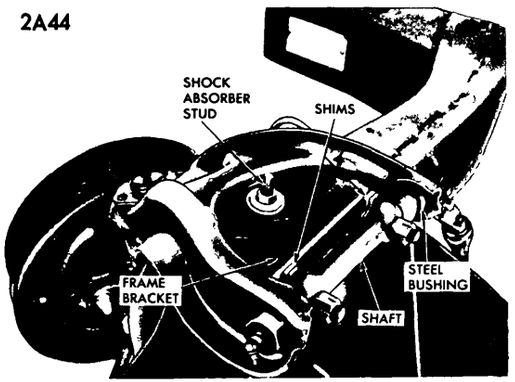
Tire & Model	Pressure (Lbs.) Front	Rear
8.00 (Exc. Air Cond.)	22	22
8.00 Air Cond.	24	22
8.50 (Exc. Sta. Wgn. & Air Cond.)	20	20
8.50 Air Cond. (Exc. Sta. Wgn.)	22	20
8.50 Station Wagon	22	24

CONTINUED ON NEXT PAGE

►FOR ALIGNMENT SPECIFICATIONS, SEE ALIGNMENT SPECIFICATION TABLE ON PAGE 364.

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (Cont.)

Caster: To decrease positive caster, add shims to front bolt. To increase positive caster remove shims from front bolt. A .030" shim change will change caster 0°23'.



Camber: To increase camber, remove shims from both front and rear bolts. To decrease camber, add shims to both front and rear bolts. A .030" shim change at both front and rear bolts will change camber approximately 1/6°.

►*NOTE: Adding or removing an equal amount of shims at both front and rear bolts will change camber without changing caster.*

PONTIAC TEMPEST (FRONT WHEELS)

ADJUSTMENTS: Caster adjustment is made by adjusting length of strut rod. *NOTE - Shims between upper control arm inner shaft and frame brackets at front and rear bolts must be of equal thickness.* Camber is adjusted by adding or removing shims equally at front and rear bolts of upper control arm inner shaft mounts.

2A44

PONTIAC (EXC. TEMPEST) CAMBER & CASTER SHIM LOCATION

After adjustments are completed, tighten bolts 55-70 ft. lbs.

Tire Inflation (Cold): 22 lbs. front and rear (26 lbs. rear on station wagon).

Caster: To increase caster, lengthen strut rod by rotating outer nut. To decrease caster, shorten the strut rod. After adjustment, tighten nut at rear of strut to 70-85 ft. lbs.

Camber: Adding shims equally between upper control arm inner shaft and frame bracket at front and rear attaching bolts will decrease positive camber. Removing shims increases positive camber. *NOTE - Shim packs at front and rear bolts must be of equal thickness. Adding or removing an equal amount of shims at both front and rear bolts will change camber without changing caster.*

(REAR WHEELS)

Toe-In: 0-¼". *NOTE - If drive-on type equipment is used, reverse car and back into position. Toe-in (overall) will be read as toe-out (readings taken from rear of tires rather than front).* To adjust, add or remove shims equally at each side of front edge of differential. *CAUTION - Shims must be added or removed equally from each side. DO NOT attempt to adjust on wheel at a time.* A shim added to each side will decrease toe-in. Removal of shim from each side will increase toe-in. *NOTE - Because of manufacturing tolerance and parts "stack-up" it is possible to have toe-out on one wheel and toe-in on opposite wheel. In this case, adjust the wheel with toe-out as close as possible to specifications, but not letting opposite wheel go out of specification. If for example, one wheel is toe-out by ¼", then opposite wheel must toe-in enough to give overall specified toe-in.*

STUDEBAKER CAMBER & CASTER ADJUSTMENT

STUDEBAKER CORP.
LARK & HAWK

ADJUSTMENT: Caster and camber adjustments are made by rotating upper control arm outer pin at steering knuckle.

Tire Inflation (Cold)

Model	Pressure (Lbs.) Front	Rear
6 Cyl.		
All Except Taxi & Sta. Wgn.	24	20
Taxi	22	22
Station Wagon	26	26
Captive Air Tires	24	① 22
V8		
All	24	② 20
Captive Air Tires	24	24

① - 24 lbs. rear on Police Station Wagon.
② - 24 lbs. rear on Station Wagons.

Caster: *NOTE - Adjust caster before making camber adjustment.* Loosen steering knuckle clamp bolt, then remove lubrication fitting from rear bushing at upper control arm outer pin. Insert an Allen wrench into pin (through lubrication fitting hole) and turn it in full turns until proper caster is obtained. *NOTE - One full turn will change caster 1/2.*

Camber: After adjusting caster, rotate pivot bolt not more than 1/2 turn in either direction to secure correct camber. *NOTE - Entire range of adjustment is obtained in 1/2 turn of pivot pin.*

►*FOR ALIGNMENT SPECIFICATIONS, SEE ALIGNMENT SPECIFICATION TABLE ON PAGE 364.*

1962 FRONT WHEEL BEARING ADJUSTMENT

BUICK & BUICK SPECIAL

Turning spindle nut to 19 ft. lbs. while turning wheel, then back off nut and retorque to 11 ft. lbs. while rotating wheel. If cotter pin hole in spindle does not line up with slot in nut, back off nut 1/12 turn (Buick), 1/6-3/12 turn (Special) and install cotter pin.

CADILLAC

Rotate wheel and tighten adjusting nut to 30 ft. lbs., then back off nut ¼ turn and install cotter pin. *NOTE - If cotter pin cannot be installed in either of the two spindle holes, loosen adjusting nut and back off as necessary.*

CHEVROLET, CHEVY II, CORVAIR

Rotate wheel and tighten spindle nut to 15 ft. lbs. or 180 inch-lbs. (Chevrolet & Corvair Trucks), 100 inch-lbs. (Chevy II & Corvair Cars), then back off adjusting nut 1 flat (1/6 turn) and install cotter pin. If slot and cotter pin hole do not line up, back off nut an additional 1/2 flat or less as necessary. *NOTE - Wheel bearings should have no preload and .000-.007" endplay when properly adjusted.*

CORVETTE

While rotating wheel, tighten spindle nut to 33 ft. lbs., then back off nut until bearings are loose. Retorque to 12 ft. lbs. If slots line up, insert cotter pin. If slots do not line up, back off nut to nearest hole, and insert cotter pin.

CHEVROLET TRUCKS

While rotating wheel or hub, tighten spindle nut to 15 ft. lbs. (10 Series), 33 ft. lbs. (20-40 Series), 40 ft. lbs. (50-60 Series), then back off adjusting nut to nearest hole in spindle (ball bearings), 1/6 turn or 1 flat (taper roller bearings) and install cotter pin.

CHRYSLER, DODGE, DART, PLYMOUTH LANCER, VALIANT

Rotate wheel and tighten wheel bearing adjusting nut to 90 inch-lbs. (Chrysler, Imperial, Dodge, Dart, Plymouth), 70 inch-lbs. (Lancer, Valiant). Place nut lock on nut with one pair of slots in line with cotter pin hole, then back off lock and adjusting nut to next slot. Install cotter pin.

ALL FORD MOTOR CO. MODELS (EXCEPT FORD & ECONOLINE TRUCKS)

►*1962 COMET FRONT WHEEL BEARING NOISE CORRECTION:* Noise may be caused by cotter pin head rubbing against inside of grease cup or static collector spring. To correct, flatten head of cotter pin as necessary.

CONTINUED ON NEXT PAGE

WHEEL BEARING ADJUSTMENT (C ntinu d)

Rotate wheel and tighten spindle nut to torque listed in table below for each car model. Install nut lock with castellations indexed with cotter pin hole, then back off spindle nut and nut lock to next castellation (Except Comet & Falcon), next 2 castellations (Comet & Falcon), and install cotter pin.

F rd M t r C . Wh el Bearing Nut Torque

Car M d l	Torque
Comet	15-20 ft. lbs.
Falcon	12-15 ft. lbs.
Fairlane & Galaxie	15-20 ft. lbs.
Meteor & Monterey	12-15 ft. lbs.
Thunderbird	15-20 ft. lbs.
Lincoln Continental	15-20 ft. lbs.

FORD TRUCKS (EXCEPT ECONOLINE)

With front wheel rotating, tighten adjusting nut to 50-80 ft. lbs., then back off adjusting nut at least one but not more than two castellations. Lock adjusting nut in this position with cotter pin.

FORD ECONOLINE TRUCKS

While rotating wheel, tighten adjusting nut to 11½-12½ ft. lbs. Back off adjusting nut at least one castellation but not more than two castellations. Loosen nut if necessary to align cotter pin hole with nearest slot in nut, and install cotter pin.

OLDSMOBILE 88, S88, 98

While revolving wheel **at least 3 times speed of nut rotation,** tighten adjusting nut to 23-25 ft. lbs. Back off nut ½ turn and retighten to 15-17 ft. lbs., then back off nut 1/6 to 1/4 turn so cotter pin hole and slot in nut line up, and install cotter pin.

OLDSMOBILE F-85

While rotating wheel, tighten adjusting nut to 10-15 ft. lbs., then back off nut 1/6 to 1/4 turn and install cotter pin.

PONTIAC & TEMPEST

NOTE - Following procedure supersedes previous information. Rotate wheel and tighten nut to 10-12 ft. lbs., then back off nut 1 flat (1/6 turn) and install cotter pin. If holes do not line up, back off adjusting nut to nearest hole. Final adjustment should be 1-1½ flats backed off. Nut should be finger loose, with .001-.010" bearing endplay.

RAMBLER

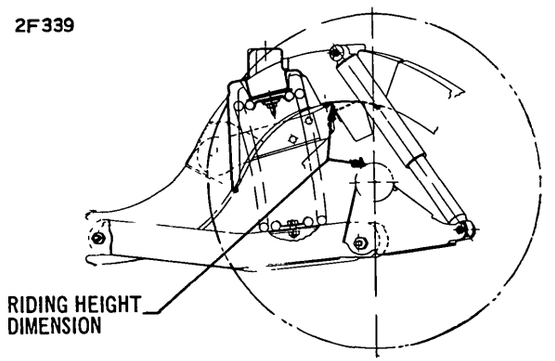
Rotate wheel and tighten adjusting nut until it is firmly seated and causes a drag on wheel. Back off adjusting nut to first castellation or until cotter pin hole is aligned, then install cotter pin. *NOTE - Wheel must be free to rotate without play in hub and bearings.*

STUDEBAKER

Rotate wheel to make sure all bearing surfaces are in contact, and at same time tighten wheel bearing nut until wheel binds on bearings. Back off nut to next castellation or as necessary for wheel to turn freely, and install cotter pin.

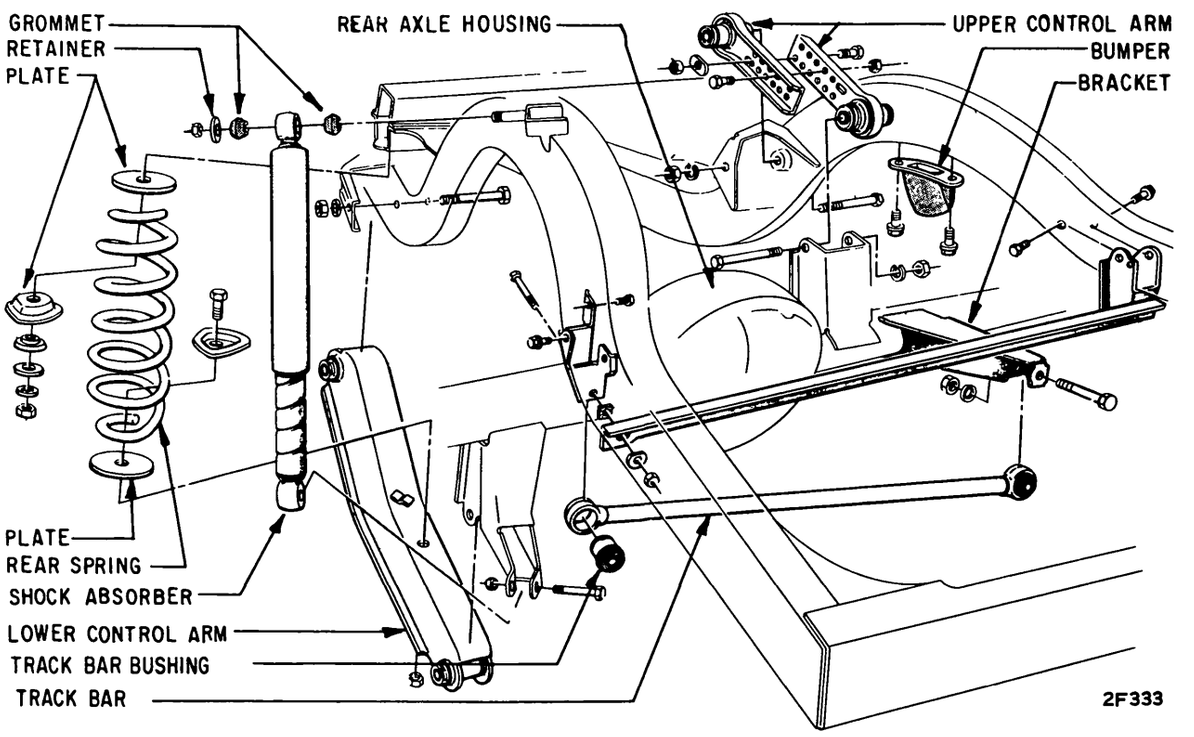
WILLYS 2-WHEEL DRIVE

Rotate wheel and tighten adjusting nut until wheel binds, then back off adjusting nut 1/6 turn. If necessary, back nut off further for installation of cotter pin.



BUICK (EXCEPT BUICK SPECIAL) REAR SUSPENSION

Buick L Sabr , Invicta, El ctra (1962)



DESCRIPTION: Coil spring, three link type rear suspension having two lower control arms connected between rear axle housing outer ends and frame side rails. These two control arms take all driving and braking forces. A single upper control arm connected to right side of rear axle housing and to right frame side rail prevents axle housing from rotating during braking and acceleration. This upper control arm is a two piece design having vernier-spaced holes and two slotted holes for adjustment of rear universal joint angle (differential housing "nose" angle).

R ar Riding H ight: 7.75" (Except Station Wagon), 7.00" (Station Wagon) measured from axle housing to axle rebound bumper at front mounting bolt location. To adjust, install additional spring insulators divided between upper and lower ends of spring. If more than three insulators required, replace the spring.

REMOVAL & INSTALLATION: *See 1961 Final Data, Pag 349.*

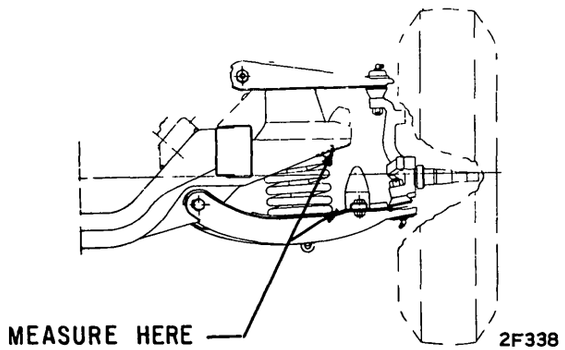
BUICK REAR RIDING HEIGHT

BUICK (EXCEPT SPECIAL) REAR SUSPENSION ASSEMBLY

BUICK (EXCEPT BUICK SPECIAL) FRONT SUSPENSION

Buick LeSabre, Invicta, Electral (1962)

►CHANGES, CAUTIONS, CORRECTIONS



►*1962 FRONT SPRING SHIM USAGE CAUTION:* Some cars may have shims on top of front springs. These shims must be reinstalled if removed during overhaul procedures.

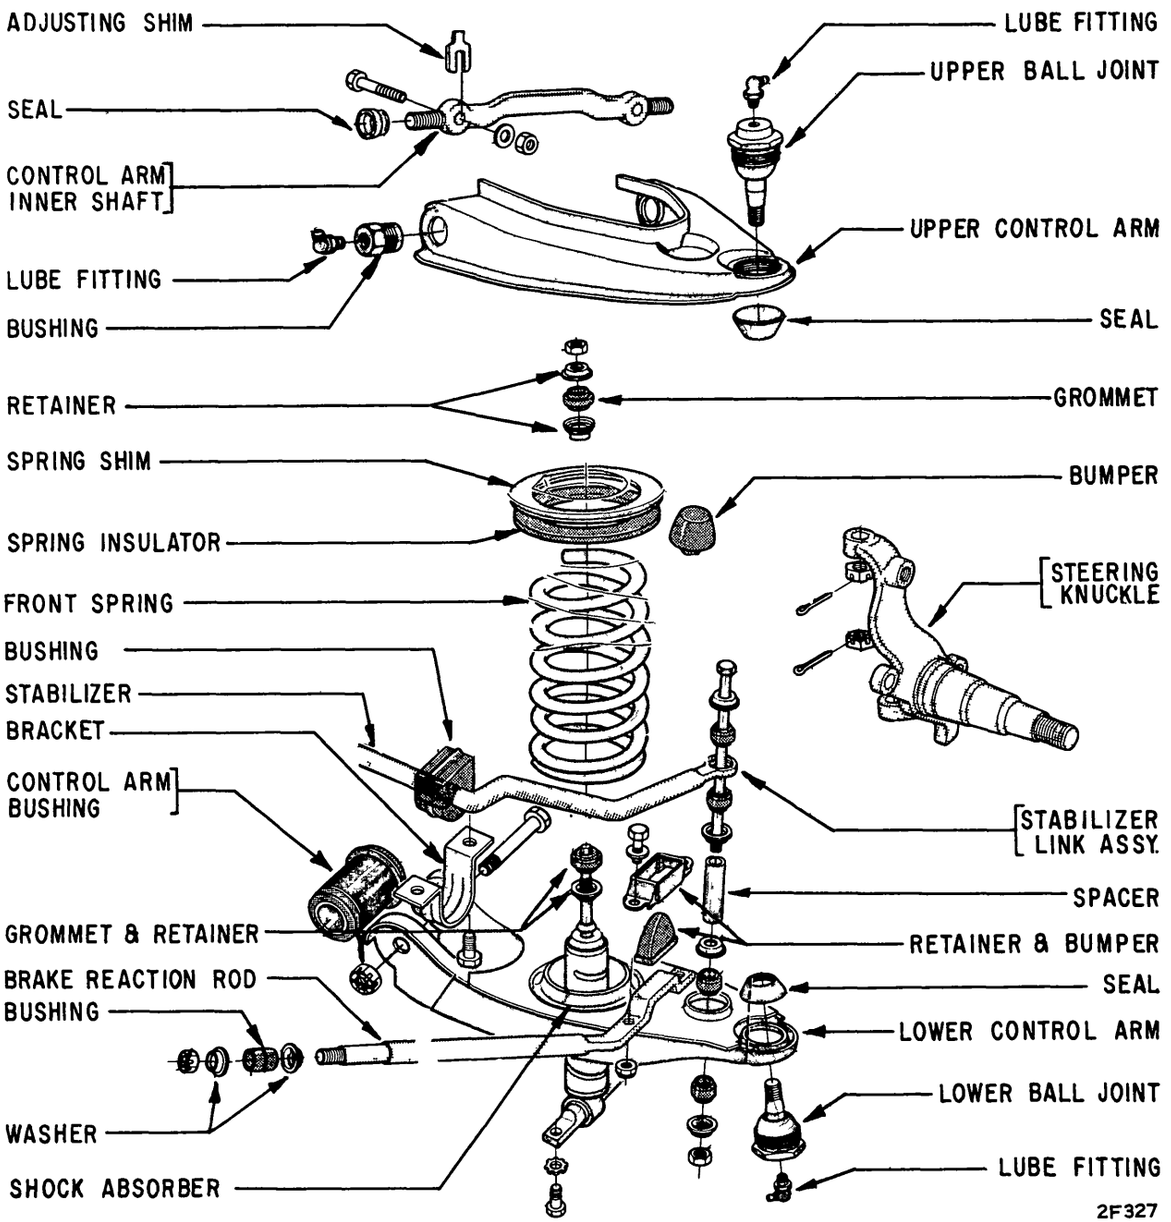
►*1962 SHOCK ABSORBER NOISE CORRECTION:* If noise occurs on cold mornings or after car has been standing for a long time, and disappears after a few minutes of car movement, correct by lubricating shock absorber piston rod with Silicone Rubber Lubricant when shock absorber is fully extended.

DESCRIPTION: Ball joint type front suspension assembly with lower control arms pivoted to frame members by rubber bushings. Lower control arms are maintained in position by brake reaction rods mounted between lower control arms and frame members. Upper control arms are pivoted on a shaft attached to a bracket on frame member.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Front Riding Height: 5.40" (All Models), measured between upper surface of lower crossmember and spring housing on crossmember. *See illustration.* To correct, add 1/8" shim between top of spring and housing. If more than three shims are required, replace the spring.

BUICK RIDING HEIGHT MEASUREMENT



REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Remove upper mounting stem nut, grommet retainer, and grommet, then remove two lower mounting bracket-to-lower control arm bolts and lower shock through lower control arm.

Installation: Install lower grommet retainer and grommet (small end up) on shock stem and install shock through lower control arm. Install shock bracket to lower control arm bolts and tighten to 15-25 ft. lbs. Assemble top grommet (small end down), grommet retainer, and nut on stem and tighten to 5-10 ft. lbs.

UPPER BALL JOINT: Removal - Raise and support car under frame, then remove wheel and tire. Loosen but do not remove nut on ball joint tapered stud, then rap steering knuckle sharply in area of stud to disengage stud. With another jack, support car weight under lower control arm and remove nut from ball joint stud. Lower jack under lower control arm slightly, being careful not to damage brake hose. Raise upper control arm and remove rubber bumper under upper control arm. Use a 1 7/8" socket and unscrew ball joint from control arm.

Installation: Install replacement ball joint and carefully pick up original threads on upper control arm and seat ball joint securely against control arm. Turn grease fitting toward rear of car. Turn ball joint stud so cotter pin hole is fore and aft and assemble dust shield over stud. Move knuckle up by jacking under outer edge of lower control arm. Clean stud and tapered hole in knuckle, then install stud in knuckle and tighten nut to 30-40 ft. lbs. and install cotter pin. Reinstall rubber bumper, wheel and tire assembly.

BUICK (EXCEPT SPECIAL) FRONT SUSPENSION ASSEMBLY

CONTINUED ON NEXT PAGE

BUICK (EXCEPT BUICK SPECIAL) FRONT SUSPENSION (C nt.)

LOWER BALL JOINT: R moval - Raise car and support under frame side rails, then remove wheel and tire. Remove wheel hub, then remove brake backing plate and place above upper control arm on frame spring seat. *NOTE - It is not necessary to remove brake hose from wheel cylinder.* Place a floor jack under lower control arm as far outboard on arm as possible, leaving approximately ½" clearance between jack and control arm. Loosen but do not remove nut on ball joint stud. *CAUTION - Do not loosen nut more than 1/8".* Rap knuckle in area of stud to disengage stud from knuckle, then raise jack against lower control arm. Remove nut and raise knuckle off ball joint stud. Use a 2 1/8" socket and unscrew ball joint from lower control arm.

Installati n: Install a new ball joint into threads of lower control arm and seat ball joint firmly against control arm. Point grease fitting toward centerline of car, then install grease shield. Install knuckle over ball joint stud and rap with a hammer to seat stud in knuckle. Install nut and tighten to 60-70 ft. lbs. and install cotter pin. Install a new "O" ring seal over spindle and install backing plate and hub assembly. Tighten the ¾" bolt and nut to 60-75 ft. lbs.; 11/16" bolt and nut to 40-60 ft. lbs.; and the brake anchor bolt to 130-150 ft. lbs. Install wheel and tire, then adjust wheel bearings.

STEERING KNUCKLE: Removal - Remove upper and lower ball joint studs from steering knuckle (see above) and remove knuckle.

Installati n: Reverse removal procedure.

UPPER CONTROL ARM: Removal - Remove upper control arm ball joint from steering knuckle (see "Upper Ball Joint" above), then remove control arm shaft-to-frame bracket nuts, carefully noting location and thickness of adjusting shims between shaft and frame bracket. Remove control arm assembly. *NOTE - If right hand upper control arm is being removed, it will be necessary to remove generator.*

Disassembly: Clamp arm assembly in a vise and remove bushings and shaft. If necessary, remove ball joint assembly (see "Upper Ball Joint" above).

R assembly: Assemble new grease seals on shaft and position shaft in arm. Start new bushing in original threads of arm and thread shaft into bushing to aid in alignment. Tighten bushing to 70 ft. lbs. Start second bushing into original threads of arm with shaft threaded into opposite bushing. After bushing has been threaded part way into arm, rotate shaft to engage threads of second bushing. Tighten bushing to 70 ft. lbs. *NOTE - Shaft should be free to turn by hand.* Install grease fittings and lubricate bushings. Rotate shaft to center shaft in arm so there is an equal distance between bolt holes in shaft and arm at both sides.

Installation: Reverse removal procedure, being careful to locate the steel washers under heads of shaft-to-frame bracket bolts. Install original shim packs in their proper locations between shaft and frame bracket. Tighten shaft-to-frame bracket bolts to 80-120 ft. lbs. Install upper ball joint (see "Upper Ball Joint" above), then check and adjust front end alignment.

COIL SPRING: Removal - Raise car and support under frame side rails. *NOTE - Raise car sufficiently high to allow lower control arm to be positioned nearly straight down with a jack placed beneath ball stud end of control arm.* Remove wheel, brake drum, and bearings, then remove steering arm-to-knuckle bolts and nuts. Remove brake anchor pin-to-knuckle bolt and slide backing plate assembly off spindle and place out of way. Remove brake reaction rod-to-lower control arm bolts, nuts and special flat washers, then remove control arm-to-frame compression bumper. Remove stabilizer link, spacer, grommet and retainers. Remove stabilizer bar bracket and shock absorber. Place a floor jack under lower control arm as far outboard as possible without damage to ball joint grease fitting or remove grease fitting and place jack under ball joint. *NOTE - Floor jack must be placed parallel with lower control arm with handle of jack toward opposite side of car to allow lower control arm to travel through its normal arc without bending arm or deforming inner bushing. Control arm must be lowered nearly straight down to remove spring.* Disconnect lower ball joint from knuckle (see "Lower Ball Joint" above), then lower jack to allow control arm to swing completely down and relax spring. Use a long pry bar to release spring from spring seat. *CAUTION - Spring, insulator, and shim (if used) will pop out on floor. Stand clear of spring to avoid injury.*

Installation: Place spring in upper spring seat and align lower end of coil with small hole in lower control arm. *NOTE - When spring assembled, lower coil must be within ¼" of this hole.* Place Plate J-7592-7 (parts of Spring Installing Tool J-9552) between 4th and 5th coil from bottom of spring (step in plate will fit contour of coil). Install Bolt J-9552-1 through plate so threaded end of bolt goes through shock absorber hole in frame spring seat. Install Nut J-9552-2 on upper end of bolt so shoulder of nut protrudes through hole in upper spring seat to protect bolt threads. With a box wrench on Nut J-9552-2, tighten Bolt J-9552-1 with a 7/8" socket and extension to compress spring until at least 1¾-2" of bolt extends through upper nut of tool. Force spring onto seat in lower control arm, then remove tool. Raise lower control arm with jack and attach lower ball joint tapered stud to knuckle. With rubber dust cover in place on ball joint, tighten nut to 70 ft. lbs. and install cotter pin. Install shock absorber (torque upper nut to 10 ft. lbs., and lower bolts to 20 ft. lbs.). Attach brake reaction rod and compression bumper to control arm, and torque nuts to 90 ft. lbs. *CAUTION - If there is any question of serviceability of brake reaction rod-to-lower control arm bolts, nuts and washers, see "Brake Reaction Rod" below for special parts required. DO NOT use standard bolts, nuts, or washers at this location.* Install stabilizer bar and grommets. Install backing plate, wheel, hub, and brake drum assembly, and adjust front wheel bearings.

LOWER CONTROL ARM: Removal - Remove coil spring (see above), then remove bolt and nut at inner end of lower control arm and remove arm. Remove bushing by pushing or driving from frame using a suitable tool.

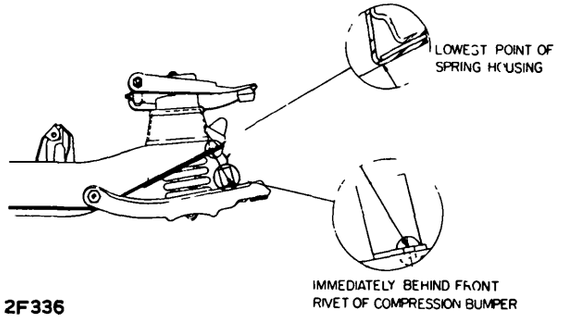
Installation: Drive a new lower control arm bushing into frame until it bottoms. Slip lower control arm over bushing and install bolt and nut. Tighten nut to 80-120 ft. lbs. and install a cotter pin. DO NOT back off nut to align hole in bolt for cotter pin installation. Bend tabs of cotter pin. Reinstall coil spring (see above).

BRAKE REACTION ROD: *CAUTION - Whenever it is necessary to replace brake reaction rod-to-lower control arm attaching bolts, nuts, and washers, use th special parts furnished in Service Package, Part N . 1389760 only. DO NOT USE standard bolts, nuts, and washers.*

Removal: Raise front of car and remove nut from front end of brake reaction rod. Remove control arm-to-frame compression bumper, then remove brake reaction rod by sliding it out of its rubber bushing on frame front crossmember.

Installation: Remove and replace old rubber bushing if worn, then install larger diameter washer on brake reaction rod first, with concave side away from nut. Install rod through bushing in frame bracket and install washer with smaller diameter, and nut. Do not tighten. Install frame compression bumper over brake reaction rod, then install two bolts and washers and tighten to 90 ft. lbs. *CAUTION - This torque is important as brake reaction rod is an integral part of lower control arm assembly and looseness can cause undesirabl car handling characteristics.* Tighten nut at front end of reaction rod to 70 ft. lbs. and install cotter pin. Check and adjust caster and camber.

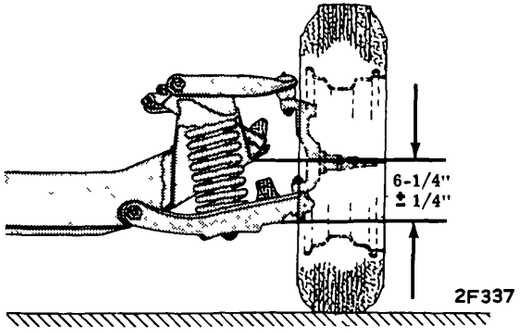
BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION



Buick Special (1962)
Oldsmobile F-85 (1962)

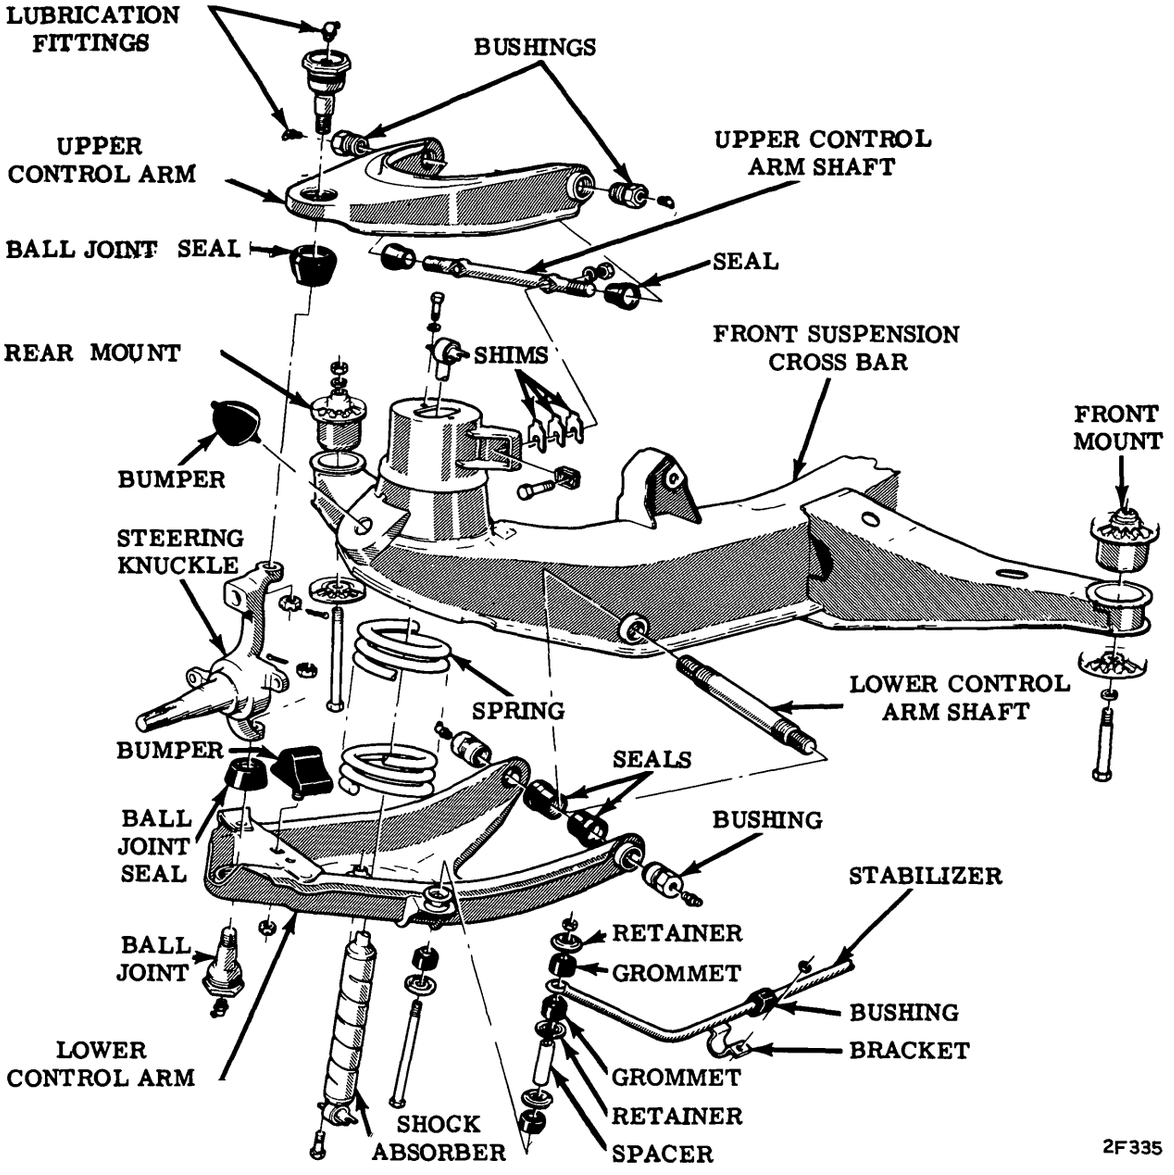
►*1962 BUICK SPECIAL SHOCK ABSORBER NOISE CORRECTION:* If noise occurs on cold mornings or after car has been standing a long time, and disappears after a few minutes of car movement, correct by lubricating shock absorber piston rod with Silicone Rubber Lubricant when shock absorber is fully extended.

DESCRIPTION: Independent suspension with ball joints connecting steering knuckle to upper and lower control arms. The entire front suspension system is mounted on front suspension crossmember which is attached to car underbody by three isolation mounts. The complete suspension unit can be removed from car as a single unit.



ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Front Riding Height: Buick Special - 4.40" (All models at curb weight) measured from a point immediately behind front rivet of compression bumper on lower control arm to lowest point of spring housing (see illustration). *NOTE - Spring shims are not available for adjusting riding height.*



BUICK SPECIAL RIDING HEIGHT

Oldsmobile F-85 - 6¼±⅛" (All Models at curb weight) measured from lower side of gauge hole in lower control arm to metal surface of spring upper housing (see illustration).

OLDSMOBILE F-85 RIDING HEIGHT

BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION ASSEMBLY

REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Remove two upper and two lower shock absorber attaching bolts, then raise car (support on wheels) and remove shock absorber through lower control arm.

Installation: Reverse removal procedure and tighten attaching bolts to 15-25 ft. lbs.

►*UPPER & LOWER BALL JOINT REPLACEMENT NOTE:* If ball joints are pressed into control arm (joint identified by circular head), control arm must be replaced.

LOWER BALL JOINT: Removal - Raise and support car at front crossmember, then place a jack ¼" below coil spring under lower control arm. Loosen ball joint nut (do not remove), then rap steering knuckle at ball joint stud with a brass drift or hammer to loosen stud. Remove nut and unscrew ball joint.

Installation: Lubricate with aluminum soap grease, then

CONTINUED ON NEXT PAGE

BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION (Cont.)

tighten ball joint in control arm until hex starts to shave metal from arm. Raise stud into knuckle and install nut, then tighten to 35-60 ft. lbs. and install cotter pin.

UPPER BALL JOINT: Removal - Raise and support car at front crossmember, then remove wheel and tire. Loosen ball joint nut (do not remove), then rap steering knuckle at ball joint stud with a brass drift or hammer to loosen stud. Support brake assembly, raise arm and unscrew ball joint from upper control arm.

Installation: Lubricate with aluminum soap grease, then tighten ball joint in control arm until hex starts to shave metal from arm. Insert stud in knuckle and install nut, then tighten to 35-60 ft. lbs. and install cotter pin. Install wheel and tire.

STEERING KNUCKLE: Removal - Raise and support car at front crossmember, then remove wheel, hub and drum assembly. Remove backing plate without disconnecting brakehose (leave steering arm connected to tie rod end). *NOTE - Support backing plate out of the way.* Disconnect ball joints from steering knuckle (see above), then remove steering knuckle.

Installation: Reverse removal procedure and tighten ball joint stud nuts to 35-60 ft. lbs. and backing plate to steering knuckle bolts to 55-80 ft. lbs.

COIL SPRING: Removal - Raise front of car and support at underbody with floor stands. Remove wheel assembly and disconnect stabilizer link from lower control arm, then remove shock absorber. Position a floor jack to support lower control arm ball, between spring seat and ball joint. Disconnect lower control arm ball joint from steering knuckle (see "Lower Ball Joint" above). Slowly lower floor jack until spring is fully extended and remove spring.

Installation: *NOTE - Top of spring is identified by a flat coil.* While holding spring against pilot in front crossmember, tilt spring so it will pilot in lower control arm, then rotate spring so end of bottom coil will index with edge of hole in control arm spring seat. *NOTE - Coil should not cover any portion of hole.* Position floor jack between spring seat and ball joint, then raise control arm until ball joint is tight in steering knuckle. Tighten ball joint nut to 35-60 ft. lbs. Install shock absorber and connect stabilizer to lower control arm and tighten nut to 13-17 ft. lbs.

LOWER CONTROL ARM: Removal - Remove coil spring (see above), then remove pivot shaft bushings from control arm assembly and remove control arm.

Installation: Lightly coat threads of shaft with chassis lubricant and start bushing onto threads of shaft. Place Spacer Tool J-8808 on shaft between control arm and crossmember, then with spacer against front crossmember and control arm against spacer, tighten bushing until hex of bushing seats firmly into arm. Remove spacer and install bushing at opposite end of shaft.

LOWER CONTROL ARM SHAFT: Removal - Remove lower control arm, then thread Installer & Remover J-8907 or J-8907-1 on rear of lower control arm shaft approximately 7/8" and tighten lock bolt of tool to hold tool to shaft. *NOTE - Do not thread tool tightly on shaft.* Turn Tool J-8907 clockwise to remove shaft through front of crossmember. Remove tool, then remove shaft. *NOTE - Threads on rear of shaft are smaller than threads at front of shaft.*

Installation: Position shaft through front of crossmember with "F" on shaft toward front. Install same tool used for removal, then coat threads of shaft with Lubriplate and thread shaft into crossmember until shaft extends an equal distance from front and rear of crossmember (approximately 1 11/16"). *CAUTION - Measure and make sure shaft extends an equal distance from front and rear of crossmember.* Install lower control arm

UPPER CONTROL ARM: Removal - Raise car and support under lower control arm, then remove wheel. Disconnect upper ball joint from knuckle (see "Upper Ball Joint" above). Support hub assembly, then remove inner control arm shaft bolts and remove arm. Note location of shims between shaft and crossmember bracket,

Disassembly: Clamp arm assembly in a vise and remove old bushings and shaft.

Reassembly: Assemble new grease seals on shaft, then apply a light coating of Lubriplate to shaft threads and position shaft in arm. Start new bushing in original threads of arm and thread shaft into bushing to aid in alignment. Tighten bushing until hex section of bushing seats firmly into arm. Start second bushing into original threads of arm with shaft threaded into opposite bushing. After bushing has been threaded part way into arm, rotate shaft to engage threads of second bushing. Tighten bushing until hex section seats firmly into arm. *NOTE - Shaft should be free to turn by hand.* Install grease fittings and lubricate bushing. Rotate shaft so distance between shaft bolt holes and arm are equal at both sides.

Installation: Assemble upper control arm and shaft assembly to bracket and install original shim packs in their proper location. Tighten shaft-to-bracket bolts to 60-85 ft. lbs. Reinstall upper ball joint on knuckle, then install wheel and adjust front end alignment.

ISOLATION MOUNTS (FRONT CROSSMEMBER): Removal - Raise front of car and support at car underbody and front crossmember. Support engine with a chain fall or other suitable means, then disconnect engine mounts at front crossmember brackets. Disconnect exhaust pipe at crossover and remove front wheels. Disconnect brake lines at hoses on both sides. Disconnect stabilizer links, then disconnect steering shaft at flexible coupling. If equipped with Power Steering, disconnect hoses at power steering pump. Remove isolation mount-to-body member bolts and disconnect ground strap at front mount (if so equipped). Lower front crossmember assembly and drive isolation mount up out of crossmember.

Installation: Press a new isolation mount into position and install mount attaching bolts and washer assemblies and tighten to 65-90 ft. lbs. Complete installation by reversing removal procedure.

BUICK SPECIAL & OLDSMOBILE F-85 REAR SUSPENSION

Buick Special (1962)
Oldsmobile F-85 (1962)

DESCRIPTION: Coil spring, four link type suspension having two lower control arms mounted between outer ends of rear axle housing and car underbody. Two upper control arms are mounted angularly between rear axle differential housing and car underbody.

ADJUSTMENT: *NOTE - Rear universal joint angle must be checked and adjusted whenever rear lower control arms are replaced. See "Propeller Shafts" in Rear Axle Section.*

REAR RIDING HEIGHT: Buick Special - 6.65"±3/8" (Exc. Station Wagon); 5.94"±3/8" (Station Wagon) measured from top of rear axle tube of axle housing to base of rebound bumper on car underbody.

Oldsmobile F-85: 6¼-6¾" (Exc. Station Wagons); 5 7/8-6 3/8" (Station wagons) measured from top of rear axle tube of axle housing to base of rebound bumper on car underbody.

REMOVAL & INSTALLATION: *See 1961 Final Data, Page 352, and note the following:*

Shock Absorber: Tighten upper attaching nut to 60-80 ft. lbs.

CADILLAC FRONT SUSPENSION

Cadillac, All S ri s (1962)

DESCRIPTION: "Ball-Joint" type with upper and lower control arms connected to frame members by rubber bushings. A "tie strut" is connected between outer end of lower control arm and front crossmember to carry fore-and-aft load of front wheels. Caster adjustments are made by adjusting nuts on threaded end of struts. The upper control arm ball joints connect upper control arm to steering knuckle through a camber adjustment eccentric. Camber adjustments are made by turning this eccentric to reposition upper ball joint stud.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Trim Dimensions: Before checking trim height, make sure that trunk is empty and fuel tank is full. Normalize position of springs by working bumper up and down and release slowly, permitting car to assume normal position. At the front, measure distance from top of rear flange on lower control arm to center of forward lower rivet on frame side rail. *NOTE - The above mentioned rivet is nearly on centerline of front coil spring. When measuring, hold rule vertical, seating in on lowest part of support arm flange, directly below rivet.* Standing trim height should be equal on both sides of car within 3/8" (see table below). To adjust, add shims at top of spring seat inside frame tower. At rear of car, measure distance between top of rear axle housing to lower under side surface of frame. Rear standing trim height should be equal within ½" on both sides of car (see table below). To adjust, add shims at top of spring seat inside tower. No more than three shims should be used at each side.

1962 Cadillac Trim Heights

Car Model	Front Height	Rear Height
Series 60,62	7 3/4"±3/8"	5 15/16"±3/8"
Series 75	8 1/4"±3/8"	7"±3/8"

REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Remove upper retaining nut, retainer, and grommet at upper suspension arm frame mounting bracket, then remove bolt holding lower end of shock to lower suspension arm. Remove shock.

Installation: Reverse removal procedure and tighten bolt at lower end to 90-110 ft. lbs.

FRONT STABILIZER: Removal - Disconnect stabilizer at lower control arm, then remove brackets and stabilizer from frame.

Installation: Reverse removal procedure and tighten bracket-to-frame bolts to 18-25 ft. lbs.

LOWER CONTROL ARM TIE-STRUT: Removal - Raise front of car and place jack stands under frame side rails, then remove splash shield covering inner ends of tie strut. Disconnect stabilizer link from lower arm. Remove nut and retainer from threaded end of strut at front frame crossmember, and back off rear nut. Disconnect strut from lower control arm and remove rear bushing retainer and nut from strut. Remove bushings and bushing spacer from frame.

Installation: Insert bushing in rear spacer and install assembly in frame through rear side of crossmember. Install nut on tie strut and run to bottom of thread, then install rear bushing retainer with concave side toward nut. Install tie strut through rear bushing in front crossmember and install front bushing on end of tie strut, sliding it into position in frame crossmember (front bushing should lock in rear bushing). Install bushing retainer with flat side against bushing and install nut (do not tighten). Attach end of tie strut to lower control arm and tighten nuts to 30-40 ft. lbs. Connect stabilizer link to lower control arm, then lower car to floor and tighten front nut on tie strut to 30-40 ft. lbs. Tighten rear nut, compressing bushing until retainer bottoms on metal spacer in bushing. Adjust caster (see above), then install splash shield.

UPPER CONTROL ARM BALL JOINT SEAL: Removal - Raise front of car and place jack stands under lower control arms, then remove lock nut and special flat washer from ball joint stud. Scribe a mark on camber eccentric and steering knuckle (for alignment at installation), then strike ball joint stud with a soft mallet to free it from steering knuckle. Raise up on upper control arm and remove ball joint from knuckle. Using Puller, J-8990, remove camber eccentric from ball joint stud. Wipe seal surface clean, then remove garter spring and seal. Clean joint pivot with solvent and inspect for looseness or binding. Replace joint if necessary.

►*BALL JOINT STUD REMOVAL NOTE:* If difficulty is encountered loosening stud from knuckle, see "Upper Control Arm Removal" below for method of loosening ball joint stud and eccentric.

Installation: Using a new seal, turn seal inside out, then place snap ring inside seal, just over bottom hole, pressing in on bottom of seal until snap ring seats itself in groove around hole. Apply a small amount of lubricant around hole in seal and install seal on ball joint stud. Unroll seal until lip engages in recess around joint housing. Allow air to enter seal by momentarily prying lip of seal away from joint housing with a small screwdriver. Squeeze seal, sliding snap ring end up on stud, then install new garter spring with Tool J-9148. *CAUTION - Make sure spring secures lip of seal in recess all around joint housing.* Install camber eccentric and align marks on eccentric and steering knuckle. Install a standard nut on ball joint stud and tighten until eccentric locks in knuckle, then remove standard nut, and install special flat washer and locking nut. Tighten to 50-65 ft. lbs. Pry out service plug from ball joint cover and discard plug. Use Repacking Gun, J-9280 and repack joint through plug hole with special lubricant. *CAUTION - Fill joint with lubricant, but do not allow seal to "balloon".* Install new service plug in ball joint cover. Check camber and adjust if necessary.

LOWER CONTROL ARM BALL JOINT SEAL: Removal - Remove lower control arm and coil spring (see below), then secure control arm in a vise and remove ball joint seal in same manner as for upper control arm ball joint seal. *NOTE - Seal can be replaced on lower control arm ball joint without removing control arm from car as follows:* Break ball joint loose from steering knuckle, then loosen anchor bolt and brake backing plate-to-steering knuckle bolts for clearance and disengage ball joint stud from knuckle. Move knuckle out of way and remove ball joint seal in same manner as for upper control arm ball joint.

Installation: Reverse removal procedure.

►*UPPER CONTROL ARM BALL JOINT REPLACEMENT NOTE: Do not attempt to remove ball joint assembly from upper control arm. Upper control arm and ball joint are serviced as a complete assembly.*

LOWER CONTROL ARM BALL JOINT: R moval - Remove lower control arm and coil spring (see below), then remove garter spring and seal from joint. Position Tool J-8999-7 on arbor press anvil and place lower control arm on tool with ball joint cover resting on tool. Position Ball Joint Remover, Tool J-8999-9 over joint stud until it seats on joint housing, and press ball joint out of arm.

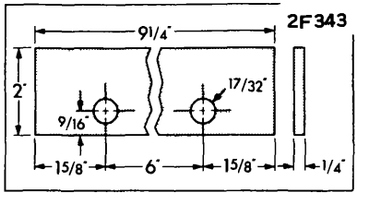
Installation: Position support, Tool J-8999-7 on arbor press anvil and place lower control arm on support, so that ball joint mounting hole is encompassed by support. Insert new ball joint in arm, stud end first, then position Ball Joint Installer, J-8999-5 on flanged portion of joint housing and press joint into arm until joint flange bottoms on mounting hole flange. Install lower control arm and coil spring.

UPPER CONTROL ARM: Rem val - Raise and support front of car with jack stands under lower control arms. Remove wheel, then remove locking nut and special flat washer from ball joint stud. *NOTE - If difficulty is encountered in freeing stud from knuckle, see not below.* Strike bottom of stud with a soft hammer to free it from knuckle support. Remove shaft mounting bolts at frame tower and remove control arm and shaft assembly. If necessary, remove camber eccentric with Puller J-8990. *CAUTION - Ball joint and upp r control arm are serviced as a complete assembly. Do not attempt to remove joint from arm.*

►*BALL JOINT STUD REMOVAL NOTE:* If difficulty is encountered loosening stud from knuckle, cut a piece of 7/16" diameter steel rod and cut to a length of 20", then proceed as follows: Remove stud nut and special flat washer, then install a standard nut about halfway up stud. Insert round end of steel rod inside nut and against bottom of stud, then pound on end of tool with a heavy hammer to break it free.

Installation: Position upper arm assembly on frame tower and install mounting bolts and locknuts. Tighten nuts to 60 ft. lbs. Install camber eccentric on ball joint stud if previously removed, then install ball joint stud and camber eccentric into knuckle and install a standard nut on end of ball joint stud. Tighten nut until camber eccentric locks in knuckle support, then remove standard nut and install special flat washer and locking nut and tighten to 60 ft. lbs. Install wheel and check front end alignment. *CAUTION - If n cessary to replace bolt, nut, or wash r attaching control arm inner shaft to frame, use only Bolt, Part No. 427569; Washer, Part No. 1477585; Nut, Part No. 9411971.*

UPPER CONTROL ARM SHAFT & BUSHINGS: R m val - *NOTE - Following procedure supers des previous procedures for both 1961 and 1962 models.* Use Tool Set J-8999 and make two spacer plates from cold rolled steel or similar material according to dimensions shown in illustration. Obtain two ½" x 2" bolts and nuts to tighten spacers around shaft. Proceed as follows: Remove screw, lockwasher, and flat washer from each end of shaft, then remove ground strap. Install the fabricated plate spacers around shaft between arm ends, insert bolts and nuts and tighten securely. Insert Driver J-8999-6 through bushing and into shaft. Place Support J-8999-2 on press bed and place opposite end of control arm on support. Drive shaft downward, using arbor press on driver until



CONTINUED ON NEXT PAGE

CADILLAC FRONT SUSPENSION (Continu d)

spacer plates touch extruded flanges of control arm. Repeat procedure for other end of shaft. One bushing should be stripped from one end of shaft. Tap bushing with hammer to complete removal and tap opposite end of bushing to complete shaft removal from control arm. Remove shaft sleeves and other bushing in a vise or arbor press.

Installation: Position Bushing Installer, Tool J-8999-16 on arbor press anvil, then insert bushing in one end of arm and place arm and bushing on installer, with outer end of bushing seated in installer tool. Place shaft between arm ends, aligning end of shaft with bushing inner sleeve. Position bushing on opposite end of shaft and place second Bushing Installer J-8999-16 on top of bushing. Hold assembly in place by exerting a light pressure on arbor press. Check alignment of bushing, arm ends, and shaft, then install Spacer J-8999-1 around shaft between arm ends to prevent arms from collapsing when bushings are installed. Press bushing onto shaft until both bushing flanges bottom on arms. *NOTE - If bushings do not butt flush against shoulder of shaft, attaching bolts, when installed, will seat them in position.* Remove tools from arm assembly, then install ground strap at one end, and flat washer, lockwasher, and screw on each end of shaft. *CAUTION - Do not tighten screws until control arm is installed on car and car weight is on wheels, then tighten screws to 60 ft. lbs.*

LOWER CONTROL ARM & COIL SPRING: Removal - Disconnect shock absorber at its upper mount, then raise front of car support with jack stands under frame side rails. Disconnect stabilizer link and tie strut at lower control arm, then remove shock absorber. Remove wheel assembly and brake drum and loosen the two bolts securing brake backing plate to steering knuckle. Remove nut from pivot bolt in lower control arm at frame mount. Position jack under outer end of lower control arm so jack is not supporting control arm, then remove locking nut from lower ball joint stud and install a standard nut on stud, running it to within two threads of knuckle support (this will prevent control arm from dropping when ball joint is broken free of knuckle support). Strike knuckle support with a hammer in area of ball joint stud to break it loose. *NOTE - Raise opposite rear corner of car to increase spring load on lower control arm and aid in breaking joint loose.* Raise jack under lower control arm sufficiently to remove spring load, then remove nut from ball joint stud. Tilt brake backing plate outward from bottom and slowly lower jack, then remove spring and insulator. Remove pivot bolt from lower control arm at frame mount and remove control arm.

UPPER CONTROL ARM SHAFT & BUSHING REMOVER SPACER TOOL

Installation: *NOTE - Air conditioned cars (except Series 75) use a shim on top of right (1961), left (1962) coil spring in addition to insulator.* Place end of lower control arm in frame mount and install pivot bolt (do not install nut), then tape rubber insulator (and shim if used) to top of spring. *NOTE - Either end of spring may be used at top. Both ends are the same.* Install top of spring in upper seat of spring tower and rotate spring so that bottom tang end fits between raised edge on top of lower control arm and centerline of shock absorber. *NOTE - Raised edge of lower control arm faces front of car on right side and rear of car on left side.* With a hydraulic jack placed under outer end of lower control arm, tilt brake backing plate outward from bottom, and raise arm into position. Guide spring into position with tang end between raised edge on top of lower control arm and centerline of shock absorber. *NOTE - When control arm is raised, shock may have a tendency to rotate, mispositioning tang end. End of tang must be between raised edge of arm and centerline of shock after spring is installed.* Guide ball joint stud into knuckle support, then install a standard nut on joint stud and tighten nut until stud seats in knuckle support. Remove standard nut and install special locking nut on stud, tightening it to 60-75 ft. lbs. Install nut on lower control arm pivot bolt but do not tighten until car is resting on all four wheels. Tighten anchor bolt on brake backing plate to 90-110 ft. lbs. and bend locking tang over one flat of bolt head. Install shock absorber (see above) but do not tighten lower nut until car is resting on all four wheels. Install tie strut on lower control arm and tighten nuts to 30-40 ft. lbs., then install stabilizer link. Install brake drum and wheel assembly and lower front end of car. Connect shock absorber at upper end and tighten nut on lower end to 90-110 ft. lbs. Tighten nut on lower control arm pivot bolt to 60 ft. lbs. Check wheel alignment and adjust if necessary.

LOWER CONTROL ARM BUSHING: Removal - With lower control arm removed, position Support, Tool J-8999-2 on arbor press anvil and insert larger diameter end of bushing in support. Place Spacer, Tool J-8999-8 around bushing sleeve between flanged sides of arm, then position Bushing Remover, Tool J-8999-10 on bushing sleeve and press bushing out of arm.

Installation: Position Support, Tool J-8999-2 on arbor press anvil and insert smaller diameter flanged end of bushing mount in support. Install new bushing in arm, smaller diameter end of bushing first, until bushing pilots itself in opposite flanged end. Place Spacer, Tool J-8999-8 around sleeve of bushing between flanged sides of arm, then position bushing Installer, Tool J-8999-9 over end of bushing and press bushing into arm until installer tool bottoms on flanged bushing mount. Install lower control arm and coil spring.

STEERING KNUCKLE: Removal - Raise front of car and place jack stands under frame side rails, then remove wheel assemblies and brake drum. Straighten locking plate on anchor bolt and remove anchor bolt, locking plate, and two bolts securing brake backing plate to steering knuckle. Position steering arm out of way and remove support plate, grease guard, and brake backing plate from knuckle. Wire backing plate to a convenient location to prevent damage to brake hose. Place a jack under lower control arm, then remove stud nut and break ball joint loose from control arm. Break joint loose from upper control arm and remove stud from upper knuckle support. Remove steering knuckle from lower ball joint stud.

Installation: Reverse removal procedure, tightening brake backing plate attaching bolts to 60 ft. lbs. and anchor bolt to 90-110 ft. lbs.

CADILLAC REAR SUSPENSION

Cadillac, Except Commercial Chassis (1962)

DESCRIPTION: Four link, coil spring type similar to design used on previous models.

REAR TRIM HEIGHT: With car trunk empty (except spare tire), and with a full tank of gas, normalize position of springs by working bumper up and down, then release bumper and allow car to assume its normal position. Measure distance from top of rear axle housing straight up to lower underside surface of frame. This distance should be as indicated in table below. *NOTE - Rear standing height should be equal within ½" on both sides of car.*

1962 Rear Trim Dimensions

Series	Rear Height
60, 62	5 15/16"±3/8"
75	7"±3/8"

REMOVAL & INSTALLATION: *See 1961 Final Data, Page 356, and note the following:*

Control Arm Attaching Bolts: Tighten front and rear control arm bolts to 80 ft. lbs.

CHEVROLET PASS. CAR FRONT SUSPENSION

Chevrolet Pass. Cars (1962)

►*UPPER BALL JOINT STUD REPLACEMENT NOTE:* If upper control arm ball stud replacement unit, Part No. 3813205, has ¼" attaching holes in flange, drill holes to 5/16" diameter. Special 5/16" diameter bolts furnished in unit must be used to attach ball stud.

DESCRIPTION: Ball joint type with coil springs and direct acting shock absorbers similar in design to previous models.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Riding Height: With car on a level floor, bounce car, then allow to settle to normal height. At front, measure distance from floor to center of front inner pivot of lower control arm, then record this measurement. Measure distance from floor to lower face of lower steering knuckle ball joint boss (on the same side of car) and record this measurement. The difference between the above two measurements should be as indicated in table below. If not within limits, replace spring. At rear, measure distance from top of rear axle housing to the frame kick-up which should be as indicated in table below. If not within limits, replace spring. *NOTE - Spring ends on both front and rear springs are not flat and shims should not be used.*

1962 Front Riding Height

Model	Front Height
All 6 Cyl.	4 1/4"±1/2"
All V8	4 7/16"±5/16"

1962 Rear Riding Height ℄

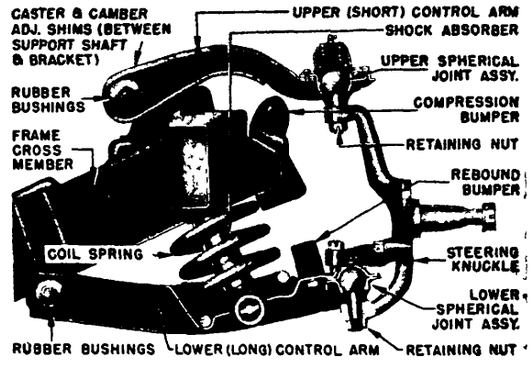
Model	6 Cyl.	8 Cyl.
2 & 4-Dr.Sed. (Exc.Spt.Sed)	5 43/64"	5 59/64"
2 & 4-Door Sport Sedan	5 43/64"	5 43/64"
Convertible	5 9/16"	5 9/16"
Station Wagon	6 11/64"	6 11/64"

℄ - Measurements are plus or minus ¼".

REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Hold upper stem of shock absorber from turning (¼" wrench), then remove retaining nut and lockwasher. Remove bolts retaining lower shock absorber pivot to lower control arm and pull shock absorber assembly and mounting out at bottom of spring housing.

Installation: Reverse removal procedure and tighten upper retaining nut to 15-25 ft. lbs.



COIL SPRING: Removal - Raise and support car at frame side rails so control arms swing free, then remove wheel, stabilizer bar (if so equipped), and shock absorber. Loosen lower ball joint-to-steering knuckle nut and the two lower control arm cross shaft bushing bolts. Place Tool J-6874-1 across top of sixth coil, then loosely secure Tool J-6874-2 to upper shoe of tool, using attaching capscrews and washers. *NOTE - "V" notch in upper shoe of tool and raised notch in lower shoe should contact spring.* Insert Tool J-6874 up through center of spring and attach to upper and lower shoe assembly with bolt and nut. Position spacer under shock absorber mounting hole and against bottom of lower control arm. Install special bearing washer and Tool J-6874-5. Locate bearing against spacer and large washer against bearing, then insert screw, Tool J-6874-5 up through large washer bearing and spacer and thread into Tool J-6874 and tighten snugly. Center shoe assembly on spring and tighten screw until a very slight amount of compression is placed on spring, then firmly tighten down the two capscrews securing upper and lower shoes to lock these shoes to spring. Turn head of screw until spring is compressed just enough to clear spring tower, then remove lower ball joint-to-steering knuckle nut. *NOTE - If may be necessary to assist spring out of tower with a pry bar.* Disconnect lower ball joint from steering knuckle and lower control arm and spring. Immediately release compression on spring. *CAUTION - Be very careful when lowering control arm to prevent injury or damage.*

Installation: *NOTE - If a new spring is being installed, remove spring compressing tool assembly from old spring and install on new spring in same manner. Place spring in its seat on lower control arm and install remaining parts of tool and compress spring.* With spring compressed sufficiently to clear spring tower, immediately install lower ball joint into steering knuckle and secure in place with nut. Release compression on spring and at the same time use a drift to guide spring into its proper seat. Tighten lower ball joint-to-steering knuckle nut to 60-94 ft. lbs., and install cotter pin. Install shock absorber, stabilizer bar, and wheel and drum assembly, then remove car from support. Tighten two lower control arm cross shaft bushing bolts to 45-55 ft. lbs.

LOWER CONTROL ARM: Removal - Remove coil spring (see above), then remove control arm cross shaft-to-frame attaching bolts and remove control arm.

Disassembly: If necessary to remove ball joint (see "Ball Joint" below). Remove bolt, lockwasher and collar from each end of cross shaft, then thread a 7/16" - 20 capscrew (furnished with Tool J-5888) to bottom of threads in one end of cross shaft. Support control arm in an arbor press on Tool J-5888-3, making sure that bushing flange does not contact support, then press on capscrew until bushing is free of control arm. Remove bushing from other end of cross shaft in same manner.

Reassembly: With cross shaft in position in control arm and control arm supported on Tool J-7052-1 & J-5888-3, start bushing into control arm and over end of cross shaft. *NOTE - End of cross shaft with two bolt holes must be toward front of control arm.* Install Tool J-7052-5 over bushing, being sure that three piece spacer is not overlapping bushing holes in control arm. Press bushing into control arm until flange contacts control arm. Install bushing in opposite arm in same manner. After complete installation, cross shaft should be free enough to be rotated by hand. Install collar, lockwasher, and capscrew in each end of cross shaft but DO NOT TIGHTEN.

CHEVROLET FRONT SUSPENSION 2F348

Installation: With control arm in position, attach with three lockwashers and special washers under rear bolt; front bolts and anchor nuts. After coil spring is installed, and car is on floor with weight on wheels, tighten cross shaft bushing bolts to 45-55 ft. lbs.

UPPER CONTROL ARM: Removal - Raise and support car at outer end of lower control arm, then remove wheel. Remove ball joint stud from steering knuckle with Tool J-6627 (Pitman Arm Puller). Disconnect upper control arm inner shaft from crossmember, noting number and thickness of shims at each bolt location. *NOTE - Bolts attaching control arm to frame member must be cut off or removed to allow proper clearance for control removal.* Remove upper control arm from car.

Disassembly: If necessary to remove ball joint (see "Ball Joint" below). Remove capscrews, lockwashers, and collars from both ends of cross shaft, then install 3/8" - 24 capscrew (furnished with Tool J-5888) in one end of cross shaft. Support control arm in an arbor press on Tool J-5888-3, making sure that bushing flange does not contact support, then press out bushing. Remove bushing from other side of arm in same manner.

Reassembly: Install arm in arbor press with Tool J-7052-2 in place and press in one bushing while supported on Tool J-5888-3. Install cross shaft in arm, then invert in press and press in second bushing, using the same tools. Cross shaft should be able to be turned by hand. Install collar, lockwasher and capscrew in ends of shaft, but DO NOT TIGHTEN.

Installation: Install upper control arm in car and make sure attaching studs are in position. Install two nuts and bolts retaining upper control arm shaft to crossmember, then install same thickness of shims as removed at each bolt location. Install new rubber seal on ball joint stud, then install ball stud through knuckle and tighten to 42-47 ft. lbs. Install wheel and lower car to floor. Bounce front end of car to centralize bushings, then tighten collar bolts to 35-40 ft. lbs.

BALL JOINT (UPPER & LOWER): Testing - *NOTE - If excessive wear is indicated in upper ball joints, both upper and lower ball joints should be replaced.* To check upper ball joint, raise and support car under outer end of lower control arm, then remove wheel assembly. Remove ball joint stud from steering knuckle with Tool J-6627 (pitman arm puller). Install a stud nut on ball stud and measure torque required to turn the ball joint assembly with a torque wrench. This torque should be 2 ft. lbs. minimum or 15 lbs. maximum.

Removal: With car supported as above and joint disconnected from steering knuckle (support knuckle assembly to avoid damage to brake hose), center punch rivets, then drill them out, being careful not to enlarge holes in control arm.

Installation: On upper control arms, ream rivet holes out to 21/64" diameter. *NOTE - Upper and lower ball joint replacement parts are in three pieces. Metal inner seal is to be carefully pressed in place in joint housing, and the rubber outer seal should then be placed over inner seal.* Install new joint against underside (lower arm), top side (upper arm) and retain in place with special bolts and nuts supplied with new joints. Tighten to 20-25 ft. lbs. *NOTE - Tighten nut on ball joint forging to 35-45 ft. lbs.*

CHEVROLET PASS. CAR REAR SUSPENSION

Ch vr let Pass. Cars (1962)

DESCRIPTION: Rear suspension is similar in design to previous models except that lower control arm bushings are a new design and the upper control arm is now connected to rear axle housing at right hand side on top of axle tubes and to bracket on frame right side rail. A tie rod is attached to frame left side rail and to right hand side of rear axle housing.

REMOVAL & INSTALLATION: *See 1958 Final Data, Pag 343, r lat r Manual editions, and note the f ll wing:*

Upp r C ntr l Arm & Bushings: Removal - Raise car on a hoist that will support rear axle housing or wheels, then remove rear pivot bushing bolt at rear axle housing. *NOTE - R ar axle must be supported in such a way as to prev nt axle housing from rotating about the low r control arm rear pivot, and to also relieve load on pivot bushings.* Remove bolts, lockwashers, and nuts securing upper control arm bracket to frame bracket or crossmember. *CAUTION - NOTE number of shims removed at these control driveline angles.* Remove arm from car. Remove bolt, nut and washer attaching upper control arm to bracket and separate control arm from bracket. With control arm bushing centered over Tool J-7574-4 and Tool J-7574-3 in place and with arm resting horizontally by supporting at opposite end, press or tap bushing from arm using Tool J-7574-1 and Tool J-7079-2 (Driver Handle). Repeat procedure for opposite end of control arm.

Installati n - Turn arm to opposite side (bushing can only be installed from one direction), center bushing hole over support Tool J-7574-4 and install Tool J-7574-3 between flanges at hole location. *NOTE - Tool J-7574-3 will prevent overcompression of arm during overtravel.* Fix Tool J-7574-2 on driver handle, then start bushing into hole and press or tap in place. Check to see that no interference or cocking takes place. Flange of bushing must be seated against arm. Repeat procedure for opposite end of arm. Tap front of upper control arm into control arm bracket, then install bolt, lockwasher and nut but do not tighten. Set control arm (with front bracket installed) on axle housing bracket and tap into place. Install bolt (head of bolt must be toward outboard side), lockwasher and locknut but do not tighten. Align forward end of upper control arm bracket with frame bracket or crossmember, then install two lower bolts through control arm bracket and frame bracket or crossmember. *CAUTION - Make sure shims removed at disassembly are reinstalled in original locations.* Install both nuts and lockwashers. Install upper bolt and flat washer from front of bracket, then install lockwasher and nut. Tighten the three bracket bolt nuts to 60-80 ft. lbs. *NOTE - If a new control arm was installed, check driveline angles (see "Propeller Shafts" in Rear Axle Section).* Lower car to floor, then bounce rear of car several times to settle bushings. Tighten upper control arm nuts to 80-90 ft. lbs.

Lower Control Arm Bushing Replacement: Removal (Front Bushing) - With control arm and bushing centered over Tool J-7574-4 and with Tool J-7574-3 in place, and with arm resting horizontally by supporting at opposite end, press or tap bushing from arm using Tool J-7574-5 and driver handle. *NOTE - Be sure to place the remover n nd f bushing with the flange.* **(R ar Bushing)** - Repeat above operations for opposite end using Tool J-7574-1 in place of Tool J-7574-5.

Installati n (Front Bushing) - Fix Tool J-7574-6 onto driver handle, then start bushing into hole and press or tap in place. Check to see that there is no interference or cocking. Flange of bushing must seat against arm. **(Rear Bushing)** - Repeat above operation for rear bushing using Tool J-7574-2 in place of Tool J-7574-6.

Rear Suspension Tie Rod: Removal - Remove nut, washer and bolt from left hand side and nut and washer from stud on right side that secures tie rod to brackets. Remove tie rod.

Bushing Replacement - With tie rod centered over Tool J-7877-2 and with tie rod supported horizontally, press or drive bushing from rod, using Tool J-7877-1 and J-7079-2. With tie rod centered over Tool J-7877-2 and rod supported horizontally, press or drive bushing into arm using Tools J-7877-3 and J-7079-2. *NOTE - Tool J-7877-2 should bottom on rod when bushing is fully seated.*

Installation - Mount tie rod to right hand stud, then install nut and special washer but do not tighten. Install bolt, lockwasher and nut to left hand bracket but do not tighten. Lower car to floor and bounce rear end several times, then tighten nuts to 55-70 ft. lbs.

Rear Standing Height Measurement ℄

Model	6 Cyl.	8 Cyl.
2 & 4 Dr. Sed. (Exc. Spt. Sed.) ..	5 43/64"	5 59/64"
2 & 4 Dr. Spt. Sed.	5 43/64"	5 43/64"
Convertible	5 9/16"	5 9/16"
Station Wagon	6 11/64"	6 11/64"

℄ - Measurements are plus or minus ¼".

Corvair, All M d ls (1962)

►*CORVAIR 95 BALL JOINT STUD REPLACEMENT*

NOTE: If upper control arm ball stud replacement unit, Part No. 3813205, has ¼" diameter attaching holes in flange, drill holes to 5/16" diameter. Special 5/16" diameter bolts furnished in unit must be used to attach ball stud assembly.

DESCRIPTION: Ball joint type suspension with ball and socket joint connecting upper and lower control arms to steering knuckles. Coil springs are mounted between lower control arm and tower in front crossmember. Shock absorbers are mounted within coil springs on lower control arm and connected at top to tower in front crossmember. On 500, 700, and 900 Series, a strut rod is connected between outer ends of lower control arms and brackets that trail back from front crossmember. On these models, caster adjustment is made with this strut rod. On 1200 Series (including Greenbriar), the lower control arm is of different design, having front and rear legs, similar to upper control arm. A strut rod is not used on these models and caster adjustment is obtained by shimming at upper control arm.

ADJUSTMENT: *S "Wh l Alignment Specifications & Adjustm nt" in this s ction.*

Riding H ight: With car at curb weight (full gas tank, and spare tire, no passengers), position car on a level floor, then bounce and rock car several times and allow to settle. *NOTE - Proc dures b low are for ch cking front riding h ight. For rear height checking, s "Corvair & Pontiac Tempest Rear Suspension" in this section.* Measure distance from center of lower control arm pivot bolt to floor. Distance should be as in table below and equal within ½" on each side of car. If not within limits, replace springs. *CAUTION - Springs do not have flat ends and shims must not be used.*

1962 Riding Height

Model	Front Height
Pass. Cars	12"±1/2"
Greenbrier & Trucks	11 7/8"±1/2"

CORVAIR FRONT SUSPENSION

REMOVAL & INSTALLATION

See 1960 Final Data, Page 376, or later Manual edition, and note the following:

1962 Ball Joint Stud Tightening Torques

Model	Upper	Lower
Pass. Cars	30-40 ft. lbs.	30-40 ft. lbs.
Greenbrier & Trucks	42-47 ft. lbs.	60-94 ft. lbs.

COIL SPRING (SERIES 1200): Removal - Pry out upper rebound bumper, then raise car and support on jack stands so front control arm hangs free. *NOTE - Position stands so control arms may be raised or lowered with a floor jack.* Remove shock absorber, then position a piece of 2" x 4" lumber, 16¼" long between top of upper control arm and behind reinforcing channel above wheel. Make sure upper corner of this wood support is placed behind reinforcing channel toward inside of car. Place a floor jack under lower control arm and raise until wood support is forced firmly against channel. Disconnect lower control arm ball joint stud from steering knuckle, then raise lower control arm and free stud from knuckle boss. Swing wheel out far enough to clear lower arm, and block or wire in this position. Carefully lower jack supporting control arm until spring is decompressed and remove spring.

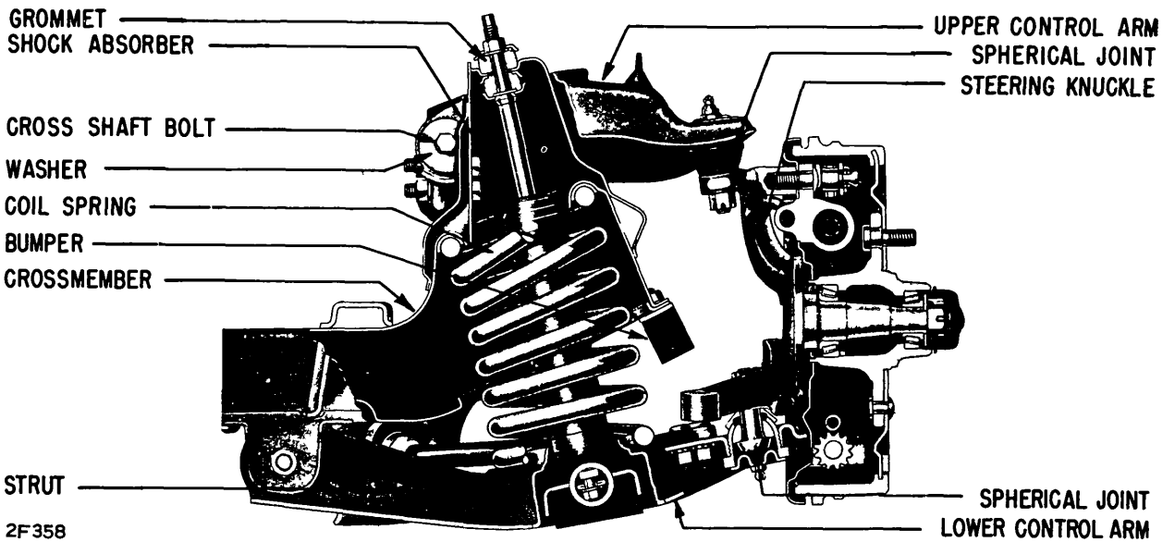
Installation: Seat spring in tower with end of spring coil in contact with step in spring seat, then swing lower control arm up as far as possible and seat spring in control arm. Place floor jack under lower control arm and raise until ball joint stud may be placed into steering knuckle boss (make sure dust cap is in position on ball stud). When stud will enter hole in knuckle, lower jack and install stud nut. Tighten to 60-94 ft. lbs. and continue to tighten until cotter pin holes are lined up and install cotter pin. Raise lower control arm and install upper rebound bumper in proper hole, then to seat it in position, slowly lower the control arm until upper arm presses point of bumper through hole in spring tower.

LOWER CONTROL ARM (1200 SERIES): Removal - Remove coil spring (see above), then disconnect lower control arm inner shaft from crossmember.

Disassembly: Remove bolt, lockwasher and collar from each end of cross shaft, then thread a 7/16" - 20 capscrew (furnished with Tool J-5888) to bottom of

CONTINUED ON NEXT PAGE

CORVAIR FRONT SUSPENSION (C ntinu d)



threads in one end of cross shaft Support control arm in an arbor press on Tool J-5888-3, being careful not to allow bushing flange to contact support, then press on capscrew until bushing is free of control arm Repeat this operation to remove bushing from opposite end of shaft.

Reassembly: Install cross shaft in control arm and position Tool J-7052-1, then support control arm with Tool J-5888-3 and hand start bushing into control arm and over end of cross shaft *NOTE - End of cross shaft with two bolt holes must be toward front of control arm.* Install Tool J-7052-5 so three piece spacer does not overlap bushing holes in control arm, then press bushing into control arm until flange concontacts arm Repeat procedure for bushing at opposite end of cross shaft. Install collar, lockwasher and capscrew in each end of shaft but DO NOT TIGHTEN

Installation: Install control arm on crossmember and attach with lockwashers, bolts and anchor nuts. Install coil spring, then with car weight on wheels, tighten cross shaft bushing bolts to 45-55 ft. lbs

UPPER CONTROL ARM (1200 SERIES): Removal - Raise and support car under outer end of lower control arm, then remove wheel assembly. Disconnect and remove ball joint stud from steering knuckle with Tool J-6627 (pitman arm puller), then wire hub, drum and steering knuckle in position to prevent damage to brake hose. Remove nuts retaining upper control arm to crossmember, noting number and thickness of shims found at each bolt, and remove control arm.

Disassembly: Remove capscrews, lockwashers and collars from both ends of cross shaft, then install a 3/8" - 24 capscrew (furnished with Tool J-5888) in one end of shaft. Support control arm in an arbor press on Tool J-5888-3, being sure that flange of bushing does not contact support, then press bushing out of arm, repeat this procedure for opposite bushing.

CORVAIR SERIES 500, 700, 900 FRONT SUSPENSION ASSEMBLY

Reassembly: Install control arm in press with Tool J-7052-2 in place between legs of control arm and press in bushing Install cross shaft in arms and invert assembly in press, and press in second bushing *NOTE - Cross shaft should be free enough to turn by hand* Install collar, lockwasher and capscrew in each end of cross shaft, but DO NOT TIGHTEN

Installation: Reverse removal procedure and lower car to floor Bounce front end to centralize bushings, then with weight of car of wheels, tighten bushing capscrews to 35-40 ft lbs

BALL JOINTS (UPPER & LOWER): Removal - With coil spring removed and control arms hanging free, remove lube fitting from joint, then mark center of rivet heads with a center punch and drill through head with a ¼" drill Cut off heads with a chisel and remove balance of rivets with a punch Remove ball joint

Installation: On upper control arms, ream rivet holes out to 21/64" Position new ball joint assembly on control arm and install special bolts through mounting holes and tighten nuts securely. *CAUTION - Us only th bolts (specially hardened) furnish d with ball joint assembly.* Complete installation by reversing removal procedure

FRONT SUSPENSION CROSSMEMBER: Removal - Remove steering relay rod from car, then remove bolts retaining idler arm to frame Disconnect brake main cylinder line and rear brake feed line from junction block at top center of cross member Use a suitable jack under crossmember and remove the four bolts holding crossmember to underbody, then remove crossmember

Installation: Reverse removal procedure and note the following Tighten crossmember mounting bolts to 100-110 ft lbs and idler arm-to-frame nuts to 13-22 ft lbs

CORVAIR & PONTIAC TEMPEST REAR SUSPENSION

C rvair, All Models (1962)
P ntiac Tempest (1962)

►*1962 PONTIAC TEMPEST REAR SHOCK ABSORBER NOISE CORRECTION:* Before replacing shock absorber for noise, torque shock absorber upper mounting bolt to new specification of 65-80 ft. lbs *Supersedes previous 45-60 ft lbs.*

DESCRIPTION: Independently sprung with individual single control arm on each side of car Coil type rear springs are mounted between control arm and frame crossmember. Shock absorbers are mounted within coil springs

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustm nt" in this section.*

R ar Riding H ight: With car at curb weight (full tank of gas and spare tire), position car on a smooth level floor, then bounce rear end several times and allow to settle to its normal height

Corvair Series 500, 700, 900 - Measure distance from floor to bottom of rocker panel 29" ahead of centerline of rear wheel This measurement should be 9"±½" Measure opposite side of car in same manner The difference between the two measurements must not exceed ½" To correct riding height, replace springs *CAUTION - These springs do not have flat ends and shims must not be used*

Corvair Series 1200 - Measure distance from center of rear suspension control arm pivot bolt to floor This measurement should be 14 5/16"±1/2" Measure opposite side of car in same manner The difference between the two measurements must not exceed ½" To correct riding height, replace springs *CAUTION - These springs do not have flat ends and shims must not be used*

P ntiac Temp st - 3 7/8", measured directly behind rear spring between control arm upper bumper bolt and top of upper control arm To correct riding height, replace springs

REMOVAL & INSTALLATION: *S 1960 Final Data, Page 377, or later Manual editi n, and not the following*

Rear Suspension Crossmemb r (P ntiac T mp st): Remove transmission and differential assembly (see "Pontiac Tempest Transaxle"), then remove both shock absorbers and coil springs (support control arms with a jack) Disconnect parking brake cables at rear equalizer, then remove fuel line and brake line from clip on top of crossmember Disconnect brake lines at junction block and remove two bolts at each side connecting crossmember to body, then lower crossmember from car *CAUTION - B sure that crossmember is properly supp rted before lowering from car*

Installati n: Place crossmember in position and install four attaching bolts, tightening them to 60-80 ft lbs Complete installation by reversing removal procedure

CHEVY II FRONT SUSPENSION

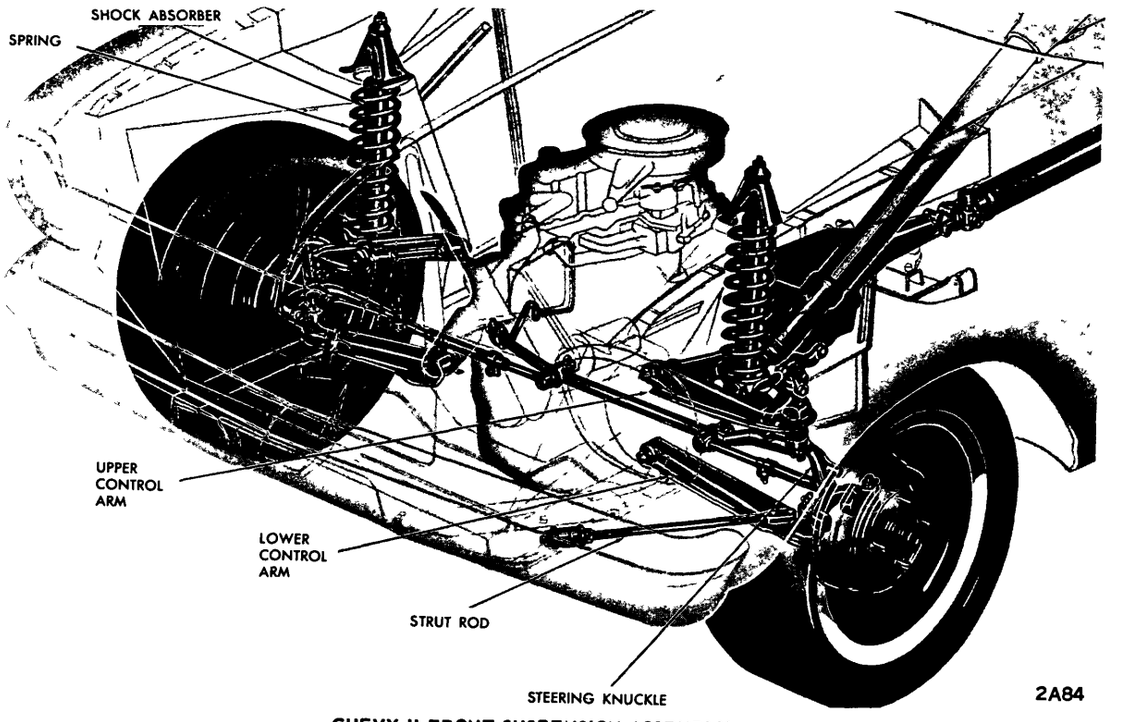
Chevy II (1962)

►*1962 FRONT SUSPENSION NOISE CORRECTION:* Noise similar to mispositioned front spring or worn ball joint may be caused by dry spring lower seat pivot shaft bearing. Make sure bearing is lubricated at regular intervals at lubrication fitting on underside of pivot shaft bearing (reach through large opening in upper control arm).

DESCRIPTION: New design "ball joint" type front suspension system with coil springs mounted between top of upper control arms and towers in front end sheet metal. Inner ends of upper and lower control arms pivot on front end sheet metal chassis structure and are mounted on rubber bushings. A cam-shaped lower control arm inner pivot bolt provides lateral movement for camber adjustment. A strut rod connects each lower control arm (at outer end) to a bracket attached between frame and radiator support at front of car. Adjusting nuts at forward end of strut rod are used to change length of rod for caster adjustments. Front shock absorbers are mounted within front coil springs.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

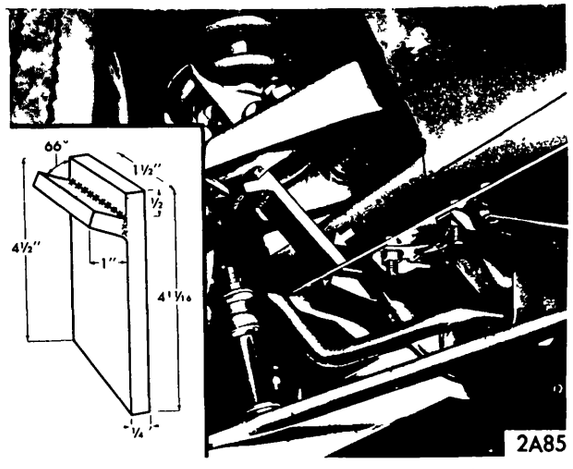
Riding Height: With car at curb weight (full tank of gasoline and spare tire), position car on a level floor, then bounce front of car several times and allow it to settle. Measure distance from floor to centerline of lower control arm pivot, then measure distance from floor to lower ball joint seat. The difference between these two measurements should be 2½"±½". *NOTE - Both sides must be equal within ½".* To adjust, replace spring. DO NOT shim springs.



REMOVAL & INSTALLATION

►*UPPER CONTROL ARM SUPPORT TOOL (TO BE MADE LOCALLY):* Fabricate a support for each side of the car as indicated in the illustration. Right hand support is shown. When making left hand support, the angled support must be placed and welded to reverse side of plate.

►*BALL JOINT INSPECTION NOTE:* Upper ball joint is a loose fit when not connected to upper control arm. Lower ball joint is a tight fit at all times. Check wear as follows:



Upper Ball Joint - With weight of car on wheels, insert upper control arm support (see illustration), then raise car and allow wheel and tire to hang free. Measure distance from tip of ball stud to top surface of control arm. Place an adjustable jack stand under tire and raise slightly to take up ball joint looseness. Repeat the measurement taken with weight on wheel and if the difference in measurements is greater than 3/32", the joint is excessively worn and should be replaced.

Lower Ball Joint - With upper control arm support in position (same as for upper ball joint), disconnect lower ball joint from steering knuckle. Assemble nut to lower ball joint stud and check rotating torque with a torque wrench. Specifications for new joints are 4-8 ft. lbs. If torque readings are excessively high or low, replace ball joint.

CHEVY II FRONT SUSPENSION ASSEMBLY

BALL JOINT REPLACEMENT (ON CAR): Upper Ball Joint - With weight of car on wheels, insert upper control arm support (see illustration), then raise car and remove wheel. Disconnect stabilizer link (if so equipped) and strut rod at lower control arm. Remove cotter pin and nut from upper ball joint stud, then strike steering knuckle adjacent to ball joint stud, backing up with another hammer, to loosen stud in knuckle. Drop lower control arm, steering knuckle and brake assembly with a floor jack until upper control arm ball joint is easily accessible. Use a large chisel and cut off the three ball joint retaining plate rivet heads. *NOTE - It may be necessary to drill out rivet heads before chiseling.* Remove ball joint and inspect ball joint seat in control arm for cracking or damage. *CAUTION - If arm is damaged in any way, replace arm.* Install replacement ball joint assembly, using special bolts furnished with replacement kit, and tighten to 20-25 ft. lbs. *CAUTION - Use only special hardened bolts furnished with replacement joint. DO NOT use other non-hardened bolts and do not attempt to rivet replacement joint to control arm.* Complete installation by reversing removal procedures. Tighten ball joint stud nut to 42-47 ft. lbs. Lubricate joint and adjust front wheel alignment.

UPPER CONTROL ARM SUPPORT TOOL

Lower Ball Joint: Install upper control arm support while weight of car is on wheels (see illustration), then raise car and remove lower ball joint stud nut. If car is equipped with stabilizer, disconnect at upper link. Strike lower steering knuckle boss, backing up with another hammer, to loosen stud, then lower the control arm until ball joint is accessible. Replace ball joint on lower control arm in the same manner as for upper control arm ball joint (see above). Tighten attaching bolts to 20-25 ft. lbs. and ball joint stud nut to 42-47 ft. lbs.

SHOCK ABSORBER: Removal - With weight of car on wheels, position upper control arm support (see illustration), then raise car and remove wheel assembly.

CONTINUED ON NEXT PAGE

CHEVY II FRONT SUSPENSION (C ntinu d)

Disconnect lower shock absorber mounting nuts and remove lockwashers, and rubber washers from lower spring seat. Remove shock absorber upper mounting bracket bolts and lift bracket and shock absorber assembly from car. Remove shock absorber from bracket.

Installation: Reverse removal procedure. Tighten shock absorber-to-bracket nut and bracket-to-tower nuts to 9-12 ft. lbs. Tighten shock absorber lower mounting nuts to 25-35 ft. lbs.

COIL SPRING: Removal - Raise car and remove wheel assembly, then support lower control arm with a floor jack and raise it slightly from full rebound position. Remove shock absorber (see above). *NOTE - It is not necessary to install upper control arm support.* Install spring compressor J-6874-4-5 with adapters J-6874-8-9 into upper spring tower so that lower U-bolt fits into shock absorber mounting holes in spring seat. Secure two lower studs to spring seat with nuts. Install tool upper pilot on top of spring and compress spring by tightening nut until screw is bottomed. Remove lower spring seat retaining nuts, then lift spring and seat assembly from control arm and guid it down and out through fender skirt. Release spring tension. If spring seat is to be repaired, disconnect spring compressor from spring seat.

Installation: Install spring seat to spring compressor (if removed). If a new spring seat is to be installed, install spring compressor and compress spring until screw is bottomed. *NOTE - Spring coil ends should be about 1/8" from spring stops in upper and lower seat to prevent squeaks.* Lift spring and tool assembly into place and position so that upper spring stop is inboard. Install lower spring seat to control arm and tighten nuts to 25-35 ft. lbs. Loosen spring compressor until spring is properly seated in upper spring tower and remove compressor. Install shock absorber (see above).

SPRING SEAT: Disassembly - Tap one bolt out of pivot shaft and remove rubber boots, then unscrew pivot shaft, drawing free end of shaft through threaded sleeve. Inspect pivot shaft and sleeve for damage to threads and for distortion. Inspect rubber shaft boots and replace if necessary.

Reassembly: Screw pivot shaft into spring seat until bolt hole centerlines are equal distance from spring seat (within .050"). Insert lip of rubber boot into groove in spring seat sleeve, then insert bolts into pivot shaft and lubricate spring seat assembly through lube fittings.

UPPER CONTROL ARM: Removal - Remove spring and shock absorber (see above), then position a floor jack under lower control arm. Remove cotter pin and nut from upper ball joint stud and strike steering knuckle boss to loosen stud. Drop lower control arm and steering knuckle assembly, then remove upper control arm pivot shaft stud nuts from fender skirt and remove upper control arm. Inspect arm for cracks or bending and replace if necessary.

Ball Joint Replacement: *See "Ball Joint Replacement (On Car)" above.*

Pivot Shaft Bushing Replacement: Removal - *NOTE - If a new pivot shaft is to be installed, also install pivot shaft bushings.* With upper control arm removed, remove nut, lockwasher and metal spacer from pivot shaft end, then stand control arm and pivot shaft assembly on support J-5888-3 and insert J-9513-1 over threaded end of pivot shaft. Press pivot shaft down (in an arbor press) until upper bushing diameter is visible for approximately 5/16", then insert J-9513-2 over journal. Release tension on pivot shaft, then invert control arm and support on J-5888-3 and press out bushing with J-9513-1. Press second bushing out in the same manner.

Installation - Insert new bushing in control arm and over pivot shaft, then support arm on J-5888-3 and insert spacer J-8345-1 and press bushing into place with installer J-9513-3. Invert arm and press remaining bushing in place with J-9513-3. Install bushing spacers, lockwashers and nuts on pivot shaft ends and tighten to 40-60 ft. lbs. *CAUTION - Pivot shaft bolts must be in horizontal position (toward centerline of car) before tightening nuts.*

UPPER CONTROL ARM: Installation - Insert upper control arm pivot shaft studs into reinforced fender skirt openings, then install lockwashers and nuts and tighten to 60-90 ft. lbs Raise lower control arm and steering knuckle assembly into position, insert upper ball joint stud into steering knuckle. Install ball stud nut and tighten to 42-47 ft. lbs. Install cotter pin. Lubricate ball joint and check front wheel alignment.

LOWER CONTROL ARM: Removal - With weight of car on wheels, install upper control arm support (see illustration) and raise car Remove lower control arm ball stud cotter pin and loosen nut. Strike lower control arm steering knuckle boss to loosen ball stud and remove nut, then drop lower control arm. Mark lower control arm pivot bolt and adjusting cam for alignment in same position, then remove nut securing pivot bolt and cam assembly. Remove pivot bolt and cam and remove lower control arm.

Ball Joint Replacement: *See "Ball Joint Replacement (On Car)" above.*

Pivot Shaft Bushing Replacement: Removal - Support control arm on Tool J-7574-4 and insert spacer J-9514. Press bushing out with Tool J-9226 and handle J-7079-2.

Installation - With spacer still in control arm, invert control arm and press in new bushings with Tool J-7574-2 and handle J-7079-2 until bushing is fully seated. *CAUTION - Bushing diam t rs ar un qual and bushing must b pr ss d into p siti n through larger diameter only.*

LOWER CONTROL ARM: Installation - Insert lower control arm into its bracket, then index pivot bolt and cams and tighten nut to 90-120 ft. lbs. Raise lower control arm ball stud into steering knuckle boss and install nut. Tighten nut to 42-47 ft. lbs. and install cotter pin. Lubricate ball joint and install wheel. Lower car and remove upper control arm support, then check front wheel alignment

STEERING KNUCKLE: Removal - With weight on wheels, install upper control arm support (see illustration), then raise car and place a floor jack under lower control arm. Remove brake drum and hub and disconnect brake shoe return springs. Remove brake shoes and clamp wheel cylinder, then remove brake anchor pin and two bolts securing brake backing plate and steering arm to steering knuckle. Remove brake backing plate and steering arm from knuckle and wire backing plate to underbody member. *NOTE - Do not disconn ct brake hos .* Remove lower control arm ball joint stud nut and strike steering knuckle boss to loosen stud and disengage steering knuckle Disengage upper ball joint stud from knuckle in same manner, then remove steering knuckle

Installation: Reverse removal procedure and tighten ball joint stud nuts to 42-47 ft. lbs Tighten brake backing plate-to-knuckle and steering arm bolts to 55-75 ft. lbs. Tighten brake anchor pin to 60-90 ft lbs.

FRONT STABILIZER (STATION WAGONS): Rem val - Raise car and support both front wheels, then disconnect stabilizer bar from link at each lower control arm. Remove stabilizer bar bracket from front radiator crossmember and remove stabilizer. Disconnect stabilizer link bolts, spacers and rubber bushings from lower control arms

Installation: Reverse removal procedure and tighten bracket bolts to 14-22 ft. lbs and link bolts to 9-12 ft lbs *NOTE - If new insulators ar n c ssary, coat stabilizer with recommended rubber lubricant and slide insulators into position.*

STRUT ROD: Removal - Raise car and remove forward nut, retainer and rubber bushing from front end of strut rod, then remove two nuts from strut rod-to-lower control arm bolts and remove bolts and washers. Withdraw strut rod from bracket and remove remaining bushing, sleeve, retainer and nut from rod.

Installation: Reverse removal procedure and tighten strut rod-to-lower control arm bolts to 40-50 ft. lbs. Check front wheel alignment

CORVETTE FRONT SUSPENSION

Chevrolet Corvette (1955-62)

DESCRIPTION: Independent, linked parallelogram type with direct acting shock absorbers and coil springs. "Threaded Bushing" pivot joints used on upper and lower control arms for connection to steering knuckle. Steering knuckle is conventional reverse Elliott type which pivots on a kingpin through split, floating bushings. A stabilizer bar, linked to lower control arms, is used. Caster and camber adjustments are made by rotating upper control arm pivot bolt (eccentric).

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Front Riding Height: With car on a level floor, bounce front end up and down and allow to settle. Distance from centerline of lower control arm inner pivot shaft to floor should be 11" ± ½" (8¾" ± ½" 1957-59 cars with H.D. springs). If height not correct, add a shim to top of coil spring. *CAUTION - Do not add more than 1 shim. If necessary to add more than 1 shim, replace spring.*

REMOVAL & INSTALLATION

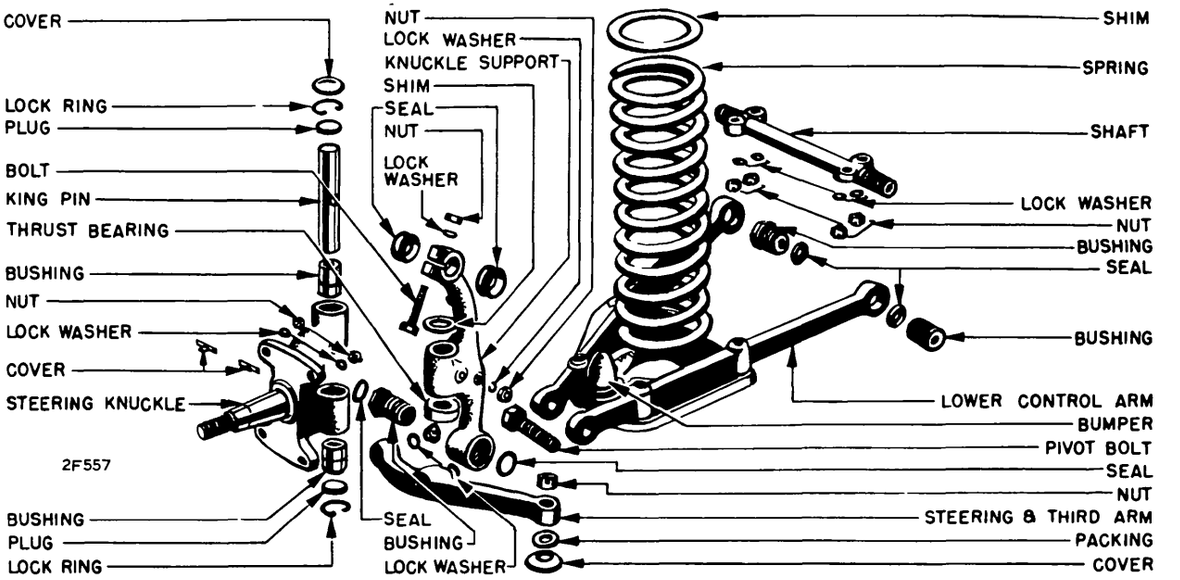
STABILIZER: Removal - Disconnect stabilizer bar from links by removing link attaching nut and bolt. Disconnect stabilizer brackets from radiator support crossmember, and remove stabilizer bar and brackets.

Installation - Reverse removal procedure but do not tighten bracket attaching bolts at radiator crossmember until after car is lowered to floor and bounced several times to align stabilizer. Then tighten mounting bolts to 17-22 ft. lbs.

SHOCK ABSORBER: Removal - Disconnect shock absorber at both upper and lower ends (hold upper stem from turning when removing retaining nut, grommet retainer, and grommet), then remove shock absorber from bottom of spring housing.

Installation - Reverse removal procedure. Tighten retaining nuts to 4-6 ft. lbs. and stake in place.

COIL SPRING: Removal - Disconnect stabilizer bar from link on lower control arm, then remove shock absorber (see above). Raise and support car with jacks under frame side rails. Place jack under control arm inner shaft, then drive out control arm shaft bracket bolts. Lower jack slowly to relieve spring pressure (lower control arm will drop down), and remove spring. Remove shim (if used) from upper spring seat.



Installation - Install spring with flat end up and reverse removal procedure.

LOWER CONTROL ARM: Removal - Remove wheel and tire. Remove front spring (see above), then remove tie rod end from steering arm. Remove lower control arm pivot bolt nut and bolt and remove control arm.

Installation - Reverse removal procedure.

LOWER CONTROL ARM CROSS SHAFT & BUSHING: *NOTE - Service procedures may be performed with control arm either installed in, or removed from the car.*

Replacement: *NOTE - Replace one bushing at a time to insure proper alignment of control arm and shaft.* Remove one bushing, make sure shaft is centered in control arm bushing hole, then thread new bushing onto shaft and into control arm. Tighten to 85-100 ft. lbs. Replace other bushing in same manner. *NOTE - When replacing cross shaft, place shaft in control arm and position by scale measurement, then install bushings.*

1955-62 CORVETTE FRONT SUSPENSION ASSEMBLY

LOWER CONTROL ARM PIVOT BOLT & BUSHING: Removal - Remove wheel and tire and tie rod end. Place jack under inner side of lower spring seat. Remove pivot bolt lock nut and lubrication fitting, then remove bolt from control arm and knuckle support. Turn wheel to extreme outward position (to lock knuckle support so it cannot move outward at bottom), then remove lower pivot bolt bushing from knuckle support.

Installation - Install bushing into knuckle support from rear and tighten to 150-170 ft. lbs. Place new seals over ends of bushing and start pivot bolt into control arm from rear. Hold knuckle support in center of yoke of control arm and thread pivot bolt into bushing. *NOTE - Be very careful to keep knuckle support centered in yoke.* Screw pivot bolt in until it contacts front face of control arm, then, if threads on control arm and bolt index properly, screw bolt into control arm until bolt head seats firmly against rear face of control arm. *NOTE - If threads do not index properly, compress control arm ends slightly with "C" clamp to insure alignment.* Tighten pivot bolt to 100-200 ft. lbs., then install locknut and tighten to 90-120 ft. lbs. Slip seals off ends of support bushing and into seal seats. Install tie rod and lubrication fittings. Lubricate bushings, install wheel and tire, and check front end alignment.

UPPER CONTROL ARM CROSS SHAFT & BUSHINGS: Removal - *CAUTION - Do not remove cross shaft unless shaft damaged or unserviceable.* Raise and support car under outer end of lower control arm. Remove wheel and tire and lubrication fittings from bushings. Remove front and rear bushings from control arm outer pivot and remove seals from ends of pin. Remove pivot pin clamp bolt from knuckle support and slide pivot pin from support with a ¼" Allen wrench. Swing knuckle support and hub and drum assembly away from upper control arm. Remove cross shaft bushings and remove control arm from cross shaft. Remove seals from cross shaft, then remove cross shaft from spring housing from rear to front with Tool J-2958.

Installation - Lubricate shaft threads, then install shaft into spring housing from front to rear with Tool J-2958. Drive shaft into housing until end projects 1 1/8" out back of housing. *CAUTION - Rear end of shaft with identification mark has tapered threads. DO NOT drive shaft in too far because backing off will leave shaft loose in spring housing.* Install new seals over shaft ends and install control arm shaft. Start both bushings on shaft, position arm by scale measurement, then tighten bushings until they seat, and then to 30-40 ft. lbs. Install lubrucation fittings, lubricate and check operation of arm (arm should fall of its own weight). Install splash guard over steering gear housing and pivot pin and bushings (see below).

UPPER CONTROL ARM PIVOT PIN & BUSHINGS: Removal - Raise car and support under spring seat. Remove wheel and tire and lubrication fitting from rear bushing. Remove pivot pin bushings from control arm, then remove seals from pivot pin. Remove clamp bolt from upper end of knuckle support and slide pivot pin from knuckle support with a ¼" Allen wrench.

Installation - Place pivot pin through control arm and into knuckle support (Allen wrench hole to rear of car). Center pivot pin in support and install lock bolt, lockwasher and nut and tighten to 30-35 ft. lbs. Install new seals over pin ends. Start front bushing onto pin, keep support centered, and carefully index bushing threads into control arm. Repeat with rear bushing. Thread bushings until heads seat, then tighten to 30-40 ft. lbs. Install wheel and tire, lubrication fittings, then lubricate. Lower car and adjust front end alignment.

CONTINUED ON NEXT PAGE

CORVETTE FRONT SUSPENSION (C ntinu d)

STEERING ARM: R m val - Raise car and support under spring lower seat, then remove wheel and tire. Remove wheel hub and brake drum assembly. Disconnect brake shoe return springs and let shoes hang freely. Remove brake anchor pin. Remove bolts holding brake backing plate and steering arm to steering knuckle. Remove steering arm from knuckle and wire backing plate up out of way. Disconnect steering arm from tie rod end. **Installation** - Reverse removal procedure, then adjust wheel bearings and front end alignment.

KINGPIN & BUSHINGS: Removal - Remove steering arm (see above). Remove kingpin lock pin, upper kingpin bearing plug cover, upper and lower lock rings, and lubrication fittings. Remove kingpin bearing plugs (drive a sharp drift through lower plug, driving kingpin upward until upper plug removed). Remove kingpin through bottom. Remove steering knuckle and thrust bearing from knuckle support and remove bushings from knuckle. *CAUTION - Do n t damag brake hos .*

Installation - *NOTE - Unnecessary to ream new bushings, but be sure oil grooves in bushings line up with lubrication fitting hole in steering knuckle.* Install new bushings in steering knuckle and install knuckle on support. Install thrust bearing between lower yoke of knuckle and support, making sure shield on bearing is toward top. Install kingpin from bottom and make sure lock pin slot is aligned with slot in support. If clearance between steering knuckle and knuckle support is is greater than .006", install a steel shim between knuckle and top of support. Install lock pin, bearing plugs, lock rings and upper bearing plug cover. Install lubrication fittings and lubricate. Install wheel and tir e, lower car, and check and adjust toe-in.

CHEVROLET TRUCK FRONT SUSPENSION

Chevrolet Trucks (1962)℄

℄ - Except 4-Wheel Drive & Forward Control Models. These models use "I-Beam" front axle. *For alignment specifications, see "Wheel Alignment Specifications & Adjustment" in this section.*

DESCRIPTION: Torsion bar type suspension of same design used on corresponding previous models.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Truck Curb Height: *NOTE - Curb height must be checked and corrected before making camber and caster adjustment.*

10,20,30,40 Series - 4¼" measured from bottom edge of crossmember to top outer flange of lower bumper bracket at centerline of spindle. Adjust torsion bar rear anchor to obtain correct height.

50, 60 Series - 5 1/16" measured from bottom edge of crossmember to top outer flange of lower bumper bracket at centerline of spindle. No adjustment provided. If dimension not correct, replace torsion bars.

REMOVAL & INSTALLATION: *See 1960 Final Data, Page 369, or later Manual edition, and note the following:*

Torsion Bar Installation (Units Without Locating Dimple In Front Socket): Before assembly of rebound bumper, and with suspension in full rebound position, install front hex of torsion bar into lower control arm socket and slide forward to position rear of bar at center of crossmember. Place upper spacer and nut on top of crossmember, then install special washer and lower spacer on bolt and insert bolt up through crossmember and upper spacer and start into nut. *NOTE - Spacer and nut must have rocker groove of spacer and ridge of nut parallel to crossmember, with locating lug on lower spacer inboard.* Assemble torsion bar arm to rear hex of bar so spacer and bolt can be slipped into arm when bolt engages about half of threads of nut. Place arm to bar so rear face of arm is flush with rear end of bar within 3/32". Make sure locating lug on lower spacer is inboard, then tighten torsion bar adjusting bolt on each side until truck assumes normal curb height. Install rebound bumper.

OLDSMOBILE (EXCEPT F-85) REAR SUSPENSION

Oldsmobile (Exceot F-85) (1962)

DESCRIPTION: Coil spring type with two upper and two lower control arms. Upper control arms are connected to rear axle housing adjacent to differential carrier and to bracket on frame side rail. Lower control arms are connected between outer ends of rear axle housing and bracket on frame side rail. Lower control arms are adjustable for length and control the differential nose angle.

RIDING HEIGHT: 5 13/16-6 9/16" (Exc. Sta. Wgn.); 5 3/8-6 1/8" (Sta. Wgn.) measured from top of axle housing to frame.

REMOVAL & INSTALLATION: As follows:

►*SHOCK ABSORBER INSTALLATION NOTE:* Tighten upper pivot bolt and nut to 45-55 ft. lbs., and lower stud nut to 30-46 ft. lbs.

COIL SPRING: Removal - Raise rear of car and disconnect shock absorber from axle housing, then disconnect parking brake cable clamp at frame and loosen suspension arms at frame and axle. Support frame, then remove upper and lower spring mounting bolts, washers, insulators and clamps. Remove coil spring and two remaining insulators.

Installation: Place upper insulator snugly in end of spring coil. Place spring with insulator against upper seat and install clamp but do not tighten upper attaching bolt. *NOTE - Locate clamp so it nests in insulator (tang in notch), then torque mounting bolt to 35-45 ft. lbs.* Place lower end of spring on axle housing pad, then raise axle housing to compress spring to normal carrying height. Install Spring Holding Tool BT-6102 at front of spring, then lower axle housing and place other spring insulator in spring coil. Raise axle housand install lower clamp. With lower clamp nesting in insulator, torque lower mounting bolt to 35-45 ft. lbs. Remove Tool BT-6102. Connect shock absorbers and tighten suspension arm bolts to 70-90 ft. lbs. with weight of car on rear springs. Place parking brake cable at locating marks and tighten cable clamps.

CONTROL ARMS: *See 1961 Final Data, Pag 370, and tight n attaching b lts t 70-90 ft. lbs.*

OLDSMOBILE (EXCEPT F-85) FRONT SUSPENSION

Oldsm bil (Except F-85) (1962)

DESCRIPTION: Ball joint type with shock absorbers mounted within front coil springs. Design is similar to that used on previous models except that upper and lower control arm inner pivot shaft bushings are not replaceable. Control arm, shaft and bushing assembly is furnished only as a complete unit.

ADJUSTMENT: *See "Wheel Alignm nt Specificati ns & Adjustment" in this secti n.*

Riding Height: Front - 11 3/8" to 12 1/16" measured from underside of front spring lower seat to underside of upper seat. To measure, insert a 1/8" welding rod in drain hole of lower spring seat (inboard side of spring) push rod up to contact underside of upper spring seat. Mark rod, then remove and measure distance rod was inserted. To adjust, replace spring.

Rear - 5 13/16" to 6 9/16" (Except Station Wagon), 5 3/8" to 6 1/8" (Station Wagon) measured from top of axle housing to frame. To adjust, replace spring.

REMOVAL & INSTALLATION: *S 1961 Final Data, Page 369, and note the following:*

►*UPPER CONTROL ARM INNER SHAFT BUSHING NOTE:* Upper control arm bushings are not replaceable. Control arm and bushing assemblies are furnished only as a complete unit, including control arm pivot shaft. If necessary, tighten upper control arm shaft-to-bushing screws to 35-45 ft. lbs. Lower control arm shaft bushings may be replaced as indicated below.

LOWER CONTROL ARM SHAFT BUSHINGS: Disassembly - With Tools J-9516 and J-8877 and arbor press, press bushings and shaft from control arm until ear on shaft contacts control arm side rail. Form a suitable spacer around cross shaft and continue to press shaft and bushings from control arm.

Reassembly - Use arbor press and Tools J-8877 and J-9481 to install bushings in control arm. Press bushings in until offset in bushing contacts flange on control arm side rail.

LOWER CONTROL ARM BALL JOINT SEAL REPLACEMENT: Support lower control arm and disconnect ball joint from steering knuckle. Clean outside of joint. On Thompson joints, drive seal retaining ring from joint and discard seal assembly. On Saginaw joints, pry garter spring from bottom of seal, then remove seal and garter spring. *CAUTION - Us xtr m car not t get dirt into ball joints.* Clean joint pivot and wipe out as much old grease as possible. Remove and discard service plug, then fill ball joint reservoir with clean Ball Joint Grease, Part No. 585617. Install new service plug and wipe all excess grease from joint. Put a thin film of grease on outside of new seal and on saw-tooth part of seal that fits around ball stud. On Thompson joints, place seal inside of Installing Tool J-9516 and drive seal onto joint, making sure seal is not cocked. On Sagainw joints, place garter spring around Installer J-9517, place seal on joint, slide tool over seal, then roll garter spring off tool and into seal groove. Connect ball joint to steering knuckle.

PONTIAC (EXCEPT TEMPEST) FRONT SUSPENSION

P ntiac (Except T mp st) (1962)

DESCRIPTION: Ball joint type with shock absorber mounted within coil spring. Same design as used on previous models.

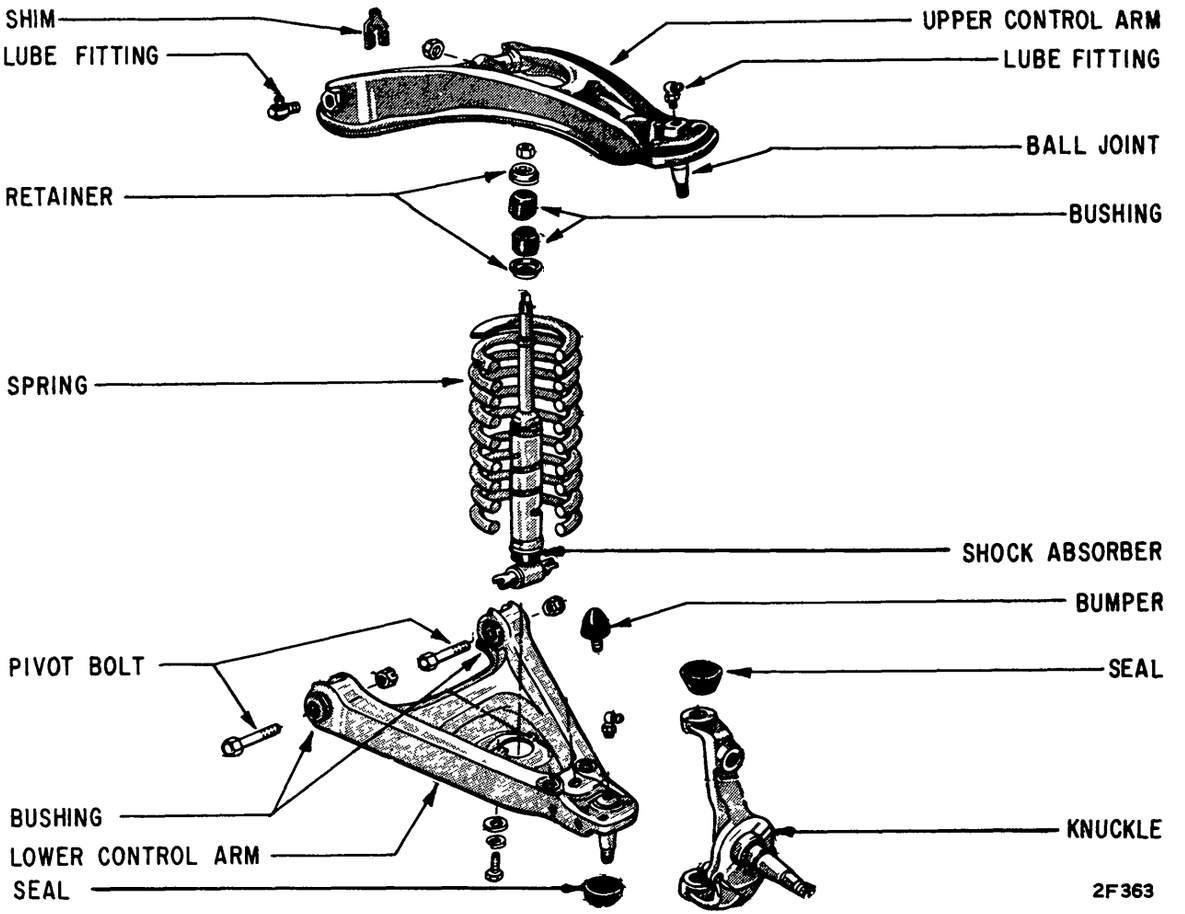
ADJUSTMENT: *See "Wh l Alignment Specifications & Adjustm nt" in this s ction.*

Riding H ight: Fr nt - 3¾" (Except Grand Prix), 3¼" (Grand Prix) measured from top of lower control arm to underside of frame directly behind centerline of spring. *NOTE - F r camber and caster adjustment, a spacer bar cut t c rr ct l ngth may be installed between l w r c ntr l arm and crossmember at centerline of spring to p siti n car for correct riding height.*

Rear - 9.70" measured from top of axle housing to top of spring seat at a point approximately 1½" outward from rubber bumper on frame. *NOTE - A spacer bar cut to c rrect l ngth may b installed at this location to position car f r c rr ct riding height when making caster and camb r adjustm nt.*

REMOVAL & INSTALLATION

SHOCK ABSORBER: R m val - Raise and support car so weight is off front wheels, then remove nut, retainer and grommet attaching upper end of shock to frame. *NOTE - Do not turn piston rod while loosening nut.* Remove lower bolts and remove shock absorber through lower control arm.



Installation: Reverse removal procedure and note the following: Tighten upper nut to 60-120 inch pounds, and lower bolts to 15-25 ft. lbs.

COIL SPRING: Rem val - Raise and support front of car with a jack placed under front crossmember, then remove wheel, shock absorber, and disconnect lower end of stabilizer link from lower control arm. Disconnect steering linkage from knuckle. Install spring compressor, Tool J-7592 as follows: Locate one compressor plate in one of the upper coils of spring so that ramp faces down against coil, then locate other plate in one of the lower coils with ramp facing up. *NOTE - Plates must parallel cent rlin of spring with holes in plate properly align d.* Place retainer, J-7592-6, cup side up, over threaded end of rod, J-7592-5, followed by bearing, then start long nut, J-7592-3 on rod. Insert rod, hex end first, up through both plates, then slide retainer, J-7592-4, cut side down, over end of hex rod and secure with "C" clip, seating clip down in retainer. While holding upper end of rod, turn nut at lower end and compress spring. Disconnect inner end of lower control arm from frame crossmember, then swing inner end of arm down and remove spring. *NOTE - If desired, spring can b remov d by disconnecting ball joint stud from knuckl and swinging out r end of arm down.*

Installati n: Reverse removal procedure and tighten control arm attaching bolts at inner end to 150-175 ft. lbs., steering arm-to-knuckle nut to 60-95 ft. lbs.

LOWER CONTROL ARM: Removal - Remove front spring, then disconnect and remove ball joint stud from steering knuckle with Tool J-6627.

Bushing Replac ment: With lower control arm removed, use an arbor press and support arm on remover, J-7022-1, then place spacer, J-7022-7 around bushing. With sleeve, J-7022-3 between control arm and arbor, press bushing from arm. Remove other bushing from opposite leg of arm in same manner. Press new bushings into arm by supporting arm on remover, J-7022-1, in an arbor press. Install spacer, J-7022-7 between sides of control arm leg and use sleeve, J-7022-3 between arbor and bushing to press bushing into position. Repeat with other bushing on opposite leg.

PONTIAC (EXC. TEMPEST) FRONT SUSPENSION ASSEMBLY

Installation: Reverse removal procedure and tighten control arm-to-frame bolts to 150-175 ft. lbs. Tighten ball joint stud nut to 80-95 ft. lbs.

UPPER CONTROL ARM: Removal - Place a jack under lower control arm, then raise and remove wheel. Remove ball joint stud from steering knuckle with J-6627. Disconnect control arm shaft from frame and remove shaft and arm assembly.

Disassembly: Remove front and rear threaded bushings from control arm assembly and remove control arm shaft.

Reassembly: Place tool, J-7167 in position and expand until distance between inner faces of arms is 8 31/32", then place pivot shaft with new rubber seals in position on control arm. Lubricate pivot shaft threads with graphite grease, then start bushing on pivot shaft and into arm at the same time. Tighten so head of bushing is firmly seated against control arm (150-175 ft. lbs.). Center pivot shaft in control arm and install other bushing, being sure threads index so there is no bind. Tighten so head of bushing is tightly against control arm (150-175 ft. lbs.), and remove spreader tool. Check to see that distance between inner faces of shaft ends of control arms is correct. Turn shaft in arm to centralize so distance between bolt hole to arm is equal at both ends. *NOTE - Frictional drag of shaft in bushings should not exceed 50 inch pounds.*

Installation: Position upper control arm and shaft on frame member and install bolts and self-locking nuts. Tighten to 80-95 ft. lbs. Assemble control arm to upper ball stud and tighten nut to 80-95 ft. lbs. Lubricate control arm shaft and ball studs.

BALL JOINT REPLACEMENT (UPPER & LOWER): With control arm removed, chisel or drill heads of rivets retaining ball joint to control arm and drive out rivets, then remove ball joint assembly. Install a new joint, retaining with special bolts, nuts and washers supplied with new joints. *CAUTION - Us nly sp cial alloy bolts supplied with stud packag for this operation.* Tighten nuts to 10-12 ft. lbs.

PONTIAC TEMPEST FRONT SUSPENSION

Pontiac Tempest (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 FRONT SUSPENSION NOISE CORRECTION:* If caused by interference at crossmember spring pocket, install Spring Insulator, Part No. 543660, between upper end of spring and spring seat.

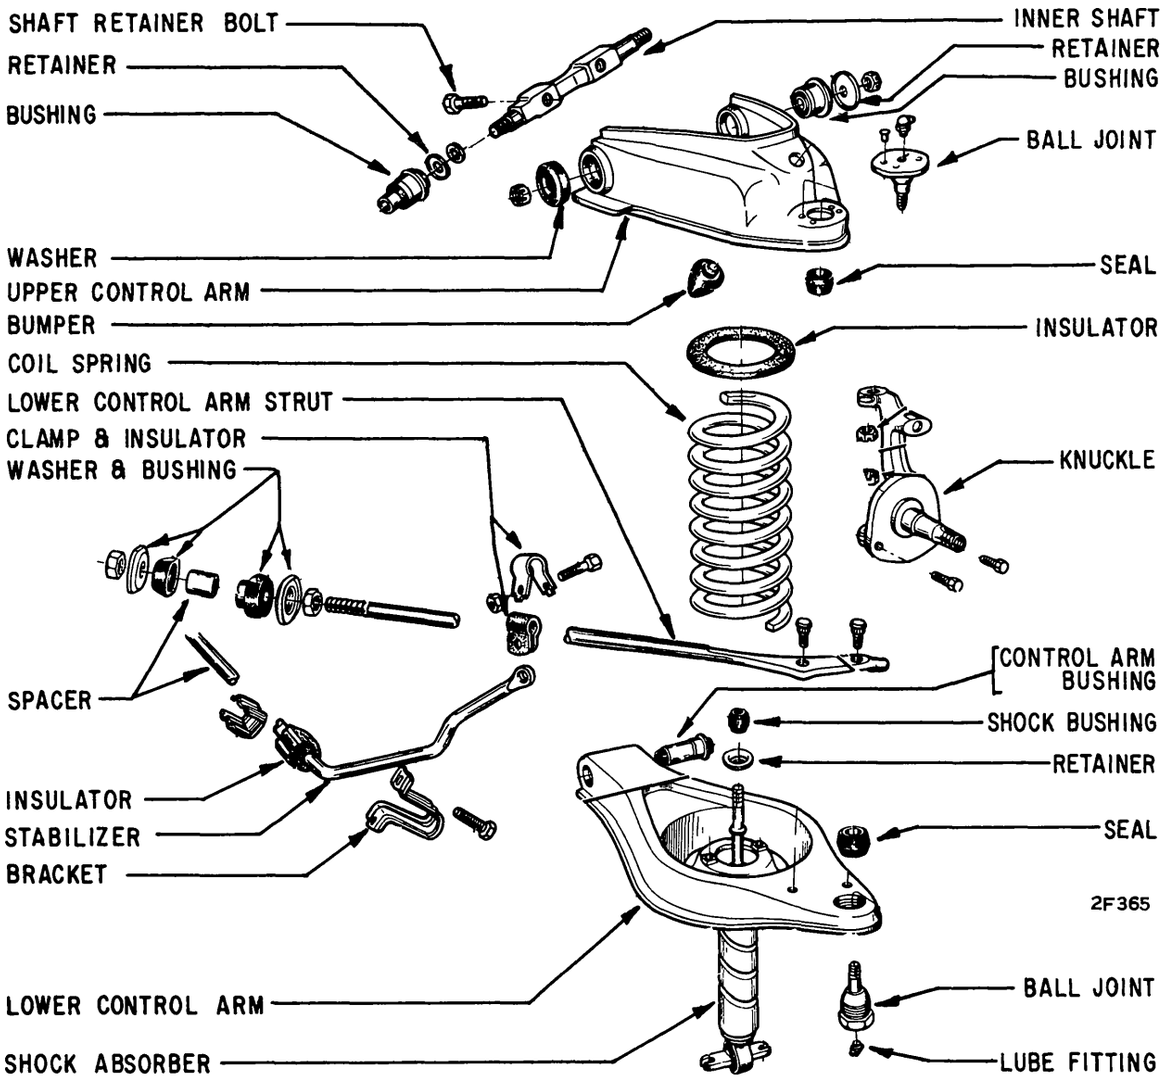
►*LATE 1961 & ALL 1962 UPPER CONTROL ARM REMOVAL NOTE:* No access holes are provided to remove upper control arm retaining bolts. To remove control arm, cut 1¼" holes in inner fender panel opposite retaining bolts. After control arm installed, plug each hole with Plug, Part No. 540402.

►*1962 BALL JOINT & STEERING KNUCKLE REPLACEMENT NOTE:* If necessary to replace lower ball joint assembly because of broken or bent stud, or loose stud nut, steering knuckle must also be replaced.

DESCRIPTION: Independent wheel suspension with an "A" frame type upper control arm and a cantilever type lower control arm combined with a compression strut mounted between outer end of lower control arm and front crossmember side rail. Rear end of strut rod is threaded and mounted in a rubber bushing. Front end is bolted to lower control arm. The front suspension unit is constructed so it is integral with front crossmember and can be removed as a complete assembly (after removal of coil springs).

ADJUSTMENT

See "Wheel Alignment Specifications & Adjustment" in this section.



Riding Height: Front - 4 7/8" measured between top of lower control arm at strut rod and lower control arm bumper bolt, directly in front of spring. *NOTE - For camber and caster adjustment, a spacer bar cut to correct length may be installed at this location to position car for correct riding height.*

Rear - 3 7/8" measured at a point directly behind spring between top of control arm and bumper attaching bolt. *NOTE - For camber and caster adjustment, a spacer bar cut to correct length may be installed at this location to position car for correct riding height.*

REMOVAL & INSTALLATION

SHOCK ABSORBER REPLACEMENT: Support car on side rails so front suspension hangs freely and so that clearance is sufficient on front lower control arms to allow removal of shock absorber. Hold flat part of shock upper stud and remove nut, cup washer and grommet, then remove lower attaching bolts. Withdraw shock absorber and remove cup washer and grommet. To install, reverse removal procedures and tighten lower attaching bolts to 15-25 ft. lbs. Tighten upper nut to 5-10 ft. lbs. *NOTE - Upper nut must be bottomed at end of threads.*

FRONT COIL SPRING REPLACEMENT: Remove shock absorber (see above), then remove strut rod-to-control arms nuts and lockwashers. *NOTE - Studs are pressed into strut and strut is under slight tension from rubber grommet on opposite end.* Place a jack stand under control arm and take up slightly on spring tension. Remove lower ball stud from steering knuckle with Tool J-6627, then raise hoist until spring is free and withdraw spring. *NOTE - A bar placed through control arm and into spring tower will retain spring and keep it from slipping free.* To replace, set rubber insulator in place in crossmember spring tower and place spring on control arm. Use a jack stand under outer end of control arm, then raise arm by lowering hoist. Install ball stud in steering knuckle and tighten nut to 55-70 ft. lbs. *CAUTION - Do not back off nut when aligning holes to install cotter pin.* Attach strut rod to control arm and tighten nuts to 40-55 ft. lbs. *NOTE - Do not change position of large nuts at grommet end of strut as caster adjustment will be changed.* Install shock absorber (see above).

PONTIAC TEMPEST FRONT SUSPENSION ASSEMBLY (EXPLODED)

LOWER CONTROL ARM REPLACEMENT: Remove shock absorber and coil spring, then remove control arm inner pivot nut, flat washer and bolt and remove control arm. To install, set control arm in position and install bolt washer and nut but do not tighten until coil spring and shock absorber have been installed and lowered to floor, then bounce car several times and tighten control arm pivot bolt to 75-90 ft. lbs.

UPPER CONTROL ARM REPLACEMENT: Support car at outer end of lower control arm, then remove wheel and tire assembly. Remove upper stud from knuckle with

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST FRONT SUSPENSION (C ntinu d)

Tool J-6627. Remove two nuts retaining upper control arm shaft to front crossmember, noting the number of shims at each bolt. Drill access holes in inner fender panel, or remove hole plugs opposite control arm retaining bolts *(s "upp r Control Arm Removal Note" ab v)*, then remove bolts through access holes. To install control arm, reverse removal procedures and note the following: Install same number of shims as removed, between crossmember and pivot shaft at each bolt location, then tighten bolts to 55-70 ft. lbs. Install a new rubber seal on ball joint stud and tighten nut to 70-85 ft. lbs. (supersedes previous 55-70 ft. lbs.). *NOTE - D n t back off nut when aligning holes to install c tt r pin.* Install wheel and tire assembly, lower car to floor, jounce front end to centralize bushings, then tighten cross shaft nuts to 55-80 ft. lbs.

LOWER BALL JOINT REPLACEMENT (ON CAR): Support control arm at outboard end to remove spring pressure from joint. Remove wheel and tire. Disconnect lower stud at steering knuckle and block upper control arm and steering knuckle up out of way. On 1961 models, thread stud assembly out of control arm. On 1962 models, stud can be driven out.

BALL JOINT REPLACEMENT (OFF CAR): Lower Control Arm - With lower control arm in a vise, either remove self-tapping joint from control arm with a 1 9/16" socket, or press ball joint from arm with Tool J-4160-A or other suitable tool, depending on year model. To install, thread joint into control arm with a 1 9/16" socket, or use Tool J-4174 or suitable tool to press joint into arm. Install lube fitting in bottom of joint and lubricate with chassis lubricant. Install a rubber cap over stud.

Upper Control Arm: Prick punch center of the four rivets and drill through the heads. Use a sharp chisel and cut off rivets, being careful not to enlarge holes in control arm. Tap rivets out with a punch and remove ball joint. To install, place a new joint against upper side of control arm and secure joint to arm with four special nuts and bolts furnished with replacement part. Tighten nuts to 10-12 ft. lbs. *CAUTION - Use only alloy bolts furnished for this p rati n.*

STRUT ROD REPLACEMENT: Remove nuts securing rod to lower control arm, then remove nut, lock tab, washer and grommet from rear end of rod. Remove rod from crossmember bracket and remove rubber grommet, spacer, washer, lock tab and nut. Studs in end of rod are pressed in and can be removed by driving them out. To install, install forward nut on rear end of shaft and position it about 1" from end of threads. Install lock tab, washer, spacer and grommet. Place rod in position in crossmember bracket and install remaining grommet, washer, lock tab and nut, then snug up rear nut. Install rod on lower control arm and tighten nuts to 60-75 ft. lbs. *NOTE - This supersed s pr vi us 40-55 ft. lbs.* Lower car to floor and adjust caster. Tighten nut at rear of rod to 70-85 ft. lbs. and bend over lock tabs on front and rear nuts.

FRONT SUSPENSION CROSSMEMBER: Removal - *NOTE - Front crossmember can be r moved as a c mpl t unit including whe ls and brake ass mbli s, r aft r all components hav be n r moved. It is sugg sted that front springs be removed before disconnecting crossmember from car.* Raise car and install jack stands under crossmember assembly so as to support crossmember when disconnected from car, then install a suitable engine support. Remove wheels and disconnect steering linkage at tie rod ends. Disconnect engine mounts at crossmember and remove ground straps from crossmember on both sides. Disconnect brake lines at junction block on crossmember and fuel line from crossmember clip. Remove three crossmember retaining bolts, washers, and nuts at each side of crossmember, then raise car and remove crossmember.

Installation: Reverse removal procedures and note the following: Tighten crossmember attaching bolts to 60 ft. lbs. (supersedes previous 70-85 ft. lbs. to prevent stripped threads), engine mount bolts to 30-45 ft. lbs., and tie rod end nuts to 55-70 ft. lbs. *NOTE - Do not back off nuts when aligning holes to install cotter pins.*

PONTIAC (EXCEPT TEMPEST) REAR SUSPENSION

Pontiac (Except Tempest) (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 REAR SHOCK ABSORBER NOISE CORRECTION:* Before replacing shock absorber for noise, torque shock absorber upper mounting bolt to new specification of 65-80 ft. lbs. Supersedes previous 45-60 ft. lbs.

DESCRIPTION: Coil spring type suspension consisting of a lower control arm at each side connected between outer end of axle housing and frame member. An upper control arm on each side is connected to rear axle housing adjacent to differential carrier and to outboard end of frame crossmember. Upper and lower control arms are not adjustable.

RIDING HEIGHT: 9.70" measured from top of axle housing to top of spring seat at a point approximately 1½" outboard from rubber bumper on frame. To correct, install new springs.

REMOVAL & INSTALLATION: *See 1961 Final Data, Page 372, and note the following:*
Shock Absorber: Tighten attaching nuts to 65-80 ft. lbs.

CHRYSLER, IMPERIAL, DODGE 880 "TORSION-AIRE" SUSPENSION

Chrysler & Imperial (1962)
Dodge Custom 880 (1962) ℂ

ℂ - For other Dodge & Dart models, see "Dodge, Dart, Lancer, Plymouth, Valiant Torsion-Aire" in this section.

DESCRIPTION: Upper control arms attach to brackets welded to the frame by the use of special bolts having an integral cam at the head of the bolt. A matching removable cam is installed at threaded end of bolt. The brackets are provided with slotted holes and each bracket has cam retainers welded to its front and rear faces to engage cams on upper control arm attaching bolts .Rotating the head of cam bolts causes the upper control arm to move horizontally in slots provided in bracket. Turning one bolt will move the upper control arm ball joint fore or aft to affect caster (more than camber). Turning both bolts on one side an equal amount in same direction will move the upper ball joint in or out to affect camber.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Front Suspension Height: Checking - Make sure car is on a level floor, tires inflated to recommended pressure, and car at curb weight (full gas tank, no passengers or load).. Measure from lowest point of lower support arm ball joint to floor and from underside of lower control arm bushing (at center line of bushing housing). *NOTE - Under car weight, the bushing housing will always b higher than the ball joint housing.* The difference between these two figures should be as specified in table below. If the difference in measurements between the two sides of the car are less than 1/8" of each other and are within limits specified, suspension height is correct. If these measurements differ more than 1/8" or if one or both of them are outside specified limits, the torsion bars must be adjusted.

►*HEIGHT CHECKING GAUGE NOTE:* Checking Gauge No. C-3895 or C-3914, is available for checking front suspension height.

►*TORSION BAR ADJUSTMENT NOTE: Torsion bar adjusting bolt should only be loosened or tightened with a torque wrench, with car supported to relieve load on torsion bars. If more than 200 ft. lbs. is required to turn adjusting bolt, then bolt and swivel must be r placed.*

Adjustment - Tighten or loosen adjusting bolt at rear end of each torsion bar until measurement differences are as specified. *NOTE - Jounce car at front and rear after making adjustment prior to height check. Also when torsion bar spring adjustment is made, ch ck alignment of front wheels and headlight aiming.*

Front Suspension Height Limits

Car Model	ℂ Height Difference
Imperial	2" ±1/8"
Chrysler (Except Station Wagon & 300H)	2" ±1/8"
Chrysler Station Wagon	2 3/8" ±1/8"
Chrysler 300H	1 3/4" ±1/8"
Dodge Custom 880 (Except Station Wgn)	2" ±1/8"
Dodge Custom 880 Station Wagon	2 3/8" ±1/8"

ℂ - Maximum variation between sides of car 1/8".

REMOVAL & INSTALLATION: *Se 1957 Final Data, Pag 341, r later Manual editions.*

DODGE, DART, LANCER, PLYMOUTH "TORSION-AIRE" SUSPENSION

D dge & D dg Dart (1962)℄
Lancer (1962)
Plymouth (1962)
Valiant (1962)

℄ - Except Custom 880. *For this model, see "Chrysler, Imperial, & Dodge Custom 880 Torsion-Aire" in this section.*

DESCRIPTION: Independent type with torsion bars instead of conventional type coil springs. Upper control arms are attached to brackets which are welded to shock absorber tower and to body horizontals (side rails). Lower control arms are attached to the "K" type front suspension crossmember which is connected to body horizontals (side rails). Ball joints are used to attach both upper and lower control arms to steering knuckles. Torsion bars are anchored at rear to engine rear support member in the body and at the front to lower control arm. Eccentric bolt assemblies at upper control arms control camber and caster adjustments. Car riding height is controlled by an adjusting bolt and lever assembly at front end of each torsion bar.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

►*RIDING HEIGHT ADJUSTMENT NOTE:* Car must be at normal curb weight (full gas tank, no luggage or passengers), and with tires at recommended pressure. Jounce car up and down several times at center of bumpers (rear bumper first) prior to taking each measurement. Car should be jounced same number of times and the bumper should be released at the same point in cycle each time.

►*HEIGHT CHECKING GAUGE NOTE:* Checking Gauge, No. C-3895 or C-3914, is available for checking front suspension height.

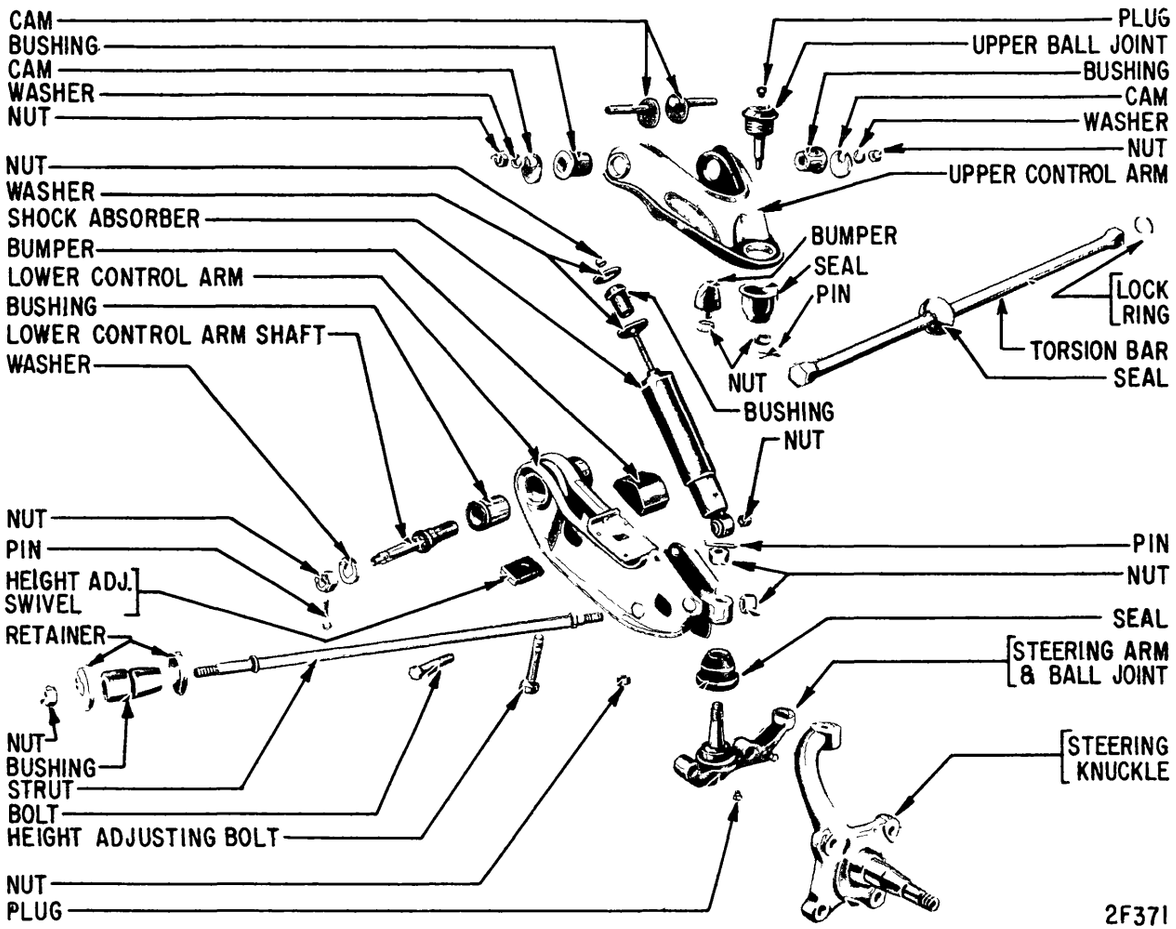
Fr nt Riding Height: Jounce car and measure distance from height adjusting lever directly below center of lower control arm inner pivot to floor, and from lowest point of steering knuckle arm to floor on same side. Subtract the two measurements. Difference should be as listed in table below. The difference from one side of car to other should not exceed 1/8". To adjust, turn adjusting bolt at front of torsion bar as necessary. After adjusting, jounce car and recheck height.

1962 Front Suspension Height Limits

Car Model	℄Height Difference
Dodge & Dart (Std. Suspension)	1 3/4"±1/8"
Dodge & Dart (Heavy Duty Susp.)	2 1/8"±1/8"
Lancer (Std. Suspension)	2"±1/8"
Lancer (Heavy Duty Susp.)	2 3/4"±1/8"
Plymouth (Std. Suspension)	1 1/2"±1/8"
Plymouth (Heavy Duty Susp.)	1 7/8"±1/8"
Valiant (Std. Suspension)	1 7/8"±1/8"
Valiant (Heavy Duty Susp.)	2 1/4"±1/8"

℄ - Maximum variation between sides of car 1/8"

REMOVAL & INSTALLATION



TORSION BAR: Removal - Remove rebound bumper from under upper control arm. Raise and support car so that front suspension is in full rebound position. *NOTE - If car raised at "K" m mber, plac a support under "K" member t distribute w ight.* Back off torsion bar adjusting bolt to release load from torsion bar. Remove lock ring from rear of torsion bar rear anchor. Remove torsion bar from anchors with Tool C-3728. *NOTE - Place tool to rear of torsion bar to allow clearance for hitting the striking pad of tool. DO NOT apply heat to torsion bar or either front or rear anchor. On cars with 225" 6 Cyl. engine, remove exhaust pipe from manifold to remove left torsion bar.* Remove tool and slide rear anchor balloon seal off anchor, then remove torsion bar by sliding out through rear of rear anchor. Do not damage balloon seal when removing from torsion bar.

Installation: Replace balloon seal if damaged. Dress torsion bar to remove sharp edges of scratches and nicks and paint repaired area with a good rust preventative. Remove all foreign material from hex openings in anchors and hex ends of torsion bar. Replace adjusting bolt and swivel if corroded or damaged, then lubricate for easy operation. Insert torsion bar through rear anchor and slide balloon seal over bar with cupped end to rear of bar. Coat hex ends of bar with multipurpose grease and slide torsion bar into lower control arm. Install lock ring in rear of bar rear anchor and pack opening in rear anchor completely full with multipurpose grease. Place balloon seal on rear anchor so lip of seal engages groove in anchor. Tighten adjusting bolt to place load on torsion bar, lower car to floor, and adjust front suspension height (see above). Install upper control arm rebound bumper.

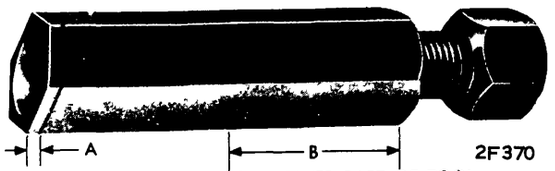
LOWER BALL JOINT: Rem val - *NOTE - L wer ball joint is integral with steering arm and is not servic d separately. Do not replace low r ball joint for l osen ss unless axial endplay (vertical mov m nt) xce ds .050".* Remove upper control arm rebound bumper, then raise car so front suspension is in full rebound position. Remove wheel and drum assembly. Remove steering arm-to-steering knuckle attaching bolts (brake backing plate lower bolts). Remove tie rod from steering arm with Tool C-3894. *Do not damag s al.* Remove ball joint stud from lower control arm with Tool C-3846, then remove steering arm and ball joint assembly.

Installation: Install new ball joint seal with lip of seal seated on ball joint housing. Install steering arm and ball joint assembly on steering knuckle and tighten mounting bolts to 100 ft. lbs. (Lancer & Valiant), 120 ft. lbs. (Dodge & Plymouth). Install ball joint stud

CONTINUED ON NEXT PAGE

DODGE, LANCER, PLYMOUTH, VALIANT FRONT SUSPENSION ASSEMBLY (EXPLODED)

DODGE, DART, LANCER, PLYMOUTH "TORSION-AIRE" SUSPENSION (Cont.)



to lower control arm and tighten stud nut to 100 ft. lbs. and install cotter pin. Repack joint with proper grease through plug hole in bottom of joint until seal passes grease or balloons, then replace grease fitting with plug. Connect tie rod to steering knuckle arm and tighten nut to 40 ft. lbs. Install stone shield, wheel and drum assembly, and upper control arm rebound bumper.

UPPER BALL JOINT: Removal - *NOTE - Tool C-3711 must be modified as shown in illustration.* Raise car with jack under lower control arm as close to wheel as possible, then remove wheel and drum assembly. Remove upper and lower ball joint stud nuts. *NOTE - On Lancer & Valiant, add approximately 7/16" of flat washers over lower ball joint stud so Tool C-3711 can be used without damaging lower ball joint stud threads.* Place Tool C-3711 over ball joint studs with threaded part of tool locked securely against upper stud. Spread tool so upper stud is under load, then strike steering knuckle sharply with hammer to loosen stud. *CAUTION - DO NOT force stud from steering knuckle with tool alone.* Remove tool, then remove ball joint stud from steering knuckle. Unscrew ball joint from upper control arm with Tool C-3714 (Lancer & Valiant), C-3560 (Dodge & Plymouth). Seal will come off when ball joint removed.

Installation: *CAUTION - Always replace balloon seals after they have been removed. Ball joint threads must engage control arm threads squarely.* Screw ball joint into control arm by hand as far as possible. With Tool C-3714 (Lancer & Valiant), C-3560 (Dodge & Plymouth) tighten ball joint until it bottoms on housing (125 ft. lbs. minimum). Install new seal over stud with Tool C-3713 (Lancer & Valiant), C-3736 (Dodge & Plymouth). Install ball joint stud into steering knuckle and tighten retaining nut to 55 ft. lbs. (Lancer & Valiant), 100 ft. lbs. (Dodge & Plymouth). Pack joint with proper grease through plug hole in top until seal passes grease or balloons, then replace grease fitting with plug. Install lower ball joint stud nut and tighten to 100 ft. lbs., and install cotter pin. Install wheel and drum assembly.

STEERING KNUCKLE: Removal - Remove upper control arm rebound bumper, then raise car so front suspension is in full rebound position. Remove wheel and drum assembly. Back off torsion bar adjusting bolt to remove all load from bar, then remove upper ball joint stud from steering knuckle (see above). Remove backing plate-to-steering knuckle, and steering arm-to-steering knuckle attaching bolts and remove steering knuckle.

Installation: Install steering knuckle to brake backing plate and tighten nuts finger tight. Install steering arm to steering knuckle and tighten nuts finger tight. Tighten upper ball joint stud nut to 55 ft. lbs. (Lancer & Valiant), 100 ft. lbs. (Dodge & Plymouth), and install cotter pin. Tighten steering knuckle upper bolts to 55 ft. lbs. and lower bolts to 100 ft. lbs. (Lancer & Valiant), 120 ft. lbs. (Dodge & Plymouth). Load torsion bar by turning adjusting bolt, install wheel and drum assembly, upper control arm rebound bumper and torque nut to 200 inch-lbs.

A. REMOVE 1/16 INCH FROM LOWER PART OF TOOL
B. ROUND OFF PORTION OF THE TOOL THAT IS POSITIONED NEXT TO THE STEERING KNUCKLE ARM.

TOOL C-3711 MODIFICATION

SWAY BAR: Removal - Remove sway bar link retaining nuts and washers. Remove sway bar cushion retaining nuts, washers, and bolts. Remove sway bar assembly. Remove sway bar link insulating bushings from frame washers over ends of links with concave side up, then slide links up through bushings and install washers with concave side down. Install nuts and tighten to 100 inch-lbs.

bracket and replace bushings if worn or deteriorated.

Installation: Install sway bar insulating bushings with a twisting motion and water lubricant. Place cushion housing on struts and install lock plates. Install bolts, washers, and nuts and tighten to 35 ft. lbs. Install

LOWER CONTROL ARM: Removal - Remove torsion bar (see above). Disconnect shock absorber from lower control arm and push out of way. Remove lower ball joint (see above). Remove strut nut and bushing retainer from forward end of "K" member. Remove cotter pin, nut, and washer from lower control arm shaft and tap end of shaft with a soft hammer to aid removal, then remove lower control arm, shaft, and strut as an assembly from "K" member. Remove strut bushing inner retainer from "K" member if it did not come out with strut. *NOTE - Remove strut rubber bushing from "K" member only if damaged or destroyed.*

Disassembly: Put strut part of control arm in a vise and remove strut from arm, then remove rebound bumper, and torsion bar adjusting nut and swivel. With assembly in an arbor press with torsion bar hex opening up, place a brass drift into hex opening and press shaft out of control arm (bushing inner shell will remain on shaft). Cut and remove rubber part of bushing from control arm. Insert a 1 3/8" NF 12 tap into pivot shaft bushing outer shell to about half the depth of bushing and force bushing from control arm with a hand press and blunt drift. Remove bushing shell from tap and bushing inner shell from pivot shaft.

Reassembly: Place new bushing on shaft (flange end of bushing first) and seat bushing on shaft shoulder. Press shaft and bushing assembly into lower control arm with Tool C-3848 and arbor press. Install torsion bar adjusting bolt and swivel. Install bounce bumper and torque to 200 inch-lbs. Place strut in lower control arm and tighten nut to 110 ft. lbs.

Installation: Install new strut bushing in "K" member using a twisting motion and water lubrication if necessary. Place lower control arm shaft and strut into mountings in "K" member (strut bushing inner retainer placed over shaft before strut inserted into bushing). Install strut bushing outer retainer and nut, and lower control arm shaft washer and nut finger tight only. Install steering knuckle and steering arm (see above). Connect tie rod and install stone shield. Connect shock absorber to lower control arm and tighten nut to 55 ft. lbs. Install torsion bar (see above), and wheel and drum assembly. Lower car and tighten strut nut at "K" member to 40 ft. lbs. Adjust front suspension height and tighten lower control arm shaft nut to 180 ft. lbs. and install cotter pin.

LOWER CONTROL ARM STRUT: Removal Remove lower control arm, shaft, and strut assembly (see above). Remove strut attaching nut and remove strut from control arm.

Installation: Reverse removal procedure and tighten strut attaching nut to 110 ft. lbs.

UPPER CONTROL ARM: Removal - Disconnect upper ball joint stud from steering knuckle (see "Upper Ball Joint Removal" above). Remove nuts, lockwashers, cams, and cam bolts holding upper control arm and bushings to front and rear support brackets, then remove upper control arm.

Disassembly: Mount control arm in a vise and use Tool C-3710 to press bushing from arm. Remove ball joint from control arm (if necessary) with Tool C-3714 (Lancer & Valiant), C-3560 (Dodge & Plymouth).

Reassembly: Place flange end of new bushing in Tool C-3710, support control arm squarely, and force bushings into control arm from outside until tapered part of bushing seats on arm. Install ball joint into control arm with same tools used for removal and tighten until seated (125 ft. lbs. minimum). Install new seal.

Installation: Slide control arm into position and install cam bolts, cams and nuts. Install upper and lower ball joint studs and tighten nuts to specifications (See above). Install wheel and tire assembly.

FRONT SUSPENSION CROSSMEMBER ("K" MEMBER): Removal - Remove engine mount-to-"K" member attaching bolts and carburetor air cleaner. On 6 Cyl., raise engine until mounts clear "K" member. On V8, remove carburetor and support engine. On all models, remove lower control arm assemblies on both sides (see above). Remove idler arm from "K" member, then disconnect steering gear housing and support to relieve all tension. Install frame stands under body side rails. Remove "K" member attaching bolts and remove "K" member.

Installation: Reverse removal procedure and tighten "K" member attaching bolts to 150 ft. lbs., engine mount bolts to 85 ft. lbs., and steering gear attaching bolts to 50 ft. lbs. Tighten idler arm nut to 45 ft. lbs.

COMET & FALCON FRONT SUSPENSION

Ford Falcon (1962)
Mercury Comet (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 LOWER BALL JOINT SEAL RUPTURE PREVENTION:* If lower ball joint seal has no grease relief, proceed as follows to prevent seal ballooning or rupture under continuous lubrication: Heat a 1/16" diameter wire red hot and pierce a hole through wall of seal the size of wire outside diameter. *CAUTION - Do not make hole larger than specified.*

►*1962 FRONT SUSPENSION NOISE CORRECTION:* Raise car, remove wheel and tire, and use only Special Lubricant, No. C1AZ-19590 (M1C-47), as follows: Lubricate, spring seat in both loaded and unloaded conditions until old chassis lube is forced out and special lubricant can be seen at inner circumference and around top half of spring seat bushing. Lubricate both upper and lower ball joints, first in unloaded condition, then in loaded condition until all old grease has been forced out. *CAUTION - Road test for minimum of 5 miles on rough roads to insure that noise is eliminated.*

►*1962 FRONT SUSPENSION PRODUCTION CHANGES & PARTS NON-INTERCHANGEABILITY NOTE:* Lower control arm and other parts have been redesigned in production and later parts are **not** interchangeable with earlier parts. Make sure correct parts are used during front suspension servicing. Parts affected (and changes) are as follows:

Lower Control Arm & Ball Joint - Ball joint and stud larger; strut attaching holes farther apart.

Front Wheel Spindle - Larger stud hole. Torque for stud nut increased to 60-80 ft. lbs.

Lower Arm Strut - Larger diameter and thread size. Front attaching nut torque increased to 45-60 ft. lbs. Strut length changed *(see "Strut Adjustment" below).*

Strut Mounting Bracket - Redesigned for larger strut.

Steering Arm Stop - Redesigned because of strut relocation on lower control arm. Hole spacing 1½" apart.

Strut Arm Insulator & Spacer - Larger diameter for larger strut.

Front Stabilizer Bar - Diameter increased, and rod bent at outboard ends (was straight).

Front Side Member & Apron Assembly - Reinforcement on inner rail.

Horn & Bracket Assembly - Redesigned and horns reversed (high horn on left side, low horn on right side). *NOTE - Use universal horn bracket, No. B9A-13830-A, for service replacement.*

DESCRIPTION: "Ball Joint" type suspension with front coil spring and shock absorber mounted between upper control arm and tower in wheel housing. Lower control arm is connected to underbody with a mounting bolt. A strut connected between outer end of lower control arm and bracket at forward end of underbody prevents horizontal movement of lower control arm. Shims located between upper control arm inner shaft and mounting bracket control camber and caster adjustment.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Front Riding Height (Comet): With car at curb weight on a level surface, measure the distance between center of lower control arm-to-frame attaching bolt and surface of floor, then measure distance between lower surface of lower control arm ball joint (zerk fitting) and floor. The difference between these two measurements is the front riding height and should be as in table below

℄ 1962 Comet Front Riding Height Specifications

Body Type	Synchro-mesh	Auto. Trans.
2-Door Sedan	4 3/16"	4 7/16"
4-Door Sedan	4 1/4"	4 3/8"
2-Door Sta. Wagon	4 1/4"	3 15/16"
4-Door Sta. Wagon	4 1/16"	4 5/16"

℄ - All measurements ±3/8".

Rear Riding Height (Comet): With car at curb weight on a level surface, measure the distance from the top surface of rear axle housing tube at spring vertically upward to underside of side rail member approximately 7/16" rearward of axle bumper bracket flange. Distance should be as listed in table below.

1962 Comet Rear Riding Height Specifications

Body Type	Rear Height
2 & 4-Door Sedans	6 9/16"±7/16"
2 & 4-Door Station Wagons	6 15/16"±7/16"

Lower Control Arm Strut Adjustment: Adjust length of strut by turning front and rear nuts securing strut rod to bracket on frame member to a length of 17 5/8" (Early Cars), 16 15/16" (Later Cars - *See "Production Change Note" above*), measured from back face of rear insulator washer to center strut-to-lower control arm attaching bolt. The correct distance between insulator washers (Measured from outer surfaces) should be 1.27"±1/32" when strut rod nuts are tightened to 40-55 ft. lbs. (Early Cars), 45-60 ft. lbs. (Later Cars).

REMOVAL & INSTALLATION: *See 1960 Final Data, Page 374, or later Manual edition, and note the following:*

Lower Ball Joint Stud Nut Torque - 35-65 ft. lbs. (Early Cars), 60-80 ft. lbs. (Later Cars). *See "Production Change Note" above.*

Strut Rod Front Attaching Bolt Torque - 40-55 ft. lbs. (Early Cars), 45-60 ft. lbs. (Later Cars). *See "Production Change Note" above.*

FORD FAIRLANE & MERCURY METEOR FRONT SUSPENSION

Ford Fairlane (1962)
Mercury Meteor (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 UPPER CONTROL ARM SHAFT BUSHING SQUEAK CORRECTION:* May be caused by insufficient lubricant at bushing. To correct, remove bushing and lubricate control arm shaft threads with Special Lubricant, No. C1AZ-19586-B. Also place a small amount of lubricant in bushing cavity. *CAUTION - Too much lubricant in bushing cavity may force "O" ring seal from bushing during or after assembly.*

►*1962 FRONT SUSPENSION NOISE ON ROUGH ROAD CORRECTION & PRODUCTION CHANGE:* On cars before February 20, 1962, noise may be caused by hardness of butyl rubber jounce bumper when upper control arm hits bumper. To correct, install new softer natural rubber bumper, No. C2OZ-3020-B. This new bumper used in production after above date.

DESCRIPTION: "Ball Joint" type with front coil spring and shock absorber mounted between upper control arm and tower in wheel housing. Upper control arm inner shaft and mounting bracket on front suspension housing are serrated to provide camber and caster adjustments by movement of upper control arm shaft. Lower control arm is connected to underbody with a pivot bolt and bushing assembly. On Fairlane, a strut connects outer end of lower control arm to a bracket on underbody at forward end to prevent horizontal movement of lower control arm. On Meteor, to limit lower control arm horizontal movement, a forward extension arm is bolted to lower control arm and connected to a spring cushion pivot link on underbody just forward of stabilizer bar.

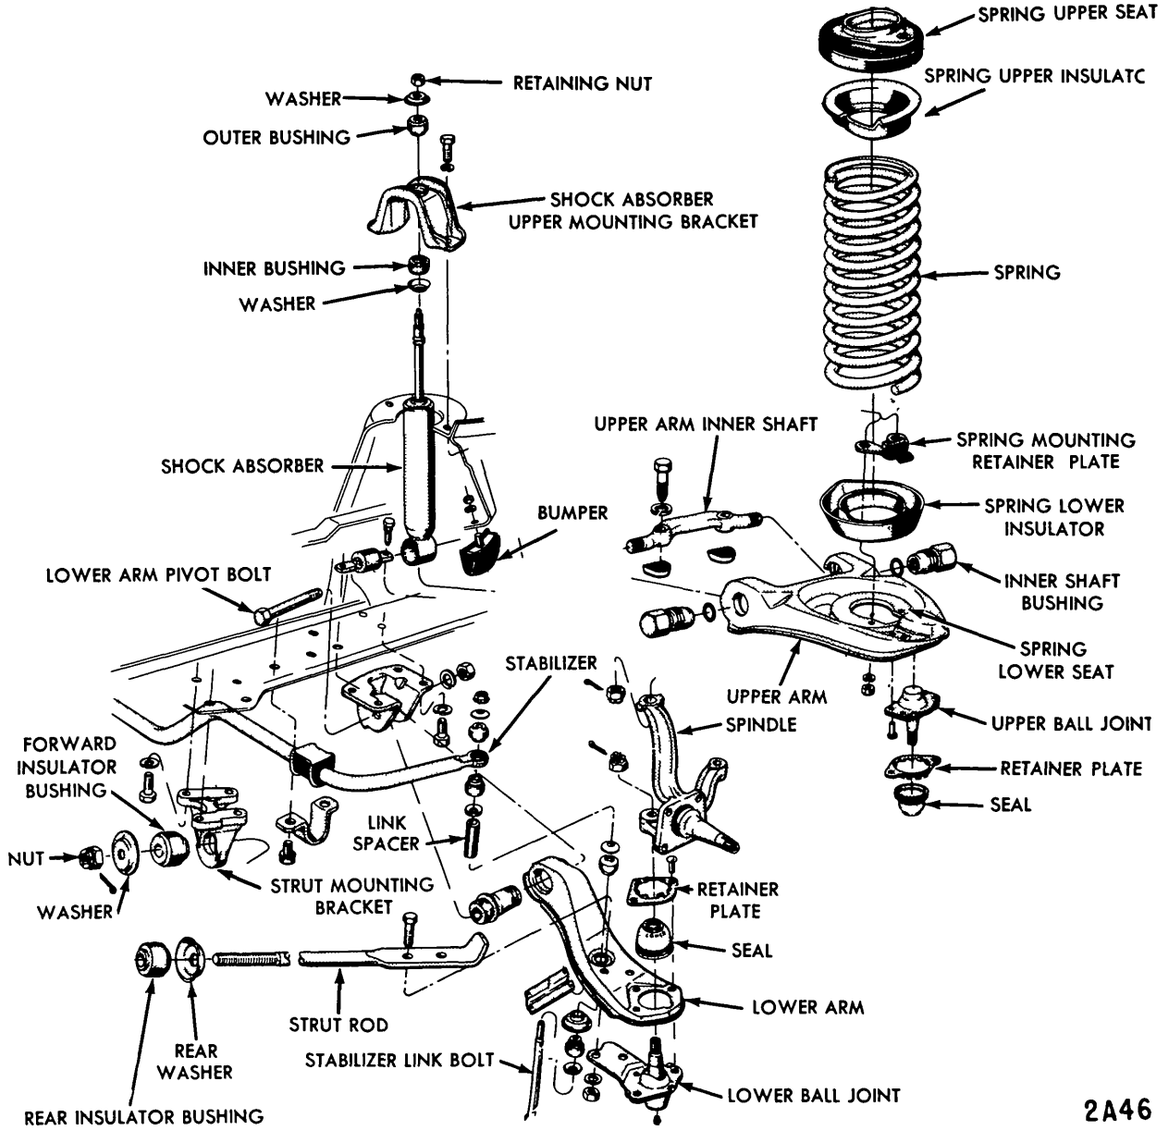
ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Meteor Suspension Riding Height: Measure riding height with tires properly inflated and car at curb weight (no passengers or cargo, full fuel tank, radiator, and engine oil level, and with spare tire, jack and jack handle in trunk).

Front Height - With car on level floor, jounce car to equalize suspension. Push front bumper down 1" and let car slowly come to normal position. Measure difference between distance from floor to centerline of lower control arm attaching pivot bolt, and distance from floor to bottom of lower ball joint assembly. Raise bumper 1", let car come to normal position, and repeat measurements. Average both measurements. Difference in measurements must be 3 3/4" +11/16", -7/16". If difference less by no more than 3/4" of specifications, install a .42" shim on front spring. *CAUTION - DO NOT install more than 1 shim.* If difference less than 13/16" or more than specified, replace spring.

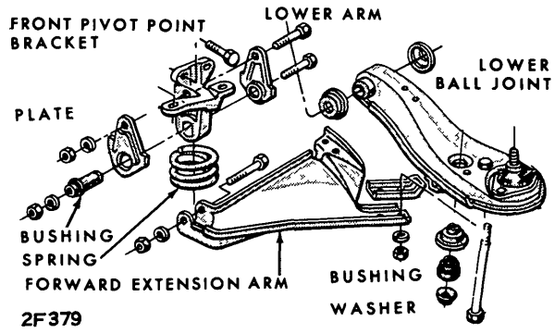
Rear Height - Using same procedure as listed for front height (above), make two measurements from top of axle housing at spring U-bolt to bottom of frame side rail. Average of both measurements should be 7 1/10" ± 1/2". If not within specifications, replace spring.

REMOVAL & INSTALLATION



SHOCK ABSORBERS: Raise car and install safety stands, then remove shock absorber lower retaining nuts and washers. Raise hood and remove shock absorber upper mounting bracket retaining bolts. Move mounting bracket-to-dash panel brace to one side, then remove mounting bracket and shock absorber as an assembly. Remove shock absorber upper retaining nut, bushing, and washer, then separate shock absorber from mounting bracket. Remove inner bushing. To install, reverse

CONTINUED ON NEXT PAGE



FORD FAIRLANE & MERCURY METEOR FRONT SUSPENSION (C nt.)

removal procedure and tighten lower retaining nuts to 30-40 ft. lbs. Tighten upper mounting stud nut to 20-35 ft. lbs. and upper bracket to body nut to 36-46 ft. lbs.

UPPER BALL JOINT (In Car): *NOTE – Lower ball joint is r plac d only as a c mplete assembly with lower control arm. For r plac m nt of lower ball joint seal, s b l w.* Position a suitable support between upper control arm and frame side rail to hold upper control arm in position while replacing ball joint, then raise car and place on jack stands. Remove wheel and tire, then remove cotter pin from upper ball joint stud and loosen stud retaining nut. Position ball joint remover, Tool T62F-3006-A with Tool T57P-3006-A, so tool is seated firmly against ends of both upper and lower studs (not against lower stud nut). Turn tool with a wrench until tool is under tension, then tap spindle with a hammer near upper stud to loosen stud from spindle. *CAUTION – Do not loosen stud with tool pressure alone.* Remove stud retaining nut and lift stud out of spindle. Remove ball joint from arm. If ball joint is riveted to control arm, drill a 1/8" pilot hole completely through each rivet, then drill off rivet head through pilot hole with a 3/8" drill. Drive rivets out of holes. *CAUTION – Do not bend arm when driving rivets out.* Remove all burrs from holes and clean arm, then attach new ball joint and seal, using only the special bolts, nuts and washers furnished with new ball joint. *Do not rivet ball joint and seal retainer to arm.* Reassemble by reversing disassembly procedure and tighten ball joint stud nuts to 60-80 ft. lbs.

FAIRLANE & METEOR FRONT SUSPENSION ASSEMBLY
(SEE SEPARATE ILLUSTRATION FOR METEOR EXTENSION ARM ASSEMBLY)

METEOR FORWARD EXTENSION ARM ASSEMBLY

LOWER BALL JOINT: *NOTE – Lower control arm ball joint is serviced only as a complete assembly with lower control arm.* If only the rubber seal requires replacement, remove all rivets in the same way upper control arm ball joint rivets are removed (see above), then remove retainer plate and seal. Install seal to ball joint, align rivet holes in seal retainer and ball joint with holes in arm. Secure these parts together with special bolts and nuts.

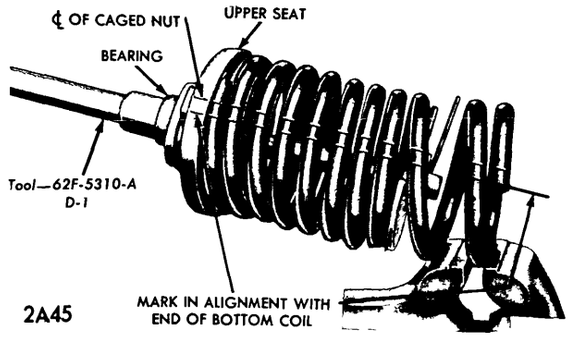
FRONT WHEEL SPINDLE: Removal - Disconnect upper ball joint stud from spindle arm as detailed under "Upper Ball Joint" above after first removing stud nut from lower ball joint. Tap lower ball joint stud loose from spindle. Disconnect spindle connecting rod from spindle. Remove spindle.

Installation: Reverse removal procedure and tighten upper and lower ball joint stud nuts to 60-80 ft lbs. Tighten spindle connecting rod ball joint stud nut to 35-40 ft. lbs.

FRONT SPRING: Removal – Remove shock absorber (see above), then remove suspension bumper and bracket assembly. *NOTE – Install one shock absorb r upper mounting bracket bolt to hold spring upper s at to spring housing while spring is being compress d.* Install tool upper plate on spring, then fit tool pilot into spring upper seat. Place tool bearing over pilot and insert tool shaft through bearing and pilot. Install lower tool plate under third coil from bottom of spring, then secure plate to coil and tool shaft with tool retainer. Compress spring by turning tool shaft with an impact wrench. Remove bolt and washer holding spring upper seat to housing, then remove spring and tool from housing as an assembly. Position spring and tool assembly in a vise, gripping lower coil of spring, then

CONTINUED ON NEXT PAGE

FORD FAIRLANE & MERCURY METEOR FRONT SUSPENSION (Cont.)



scribe 2 lines on narrow side of spring upper seat for proper alignment with replacement spring. *NOTE – The first line should be aligned with center line of caged nut. The second line should be ¾" from first line and in alignment with end of bottom coil.* Release spring tension and remove tool and seat assembly from spring.

Installation: Reverse removal procedure and note the following: Position upper seat and insulator assembly on spring so that mark made during removal is aligned with end of bottom coil. *NOTE – If a new seat is being installed, first scribe a line at centerline of caged nut on narrow side of seat. Position seat on spring so line on caged nut is aligned with bottom coil. Scribe a second line ¾" clockwise from first line, then turn seat counterclockwise until second line is aligned with the end of bottom coil.* Install tool and compress spring, then install tool and spring assembly in spring housing with end of bottom coil bearing against punched end of recess in spring lower seat. Secure spring upper seat to top of spring housing with two bolts and washers (this will hold spring in correct position while it is being released). Release spring tension, then remove the two temporary bolts and remove tool from spring.

UPPER CONTROL ARM: Removal – Remove front spring (see above), then remove upper control arm ball joint from steering knuckle (see "Upper Ball Joint" above). *NOTE – If lower control arm is being removed also, loosen lower ball joint in same manner as for upper ball joint.* Working from engine compartment, remove upper control arm inner shaft retaining bolts and lockwashers. Remove nut from upper ball joint stud, lift stud out of spindle, then remove control arm from car.

Installation: Reverse removal procedure and tighten upper control arm inner shaft retaining bolts to 115-135 ft. lbs. (Fairlane), 150-160 ft. lbs. (Meteor).

UPPER CONTROL ARM SHAFT & BUSHING REPLACEMENT: Remove front spring (see above), then remove upper control arm inner shaft retaining bolts and lockwashers. Pull upper control arm and shaft assembly away from underbody and swing 180° outward. Position a stand under control arm for support. Remove bushings from shaft and arm, then remove shaft. Install a new shaft and apply grease to new bushings and install bushings loosely on shaft and arm. Turn bushings so that shaft is exactly centered in arm. *NOTE – Shaft will be properly centered when the distance between center of attaching bolt hole at each end of shaft is an equal distance from inner side of control arm flange.* Make an 8" spacer from ¾" diameter pipe or rod and position spacer parallel with inner shaft, and force spacer between flanges of upper control arm. *CAUTION – If spacer cannot be forced between arm flanges, directly below inner shaft, replace upper control arm.* With spacer positioned in arm, tighten bushings securely. Move control arm on shaft to make sure there is no binding, then remove spacer. Reinstall by reversing removal procedure and tighten inner shaft to underbody bolts to 115-135 ft.lbs. (Fairlane), 150-160 ft. lbs. (Meteor).

FRONT SPRING COMPRESSION TOOL ASSEMBLY

LOWER CONTROL ARM: Removal - Position a support between both left and right upper control arms and frame side rail to hold upper control arms in position while removing lower control arm. Raise car and support on jack stands, then disconnect stabilizer bar from lower control arm. Disconnect strut or forward extension arm from lower control arm. Remove lower control arm ball joint stud from steering knuckle in the same way upper ball joint stud is removed (see above). Remove nut from lower stud. Remove control arm-to-underbody pivot bolt (Fairlane), control arm mounting bracket-to-underbody bolts (Meteor), then remove control arm.

Installation: Reverse removal procedure. Torque Meteor control arm mounting bracket bolts to 32-42 ft. lbs., and forward extension arm-to-lower control arm bolts to 50-65 ft. lbs., and control arm-to-mounting bracket bolt to 50-65 ft. lbs. Torque Fairlane control arm-to-underbody pivot bolt to 50-65 ft. lbs., and strut rod-to-control arm bolt to 70-90 ft. lbs. On all cars, torque stabilizer bar-to-control arm bolt to 10-15 ft. lbs.

LOWER CONTROL ARM BRACKET (METEOR): Removal - Remove lower control arm (see above), then remove bracket attaching bolt and remove bracket from control arm with a soft hammer. *NOTE - Bushing in lower control arm is not serviced separately from control arm.*

Installation: Place control arm bushing end with cupped washers on each side in a vise so vise jaws cover about ½ of hole in washers. Compress ends of torsion bushing with cupped washers by tightening vise jaws. Place lower edge of mounting bracket over top of cupped washers and position bracket downward and over washers with a soft hammer. Loosen vise and install bracket completely on control arm. Install retaining bolt, lockwasher, and nut, and torque to 50-65 ft. lbs.

LOWER CONTROL ARM STRUT & BUSHING REPLACEMENT (FAIRLANE): Position a support between upper control arm and frame side rail to hold upper control arm in position, then raise car and place on jack stands. Remove wheel, then disconnect strut from front bracket and from lower control arm and remove strut assembly. To install, place a new washer and bushing on forward end of strut rod and position strut rod into front mounting bracket and on lower control arm. Tighten lower control arm-to-strut rod retaining bolts and nut to 70-90 ft. lbs. Install forward insulator bushing, washer, and nut and tighten nut to 36-46 ft. lbs. Complete reassembly by reversing removal procedure.

FORWARD EXTENSION ARM (METEOR): Removal - Raise car and place a support under lower control arm. Remove extension arm-to-front pivot point bracket bolt, and extension arm-to-lower control arm bolts. Remove forward extension arm and steering stop.

Installation: Attach extension arm to lower control arm but do not tighten attaching bolts. Install front pivot point bracket to extension arm and torque attaching bolt to 50-65 ft. lbs., then tighten attaching bolts at lower control arm to 70-90 ft. lbs. (tighten bolts near lower ball joint first). Remove support stand and lower car.

FRONT PIVOT POINT BRACKET (METEOR): Removal - Support lower control arms, then disconnect pivot point from forward extension arm. Remove bracket-to-underbody attaching bolts and remove bracket.

Disassembly: Install Spacer Tools 3069-M-7 between side plates and main casting and place assembly in arbor press. Support assembly with Tool 6306-AC and use a 15/16" socket and 6" extension to press out bushing. Place assembly in a vise, compress one side of coil spring with vise, and other side of spring with a vise-grip pliers. *CAUTION - Coil spring must be completely compressed before removing side plate retaining bolt.* Remove side plate retaining bolt and remove side plates and main casting. Remove spring from pliers and vise.

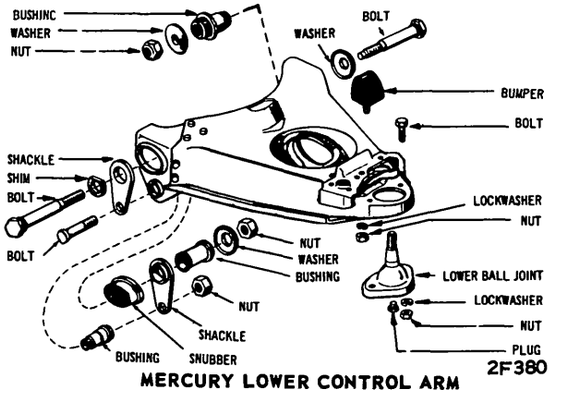
Reassembly: *NOTE - Main bushing serviced only with main casting.* With main casting in an "on car" position, install coil spring on casting. Install side plates in correct position as follows: Side plate with **large** bushing hole to **front** of car. Slide plate with **small** bushing hole to **rear** of car. Compress coil spring with vise and pliers as given under "Disassembly" above, then install side plate retaining bolt, lockwasher, and nut and torque to 36-46 ft. lbs. Install bushing through largest hole and press into position with a 1¼" socket and 6" extension and support tools used for removal.

Installation: Reverse removal procedure and torque pivot bracket-to-extension arm retaining bolt to 50-65 ft. lbs. Torque bracket-to-underbody retaining bolts to 32-42 ft. lbs.

FORD GALAXIE & MERCURY MONTEREY FRONT SUSPENSION

Ford Galaxie (1962)
Mercury Monterey (1962)

►CHANGES, CAUTIONS, CORRECTIONS



►*1962 FRONT STABILIZER LINK SQUEAK CORRECTION:* May be caused by improperly installed front stabilizer link insulators. To correct, place car in a normal curb load position, loosen stabilizer links and reposition insulators at top and bottom of links so insulators seat solidly. Torque retaining nuts to 10-15 ft. lbs.

DESCRIPTION: Ball joint type suspension similar to design used on previous models except that lower control arms used on Mercury are connected at the front to frame crossmember through a shackle and rubber bushing. On all models, threaded steel bushings are used on upper control arm inner shaft pivots. Camber and caster adjustments on all models are controlled by shims located between upper control arm inner shaft and bracket on frame crossmember.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

OVERHAUL: *See 1957 Final Data, Page 344, or later Manual additions, and not the following:*

UPPER CONTROL ARM INNER PIVOT SHAFT BUSHING: Removal & Installation - With upper control arm shaft removed from car, hold shaft in a vise and turn bushing off shaft and out of control arm. Install a new "O" ring seal in each bushing, then coat inside of each bushing with a small amount of multi-purpose lubricant (coat outer threads also). *CAUTION - An excessive amount of lubricant inside bushing will force the "O" ring out of place when bushing is installed.* Insert inner shaft in upper control arm, making sure that "bow" in shaft is upward, then install Tool T58P-3044A (Ford); Tool 3082-A (Mercury). With tool inserted between arms of upper control arm to properly locate arms the correct distance apart, place tool in a vise and thread bushing on each end of shaft, then turn

MERCURY LOWER CONTROL ARM

bushings in until hex heads bottom on upper arm. *NOTE - New upper arms are not threaded. Bushings are self-tapping type.* Tighten bushing to 160-190 ft. lbs. Remove assembly from vise and remove tool, then check to see that shaft rotates with moderate effort. If shaft binds, check for misalignment

LOWER CONTROL ARM (MERCURY): Removal - Remove in same manner as for conventional lower control arm assembly.

Disassembly: *NOTE - Do not wash ball joint assembly with solvent.* Remove shackle nut, then tap the two horseshoe-shaped spacers of Tool 3079-M7 between shackle plates and ends of large elliptical bushing. Using an arbor press, support arm and shackle assembly with support cup, Tool 3069-M1 (small end) against inner shackle plate. Insert remover, Tool 3069-M2 into upper inner bushing and press bushing through both shackle plates and into support cup. Remove inner shackle plate and the outer plate and bolt assembly. Press lower bushing from arm using support cup, Tool 3069-M1 (small end) and remover, Tool 3069-M4. Press upper outer bushing from arm using support cup. Tool 3069-M1 (large end) and remover, Tool 3060-M6. Remove lower arm rear bushing using support cup, Tool 3069-M1 (small end) and remover, Tool 3069-J.

Reassembly: *NOTE - Clean bushing bores in arm. Use silicone or liquid soap as lubricant during reassembly.* Install rear bushing using replacer, Tool 3069-M5, support cup, Tool 3069-M1 (small end), and a piece of flat stock across large end of support cup. Press bushing into place until points of ribs on bushing sleeve bottom on arm. Start upper outer bushing squarely into arm by lightly tapping it into position. Use a piece of flat stock on bed of press to support upper outer bushing and press bushing into place using support cup, Tool 3069-M1 (large end) and Tool 3069-M6 over small end of support cup. Press bushing into place until shoulder of bushing sleeve bottoms on arm. Press lower bushing into arm using replacer, Tool 3069-M3, support cup, Tool 3069-M1 (small end), and a piece of flat stock across large end of support cup. Insert bolt of shackle plate and bolt assembly through lower bushing with threaded end of bolt toward inside of arm. Add inner shackle plate, then install and snugly tighten nut. Position the two horseshoe-shaped spacers, Tool 3069-M7 between shackle plates and upper outer bushing, then center shackle plates. Support the assembly and, using replacer, Tool 3069-M5, lightly tap upper inner bushing to start it squarely into position in inner shackle plate. Press upper inner bushing through shackle plates using replacer, Tool 3069-M5, support cup, Tool 3069-M1 (small end), and a piece of flat stock over large end of support cup. Remove spacers and tighten nut. *NOTE - If ball joint was removed, install new joint using parts supplied in ball joint kit. Tighten nuts to 28-35 ft. lbs. Make sure ball joint is completely filled with specified lubricant.*

Installation: Reverse removal procedure.

THUNDERBIRD FRONT SUSPENSION

Ford Thunderbird (1962)

DESCRIPTION: Ball joint type front suspension system with coil spring mounted between top of upper control arm and bracket attached to car underbody. Design is similar to that used on previous models.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

REMOVAL & INSTALLATION: *See 1961 Final Data, Page 365, and not the following:*

FRONT SPRING: Removal - Raise front of car and place a safety stand under lower control arm, then lower car slightly. Remove shock absorber (see above), then remove wheel, hub, and drum assembly. Remove upper suspension arm bumper and raise car slightly off safety stand to lower upper control arm. Insert the lock bar of Tool T61B-5310-A through top of spring and position bar on seventh coil from bottom. Slide tool bearing over tool shaft against the integral nut. Insert shaft through shock absorber mounting hole in lower spring seat so that end of shaft will thread into lock bar. Compress spring by turning shaft into lock bar until top coils are drawn out of spring upper seat. Remove tapered shim and pivot spring outward. Turn tool shaft out of lock bar to release spring, then remove tool bar and shaft from spring and lift spring out of lower seat.

Installation: Install tapered shim in top of spring housing with thick part of shim to centerline of car. Retain shim with tape. Insert one helix insulator between the two top coils of spring and attach other insulator to bottom coil and secure with tape. Place flat rubber insulator over top of spring and secure in three places with tape. Place lower end of spring in lower seat, slide bearing of Tool T61B-5310-A over tool shaft against integral nut, then insert shaft through shock absorber mounting hole in lower seat. Insert lock bar of Tool T61B-5310-A on seventh coil from spring lower end. Thread shaft of tool into lock bar until spring is completely compressed, then tilt spring inward so top coils align with spring upper seat. Turn tool shaft out of lock bar and spring will release top coils into upper seat. Remove lock bar through top of spring and slide tool shaft out of shock absorber mounting hole in lower seat. Install shock absorber at upper mounting, then lower car slightly with stand under lower control arm so shock absorber can be installed at lower end. Install upper arm bumper and bracket assembly.

UPPER CONTROL ARM: Removal - Raise front of car and support under lower control arm, then remove front spring (see above). Remove upper ball joint (see "Wheel Spindle" above). Remove upper control arm inner shaft retaining nuts and washers, then remove upper control arm.

Disassembly: Position upper arm inner shaft in a vise and unscrew bushings from shaft and arm. Remove assembly from vise and separate inner shaft from arm.

Reassembly: *NOTE - If either bushing is worn or damaged, replace both bushings. When replacing inner shaft, use only new bushings.* Position shaft in arm and install new bushings on shaft and arm. *NOTE - Turn bushings so shaft is centered in control arm (centerline of shaft attaching bolts holes should be 1.85±.02" from side of arm).* Tighten bushings to 15-25 ft. lbs.

Installation: Reverse removal procedure and torque inner arm-to-underbody nuts to 50-70 ft. lbs.

LOWER CONTROL ARM: Tighten pivot bracket bolt to 60-80 ft. lbs.

LINCOLN CONTINENTAL FRONT SUSPENSION

Lincoln Continental (1962)

DESCRIPTION: Ball joint type suspension system of same design used on previous models.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

Riding Height: Front - With car on a level floor and tires properly inflated, gas tank full and luggage compartment empty, push front bumper down 1", release slowly and let car assume normal position. Measure distance between top of drag strut and inside of No. 2 crossmember next to forward edge of bumper striking pad. Raise bumper up 1" and repeat measurement. Average of both readings should be 5.5-6.1" (Normal), 6.2" (Maximum), 5.2" (Minimum). If not correct, shim or replace spring.

Rear - Make two measurements after pushing bumper up and down as detailed under front height measurement (above), and measure distance from top of axle housing to underbody at rear of rebound bumper bracket rear attaching bolt. Distance should be 7.7-8.7" (Normal), 8.8" (Maximum), 7.0" (Minimum). If not correct, replace spring.

REMOVAL & INSTALLATION: *See 1961 Final Data, Page 367.*

RAMBLER (EXCEPT AMERICAN) REAR SUSPENSION

Rambler Classic & Ambassador (1962)

DESCRIPTION: Rear springs are mounted between seats on rear axle housing and seats on car underbody and are held in position by weight of car on springs and by extended limits of shock absorbers. A rear stabilizer bar connected between car underbody on right side and a bracket on left side of rear axle housing prevents prevents lateral movement of rear axle assembly. Shock absorbers are mounted adjacent to rear springs on forward side of rear axle housing and are connected to a bracket on rear axle housing and to car underbody assembly. Rear wheel driving force is transmitted to car body by a torque tube between rear axle housing and transmission.

SHOCK ABSORBERS: Removal - Disconnect shocks from car underbody and from bracket on rear axle housing and remove shock.

Installation: Reverse removal procedure.

REAR COIL SPRINGS: Removal - Raise and support rear of car with a jack stand placed under car underbody, then raise rear axle assembly to approximately normal ride position. Disconnect shock absorbers at bracket on rear axle, then lower rear axle sufficiently to free springs from seats. Springs can then be lifted out. *CAUTION* - When lowering rear axle assembly be careful not to lower it to the point where a strain will be placed on torque tube connection at transmission.

Installation: Reverse removal procedure.

STUDEBAKER FRONT SUSPENSION

Studebaker (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 TIE-ROD REPLACEMENT CAUTION:* Both 1961 and 1962 type tie rods are used in production. Be sure to replace tie rod with correct part, as tie rods are **not** interchangeable.

►*UPPER CONTROL ARM BUSHING PRODUCTION CHANGE & SERVICE NOTE (TAXI & POLICE CARS):* Threaded steel bushings, replacing rubber bushings, entered production beginning Serial Nos. 62S-12830 & 62V-10608, for longer service life under severe operating conditions. Service procedures for these bushings are different as detailed below.

►*LOW FRONT END RIDING HEIGHT CORRECTION:* If front riding height too low because of accessories or optional equipment, front spring spacers may be installed at one or both ends of front spring. Table below indicates amount a single spacer will raise front of car (if two spacers used, double the specification).

Front End Height Spacer Specifications

Spacer No.	Thickness	℄ Raises Car Approx.
526830	3/16"	5/16"
436420	3/8"	5/8"
436417	1/2"	13/16"

℄ - If one spacer only is installed.

DESCRIPTION: Independent coil spring type of same design used on previous models.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

REMOVAL & INSTALLATION: *See 1957 Final Data, Page 351, or later Manual editions, and not the following:*

Upper Control Arm Bushing Replacement (Threaded Steel Type): Place control arm in a vise and remove bushings from inner shaft. Shift shaft as far as possible to one side, move opposite end of shaft out of control arm end and remove shaft and seals from control arm, then remove grease seals. To install, place grease seals on inner shaft and insert one end of shaft into control arm, then bring other end into position and insert into control arm. Spread inner ends of control arm .015" with Spreader Tool J-3957, with J-3957-7 & 8 at inner ends of arm. Turn hexagon of tool until hand tight, then tighten an additional two flats which will spread arms desired .015". Centralize inner shaft between ends of control arm and install bushings securely. *Shaft must be free to turn.*

RAMBLER FRONT SUSPENSION

Rambler, All Series (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 UPPER CONTROL ARM CLICKING NOISE CORRECTION (CLASSIC & AMBASSADOR):* A sharp clicking noise when brakes applied or when turning wheels right and left while parking, may be caused by upper control arm spacer serrations digging into control arm and causing looseness in arms. To correct, install new larger diameter spacer, No. 3169234. Make sure upper control arm metal surfaces in spacer area are smooth before installing spacer. If control arm badly marred, install new arm. Use special unplated hardened steel bolt, No. G-455017, and nut, No. G-225857, DO NOT lubricate these parts, and torque to 90-100 ft. lbs. *NOTE - Above recommendations supersedes previous instructions.*

►*LOWER CONTROL ARM THROUGH BOLT TIGHTENING CAUTION:* The lower control arm through bolt which also acts as the front shock absorber lower anchor (on all models) is specially heat treated and must be properly tightened to 110-125 ft. lbs. *DO NOT REPLACE THIS BOLT WITH ONE THAT IS NOT HEAT TREATED.*

►*TOE-IN ADJUSTMENT NOTE (Cars with Power Steering):* Operate engine to permit steering pump oil pressure to center valve spool in control valve assembly before checking or adjusting toe-in.

►*CAR LEVELING NOTE (EXCEPT AMERICAN):* On 1956-62 cars, an aluminum alloy front spring spacer (¼" thick), Part No. 3202359, is available to assist in leveling a car that leans at right or left front corner. Install spacer on spring seat with spring cushion and spring resting on spacer. *CAUTION - If two spacers are used, install one spacer on upper spring seat at and one on lower spring seat.* The addition of one spacer will raise affected corner approximately ½".

DESCRIPTION: Basic design is similar to that used on previous models. Upper control arms are connected to steering knuckles by trunnion assemblies. On Rambler American, the upper trunnion assembly is integral with front spring lower support. On other models, coil spring lower support is threaded on upper trunnion.

ADJUSTMENT: *See "Wheel Alignment Specifications & Adjustment" in this section.*

REMOVAL & INSTALLATION: *See 1958 Final Data, Page 355, or later Manual editions.*

STEERING LINKAGE

►*POWER STEERING LINKAGE NOTE:* Linkage on these cars is essentially the same as linkage for manual steering cars.

AMERICAN MOTORS

Rambl r (All Seri s): Linkage - Consists of relay rod connected between pitman arm and steering idler arm with tie rod on left side connected between pitman arm and steering arm. On right side, tie rod is connected between idler arm and steering arm. Ball and socket joints are adjustable on Series 01 (American), and not adjustable on Series 10 & 80 (Classic & Ambassador).

Ball & Socket J int Adjustment - On idler arm side, tighten adjusting plug until solid contact made, then back out to first cotter pin hole (no more than 3/8-turn, no less than 1/8-turn). On pitman arm side, tighten adjusting plug until solid contact made, then back out 3/4-turn and install cotter pin in holes nearest this position.

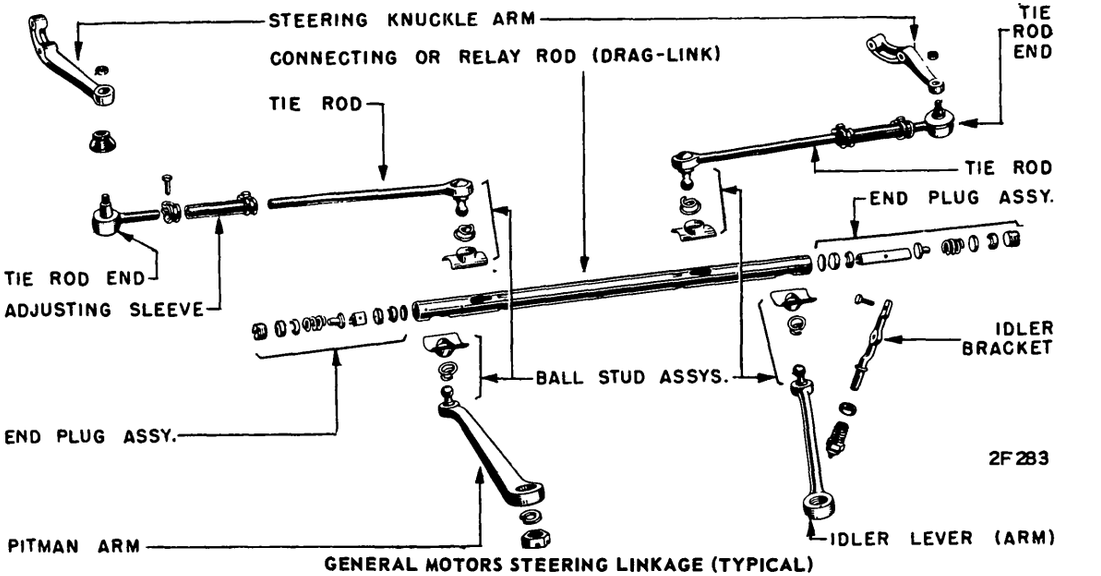
CHRYSLER CORP.

Chrysl r, Imp rial, D S t , Dodge, Dart, Lancer, Plymouth, Valiant: Linkag – Consists of idler arm bracketed to right frame side member and connected to right end of drag link. Pitman arm is connected to left end of drag link. Individual tie rods, connected to drag link near its center, have sleeve adjustment for toe–in.

Idl r Arm Bushing R placement – Idler arm with bushing is serviced only as an assembly. When bushing worn, replace assembly.

FORD MOTOR CO.

Com t, Falcon, F rd Pass. Cars, Lincoln, Mercury, Thund rbird: Linkag – Consists of steering (pitman) arm–to–idler arm rod which transmits motion from steering gear through steering arm which is attached to left end of steering arm–to–idler arm rod, then to front wheels through the tie rods. Tie rods have adjustable sleeves on outer ends for toe–in adjustment. An idler arm is attached to right side of underbody.



Ti R d End Replac ment – *NOTE – Idler (interm diat) rod nds ar not replaceable. Complete rod ass mbly should b r placed when rod ends are worn.* Remove nut from ball end stud, then place a support behind arm near stud and tap with a soft hammer to drive it out of arm. *CAUTION – DO NOT use a wedge typ ball stud separator because of special design of ball stud seals.*

Idl r Arm & Bushing Replacement - *NOTE - If one bushing is w rn, b th bushings must be replaced.* Replace bushings with Tool Set T61P-3355-A or 3355 (or suitable puller). *CAUTION - Replace idler arm bracket if thr ads ar worn or bracket is bent. DO NOT attempt to straight n a b nt idler arm bracket.*

F rd Trucks: *C SERIES NOTE - See "Production Change" b l w.*

Linkag - Consists of a connecting rod between front wheels. Rod has adjustable features at both ends. Spindle arm, attached to connecting rod at left end, is in turn attached to a one-piece drag link with manual adjustment features at both ends. Rear of drag link is attached to sector shaft arm.

Drag Link Adjustm nt - Remove cotter pins from each end of drag link. Tighten each drag link plug until drag link ball springs are fully compressed. Back off each plug to first cotter pin hole, then install new cotter pins.

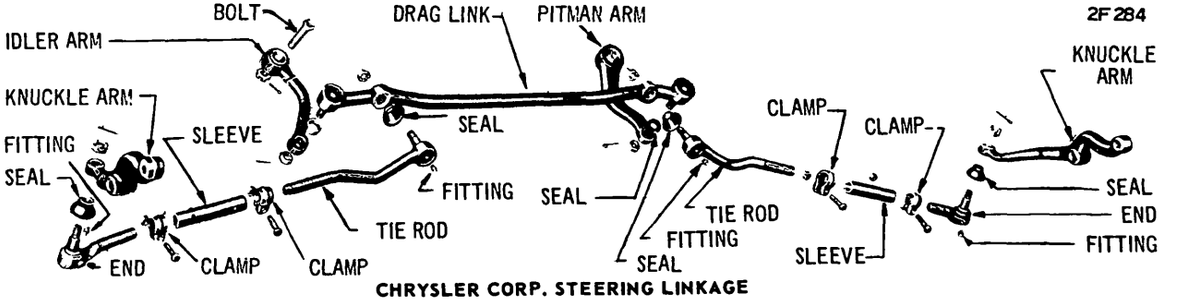
GENERAL MOTORS STEERING LINKAGE (TYPICAL)

►*1962 C SERIES LINKAGE PRODUCTION CHANGE & ADJUSTMENT NOTE:* Later production trucks have single adjustable type drag link. With steering wheel centered, adjust drag link for length of 39 1/8"±1/16". Clamp bolt torque should be 35-45 ft. lbs. *CAUTION - Greater offset in curved drag link must be to front for proper tire clearance. Rear clamp opening must face right side of truck, and front clamp opening must face left side of truck.*

GENERAL MOTORS

Buick (Except Special): Linkage – Parallelogram type linkage consisting of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each front wheel. Adjustable sleeves at end of each tie rod for toe-in adjustment. No intermediate rod end plug adjustment is provided.

Idler Lever & Support Adjustment – In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is 2 15/16–3 1/16".



Buick Special: Linkage – Parallelogram type linkage consisting of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each front wheel. Adjustable sleeves at end of each tie rod for toe–in adjustment. Intermediate rod end plug adjustment provided at both pitman arm and idler lever ends of intermediate rod on both manual and power steering cars.

Idler Lever & Support Adjustment – In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is 7/16".

Intermediate Rod End Plug Adjustment – Adjust plugs on both pitman arm and idler lever ends of intermediate rod as follows: Turn end plug up tight, then back off plug ¼ – ¾ turn (½ turn preferred) and install cotter pin.

Cadillac: Linkage – Consists of a drag link between steering gear pitman arm and idler arm mounted on right frame side rail, and individual tie rods between drag link and each wheel. Adjustable sleeves at outside ends of tie rods for toe–in adjustment. No. adjustment plugs are provided at drag link ends as drag link is attached to idler and pitman arms by spherical pivots.

CONTINUED ON NEXT PAGE

CHRYSLER CORP. STEERING LINKAGE

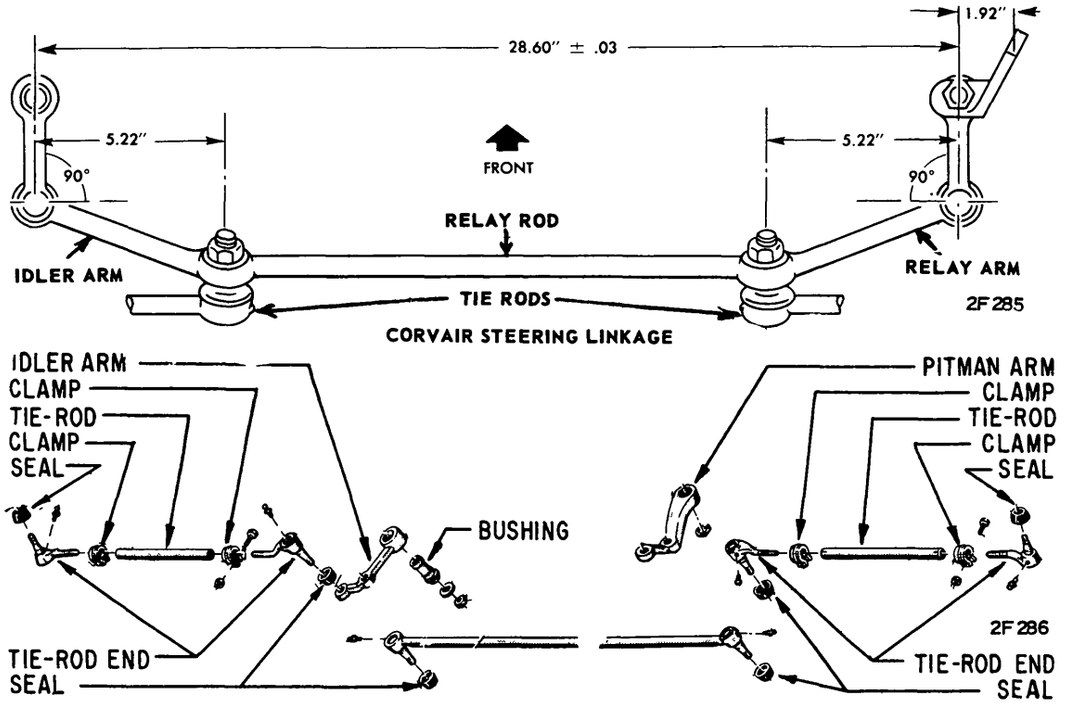
STEERING LINKAGE (C nt.)

Drag Link Height Adjustm nt – Place a straight bar across two adjustable jacks directly below drag link. Adjust height of jacks so distance from top of bar to centerline of lower control arm pivot bolts is equal on both sides (adjust jacks so distance is an even number of inches). Measure distance from top of bar to lower edge of drag link on both sides using a combination square and level with bubble centered in level. *CAUTION – Do not reposition bar or move car.* Difference in measurement between 1st measurement (top of bar to centerline of lower control arm pivot bolts) and 2nd measurement (top of bar to lower edge of drag link) should be 2 15/16"±1/16" and equal at both inner pivot points within 1/16". If idler arm end of drag link not within limits, loosen idler arm support mounting screws and move support. If proper adjustment still not obtainable, remove and bend idler arm slightly. If pitman arm end of drag link not within limits, loosen steering gear mounting bolts and move gear. If proper adjustment still not obtainable, remove and bend pitman arm slightly. *CAUTION – Bend pitman and idler arms off the car and cold.*

Chevrolet Pass. Cars: Linkage – Consists of steering relay rod between pitman arm and idler arm. Pitman arm connected to relay rod by an adjustable ball and socket joint. Individual adjustable tie rods are installed between relay rod and each front wheel.

Relay Rod Ball Joint Adjustment – Remove cotter pin from end of relay rod and tighten end plug until springs are compressed and plug bottoms. Back off end plug ¾ turn plus amount necessary to insert cotter pin, then insert pin.

Idler Arm Inspection – Remove idler arm from bracket and remove relay rod from idler arm. Remove idler arm stud seals and all grease, then inspect idler arm for damage or wear. Place idler arm in vise, turn nut on stud until nut bottoms on threads. Torque to turn stud should be not less than 1 ft. lb., nor more than 10 ft. lbs. Replace idler arm when turning torque not within limits.



Chevy II: Linkage - Consists of steering relay rod between pitman arm and idler arm. Pitman arm connected to relay rod by an adjustable ball and socket joint. Individual adjustable tie rods are installed between relay rod and each front wheel.

Relay Rod Ball Joint Adjustment - Remove cotter pin from end of relay rod and tighten end plug until springs are compressed and plug bottoms. Back off end plug ¾-turn plus amount necessary to insert cotter pin, then insert cotter pin.

Chevrolet Trucks: Linkage – Consists of twc tie rod assemblies connected between pitman arm and wheel on left hand side and between idler arm and wheel on right hand side. A relay rod is connected between pitman arm and idler arm.

Idler Arm Inspection–*See "Chevrolet Pass. Cars" above.*

Idler Arm Bushing Replacement – *NOTE – On Series 10 through 40, idler arm bushing is not replaceable.* On Series 50 & 60 remove idler arm, then press bushing out with Tool J–1614. *NOTE – Wh n pr ssing bushing from housing, pr ssing t l must thr ad d wn through n bushing and nt top of l w r bushing. Aft r pr ssing this bushing ut, turn support housing v r and press sec nd bushing ut. Always press from inn r rim of bushing t ward utside f housing.*

Press new bushing into place with Tool J–7079–2 and J–8522 Bushings will be properly located in bore when pressed in until tool contacts housing

Relay Rod Ball Joint Adjustm nt (If Equipped) - Turn adjusting plug in until it is solid, then back out 3½ turns to nearest cotter pin hole, then install cotter pin.

Steering Connecting Rod Length - Steering connecting rod length should be as in table below. *CAUTION - On non-adjustable type rods, replace rod if length not within specifications.*

Steering Connecting Rod Length

Truck Model	Rod Length
K10 & K20	16 9/16"±1/16"
P20 & P30	17"±1/16"
T60	18 13/16"±1/16"

Corvair: Linkage – Consists of a relay rod connected between pitman arm and steering idler arm located on right hand side of frame. Tie–rods are connected between relay rod and each front wheel. Bushing on pitman arm end of relay rod is replaceable.

Relay Rod Bushing Replacement – With relay rod removed from car, drive bolt out of bushing, then use a suitable size socket to press bushing sleeve and rubber out of relay rod. Press a new bushing into place with Tool J–8357. *CAUTION – When installing relay rod in car, idler arm and pitman arm must be in proper alignm nt (s illustration). B sur to h ld hex .h ad of bushing bolts s bushing will n t be twist d.*

C rvett : Pitman arm connected by a short drag link to a "third arm" bolted to underside of suspension crossmember at center. Equal length tie rods connect from "third arm" to steering arms at brake backing plates and steering knuckles. "Third arm" pivots on a double row ball bearing inside arm and arm is mounted to crossmember by a stud through ball bearing. A "Fast Steering Adapter" which changes steering ratio from 21.1-1 to 16.3-1 may be found mounted on "third arm" on some cars.

"Third Arm" Assembly - R m val - Disconnect drag link from third arm, then disconnect tie rods from third arm. Remove third arm from crossmember.

Disassembly - Remove grease seal and lock snap ring from inside arm opening. Install a nut on stud and hold nut firmly in vise. Hold other end of arm and use a hammer to tap around arm opening to remove stud and ball bearing.

Assembly - Press bearing and stud assembly into arm with suitable driver (2 3/8"pipe cut to suitable length). Install lock snap ring into groove, making sure it is seated to full depth of groove.

Installation - Pack cavity between bearing lock snap ring and outer edge of arm opening with cup grease. Place seal around outer edge of arm opening. Reverse removal procedure, tighten retaining nut to 60-85 ft. lbs. and install cotter pin.

Drag Link End Plug Adjustment - Tighten end plugs to remove all endplay from ball and socket, then back off each plug 1/4-1/2 turn plus amount necessary to insert cotter pin.

Oldsmobil (Exc pt F–85): Linkag – Consists of steering relay rod between pitman arm and idler arm, bracketed to right frame side rail. Individual adjustable tie rods are attached to center portion of steer-

CONTINUED ON NEXT PAGE

STEERING LINKAGE (C nt.)

ing relay rod and are provided with adjustable sleeves for toe–in adjustment. Toe–in adjustment is the only adjustment necessary for steering linkage.

Oldsm bil F–85: Linkag – Consists of steering relay rod between pitman arm and idler arm which is bracketed to right frame side rail. Individual adjustable tie rods are attached to relay rod and are provided with adjustable sleeves for toe–in adjustment.

R lay R d End Plug Adjustment – Thread plugs into relay rod until tight, then back off ¼–¾ turn and install cotter pin with head to front of car.

Idl r Arm & Support Adjustment – Thread idler arm support with seal into bushing until distance from upper face of idler arm to shoulder of support is ½". *NOTE – Idl r arm must be able to rotate 90° in each dir cti n fr m straight ah ad position.*

P ntiac & P ntiac T mp st: Linkag – Consists of steering connecting rod between pitman arm and idler arm, bracketed on right frame side rail, and individual adjustable tie rods between steering connecting rod and each front wheel. Tie rods have adjusting sleeves at outer ends for toe–in adjustment.

Idler Lever & Support Adjustment – With lever and support off car, thread idler support into bushing until distance between upper face of idler arm and shoulder at thread end of idler support is 11/16".

►*1962 TEMPEST STEERING LINKAGE PRODUCTION CHANGE & PARTS NON-INTERCHANGEABILITY CAUTION:* Later cars have linkage with plastic lined ball joints which are lubricated for life. Early and later type parts are **not** interchangeable.

STUDEBAKER CORP.

Studebaker Lark & Hawk: Linkage – Consists of two adjustable tie rods attached to bellcrank mounted at center of frame crossmember. Bellcrank is attached to steering gear pitman arm by a reach rod (drag link).

B llcrank B aring Adjustm nt – Insert shims between lower thrust washer and shaft until there is no endplay. Shaft should turn freely in bearings. Lock nut securely with cotter pin.

WILLYS MOTORS

Willys (All Models): Linkage – Bellcrank on frame crossmember linked to each front wheel by adjustable tie rods and to steering gear pitman arm by a steering connecting rod (drag link).

Connecting Rod End Plug Adjustment – On idler arm end of connecting rod, screw plug in firmly against ball, then back off ½ turn (except FC–150), 1/8–1/4 turn (FC–150), and install cotter pin. On pitman arm end, screw plug in firmly against ball, then back off 1 full turn (except FC–150), 1/8–1/4 turn (FC–150) and install cotter pin.

Chrysler (1962)
D dg Custom 880 (1962) ①
F rd Trucks (Except F-100 & F-250) (1962) ②
Rambler American (1962) ③

③ - *For Rambl r Classic & Ambassador, see "Saginaw Ball B aring Worm & Nut" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 RAMBLER STEERING COLUMN BINDING OR SCRAPING CORRECTION:* May be caused by insufficient lubrication at lower nylon bushing in lower jacket tube. If bushing has no oiler, drill a 1/8" hole above the bushing and apply oil through the hole.

DESCRIPTION: Similar in design to units used on previous models. Roller shaft adjusting screw is secured in end of roller shaft with a snap ring on some models. Chrysler Corp. cars have flexible coupling between steering gear worm shaft and steering tube.

ADJUSTMENT: *NOTE – Adjustments must be made in th foll wing s qu nc .*

W rm B aring: All Except Ford Trucks – Turn steering wheel about one turn from straight ahead position and secure wheel to prevent any movement. Determine endplay by shaking front wheels sideways noting any movement that may be felt between steering wheel hub and steering jacket tube. If endplay is present, adjust worm bearing by loosening the four bottom cover bolts about 1/8", then separate top shim with a knife blade and remove. *CAUTION – Do not mutilate remaining shims or gask t.* Tighten cover and recheck for endplay. *NOTE – R move only one shim at a time to prevent btaining too tight an adjustment.*

F rd Trucks (F, B, P Series) – Disconnect pitman arm from drag link (or from control valve ball stud on power steering models). Turn steering wheel two complete turns from straight ahead position, then install an inch–pound torque wrench on steering wheel nut and measure torque required to keep wheel moving at a constant rate for at least one complete turn. If torque or preload is not within specifications in table, adjust as indicated below.

GEMMER WORM & ROLLER

Adjustment – Disconnect horn wire at bullet connector just below steering column housing. Remove bolts attaching endplate to steering gear housing, then remove or install one gasket at a time to obtain proper preload. Gaskets are available in thicknesses of .002", .005", .010". *NOTE – Removal of gasket will increase preload and installation of gasket will decrease preload.* To remove a gasket, separate outer gasket from pack by passing a knife blade all around inner face of gasket being careful not to cut or tear remaining gaskets in pack. Install endplate and recheck preload. *NOTE – On P Series, steering gear and column must be loosened before endplate can be removed for installation of gasket.*

Ford Trucks (C Series) – Disconnect pitman arm from drag link (or from control valve ball stud on power steering models). Remove lower universal joint retaining bolt and nut and raise steering shaft assembly off steering gear, then install a 4" block of wood between steering wheel and upper steering column tube flange. Bend a piece of light strap iron (10" long) so a 1" section is at right angles to longer section, then use a heater hose clamp and fasten strap iron to worm shaft so longer section of iron forms a lever. Turn worm shaft two complete turns from straight ahead position and measure pull required to keep worm shaft moving at a constant rate for at least one complete turn, using a spring scale hooked to lever at a point 8½" from outer diameter of steering shaft. If pull required to turn shaft not within specifications in table, adjust as indicated below.

Adjustment – *Same as for F, B, P Series above.*

Ford Truck Worm Bearing Preload

Truck Model	Worm Preload
F, B, P Series ①	②4½–9 lbs.
F & B–600 Series③	②4½–11¼ lbs.
C Series	④9–13½ lbs.

① – Except F & B–600 With 6000 Lb. Front Axle.
② – Inch–lbs. With inch–pound torque wrench on steering wheel nut.
③ – With 6000 Lb. Front Axle.
④ – Pounds pull. With spring scale installed on steering wheel at right angle to spoke.

Cr ss Shaft R ller & W rm M sh: Chrysler & D dge - Disconnect pitman arm at link, then rotate steering wheel to mid-position and check for backlash by moving pitman arm back and forth. If backlash exists, loosen roller shaft adjustment screw locknut and tighten adjusting screw enough to eliminate freeplay. Rotate steering wheel to one end of its travel and apply a spring scale at rim of steering wheel. A pull of 1-2 lbs. should be required to turn wheel. Tighten adjusting screw locknut while holding adjusting screw from turning.

Ford Trucks (F, B, P Series) – Disconnect drag link from pitman arm, install an inch–pound torque wrench on steering wheel nut and measure torque required to turn wheel through straight ahead (high point) position. If torque not within limits in specification table, adjust as indicated below.

Adjustment – Loosen adjusting screw locknut at engine side of steering gear housing and adjust by turning screw inward (clockwise) to tighten mesh, outward (counterclockwise) to loosen mesh. Hold adjusting screw stationary and tighten locknut.

Ford Truck Worm & Mesh Setting

Truck Model	Worm & Roller Mesh
F, B, P Series ①	②13½–22 lbs.
F & B–600 Series ③	②15¾–24¼ lbs.
C Series	④18½–29¾ lbs.

① – Except F & B–600 With 6000 Lb. Front Axle.
② – Inch–lbs. With inch–pound torque wrench on steering wheel nut.
③ – With 6000 Lb. Front Axle.
④ – Pounds pull. With spring scale installed on steering wheel at right angle to spoke.

Ford Trucks (C Series) – Disconnect pitman arm from drag link. Remove lower universal joint retaining bolt and nut and raise steering shaft assembly off steering gear, then install a 4" block of wood between steering wheel and upper steering column tube flange. Bend a piece of light strap iron (10" long) so a 1" section is at right angles to longer section, then use a heater hose clamp and fasten strap iron to worm shaft so longer section of iron forms a lever. Turn worm shaft so it is at straight ahead position and measure pull required to turn worm shaft through straight ahead (high point) position, using a spring scale hooked to

CONTINUED ON NEXT PAGE

GEMMER WORM & ROLLER (Continued)

lever at a point 8½" from outer diameter of steering shaft. If pull not within limits in specification table, adjust as indicated below.

Adjustment – *Same as for F, B, P Series above.*

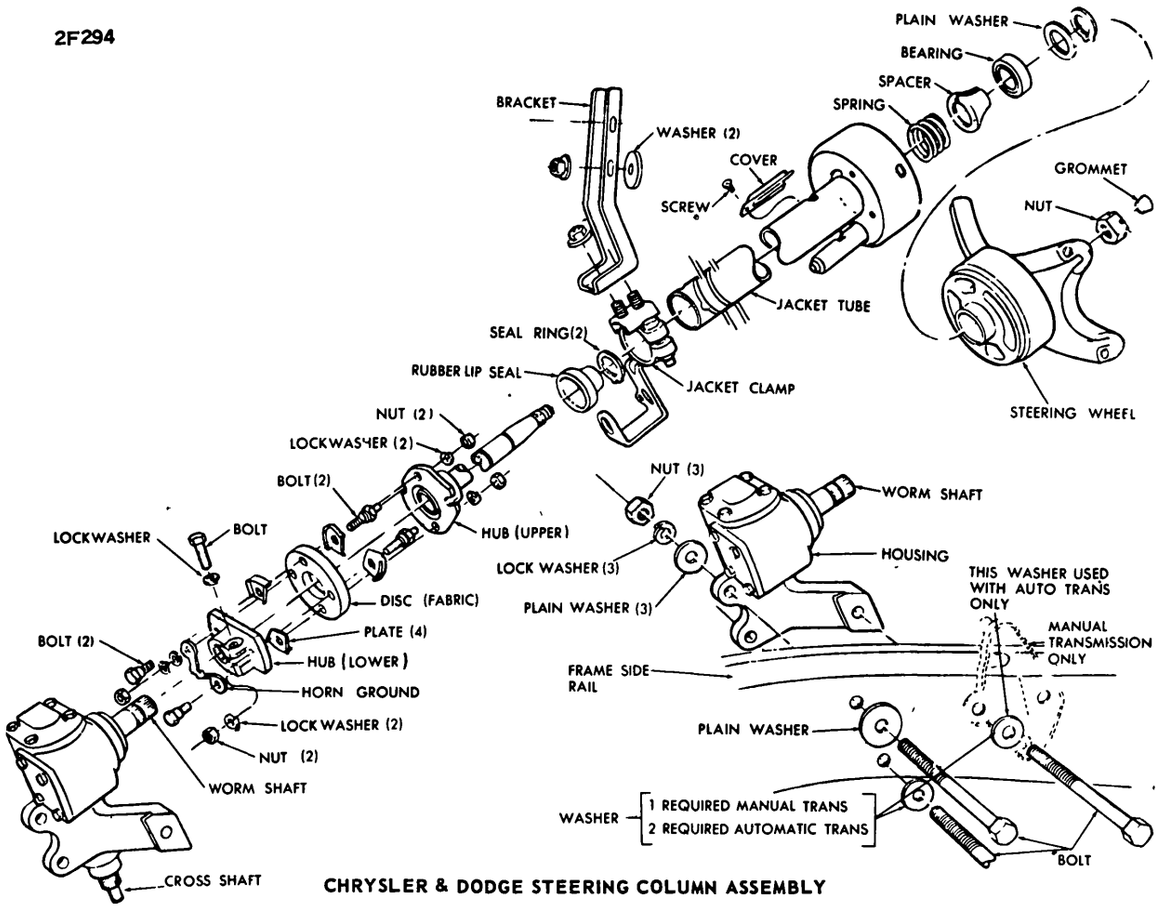
Rambler American – With pitman arm disconnected and steering wheel at mid position of turning limits, shake pitman arm sideways to determine worm and cross shaft roller clearance; or hook spring scale to rim of steering wheel and note pull required to pull wheel through center of travel. Pitman arm movement should not exceed 1/32", and pull on steering wheel should be 7/8-1 1/8 lbs. To adjust, loosen locknut on adjusting screw and tighten screw as necessary. DO NOT OVERTIGHTEN.

STEERING WHEEL & HORN BUTTON REMOVAL:

Chrysler & Dodge: Disconnect battery, then remove two screws from underside of steering wheel to remove horn ring, retainer and attaching screws. Disconnect horn wire at switch, then remove horn switch. Loosen steering wheel nut several turns and use Puller C-3428 to remove steering wheel and nut.

Ford Trucks: Disconnect horn wire at bullet connector under instrument panel. Remove horn button or ring by pressing down and turning counterclockwise. Remove steering wheel nut. Install a steering wheel puller such as 3600—AA, and remove steering wheel.

Rambler American: Remove horn button or ring and pull steering wheel with Tool J—5290. To replace steering wheel, turn steering shaft until mark on shaft is at top center, then place wheel on shaft with steering wheel spokes equal distance from center.



STEERING GEAR REMOVAL, INSTALLATION & ALIGNMENT: Note the special alignment procedures outlined below.

Chrysler & Dodge: Removal - Remove pitman arm from sector shaft with Tool C-3646, then remove flexible coupling-to-steering gear worm shaft attaching bolt and washer. Remove steering gear-to-frame side rail attaching bolts and slide gear assembly forward to disengage flexible coupling from worm shaft. Raise gear and remove through engine compartment.

Installation – Place steering gear worm shaft on exact center of travel (high point). Mark master spline in outer row of serrations on worm shaft, then install gear in engine compartment. Align index mark on outside of flexible coupling hub with master spline on worm shaft. Slide coupling on worm shaft and install gear housing—to—frame attaching bolts and tighten bolts evenly to 50 ft. lbs. Position flexible coupling bolt hole in line with groove on worm shaft and install bolt and lockwasher and tighten to 30—35 ft. lbs. Install pitman arm and tighten nut to 125 ft. lbs.

Alignment – Check steering tube for alignment in steering column seal. If tube is not centered, proceed as follows: *NOTE – Steering tube must be centered in steering column seal, also lip of seal which contacts tube must be well lubricated with wheel bearing lubricant.* Loosen steering column clamp bolts at instrument panel, then loosen lower column clamp bolt and support bracket at both firewall and at column clamp. Hold steering column so it is centered on tube while aligning column support bracket to firewall and lower column clamp. When properly located, tighten support bracket stud nuts at firewall and at column

2F294

CHRYSLER & DODGE STEERING COLUMN ASSEMBLY

clamp to 100 inch—pounds. Tighten steering column—to—instrument panel clamp bolts to 15 ft. lbs., then tighten lower steering column clamp bolt to **200 inch—pounds.**

Ford Trucks (F & B Series): Disconnect battery ground cable, then disconnect horn wire from bullet connector below steering gear housing and remove wire from clips on frame and fender apron. Loosen steering column lower clamp and slide clamp down. Disconnect transmission shift control rod or rods at shift levers. Remove steering wheel (see above), then remove steering column upper bushing spring and bushing. Disconnect turn signal wires, and remove from retaining clip at instrument panel bracket. Remove steering column bracket clamps and rubber sleeve. If truck has a floor mounted gear shift lever, pull steering column tube off shaft. On a truck with automatic transmission or a remote type gearshift lever, remove steering column shields from floor pan. If truck has a V8 engine, remove engine oil filter. On a clutch equipped truck, disconnect clutch retracting spring and remove clutch equalizer shaft outer bearing bracket and shaft (do not loosen split bearings). On F—350 with remote type shift, remove inner bearing bracket. Remove pitman arm. Disconnect steering gear from frame side rail. On a model with floor mounted gearshift, remove steering gear assembly from under truck. On models with automatic transmission or a remote type gearshift, remove assembly through passenger compartment. If steering column tube has not been removed, loosen lower clamp and remove tube. To install, reverse removal procedure.

Ford Trucks (C Series): Remove horn wire brush from steering column just below instrument panel bracket. Remove universal joint upper retaining nut and bolt, then turn wheels to right and remove pitman arm. Remove steering gear housing—to—frame bolts and remove steering gear with universal joint attached. Install by reversing removal procedure.

Ford Trucks (P Series): Remove steering wheel (see above), then remove steering column bracket bolts from instrument panel. Raise front of truck, install stands, then remove pitman arm. Loosen steering column lower clamp, and disconnect horn wire. Move steering gear to left and remove from beneath truck.

Rambler American: Removal – Remove steering wheel (see above), and pitman arm. Loosen steering jacket tube assembly at support plate and at instrument panel mounting bracket. Remove steering gear attaching

CONTINUED ON NEXT PAGE

GEMMER WORM & ROLLER (C ntinued)

bolts and remove gear from beneath car.

Installati n – Reverse removal procedure.

Alignm nt – Loosen housing mounting bolts and align housing at angle determined by height setting of jacket tube bracket. Use shims between housing and mounting surface as necessary. Tighten mounting bolts. Loosen jacket tube bracket and let it match gear column position, then tighten.

OVERHAUL (STEERING GEAR ASSEMBLY): Disass mbly – Remove seal from pitman arm end of sector shaft with a suitable puller. Loosen sector shaft adjusting screw locknut, remove sector shaft cover, adjusting screw and sector shaft as an assembly. Remove housing lower cover plate, shims, spring, seal, washer, and lower bearing. Remove worm shaft and upper bearing from housing. Drive sector shaft bushings or bearing from housing with suitable removing tools.

Reassembly: *NOTE – DO NOT lubricate any parts until unit is reassembled.* Install lower sector shaft bushing to within 1/16" of end of counterbore in housing, and upper bushing flush with housing bore face, using suitable tools. Install worm and shaft in housing with both upper and lower bearings properly seated. Install housing lower cover and shims, making sure no bind exists in worm shaft. Check worm bearing preload as follows: *See above for Ford Trucks.* For other cars, temporarily install steering wheel on worm shaft and tighten cover screws so endplay disappears with 3/8 to 3/4 pound pull required to rotate shaft. Remove or install shims between cover and housing as necessary. Install worm shaft upper seal using a protector over shaft spline to prevent seal damage. Install sector shaft and cover with adjusting screw turned all the way out. Make worm and roller mesh adjustment as detailed above. Fill housing with steering gear lubricant and check for leaks.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 MERCURY METEOR & FORD FAIRLANE RUBBING NOISE IN STEERING COLUMN CORRECTION:* May be caused by steering shaft not centralized and consequently binding in steering column. To correct, adjust cover plates at firewall. *DO NOT shim steering g ar b x.*

►*1962 MERCURY MONTEREY (WITH ECCENTRIC STEERING COLUMN) EXCESSIVE STEERING SHAFT ENDPLAY CORRECTION:* Torque upper bearing retainer screws to 25-35 inch-pounds (supersedes previous 19-23 inch-pounds). Make sure the 3 bearing retainer rings are properly installed. Make sure that rubber bearing sleeve is properly installed and not mutilated. Make sure bearing is not loose on steering shaft.

►*1962 PONTIAC STEERING COLUMN LOWER SUPPORT BRACKET-TO-MOUNTING BRACKET SCREW TORQUE CHANGE NOTE:* Steering column lower support bracket-to-mounting bracket screw torque has been changed to 5-10 ft. lbs. (supersedes previous 10-20 ft. lbs.) to prevent collapsing of steering column reinforcement.

SAGINAW BALL BEARING WORM & NUT

►*1962 PONTIAC STEERING COLUMN SEAL PRODUCTION CHANGE:* New foam rubber steering column seal, Part No. 544463, used on cars after February 1, 1962 to replace felt seal for easier installation of steering column jacket beneath toe plate grommet.

►*1962 RAMBLER STEERING WHEEL STOP ON STRUT ROD RUBBING ON STEERING ARM ON SHARP TURNS CORRECTION:* To correct, slightly round the square edge of strut rod contact area and apply some fibre grease to the contact points.

►*1962 RAMBLER STEERING COLUMN BINDING OR SCRAPING CORRECTION:* May be caused by insufficient lubrication at lower nylon bushing in lower jacket tube. If bushing has no oiler, drill a 1/8" hole above the bushing and apply oil through the hole.

►*1962 STUDEBAKER PROCEDURE TO CHANGE STEERING WHEEL HEIGHT:* Steering wheel height can be changed by adding or removing shims between upper steering jacket clamp and pedal mounting bracket. *NOTE - A 1/8" shim will change wheel height 1/4". Cars are produced with one 1/8" shim between each end of upper jacket clamp and pedal mounting bracket.* Proceed as follows: Loosen steering gear attaching bolts. To lower wheel, install 1/8" shims, Part No. 1555827, between ends of steering jacket upper clamp and pedal mounting bracket (clamp-to-bracket bolt lengths will permit installation of 3 shims at each bolt). To raise wheel, remove shims between steering jacket upper clamp and pedal mounting bracket. Tighten steering gear attaching bolts.

►*STEERING GEAR NOISE CORRECTION:* May be due to insufficient lubricant caused by an air bubble in gear housing. Make sure correct amount of lubricant is used and turn wheels from stop to stop while filling to eliminate any air bubble.

DESCRIPTION: Recirculating ball nut type. Nut mounted on worm and driven through steel balls which circulate in helical grooves in both worm and nut. Return guides attached to nut serve to recirculate the two sets of balls through grooves. Gear teeth on nut mesh with sector teeth on cross shaft so that cross shaft (and steering gear pitman arm) rotate as steering wheel is turned, causing nut to move up and down.

ADJUSTMENTS

►*NOTE:* Make adjustments in the following sequence.

Steering G ar Alignment: Before any adjustments are made to steering gear, check for binding at frame bracket mounting bolts and at instrument panel bracket or flexible coupling. Disconnect relay rod from pitman arm and check tightness of pitman arm nut. Back off pitman shaft adjusting screw just enough to obtain a slight backlash between ball nut and pitman shaft. Steering shaft should turn through full range in both directions without bind or hard pull and be free of any rough spots. A bind indicates misaligned steering gear on mountings or couplings. Rough spots indicate damaged bearings or parts. Hard pull indicates excessive preload adjustment.

Steering Gear Shaft Worm Bearing Preload Adjustm nt (All Models): With relay rod disconnected from pitman arm and pitman arm properly tightened on steering gear pitman shaft, loosen pitman shaft adjusting screw to obtain a slight backlash between ball nut and pitman shaft. Loosen worm thrust bearing adjuster locknut at upper or lower end of worm shaft depending on car model, and turn adjuster until a slight load is felt (with steering wheel at extreme right or left positions), then tighten locknut. Install a spring scale at right angles to spoke or install an inch-pound torque wrench on steering shaft *(see "Worm Bearing Setting" tabl below for proper method to use in checking preload).* Note spring scale or torque wrench reading required to keep steering wheel moving (when off high point). Rotate adjusting nut as necessary to obtain correct reading on spring scale or torque wrench (see table below).

WORM BEARING SETTING

Car Model	Preload Setting (lbs.)
Buick & Buick Special	① 2-7
Chevrolet Pass. Cars	② 3/8-5/8
Chevy II (Manual Steering)	②③ 1/2-7/8
(Power Steering)	②④ 1/2-3/4
Chevrolet Trucks, Series P-20 & 30	② 1-1 1/2
Series 50 & 60	② 1 1/2-2
Other Series	② 1/4-3/4
Comet	① 3-6
Corvair Cars (On Car)	② 7/16-11/16
(On Bench)	① 2-6
Corvair Trucks	② 1/2-3/4

① - Inch-lbs. With torque wrench on steering shaft.
② - Pounds pull. With spring scale installed on steering wheel at right angle to spoke.
③ - Combined preload and backlash settings must not exceed 1 3/4 lbs.
④ - Combined preload and backlash settings must not exceed 1 1/4 lbs.

Rambler	② 1/2-3/4
Studebaker	① 2 1/4-6 3/4
Valiant (On Car)	⑤ 2 1/2-6
(On Bench)	⑤ 1 1/2-6

① - Inch-lbs. With torque wrench on steering shaft.
② - Pounds pull. With spring scale installed on steering wheel at right angle to spoke.
③ - Combined preload and backlash settings must not exceed 1¾ lbs.
④ - Combined preload and backlash settings must not exceed 1¼ lbs.
⑤ - Use Torque Wrench C-3380.

Pitman Shaft Endplay (Gear Mesh) Adjustment: With bearing preload adjustment completed (see above), check effort required to pull steering wheel through center (high point) of gear. If turning effort is not within specifications (see table below), turn pitman shaft adjusting screw clockwise to increase turning effort and counterclockwise to decrease turning effort. With locknut tightened, recheck turning effort and adjust as necessary.

►*PITMAN SHAFT ENDPLAY ADJUSTMENT CAUTION: This is a push-pull type adjustment and controls pitman shaft endplay as well as gear mesh.*

STEERING WHEEL & HORN RING OR BUTTON REMOVAL

Buick & Buick Special 1962:

Steering Wheel Removal - Disconnect horn wire at connector at mast jacket. Remove emblem from steering wheel hub. On Buick Special, remove cap assembly with a screwdriver inserted through hole in cap to loosen retaining screw, and unplug horn connector brush wire from cap. On all models, loosen steering wheel retaining nut several turns, attach a suitable puller to wheel hub and pull wheel up to nut. Remove puller, nut, and steering wheel.

Chevrolet Pass. Cars 1962:

Steering Wheel Removal - Disconnect horn wire and direction signal harness from mast jacket switch. Remove steering wheel nut and washer from steering shaft and install a puller (J-2927) into threaded holes in steering wheel hub. Remove steering wheel.

Chevy II 1962:

Steering Wheel Removal - Pry out horn button, then remove screws holding receiver cup (or horn ring) and bushing spacer to steering wheel. Remove flat belleville spring. Remove steering wheel nut and washer from shaft. Use Puller J-2927 to remove steering wheel. *NOTE - Do not lose spring or seal on shaft under steering wheel.*

Chevrolet Trucks 1962:

Steering Wheel Removal - Remove horn button and steering shaft nut and washer. Install a puller (J-2927) into threaded holes in steering wheel hub. Remove steering wheel.

Corvair Cars & Trucks 1962:

Steering Wheel Removal - Pry out horn button, then remove screws holding receiver cup and bushing spacer to steering wheel and remove flat bellville spring. Remove nut and washer from steering shaft and insert a puller (J-2927) into threaded holes in steering wheel hub. Remove steering wheel. *CAUTION - Do not lose spring or seat on shaft under steering wheel.*

Dodge & Plymouth 1962:

Steering Wheel Removal - Turn horn button ¼-turn counterclockwise to remove. Remove horn ring by removing screws on underside of steering wheel. Remove steering wheel nut and washer, then pull steering wheel from shaft with Puller C-612.

Comet & Falcon 1962:

Horn Button Removal - Disconnect horn wire under instrument panel at left side of steering column, then press down on horn button or ring and turn counterclockwise until it lifts out of steering wheel. Remove horn button and spring, then remove steering wheel (see below). Remove turn indicator lever and indicator mechanism retaining screws, and lift mechanism to one side. Remove screws retaining horn button contact and pull wire and contact from steering column.

Steering Wheel Removal - Remove horn button or ring (see above), then remove steering wheel nut and pull wheel from shaft with Puller 3600-AA or 3826 (Comet), 3600-N (Falcon).

Ford Fairlane & Mercury Meteor 1962:

Steering Wheel Removal - Disconnect battery, remove horn button or ring by pressing down and turning counterclockwise. Remove steering shaft nut, then remove steering wheel with Puller 3600-AA or 3826.

Ford Galaxie 1962:

Horn Button Removal - Disconnect horn wire at bullet connector under instrument panel, then push down on horn ring assembly and turn counterclockwise until it lifts out. Remove horn ring spring and horn ring contact brush, then remove steering wheel (see below). Remove wire cover on left side of steering column, then remove two contact retaining screws and remove contact and wire assembly.

Steering Wheel Removal - With horn ring, spring and horn contact brush removed (see above), remove steering wheel with Puller 3600-AA.

Ford Trucks 1962:

Steering Wheel Removal - Disconnect horn wire at instrument panel or at horn relay. Press down on horn button or ring and turn counterclockwise until it lifts out, then remove horn button and spring. Remove steerwheel nut and remove steering wheel with Puller 3600-N (Econoline), 3600-AA (Others).

Mercury Meteor 1962: *See "Ford Fairlane & Mercury Meteor 1962" above.*

Mercury Monterey 1962:

Horn Button Removal - Remove horn ring or steering wheel hub cap by pressing down and turning counterclockwise. Remove steering wheel (see below), then

① - Inch-lbs. With torque wrench on steering shaft.
② - Pounds pull. With spring scale installed on steering wheel at right angle to spoke.
③ - 4-8 lbs. greater than worm bearing preload. Total overcenter pull not to exceed 13 inch-lbs.
④ - Combined preload and backlash settings must not exceed 1 3/4 lbs.
⑤ - Combined preload and backlash settings must not exceed 1 1/4 lbs.
⑥ - Use Torque Wrench C-3380.
⑦ - Worm bearing preload plus 2-6 inch-lbs.
⑧ - Worm bearing preload plus 2-6 inch-lbs. Total overcenter pull not to exceed 17 inch-lbs.
⑨ - Worm bearing preload plus 3-7 inch-lbs. Total overcenter pull not to exceed 11 inch-lbs.

SAGINAW BALL BEARING WORM & NUT (C nt.)

remove horn contact plate and brush assembly.

Steering Wheel Removal - With horn ring and related parts removed, remove nut from steering shaft and remove steering wheel Puller 3600-AA or 3826.

Lancer & Valiant 1962:

St ring Wheel R m val - Pry horn button out with screwdriver inserted into slot in steering wheel at edge of horn button. Remove steering wheel retaining nut and washer, then remove steering wheel with Puller C-612.

Oldsm bile (Except F-85) 1962:

H rn Button R moval - Disconnect horn wire from harness. On standard type wheel, remove cap-to-steering wheel attaching screw and lockwasher, then pull cap from wheel. Disconnect horn switch wire from contact assembly. On deluxe wheel, remove setscrew if present, then pry cap and emblem assembly from shroud. On all models, remove steering wheel (see below). On deluxe wheel, disconnect horn switch wires from contact assembly lead, then remove the four shroud attaching screws and shroud. Remove staking from wheel hub and remove contact assembly from steering wheel.

Steering Wheel Rem val - With cap and emblem removed (see above), remove steering wheel nut, then pull wheel with Puller BT-61-9.

Oldsm bil F-85 1962:

Steering Wh el R m val - On standard wheel, remove cap by loosening attaching screw with a Phillips screwdriver inserted into access hole in side of cap, then slide cap off wheel. On deluxe wheel, pry cap from wheel. Disconnect horn wire and remove nut and washer from steering shaft. Pull steering wheel from shaft with Puller BT-61-9.

Plym uth 1962: *S "Dodge & Plymouth 1962" above.*

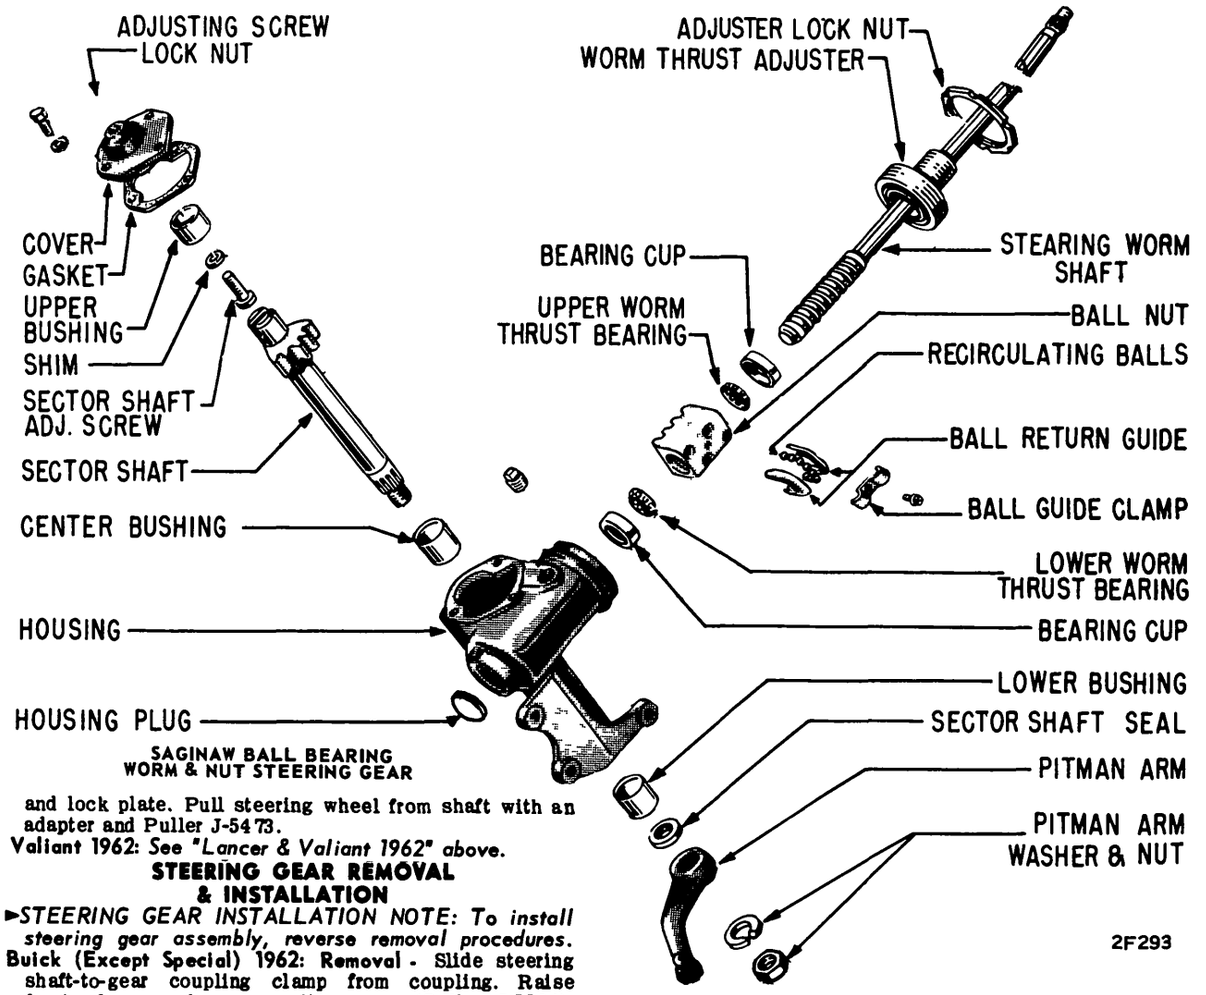
P ntiac (Except T mpe st) 1962:

St ering Wh el Rem val (Std. Wheel) - Pry horn button out, remove horn button retainer, contact ring, pivot contact, spring and insulator. Remove steering shaft nut and washer and contact plate. Remove steering wheel with Puller J-3044. Remove coil spring and seat from shaft.

Steering Wheel Removal (Deluxe Wheel) - Twist and lift out steering wheel ornament. Remove lock nut, retaining nut, and washer from steering shaft, then pull horn ring and contact assembly from shaft. Remove contact assembly from horn ring. Remove pivot contact, spring and insulator from steering wheel hub, then pull steering wheel with Puller J-3044. Remove coil spring and seat from shaft.

P ntiac Tempest 1962:

Steering Wheel Removal - Lift ornament out and remove both nuts and washer from steering shaft. Remove horn ring or receiver cup, then remove pivot ring and bellville spring. Remove contact assembly. Pull steering wheel with Puller J-3044-01.



Rambl r 1962:

Ste ring Whe l Rem val - Remove horn ring or button and pull steering wheel from steering shaft with Puller J-5290.

Stud baker 1962:

Steering Wh el Rem val - Pry out steering wheel cap, then remove horn ring retaining screws and remove ring and insulators. Remove steering wheel retaining nut and lock plate. Pull steering wheel from shaft with an adapter and Puller J-5473.

Valiant 1962: *See "Lancer & Valiant 1962" above.*

SAGINAW BALL BEARING WORM & NUT STEERING GEAR

STEERING GEAR REMOVAL & INSTALLATION

►*STEERING GEAR INSTALLATION NOTE: To install steering gear assembly, reverse removal procedures.*

Buick (Except Special) 1962: Removal - Slide steering shaft-to-gear coupling clamp from coupling. Raise front of car and remove pitman arm (Puller J-5504). Remove steering gear attaching bolts and remove steering gear.

Buick Special 1962: Rem oval - *NOTE - Pitman arm cannot be removed or installed with steering gear installed on crossmember. If pitman arm is to be removed from gear, loosen pitman arm nut before disconnecting gear from crossmember. When installing gear, do not tighten pitman nut until after steering gear is installed on crossmember.* Remove lower coupling clamp bolt and nut, then loosen clamp retaining mast jacket to toe pan cover and "U" bolt retaining jacket to instrument panel. Pull mast jacket assembly up far enough so lower coupling can be removed from worm shaft. Raise car and disconnect pitman arm from intermediate rod, then loosen pitman arm nut with Tool J-8987. Remove steering gear-to-crossmember attaching bolts and remove gear assembly. *NOTE - Do not remov pitman arm from shaft unl ss pitman shaft assembly r seal is to b r moved.*

Chevrolet Pass. Cars 1962: Removal - Remove pitman arm (Tool J-6632 or J-5504). Remove splash pan, then remove steering gear-to-frame bolts and shims. Remove coupling clamp bolts and remove steering gear and shaft from under car.

►*CHEVROLET LOWER COUPLING REPLACEMENT NOTE:* If lower coupling is to be removed, it will be necessary either to lower the steering gear from its original position, or the mast jacket, upper steering gear shaft, coupling and intermediate shaft must be loosened and pulled up far enough to permit coupling to be removed from worm shaft.

Chevy II 1962: Removal - Remove power brake cylinder and/or clutch pushrod. Remove pitman arm from sector shaft (Puller J-6632). Disconnect transmission linkage from shift levers and remove lower steering gear attaching bolts. Disconnect wires from horn junction, direction signal and back-up light switches on steering

CONTINUED ON NEXT PAGE

SAGINAW BALL BEARING WORM & NUT (C nt.)

column. Remove steering wheel (see above). Remove mast jacket hole seal-to-toe panel screws. Remove mast jacket-to-steering gear clamp (Powerglide cars). Remove nuts from mast jacket-to-dash brace clamp. Move mast jacket and steering gear assembly down and away from dash while pivoting on upper steering gear attaching bolt. Now move front seat as far rearward as possible so mast jacket assembly can be pulled to rear of car and rotated so shift levers will pass through toe pan opening. Remove steering gear upper mounting bolt and remove steering gear assembly.

Chevrolet Trucks 1962: Removal - Loosen bolt attaching lower end of intermediate shaft to steering gear, then disconnect pitman arm from steering shaft, using Puller J-6632. Remove all steering gear-to-frame attaching bolts and remove steering gear.

C rvair Pass. Cars 1962: Removal - Remove pitman arm with Tool J-6627, then disconnect coupling, remove gear attaching bolts, and remove gear by sliding it forward and down.

C rvair Trucks 1962: Removal - Remove bumper and left front outer extension panel. Remove steering connecting rod from pitman arm. Remove steering wheel (see above). Remove direction signal assembly and mast jacket-to-dash clamp. Remove steering gear attaching bolts and remove steering gear.

Dodge & Plymouth 1962: Removal - Remove pitman arm from sector shaft, then remove bolt from coupling clamp at upper end of steering gear worm shaft. Disconnect steering column from instrument panel at clamp just sufficient to disengage tab on clamp from slot in column jacket. Slide steering column up and away from steering gear to disengage coupling from worm shaft. *NOTE - Unnecessary to disconnect gear shift linkage. Also DO NOT loosen floor plate-to-toe board bolts or steering column will be placed out of alignment.* Remove steering gear attaching bolts and remove steering gear from engine compartment (6 Cyl.), from beneath car (V8).

Comet & Falcon 1962: Removal - Raise front of car and place on stands, then remove pitman arm from sector shaft. Remove steering gear bolts from underbody and disconnect transmission shift rods at shift levers . Pull rubber seal up on steering column and fold floor mat aside. Move dash panel. insulation out of way, then remove retaining screws from steering column weather seal on dash panel and remove column cover plates and gasket. Disconnect horn and direction signal wires under instrument panel. Also disconnect neutral switch wires. Remove steering wheel (see above). Remove upper bearing sleeve and spring, then remove turn indicator lever. Remove steering column clamp-to-instrument panel bolts and remove clamp (upper and lower halves) and remove insulator. Slide steering column tube assembly from steering shaft, guiding shift levers up through rubber seal at dash panel. Remove steering gear and shaft assembly out toward front through engine compartment.

Ford Fairlane & Mercury Meteor 1962: Removal - Raise front of car and remove power steering cylinder mounting bracket (if equipped). Remove pitman arm from sector shaft. Disconnect flexible coupling from steering gear worm shaft. Remove steering gear attaching bolts and remove steering gear.

F rd Galaxi &Mercury M nter y 1962: R m val - Remove pitman arm from sector shaft and disconnect muffler inlet pipe if necessary. Remove steering gear attaching bolts and flexible coupling clamp bolt. Remove steering gear.

Ford F-100 & F-250 Trucks 1962: Removal - Disconnect horn wire from bullet connector below instrument panel, loosen steering column lower clamp and slide clamp down. Disconnect remote control shift control rods at shift levers. Remove steering wheel (see above). Remove steering column upper bushing spring and bushing. Disconnect direction signal wires and remove from retaining clip. Remove steering column bracket clamps and rubber sleeve. On floor mounted gearshift lever models, pull steering column tube off shaft. On remove control shift models, remove steering column shields from floor pan. Remove engine oil filter on V8 trucks. Remove exhaust pipe from exhaust manifold if necessary on 6 Cyl. trucks. Disconnect clutch retracting spring and remove clutch equalizer shaft outer bearing bracket and shaft (do not loosen the four split bearings). Remove inner bearing bracket. Remove pitman arm from sector shaft and wedge sector shaft opening in arm if necessary. Remove steering gear attaching bolts and remove gear from under truck (floor mounted gear shift lever), through passenger compartment (remote control shift lever). Loosen steering column tube lower clamp and remove tube.

Ford Econoline Trucks 1962: Removal - Disconnect horn and direction signal wires under instrument panel and free them from retaining clip. Fold floor mat out of way, pull up rubber seal, and remove steering column floor pan cover. Remove steering column-to-instrument panel clamp, disconnect transmission shift rods from shift tube arms. Remove steering gear attaching bolts, and pitman arm attaching bolt and nut. Spread pitman arm and partially remove it from sector shaft, then remore steering gear from pitman arm. Lift steering column, shift tube, and steering gear assembly out through passenger compartment.

Lancer 1962: Removal - *See "Dodge & Plymouth 1962" above.*

Oldsmobile (Except F-85) 1962: Removal - Remove steering wheel (see above), upper bearing spring and seat, then remove mast jacket cover plate from toe pan. Disconnect horn, direction signal, and neutral switch wires from switches and connector. Remove cap from upper mast jacket bracket and disconnect upper clamp. Disconnect shift linkage and battery cable sleeve from lower end of mast jacket. Loosen lower clamp and remove mast jacket from gear and worm shaft. Remove pitman arm from pitman shaft. Remove steering gear attaching bolts and remove steering gear.

Oldsmobile F-85 1962: Removal - Remove the coupling clamp bolt and slide the clamp off of the coupling onto steering gear worm shaft. Disconnect horn wire at harness and remove horn shroud from center of steering wheel. Remove steering wheel (see above). Pull horn contact plate out of recess in actuator assembly and remove upper bearing-to-actuator assembly retaining clip. Pull steering shaft up out of steering column about 2" and block in position. Pull relay rod off pitman arm. Remove steering gear attaching bolts and remove steering gear.

Plym uth 1962: Rem val - *S "Dodg & Plymouth 1962" abov .*

P ntiac (Exc pt T mp st) 1962: R m val - Remove pitman arm from pitman shaft, scribe mark worm shaft flange and steering shaft, and disconnect lower flange from steering shaft. Remove steering gear attaching bolts and remove steering gear.

Pontiac Tempest)1962: Rem val - Remove steering wheel (see above). Remove steering gear attaching bolts and remove steering gear and shaft assembly.

Rambler 1962: Removal - Disconnect battery, remove steering wheel (see above) and jacket tube support plate screws. Loosen jacket tube bracket-to-instrument panel mounting bolts. Remove pitman arm. Support front of engine and remove engine front support crossmember. Mark location of turning radius stop plate, then remove plate. Remove steering gear attaching bolts and remove steering gear.

Studebaker 1962: Removal - Remove battery, disconnect horn switch wire at connector, and battery cable at starter switch. On Hawk, remove battery box. Remove steering wheel and steering post jacket assembly. *NOTE - On V8 models (except Hawk), r mov distributor cap, disconnect left front ngin support and rais left front corner of engin about 1½".* Remove reach rod from pitman arm. Remove steering gear attaching bolts, turn gear upside down, lift and remove through engine com partment.

Valiant 1962: Removal - *See "D dg & Plym uth 1962" above.*

OVERHAUL

►*CHRYSLER CORP. CARS BALL NUT DISASSEMBLY*

CAUTION: Steering gear ball nut and w rm shaft assembly is serviced as an ass mbly nly. No separate parts furnished. DO NOT disass mbl this unit.

DISASSEMBLY: Remove pitman arm from sector shaft if arm still attached. Loosen sector shaft adjusting screw locknut, back out adjusting screw, then remove housing side cover with sector shaft attached. Remove gasket. Separate sector shaft from side cover by unscrewing adjusting screw. *Do not los shim.* Loosen worm thrust bearing adjuster locknut and back out adjuster several turns, then remove housing end cover and gasket. Remove lower thrust bearing, worm shaft, and upper bearing from housing. *CAUTION - Do not allow ball nut to run down to either end of worm or damage to ends of ball guides will r sult.* If ball nut is to be disassembled, remove ball return guide clamps and guides from ball nut, turn ball nut over to remove balls. *CAUTION - Hold shaft and ball nut assembly over a wide pan while disassembling to retain all balls. It is very important that balls be counted and the sam number of balls reinstalled when gear is ass mbl d. Remove ball nut from worm shaft.*

►*CHEVRCLET BALL NUT REASSEMBLY NOTE:* Some steering gears have ball nut guides with a top loading hole for the balls. To assemble this type, coat inside of worm, ball nut, and guides with oil and install guides into ball nut with nut installed on worm. Load all balls through holes in guide and then install guide clamp. *CAUTION - DO NOT us a 1961 typ clamp in a 1962 gear with holes in ball guid s as balls may fall out.*

REASSEMBLY: 1) Use suitable tools to remove and install bushings, bearings, bearing cups, and seals as necessary. On some models, sector shaft bearings are needle bearing type; other models use bushings. New

CONTINUED ON NEXT PAGE

SAGINAW BALL BEARING WORM & NUT (C nt.)

bushings do not require reaming.

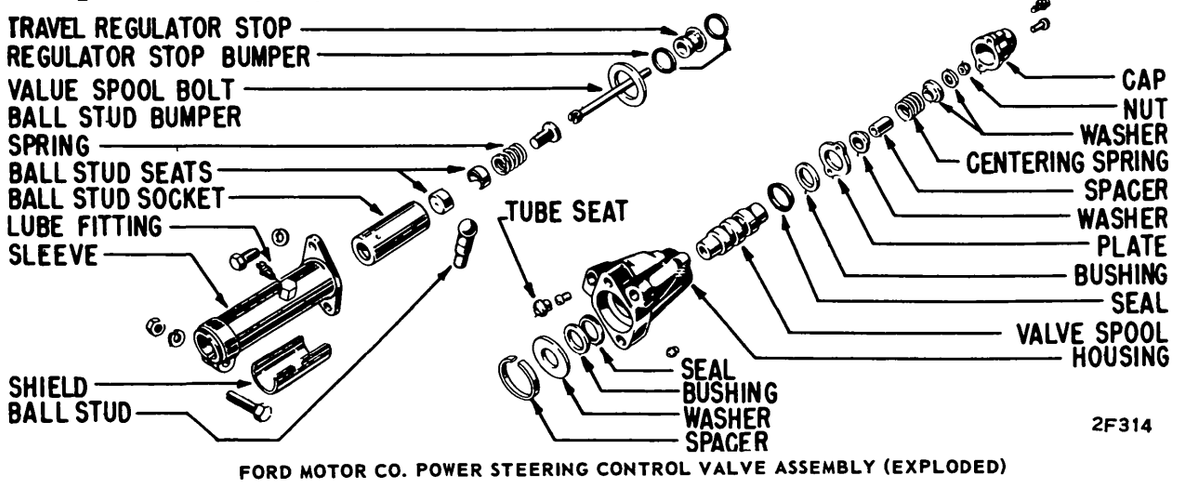
2) Place worm shaft flat on bench and slip nut over worm with ball guide holes up and shallow end of rack teeth to left of steering wheel position. Align grooves in worm and nut by sighting through guide holes. Count out one-half the number of balls removed at disassembly and drop them into one of the guide holes while turning the worm gradually away from the hole until guide hole is full from bottom of one guide hole to the bottom of the other. *NOTE - In cases where balls ar stopped by nd of worm, hold down the balls alr ady dropped int hol and rotate worm back and forth.* Lay one-half of guide, groove up, on bench and place remaining balls in it. These remaining balls should fill guide. Close this half of guide with other half and hold both halves of guide together and plug each end with vaseline to hold balls in place. Push guide into holes of nut to complete one circuit. Repeat same operation with other circuit. Reassemble ball guide clamp to nut with lockwashers under clamp screws and tighten screws securely.

3) Place worm shaft and nut assembly into housing and place upper roller bearing over worm shaft. Place new housing end cover gasket over end of worm shaft, then slide housing end cover over worm shaft and assemble it to housing. Install lower roller bearing. Install worm bearing adjuster and locknut. *NOTE - Worm bearing preload adjusting may be made at this time, or made when steering gear is assembled.* Assemble sector shaft adjuster and shim in slot in end of sector shaft. Insert a feeler gauge between head of adjuster screw and bottom of slot. Adjuster screw must be free to turn and endplay must not exceed .002". Change adjuster shim as necessary (shims furnished .063", .065", .067", .069" thick). Start sector shaft pilot into bushing or bearing in side cover, then using a screwdriver through hole in cover, turn lash adjuster in counter-clockwise direction to pull sector shaft pilot into its bushing as far as it will go. Rotate worm shaft by hand until ball nut is at center of travel. Place a new gasket on side cover, then push side cover assembly including sector shaft into place. After making sure there is some play between rack and sector teeth, assemble and tighten side cover bolts. Perform worm bearing preload adjustment (if not already adjusted), then adjust pitman shaft endplay (gear mesh). *See "Adjustments" above.* Fill steering gear with proper lubricant.

BENDIX LINKAGE TYPE POWER STEERING

Checker (1962)
Ford Fairlane & Galaxie (1962)
Mercury Meteor & Monterey (1962)
Studebaker (1962)

►CHANGES, CAUTIONS, CORRECTIONS



►*1962 MERCURY METEOR & FORD FAIRLANE RUBBING NOISE IN STEERING COLUMN CORRECTION:* May be caused by steering shaft not centralized and consequently binding in steering column. To correct, adjust cover plates at firewall. DO NOT shim steering gear box.

►*1962 MERCURY MONTEREY (WITH ECCENTRIC STEERING COLUMN) EXCESSIVE STEERING SHAFT ENDPLAY CORRECTION:* Torque upper bearing retainer screws to 25-35 inch-lbs. (supersedes previous 19-23 inch-lbs.). Make sure the 3 bearing retainer rings are properly installed. Make sure that rubber bearing sleeve is properly installed and not mutilated. Make sure bearing is not loose on steering shaft.

►*1962 STUDEBAKER POWER STEERING PUMP RESERVOIR LEAK CORRECTION:* May be caused by reservoir fluid level being too high or by a restricted reservoir vent. Maintain fluid level at ¼" below lowest point of reservoir opening flange with front wheels in straight-ahead position. Clean cover retaining nut and stud threads to clear the vent (reservoir vented between cover retaining stud and wing nut). *CAUTION - Do not remove seal under cover wing nut flat washer, or modify flat washer or more severe oil loss will result.*

►*1962 STUDEBAKER PROCEDURE TO CHANGE STEERING WHEEL HEIGHT:* Steering wheel height can be changed by adding or removing shims between upper steering jacket clamp and pedal mounting bracket. *NOTE - A 1/8" shim will change wheel height 1/4". Cars are produced with one 1/8" shim between each end of upper jacket clamp and pedal mounting bracket.* Proceed as follows: Loosen steering gear attaching bolts. To lower wheel, install 1/8" shims, Part No. 1555827, between ends of steering jacket upper clamp and pedal mounting bracket (clamp-to-bracket bolt lengths will permit installation of 3 shims at each bolt). To raise wheel, remove shims between steering jacket upper clamp and pedal mounting bracket. Tighten steering gear attaching bolts.

►*1962 STUDEBAKER HAWK SLOW RECOVERY FROM TURNS CORRECTION:* If not corrected after all other steering and suspension checks and adjustments made, install new higher rate control valve centering spring, No. 1545318, in control valve. *CAUTION - Do not install new spring on cars with less than 2000 speedometer miles.*

FORD MOTOR CO. POWER STEERING CONTROL VALVE ASSEMBLY (EXPLODED)

DESCRIPTION: Linkage type similar to previous models. Main control valves on Ford Motor Co. models have a "Reaction Limiting Valve" which limits amount of effort required to turn wheel when parking or making sharp turns at low speed. Some models may have a hydraulically operated idle speed-up control valve to prevent engine stalling when steering linkage stops are contacted (as in parking the car). Valve is operated by hydraulic pressure from power steering pump.

ADJUSTMENT: Idle Speed-Up Control Valve - *See appropriate Car Model pages.*

Pump Drive Belt: *CAUTION - Do not pry or lift against pump reservoir to raise pump assembly.*

Ford Motor Co. Models - Use a suitable belt tension gauge and adjust pump mounting bracket for 120-150 lbs. (new belt), 90-120 lbs. (used belt) tension. *NOTE - Used belt is any belt operated for 10-15 minutes or longer. On V8 engines, it may be necessary to install a "C" clamp on adjusting bracket to adjust belt tension.* Tighten adjusting and pivot bolts to 12-15 ft. lbs. (170" Engine), 20-25 ft. lbs. (All Other Engines).

Studebaker - Belt deflection should be 1/4-3/8" with 4 lbs. pull midway between pulleys. To adjust, loosen bracket mounting screws and shift pump body to secure proper belt tension.

LUBRICATION: Check fluid level every 6000 miles (Ford Motor Co. Models), 5000 miles (Checker & Studebaker). Start engine and turn steering wheel right and left a few times, then shut off engine. Add Automatic Transmission Fluid Type A, Suffix A, to bring level up to following specifications:

Checker - Bring level to within 1" of top.

Ford Motor Co. Models - Bring level up to "F" mark on dipstick.

Studebaker - Maintain fluid level at ¼" below lowest point of reservoir opening flange with front wheels in straight-ahead position.

TESTING: Turning Effort - With wheels properly aligned and tire pressure correct, place car on dry concrete, set parking brake, then proceed as follows: With engine running at normal idle speed, turn wheel to right and

CONTINUED ON NEXT PAGE

BENDIX LINKAGE TYPE POWER STEERING (Cont.)

left several times to bring fluid to normal operating temperature. Hook a spring scale to steering wheel rim and measure pull required to turn wheel at least one full turn in both directions. Pull should be about equal in both directions as listed in table below:

Turning Effort Specifications

Car Model	Turning Effort
Fairlane & Meteor	4½ lbs. max.
Galaxie & Monterey	12 lbs. max.
Studebaker	11 lbs. max.

Pump Pressure: Install a suitable pressure gauge between pump hose and pump outlet with pressure gauge between pump and shutoff valve of pressure gauge. Run engine at idle speed (with shutoff valve open) for two minutes to normalize oil temperature. Turn wheels all the way to right and left, noting fluid pressure reading on gauge when wheels are against stops. *CAUTION - Do not hold wheel against stop for more than 30 seconds.* Fluid pressure with wheels against stops should be as listed in table below. Close gauge valve and check pressure. If pressure is less than minimum, pump is faulty. If pressure increases but does not reach maximum, inspect pump, control valve, and power cylinder. If pressure is within limits and steering gear does not function properly, trouble is in control valve or power cylinder.

Pump Pressure Specifications

Car Model	Pump Pressure
Fairlane & Meteor	750-900 lbs.
Galaxie & Monterey 6 Cyl. & 292" V8	700-900 lbs.
Galaxie & Monterey Other V8	950-1100 lbs.
Studebaker	850 lbs.
Checker	700-900 lbs.

OVERHAUL & TROUBLE SHOOTING: *See 1957 Final Data, Page 364, or later Manual editions, and note the following:*

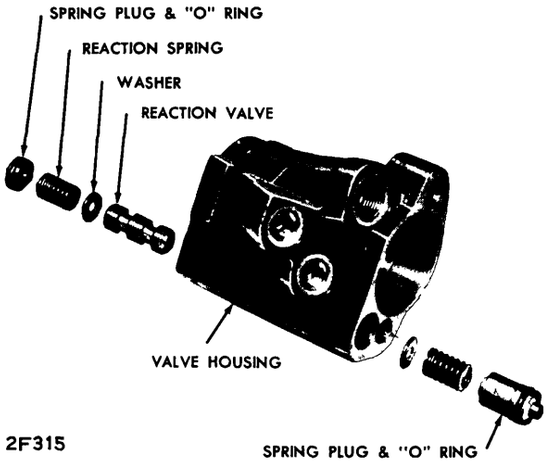
Control Valve Removal (Studebaker): Disconnect hoses at pump body, pump reservoir, and power cylinder. Drain fluid from hoses, then remove hose retaining clips. Disconnect reach rod from steering bellcrank, then remove pitman arm from steering gear shaft with Puller J-5664. Remove control valve, reach rod, and hoses from car as an assembly. *NOTE - Before removing valve assembly from reach rod, clean assembly to remove dirt and grease from valve body, then loosen clamp on actuator sleeve and screw valve assembly off reach rod, counting the number of turns required to unscrew valve from reach rod. Record the number of turns for use at installation to maintain proper reach rod length.*

Valve Sleeve Mounting Bolt Tightening Torque: Tighten the two bolts to 30-35 ft. lbs. (Ford Motor Co. Models), 140-170 inch-lbs. (Studebaker).

Control Valve Installation Measurement

Car Model	℄ Dimension
Fairlane	4 3/16"
Meteor	4.150"
Galaxie & Monterey	11 15/16"
Studebaker	See Note Below

℄ - This measurement is the distance between center of pitman arm ball stud and tie rod ball stud.



►*STUDEBAKER INSTALLATION NOTE:* With control valve reinstalled and control valve assembly screwed into reach rod the same number of turns (recorded at time of removal), set wheels in straight ahead position and center wheel in the high spot. Slip pitman arm on steering gear shaft, aligning marks on arm and shaft, then check distance between center of pitman arm ball and reach rod ball by holding end of reach rod in position at bellcrank. Adjust length of reach rod so that reach rod ball stud will slip into bellcrank without moving front wheels from straight ahead position. *NOTE - It is necessary to remove unit from car to make adjustments.*

Reaction Limiting Valve (Ford & Mercury): Disassembly - After disassembly of control valve, remove aluminum plug and "O" ring assembly from each end of control valve body, then remove springs, washers, and reaction valve.

Reassembly - Insert washer, spring, and longest plug and "O" ring assembly into valve housing from sleeve end. Carefully insert reaction valve into bore of valve housing from spring cap end, then insert washer, spring and short plug into housing.

Cylinder Rod Tightening Torque: With outer insulator, washer and nut installed on piston rod, tighten nut to 18-24 ft. lbs. (Ford Motor Co. Models), 45-50 ft. lbs. (Studebaker).

POWER STEERING PUMP: Eaton Roller Type - *See 1958 Final Data, Page 398, or later Manual editions.*

REACTION LIMITING VALVE

MONROE LINKAGE TYPE POWER STEERING

Rambler, All Series (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 RAMBLER STEERING COLUMN BINDING OR SCRAPING CORRECTION:* May be caused by insufficient lubrication at lower nylon bushing in lower jacket tube. If bushing has no oiler, drill a 1/8" hole above the bushing and apply oil through the hole.

►*1962 RAMBLER CLASSIC & AMBASSADOR POWER CYLINDER ASSEMBLY PRODUCTION CHANGE & OVERHAUL CAUTION:* To limit internal hydraulic action on extreme turns, longer piston rod assembly, and a piston rod stop are used on cars after Serial Nos. W-120926 & E-121305. Four washers are installed on each side of piston rod grommet retainers to control turning radius. These washers may be varied on either side to equalize turning radius, but total of 8 washers must be used. Production cars have 2 washers to inside of inner grommet retainer (next to rod shoulder), and 6 washers between outer grommet retainer and nut.

DESCRIPTION: Linkage type of same design used on previous models.

ADJUSTMENT: *See 1959 Final Data, Page 390, or later Manual edition, and note the following:*

Pump Belt Adjustment: Use a strand tension gauge to adjust belt tension to 110-120 lbs. (new belt), 70-80 lbs. (used belt). *NOTE - If deflection method used, there should be no more than ¼" belt deflection midway between pulleys.*

OVERHAUL & TROUBLE SHOOTING: *See 1959 Final Data, Page 390, or later Manual edition.*

POWER STEERING PUMP: American & Classic Models - Slipper type pump. *See 1960 Final Data, Page 403, or later Manual edition, and note the following:*

Pulley Mounting Dimension - 1 3/4" (single groove pulley), 2 1/64" (double groove pulley).

Ambassador Models: Eaton Roller Type. *See 1958 Final Data, Page 398, or later Manual editions.*

PRESSURE TEST: With fluid level in reservoir correct, install oil pressure gauge J-5548-A in main oil line at control valve assembly, then start engine and bring oil to normal operating temperature. Turn wheels against curbing or other obstacle and hold tension on wheel. Oil pressure should be 800-900 lbs. (Roller Type Pump); 850-950 lbs. (Slipper Type Pump). Turn wheel in opposite direction and note pressure. If there is a variation between right and left turn, internal leakage is indicated. If pressure is low, stop engine and disconnect gauge from cylinder and valve assembly and cap pressure line. Restart engine and note pressure. If pressure is within specifications, pump is operating properly. If pressure is low (belt tension correct), trouble exists in pump. *CAUTION - Do not hold wheels at maximum pressure longer than is necessary to obtain a steady pressure reading.*

CHRYSLER CORP. "CONSTANT CONTROL" POWER STEERING

Chrysler & Imperial (1962)
Dodge & Dodge Dart (1962)
Lancer (1962)
Plymouth (1962)
Valiant (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961-62 POWER STEERING OIL LEAK CORRECTION & "O" RING AND SEAL REPLACEMENT CAUTIONS:* Power steering unit ordinarily needs overhaul only at extreme high mileage. Most leaks can be corrected by replacing external seals or "O" rings. Manufacturer recommends that Seal Kits, No. 2279985 (Valve Package), No. 2279986 (Cross Cover Seal Package); and a Cross Shaft Outer Oil Seal, be used to correct leaks.

►*1962 STEERING SHAFT OIL SEAL LUBRICATION NOTE:* To prevent corrosion of steering shaft and to reduce coefficient of friction of seal on shaft, make sure that cars produced before November 14, 1961 have steering gear shaft bore cavity below seal filled with multi-purpose chassis grease. When replacing this seal, fill cavity with this grease after installing new seal, retainer washer, and snap ring, and before installation of pitman arm.

DESCRIPTION & OPERATION: Similar in design and operation to previous 1959-61 models.

ADJUSTMENTS: *See 1958 Final Data, Page 387, or later Manual editions and note the following:*

Pump Belt Adjustment (Pumps With Load Reaction Belt Tensioner): Loosen adjusting bracket bolts and install Adapter C-3832 over edge of mounting bracket as close as possible to outer edge of bracket. Insert torque wrench into adapter and tighten belt until torque wrench reads 45 ft. lbs. Hold tension with wrench, and tighten mounting bracket bolts to 30 ft. lbs. torque.

Pump Belt Adjustment (Pumps Without Load Reaction Belt Tensioner): Deflection Method - There should be 1/16" (Except 361" Eng.), 1/8" (361" Eng.) new belt deflection, or 1/8" (Except 361" Eng.), 3/16" (361" Eng.) used belt deflection, midway between pulleys under a 5 lb. load.

Torque Method - With a torque wrench in pump mounting bracket, tighten belt to specification listed in table below.

Belt Tightening Specifications (Ft. Lbs.)

Engine	New Belt	Used Belt
170"	100	60
225"	80	45
318"	85	50
361"	90	55

LUBRICATION: Check fluid level in reservoir every 4000 miles. Fluid level should be at bottom of filler neck when fluid is cold, and should be about half-way up filler neck when fluid is hot. **Use only MoPar Power Steering Fluid, Part No. 2084329.** DO NOT OVERFILL.

BLEEDING SYSTEM: All air can be expelled from unit by turning steering wheel several times from full right to full left and back again.

HYDRAULIC PRESSURE TEST: Disconnect pump-to-steering gear pressure hose at steering pump and connect test hose C-3388 with proper adapters between pump and gauge C-3309-B with shut-off valve between gauge and steering gear. With engine idling at 500 RPM and oil at normal operating temperature (150°-170°F., checked with thermometer in reservoir), pressure should be less than 100 lbs. Increase engine speed to 1000 RPM and slowly close shut-off valve. Pump pressure should be as indicated in table below. *CAUTION - Do not hold valve closed for more than a few seconds.* If pressure is in excess of maximum, relief valve is faulty or pump has wrong relief valve. If pressure less than minimum, relief valve or pump is defective.

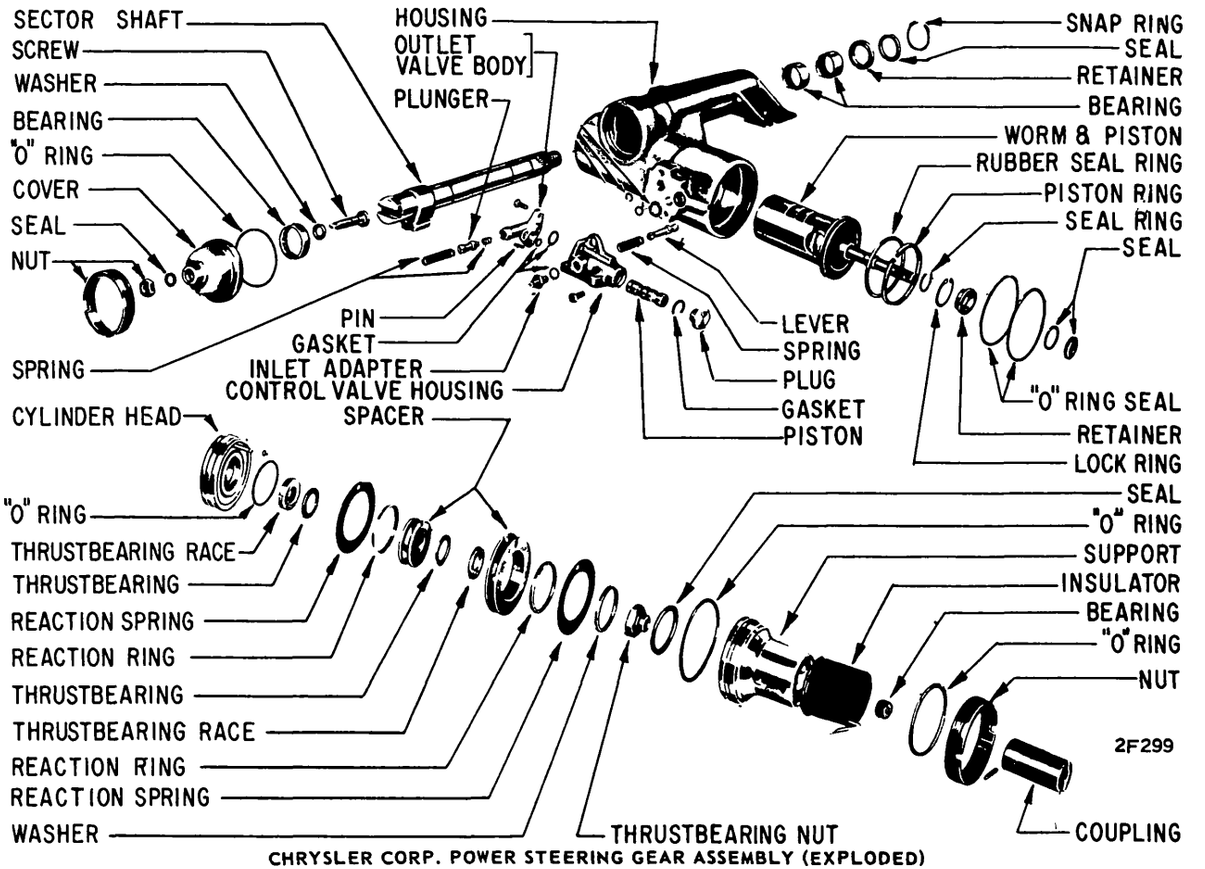
Power Steering Pump Pressure

Car Model	Lbs. Pressure
Imperial	1150-1300 lbs.
Chrysler	1000-1100 lbs.
Dodge & Plymouth ①	850-950 lbs.
Dodge & Plymouth ②	900-1000 lbs.
Lancer & Valiant	650-750 lbs.

① - Without Load Reaction Belt Tensioner.
② - With Load Reaction Belt Tensioner.

TROUBLE SHOOTING: *See 1958 Final Data, Page 387, or later Manual editions.*

REMOVAL & INSTALLATION: Steering Wheel & Horn Button (Chrysler) - Press down on center ornament and turn ¼" to remove. Disconnect horn wire, then remove screws, bushings, horn blowing ring, rubber insulator and horn terminal plate. Disconnect direction signal wires and horn wire at connectors. Loosen steering wheel nut three turns and use Puller C-3428 to remove steering wheel.



Steering Wheel & Horn Button (Imperial): Remove screws from underside of steering wheel and remove horn blowing actuator and steering wheel cover. Disconnect horn wire at switch. Remove screws, insulators, then remove horn blowing switch. Remove horn blowing ring mounting plate. Loosen steering wheel nut three turns and use Puller C-3428 to remove steering wheel.

Steering Wheel & Horn Button (Dodge & Plymouth): Turn horn button ¼-turn counterclockwise to remove. Remove horn ring by removing screws on underside of steering wheel. Remove steering wheel nut and washer, then pull steering wheel from shaft with Puller C-612.

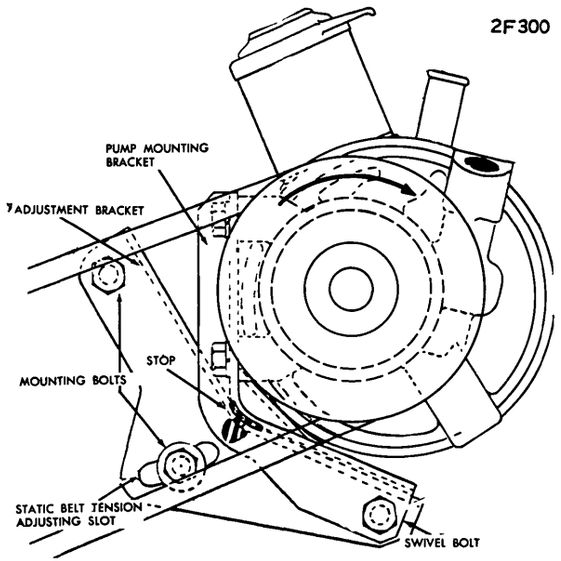
Steering Wheel & Horn Button (Lancer & Valiant): Pry horn button out with screwdriver inserted into slot in steering wheel at edge of horn button. Remove steering wheel retaining nut and washer, then remove steering wheel with Puller C-612.

Steering Gear Removal (Chrysler, Imperial, Dodge Custom 880): Remove steering wheel (see above), then remove direction switch lever and steering column lower cover. Remove direction signal switch and wiring from steering shaft. Remove retainer snap ring from groove in steering tube at top of bearing with Tool C-3229. Remove jacket tube shield for access to column tube

CONTINUED ON NEXT PAGE

CHRYSLER CORP. POWER STEERING GEAR ASSEMBLY (EXPLODED)

CHRYSLER CORP. "CONSTANT CONTROL" POWER STEERING (C nt.)



clamp and remove screw attaching steering jacket tube clamp at instrument panel and remove clamp. Raise carpet and move rubber grommet up on jacket column, then remove screws attaching rubber dust boot to firewall. On Imperial, remove floor inspection panel. Loosen jacket tube clamp at steering gear housing. Remove cotter key and nut at drag link and disconnect link from steering arm, then remove steering arm nut and washer at steering gear shaft. Slide Tool C-3646 up on steering arm and place shoe of puller behind steering arm and pull steering arm from gear shaft. *CAUTION - Do not remove steering arm by prying with a lever or striking with a hammer.* Disconnect hydraulic brake line at master cylinder and brake tee and remove line, then disconnect pressure and return hoses at steering gear (fasten ends of hoses above reservoir oil level and cap all openings). Slide jacket tube up and off steering gear through driver's compartment, then remove jacket tube upper spring and retainer. Remove steering shaft coupling pin, two plastic inserts, horn ground strap, rubber insulator and upper steering tube. Remove gear housing-to-frame bolts, washers, and alignment wedge. Slide steering gear upwards and toward rear of car and at the same time raise lower end of gear and remove gear from engine compartment (Chrysler), from driver's compartment (Imperial).

Installation - Reverse removal procedures and note the following: Make sure there is at least 1/16" clearance between bottom face of jacket tube clamp and column support spanner nut. With steering gear completely installed (gear assembly-to-frame bolts not tightened), tighten front upper and lower gear housing-to-frame attaching bolts to 20 ft. lbs. Install wedge over rear bolt between housing and frame so that tapered surfaces match, tapping it lightly into place, then tighten all three gear attaching bolts to 50 ft. lbs.

Steering Gear Removal (Dodge & Plymouth V8): Disconnect battery. Remove steering jacket cover plate at instrument panel and loosen (do not remove) jacket clamp screw. Disconnect hydraulic hoses at steering gear and fasten end of hoses above reservoir oil level and cap all openings. Remove steering shaft coupling-to-worm shaft clamp bolt. Lift steering column assembly up and off end of worm shaft. Raise car. Remove pitman arm from sector shaft (Tool C-3646). On 318" engine cars, disconnect transmission oil cooler lines from oil filter and radiator. Remove starter. Remove steering gear attaching bolts and remove steering gear.

Installation - Reverse removal procedure and note the following: Position steering jacket assembly so steering shaft is centered at mid-point of vertical travel. *NOTE - Coupling is centered when dimension from top of coupling to centerline of 3/16" gauge hole in steering column shaft is 13/16".* After coupling is centered, tighten column jacket-to-instrument panel clamp bolts to 90 inch-lbs.

Steering Gear Removal (Dodge & Plymouth 6 Cyl., Lancer & Valiant): Remove pitman arm from sector shaft (Tool C-3646). Disconnect hydraulic lines from steering gear (fasten ends of hoses above reservoir oil level and cap all openings). Remove steering gear attaching bolts. Remove bolt from coupling clamp at upper

LOAD REACTION BELT TENSIONER

end of worm shaft. Support steering gear assembly and tap coupling assembly upward until free of worm shaft splines. Remove steering gear.

Installation - Reverse removal procedure and note the following: With steering shaft coupling clamp in position on coupling assembly, install clamp bolt so it engages groove in worm shaft, then tighten clamp bolt nut to 30 ft. lbs.

OVERHAUL: *See 1958 Final Data, Page 387, or later Manual editions, and note the following:*
Steering Valve End Plug Torque - 25 ft. lbs.
Column Support Spanner Nut Torque: 110-200 ft. lbs.
Cover Spanner Nut Torque - 110-200 ft. lbs.

Power Train Reassembly: With Tool C-3676 held securely in vise, place piston and ring assembly in tool with lower part of piston and ring resting in tool land. Pressing down on piston will cause piston ring to bottom in its groove, forcing open ends of ring upwards for ease of locking the piston ring (ring should be positioned with ring hooks in line with ball guide hole). *NOTE - Positioning hooks in this manner will control internal leakage through the ring.* Wire brush knurled area of worm shaft to remove staking deposits. Lubricate each part with Automatic Transmission Fluid, then place piston on bench in a vertical position (worm shaft up). Install cylinder head assembly on worm shaft making sure that gap on worm shaft seal is closed to avoid damaging the ring when cylinder head is bottomed against piston top flange. Install lower reaction plate over ferrule on cylinder head, then install lower reaction ring on pressure plate with flange up so that ring protrudes through pressure plate. Lubricate following parts with Automatic Transmission Fluid and slide them over shaft in the following order: Lower (thick) thrust bearing race, lower thrust bearing, center bearing race, upper thrust bearing and upper (thin) thrust bearing race. Install a new worm shaft thrust bearing nut and tighten nut as follows: Grip piston assembly in a soft jawed vise, then turn worm shaft counterclockwise one-half turn and while holding worm shaft in this position, tighten worm shaft nut to 50 ft. lbs. to preset the bearings. *CAUTION - If worm shaft is turned more than one-half turn, the cylinder head sleeve will clear the oil seal ring on worm shaft. Always position worm shaft oil seal ring before bottoming the cylinder head against piston top flang to avoid damaging oil seal ring.* Loosen the adjusting nut and place several rounds of cord around center bearing race, then make a loop in one end of cord and hook the loop of a distributor breaker arm spring scale (Tool MTU-36) in the cord loop. Pulling cord will cause bearing race to rotate. Retighten worm bearing adjusting nut while pulling on the cord with the scale. If adjusting nut is tightened properly, reading on scale should be 8-16 ounces (12 inch ounces preferred) while bearing race is turning. *CAUTION - Place a support under the adjusting nut during the staking operation to avoid brinnelling piston and worm bearings.* Stake the upper part of worm shaft adjusting nut into knurled area of shaft as follows: Hold a ¼" flat end punch on centerline of worm shaft and perpendicular to worm shaft at a slight angle to nut flange. Strike the punch a sharp blow with a hammer and recheck preload. If adjusting nut moved during the staking operation, it can be corrected by striking the nut a glancing blow in direction required to regain proper preload. After proper preload, stake the nut at three more locations 90° apart around upper part of nut. To test staking, torque nut to 20 ft. lbs. in either direction. If nut does not move, the staking operation is satisfactory. Recheck adjustment. Install center bearing spacer assembly over center bearing race and engage dowel pin of spacer in slot of race and slot of spacer entered over cylinder head ferrule. *NOTE - This will align valve lever hole in center bearing race with valve lever hole in center bearing spacer assembly.* Place reaction ring (outer) with flange, down against center bearing spacer. Place reaction ring (inner), without flange, inside of the outer reaction ring, with flange, and install upper reaction pressure plate over both reaction rings and over cylinder head ferrule and "O" ring making sure reaction rings enter circular groove in jacket support. *CAUTION - Form a .0015" feeler into a coil and insert with jacket support to protect seal lip when installing over worm-shaft serrations.* Align parts on power train so that valve lever hole in center bearing spacer assembly is 90° counterclockwise from piston rack teeth and lock all parts in worm shaft by entering a drill rod or suitable drift through jacket support holes and groove in worm shaft. Complete reassembly of steering gear as outlined in 1958 Annual Data or later Manual edition.

Cross Shaft Adjustment (On 8 nch): With hydraulic power to unit and with gear shaft on center plus or minus 2°, readjust gear shaft backlash. This will require loosening the adjusting screw until backlash is evident. Retighten adjusting screw until backlash just disappears, then continue to tighten for 3/8 or 1/2 turn from this position and tighten locknut to 50 ft. lbs. to maintain this setting. Starting from a point at least one full turn either side of center, the torque at gear shaft required to turn unit through center at 2 RPM in each direction shall not exceed 20 ft. lbs. or vary more than 5 ft. lbs.

CONTINUED ON NEXT PAGE

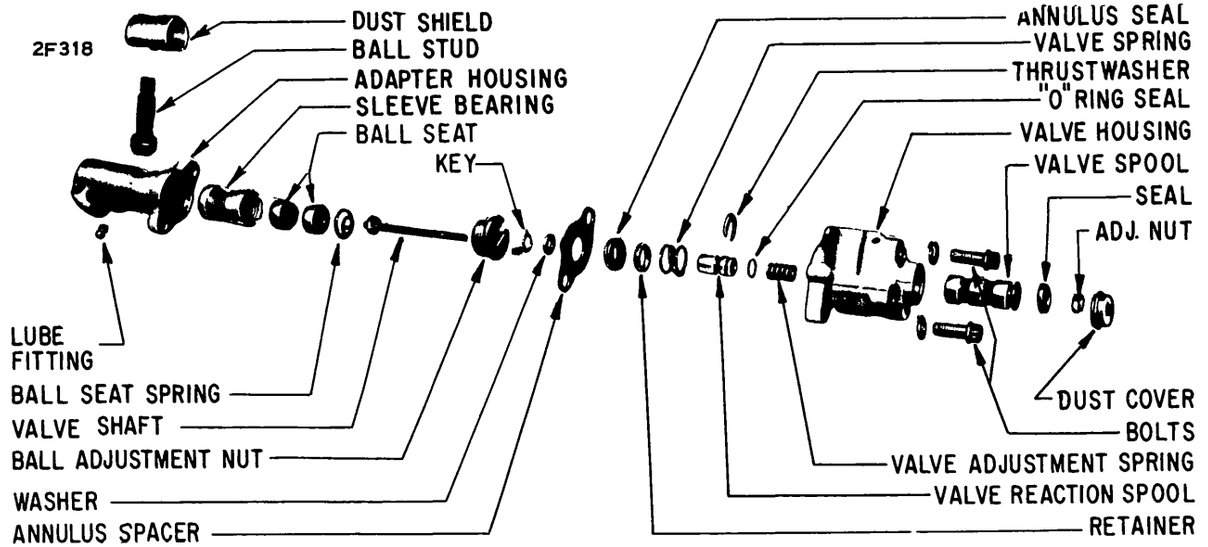
CHRYSLER CORP. "CONSTANT CONTROL" POWER STEERING (C nt.)

from left to right. Position steering valve to obtain equal torque and tighten valve body attaching screws to 15 ft. lbs. With unit at or near full turn in either direction, attempt to return the unit to center by applying a torque wrench at steering gear cross shaft. Hold worm shaft until cross shaft torque builds up to 50 ft. lbs. Release worm shaft and maintain a constant steady pull on cross shaft (turning cross shaft slowly). If cross shaft torque does not drop to 25 ft. lbs. maximum as the piston passes through center, check for too much interior drag; binding valve lever, binding valve spool, or cross shaft adjustment is too tight. With unit under power, but with no load, the torque required to rotate the worm shaft through an inclined angle of 180° (90° either side of center) shall be 6-9 inch lbs. Disconnect test equipment and mounting fixture and install unit in car.

POWER STEERING PUMP: *See 1960 Final Data, Pag 403, or later Manual edition.*

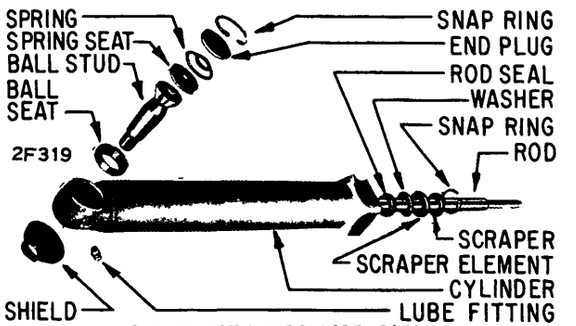
CHEVROLET & PONTIAC TEMPEST LINKAGE TYPE POWER STEERING

Chevr l t Pass. Cars (1962)
Chevy II (1962)
P ntiac T mp st (1962)



DESCRIPTION: Linkage type with power cylinder mounted between steering relay rod and bracket on frame side rail. Control valve assembly is mounted on left side relay rod and is operated by pitman arm acting on spool valve assembly. The control valve assembly is adjustable to provide greater uniformity of operation and faster response. Power steering pump is mounted on engine and is driven by a belt from crankshaft pulley.

ADJUSTMENT: P w r St ring Pump Belt (Chevrolet & Chevy II) - Loosen power steering pump-to-bracket attaching bolts and move pump with belt in place until belt is tensioned so that a 15 lbs. force applied at midpoint between fan pulley and pump pulley will cause a ½" to ¾" belt deflection, then tighten mounting bolts. *NOTE - If strand tensi n gauge used, a reading of 75 lbs. (n w belt), 50 lbs. (used belt) should be obtained.*



P wer Ste ring Pump B lt (Tempest): Strand tension gauge should read 70-75 lbs.

Control Valv Balancing: *NOTE - If a hard steering effort is required (in on direction), balance control valve as follows:* With car on a hoist, engine running, and power cylinder rod disconnected from frame bracket, piston rod will be fully retracted or fully extended (if valve is out of balance). If piston rod remains retracted, turn adjusting nut clockwise until rod begins to move out, then turn nut counterclockwise until rod begins to move in. Now turn nut clockwise to exactly one-half the rotation needed to change direction of shaft movement. If rod remains extended, move nut counterclockwise until rod begins to retract, then clockwise until rod begins to move out. Now position nut to exactly one-half the rotation needed to change direction of shaft movement. *CAUTION - Do not turn nut back and forth more than is absolutely necessary to balance valve.* With valve properly balanced, it should be possible to move rod in and out manually. Stop engine and connect cylinder rod to frame bracket, then restart engine. If front wheels (still on hoist) do not turn in either direction from center the valve is properly balanced. With valve properly adjusted, install dust cap.

LUBRICATION: Checking Fluid Level – With oil at normal operating temperature, check fluid level on dipstick. Fill to indicated level with Automatic Transmission Fluid.

CHEVROLET & TEMPEST POWER STEERING CONTROL VALVE ASSEMBLY

POWER CYLINDER ASSEMBLY

Bleeding Hydraulic System: Fill reservoir to proper level and let oil remain undisturbed for at least two minutes, then start engine and run at idle speed for two minutes. Add oil if necessary, then raise front of car so wheels are off ground. Increase engine speed to 1500 RPM (Chevrolet), 1000 RPM (Pontiac), and turn wheels from full right to full left, contacting stops lightly. Lower car and turn wheels right and left on ground. Check oil level and refill as necessary. Continue this process as long as required to bleed all air from system.

PRESSURE TEST: Install pressure gauge J-5176 or equivalent between pump and pressure line at pump. *NOTE - Adapter J-5900 or J-7786 or equivalent may be necessary to install pressure gauge to pump.* With gauge valve open and engine at idle speed, turn wheels against stops a few times to bring power steering fluid to 150-170°F. With wheels against stops, pressure should not be less than specified in table below. If pressure less, slowly close valve and check for pressure increase. Pressure will increase if pump in good condition. If pressure does not increase with valve closed, pump is faulty. *CAUTION - Do not hold gaug valve closed more than 15 seconds.* After removing gauge, bleed hydraulic system (see above).

Pump Pressure Specifications

Car Model	ℂ Pump Pressur
Chevrolet Pass. Cars	870-1000 lbs.
Chevy II	870-1000 lbs.
Tempest	775 lbs.

ℂ - At engine idle speed and steering oil at 150-170°F.

REMOVAL, INSTALLATION & OVERHAUL: *S 1960 Final Data, Pag 398, r later Manual edition.*

POWER STEERING PUMP: Saginaw Vane Type With Integral Res rv ir. *See 1961 Final Data, Pag 390.*

SAGINAW ROTARY VALVE POWER STEERING

Buick (1962)
Buick Special (1962)
Cadillac (1962)
Chevrolet Truck (1962)
Oldsmobile (1962)
Oldsmobile F-85 (1962)
P ntiac (Except Tempest) (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 ADJUSTER PLUG & UPPER THRUST BEARING PRODUCTION CHANGE & REPLACEMENT NOTE:* On later cars, adjuster plug and upper thrust bearing are a single-piece unit. Steering gear units having a daub of green paint will have this new assembly. New adjuster plug assembly, No. 5686866, should be installed on early type gears whenever they are serviced. Only later type assembly will be furnished for service.

►*1961-62 BUICK (EXCEPT SPECIAL) STEERING SHAFT LOWER COUPLING REPLACEMENT NOTE:* If coupling is to be replaced, it is unnecessary to replace steering shaft and coupling assembly. Use a Lower Coupling, Part No. 5689730, and a Lower Coupling Bolt & Reinforcement Kit, Part No. 5689776.

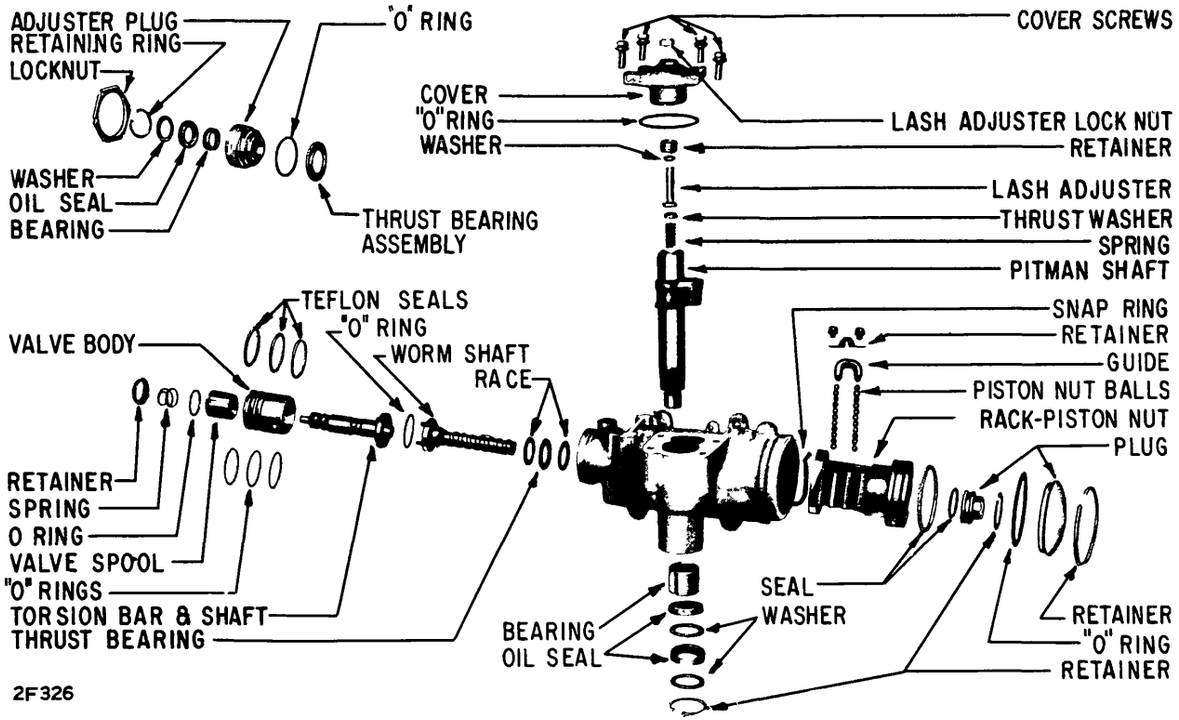
►*1962 PONTIAC STEERING COLUMN LOWER SUPPORT BRACKET-TO-MOUNTING BRACKET SCREW TORQUE CHANGE NOTE:* Steering column lower support bracket-to-mounting bracket screw torque has been changed to 5-10 ft. lbs. (supersedes previous 10-20 ft. lbs.) to prevent collapsing of steering column reinforcement.

►*1962 PONTIAC STEERING COLUMN SEAL PRODUCTION CHANGE:* New foam rubber steering column seal, Part No. 544463, used on cars after February 1, 1962 to replace felt seal for easier installation of steering column jacket beneath toe plate grommet.

DESCRIPTION: All Models Except Chevrolet Truck - Similar in design and operation to previous models.

Chevrolet Truck: The control valve assembly of this linkage type power steering unit is located directly on the steering gear and is similar to the control valve assembly used on cars with "integral" type power steering. Service procedures for control valve are the same as for other models. For steering gear overhaul procedures, *see "Saginaw Ball Bearing Worm & Nut" in this section.*

PUMP BELT ADJUSTMENT: Proceed as follows:



Buick (Except Special): Use strand tension gauge and adjust pump in mounting bracket for 100 lbs. belt tension.

Buick Special: Loosen power steering pump mounting bolts and rotate pump assembly to tighten belt until torque required to slip pulley on belt with a torque wrench applied to pulley nut is 40-45 ft. lbs. *NOTE - If strand tension gauge used, tighten belt until a reading of 80 lbs. is obtained.*

Cadillac: Use strand tension gauge and adjust pump in mounting bracket for 90 lbs. (new belt), 60 lbs. (used belt) tension. Tighten mounting bracket bolts to 30 ft. lbs.

Chevrolet Truck: Use a strand tension gauge and adjust pump in mounting bracket for 75 lbs. (new belt), 70 lbs. (used belt) tension.

Oldsmobil (All Mod ls): Position Tension Gauge 33-70 on pump belt, then loosen pump attaching bolts and adjust belt tension by moving pump away from engine until pointer on gauge indexes with groove in gauge

SAGINAW ROTARY VALVE POWER STEERING GEAR ASSEMBLY (EXPLODED)

plunger. Tighten attaching bolts to 20-28 ft. lbs. and recheck adjustment.

Pontiac: Loosen pump mounting bolts, then move pump until belt has ¼" deflection with a 5-6 lbs. load applied midway between fan and steering pump pulleys, or a 70-75 lb. load is indicated on a strand tension gauge. Tighten mounting bolts to 25-35 ft. lbs.

LUBRICATION: Check fluid level in power steering pump reservoir every 1000 miles (Buick & Chevrolet Truck), at each engine oil change (Cadillac, Oldsmobile, Pontiac) with steering gear and fluid at normal operating temperature. If necessary, add automatic transmission fluid to bring level to mark on reservoir filler neck. If steering gear and fluid are cold, bring fluid level to lower end of filler neck. *NOTE - On Chevrolet Trucks, also check lubricant level in gear box and add "Multi-Purpose" lubricant as necessary.*

CHECKING & ADJUSTMENT (ON CAR): Disconnect pitman arm at intermediate arm or drag link (Buick Special, Cadillac, Oldsmobile F-85 & Pontiac). Remove pitman arm from shaft (Buick, Exc. Special & Oldsmobile, Exc. F-85), then proceed as follows:

Buick & Buick Special: Remove horn emblem from steering wheel hub, then turn steering wheel to extreme right or left position and attach a 0-25 inch pound torque wrench to wheel retaining nut and check torque required to turn wheel steadily for 1/8 turn from extreme position (this is where lash exists). Reading on torque wrench should be 1-11 inch pounds. Turn steering wheel ½-¾ turn off "high point" center position and check torque required to turn wheel. The reading should be 1-5 inch pounds (Exc. Buick Special); 2-5 inch pounds (Buick Special) higher than reading taken at extreme right or left position. Check torque required to turn gear through gear "high point". This reading should be 4-8 inch pounds higher than reading taken at ½-¾ turn off "high point". To adjust for proper overcenter torque, loosen lash adjuster locknut and use an Allen wrench to turn lash adjuster.

►*BUICK & BUICK SPECIAL ADJUSTMENT NOTE: Thrust bearing preload and ball nut pr load can only be adjusted with steering g ar out of car.*

Cadillac: 1) Thrust Bearing Pr l ad - Remove pitman arm from drag link and turn steering wheel 2 turns "off center". Attach a spring scale to rim of steering wheel and pull at right angle to wheel. Pull required to pull wheel through an arc not to exceed 1" should be 2-12 ozs. If not as specified, back out adjuster plug 1/8-turn and recheck. Now adjust preload by tightening adjuster plug to obtain 2-6 ozs. in excess of total drag just measured with adjuster plug backed off 1/8-turn. Tighten locknut.

2) Worm & Ball Preload - Turn steering wheel ½-turn "off center" and measure pull required to move steering wheel at this position. This reading should be 2-8 ozs. greater than thrust bearing preload reading obtained above. If preload incorrect, worm shaft balls should be replaced. If roughness evident when wheel turned between ½-turn and 1-turn "off center", worm should be replaced.

3) Pitman Shaft Endplay - With wheel "on center", measure pull required to pull wheel through an arc

CONTINUED ON NEXT PAGE

SAGINAW ROTARY VALVE POWER STEERING (C nt.)

not to exceed 3". Reading should be at least 8 ozs., but not more than 36 ozs. greater than reading at ½-turn "off center" obtained above. If endplay not within limits, adjust so "on center" preload is 16-18 ozs. greater than ½-turn preload but still not more than 36 ozs.

Ch vr let Truck: There are no "On Car" adjustments.

Oldsmobil & Oldsm bil F–85: *NOTE – The over–center adjustm nt is th only power steering gear adjustm nt which can b made on the car; however, in order to mak this adjustment, it is also necessary to check c mbin d ball and thrust bearing preload.* On Oldsmobile, remove pitman arm from pitman shaft. On Oldsmobile F–85, disconnect pitman arm from relay rod. Loosen pitman shaft adjusting screw locknut and thread adjusting screw out to limit of its travel. Disconnect horn wire at relay, then remove horn button or ornament from steering wheel. Turn steering wheel through its full travel, then locate wheel at its center of travel. Check combined ball and thrust bearing preload with an inch pound torque wrench on steering wheel nut by rotating through center of travel (approximately ¼–turn in each direction) and note the highest reading. Tighten pitman shaft adjusting screw until torque wrench reads 4–8 inch pounds (Oldsmobile), 3–6 inch pounds (Oldsmobile F–85), higher than previous reading. *NOTE – Total preload must not exceed 16 inch pounds (Oldsmobile); 14 inch pounds (Oldsmobil F–85).* Tighten locknut and recheck. Install horn button, horn wire, and reconnect pitman arm.

Pontiac: Remove horn button or ring and install an inch pound torque wrench on steering wheel nut. *NOTE – Wh n taking t rqu r adings, take reading when pulling torqu wr nch to l ft and to right, then total both r adings and av rage them out.* To check adjuster plug preload, turn steering wheel one full turn off center "high point" and check torque required to turn wheel. This should not exceed 10 inch pounds. *NOTE – If r ading is b low 3 inch pounds, there may be some lash in thrust b aring.* To adjust (with unit in car), loosen plug locknut using a drift punch, then move flexible coupling as necessary to install Tool J-7624 (spanner wrench) on plug. Tighten plug as necessary to obtain a bearing preload of 3–5 inch pounds, then tighten adjuster plug locknut. *NOTE – Bearing pre- l ad must b measured with spanner removed and locknut tightened.* To check worm preload, turn steering wheel one–half turn off center "high point". This reading should be 0.5–5.0 inch pounds higher than previous reading. *NOTE – Worm preload is controlled by fit of rack–piston balls.* To adjust pitman shaft lash, take reading while turning wheel through center "high point". This reading should be 4–8 inch pounds higher than worm preload reading. If not within specifications, loosen pitman shaft adjuster nut and adjust lash with a 7/32" Allen wrench. Tighten locknut to 20-30 ft. lbs. Reassemble steering wheel and connect pitman arm.

PUMP PRESSURE TEST: Install pressure gauge J-5176 or equivalent between pump and pressure line at pump *NOTE - Adapter J-5900 or J-7786 or quival nt may be n cessary to install pr ssur gaug t pump.* With gauge valve open and engine at idle speed, turn wheels against stops a few times to bring power steering fluid to 150-170°F. With wheels against stops, pressure should not be less than specified in table below. If pressure less, slowly close valve and check for pressure increase. Pressure will increase if pump in good condition. If pressure does not increase with valve closed, pump is faulty. *CAUTION - Do not hold gauge valve closed more than 15 seconds.* After removing gauge, bleed hydraulic system (see below).

Pump Pressure Specifications

Car Model	℄ Pump Pressure
Buick (Except Special)	1000 lbs.
Buick Special	750 lbs.
Cadillac	1100 lbs.
Chevrolet Trucks	900 lbs.
Oldsmobile (Except F-85)	1100 lbs.
Oldsmobile F-85	800 lbs.
Pontiac	900 lbs.

℄ - At engine idle speed and steering oil at 150-170°F.

BLEEDING HYDRAYLIC SYSTEM: Fill reservoir to proper level and let oil remain undisturbed for at least two minutes. Start engine and run at idle speed for a very short time and add necessary oil to maintain fluid at proper level. Raise front wheels off floor, increase engine speed to approximately 1500 RPM and turn wheels full right and left, contacting stops lightly. Lower car and turn wheels right and left on the floor. Check oil level and refill as necessary. Continue this process as long as necessary to bleed all air from system.

STEERING WHEEL & HORN BUTTON: *See "Saginaw Ball Bearing Worm & Nut (Manual Steering Gear) in this section, and note the following:*

Cadillac: Steering Wheel Removal - Carefully pry cap from steering wheel hub. Disconnect horn wire from top of steering shaft, then remove upper steering shaft nut. Lift horn control shroud and switch assembly from steering wheel. Scribe alignment marks on hub and steering shaft for reassembly, then remove steering wheel with suitable puller (J-1859-02). To install, make sure scribe marks are in alignment, then reverse removal procedure. Torque upper steering shaft nut to 50 ft. lbs.

TROUBLE SHOOTING: *See 1959 Final Data, Page 379, or later Manual edition.*

STEERING GEAR REMOVAL & INSTALLATION: As follows:

Buick (Except Special): Removal - Disconnect hydraulic lines from steering gear and elevate ends higher than pump reservoir. Remove lower coupling flange pinch bolts. Remove pitman arm from steering shaft. Remove steering gear attaching bolts and remove steering gear. **Installation** - Reverse removal procedure. Torque steering gear attaching bolts to 60-75 ft. lbs. Torque coupling flange pinch bolt to 20-35 ft. lbs.

Buick Special: Removal – *NOTE – Pitman arm cannot be removed or installed with steering gear installed on crossmember. If pitman arm is to be removed from gear, loosen pitman arm nut before disconnecting gear from crossm mb r. Wh n installing g ar, do not tight n pitman nut until aft r st ering g ar is install d on crossmemb r.* Remove lower coupling clamp bolt, then loosen clamp retaining mast jacket to toe pan cover and "U" bolt retaining jacket to instrument panel. Pull mast jacket assembly up far enough so lower coupling can be removed from worm shaft. Raise car and disconnect pitman arm from intermediate rod, then loosen pitman arm nut with tool, J–8987. Remove steering gear–to–crossmember attaching bolts and remove gear assembly. *NOTE – Do not remove pitman arm from shaft unless pitman shaft assembly or seal is to be replaced.*

Installation: Reverse removal procedure and note the following: Tighten gear–to–crossmember attaching bolts to 55 ft. lbs., and pitman arm nut to 165 ft. lbs. Make sure that tang of mast jacket saddle engages slot in jacket and that steering shaft is centered in end of jacket assembly. Align coupling and clamp with groove on worm shaft and install clamp bolt and nut.

Cadillac: Removal - Remove steering flange attaching nuts, and remove ground wire from flange bolt. Disconnect hoses from pump and cap all openings. Raise car and remove pitman arm with a suitable puller. Remove steering gear attaching bolts and remove steering gear with hoses attached.

Installation - Apply sodium soap fiber grease to gear mounting pads. Make sure alignment pin on gear housing enters hole in frame side rail. Make sure flexible coupling is not distorted, then tighten steering gear attaching bolts to 60-80 ft. lbs., and pitman shaft nut to 90-120 ft. lbs.

Chevrolet Truck: Removal – Disconnect steering shaft from lower coupling, then remove hoses from valve. Remove pitman arm nut, lockwasher and pitman arm. Remove mounting bolts and steering gear.

Installation – Reverse removal procedure.

Oldsmobile (Exc. F–85): Removal – Scribe alignment marks on steering shaft flange and coupling flange, remove coupling flange attaching nuts and ground wire from attaching bolts. Disconnect hoses from pump, then raise car on a hoist. Remove pitman arm from shaft using puller J–5504, then remove gear to frame attaching bolts and remove gear.

Installation –Reverse removal procedure and note the following: Apply a soap fine fibre grease to gear mounting pads. Make sure alignment pin on gear housing enters proper hole in frame side rail, and that gear is properly aligned with steering shaft. Tighten gear–to–frame bolts to 60–80 ft. lbs. and pitman shaft nut to 90–120 ft. lbs.

Oldsmobile F–85: Removal – Remove coupling flange attaching nuts and ground wire, then disconnect hose from power steering pump. Remove steering shaft coupling clamp bolt and slide clamp off coupling housing onto steering gear worm shaft. Mark steering shaft in line with slot at coupling clamp surface. Disconnect horn wire from harness and horn shroud from center of steering wheel. Remove steering wheel (see above), then pull horn contact plate up out of recess in actuator assembly for necessary clearance to allow removal of upper bearing–to–actuator assembly retainer clip. Use a small screwdriver and pry upper bearing-to-actuator assembly retaining clip out of actuator housing. Pull steering shaft up out of steering column and block shaft up approximately 2". Raise car and remove pitman arm from relay rod. Disconnect steering gear from crossmember and remove from car.

CONTINUED ON NEXT PAGE

SAGINAW ROTARY VALVE POWER STEERING (Cont.)

Installation – Reverse removal procedure and note the following: Tighten pitman nut to 150–180 ft. lbs. and steering gear–to–crossmember bolts to 45–60 ft. lbs.

Pontiac: Removal – Disconnect pressure and return hoses from housing, then disconnect pitman arm from shaft using puller J–5504. Scribe mark on steering shaft worm and worm shaft flange and disconnect gear lower flange from steering shaft. Remove gear housing–to–frame bolts noting number and location of frame shims (if any), and remove steering gear.

Installation – Reverse removal procedure and note the following: Locate any shims that were removed in their original position between housing and frame. Tighten housing-to-frame bolts to 70-90 ft. lbs., pitman arm nut to 100-140 ft. lbs., and flange attaching nuts to 10-20 ft. lbs.

OVERHAUL: *See 1959 Final Data, Page 379, or later Manual edition, and note the following:*

►*ADJUSTER PLUG & THRUST BEARING SERVICE NOTE:* Following procedures are applicable whether adjuster plug and thrust bearing are early type two-piece unit, or later type single-piece unit (delete instructions to separate units when working on a single-piece unit).

Adjuster Plug: Removal - On Oldsmobile and Chevrolet Trucks, scribe marks on stub shaft and coupling flange to make sure they are assembled in same position. *NOTE - This is not necessary on other models.* On Oldsmobile and Chevrolet Truck, remove stub shaft to flange retaining screw and remove flange assembly. On other models, remove lower flange pinch bolt and remove flange from shaft. Loosen and remove adjuster plug locknut and remove adjuster plug with Tool J-7624.

Disassembly - Remove thrust bearing retainer with a screwdriver, being careful not to score needle bearing bore. Discard retainer. Remove thrust bearing spacer, thrust bearing, and thrust bearing races. Remove adjuster plug "O" ring and discard, then remove stub shaft seal retaining snap ring. On Chevrolet Truck, remove seal back-up washer. On other cars, remove and discard dust shield. On all models, remove stub shaft seal by prying out with a screwdriver and discard. Inspect needle bearing in adjuster plug, and if rollers are broken or pitted, remove needle bearing from adjuster plug by pressing from thrust bearing end using Bearing & Seal Remover, Tool J-6221 (Buick & Cadillac), J-5254 (Oldsmobile), J-5188 (Pontiac), J-8524-2 & J-7079-2 (Chevrolet Truck), Discard the bearing.

Inspection - Inspect thrust bearing spacer for cracks, then inspect thrust bearing rollers for wear, pitting, scoring or cracking. If any of these conditions are found, replace both thrust bearing races and check thrust bearing spacer. Inspect thrust bearing races for wear, pitting, scoring, cracking, or brinelling. Replace if necessary. Check thrust bearing and thrust bearing spacer.

Reassembly - Install needle bearing by pressing from thrust end of adjuster plug against identification end of bearing using the same tool used for removal. *NOTE - End of bearing must be flush with bottom surface of stub shaft seal bore.* Lubricate stub shaft seal with automatic transmission fluid, then, on Chevrolet Trucks, install seal and back-up washer. On other models, install seal with spring in seal toward adjuster plug. *NOTE - Use Tool J-8524-1 (Chev. Truck), J-5188 (Buick, Cadillac, Pontiac), J-5254 (Oldsmobile) to install seal far enough in plug to provide clearance for retaining ring (Chev. Truck), dust seal and retaining ring (Other Models).* On Chev. Truck, install retaining ring. On other models, install dust shield with lip up in plug, then install retaining ring. Lubricate "O" ring seal with petroleum jelly and install on adjuster plug. Assemble large diameter thrust bearing race, thrust bearing, small thrust bearing race, and thrust bearing spacer on adjusting plug. Press bearing retainer into needle bearing bore with a brass or wooden dowel. *NOTE - Radial position of dimples is not important.*

Installation - Install adjuster plug in end of housing just enough to make certain that all parts are properly seated in gear housing. Back adjuster plug off 1/8 turn and measure valve assembly drag, using a torque wrench. Use a spanner wrench and adjust thrust bearings so that preload of 1–3 inch–pounds in excess of valve assembly drag is obtained. Total thrust bearing preload and valve drag should not exceed 8 inch–pounds (Cadillac, Oldsmobile & Chevrolet Truck); 11 inch–pounds (Buick & Buick Special); 10 inch–pounds (Pontiac). Hold adjuster plug in position and install and tighten locknut. Install coupling shaft assembly on stub shaft (align marks made at disassembly on Oldsmobile & Chevrolet Truck). On all models except Oldsmobile & Chevrolet Truck, align groove in lower flange with pin extending from stub shaft and install flange. On Oldsmobile and Chevrolet Truck, install coupling flange bolt and tighten to 20–25 ft. lbs. On other models, install lower flange pinch bolt and tighten to 30 ft. lbs.

►*VALVE ASSEMBLY NOTE (CHEVROLET TRUCKS):* Overhaul procedures are the same as for other models with power steering except that free length of valve spool spring is .760-.790".

►*RACK PISTON END PLUG REMOVAL NOTE:* Plug may take on permanent set as it is tightened to 50 ft. lbs. torque. Plug could break if not handled carefully. To remove, rap plug with a plastic hammer or rawhide mallet to unseat threads.

►*RACK PISTON REMOVAL NOTE:* Some models have a snap ring in upper end of piston bore in housing. *Do not remove this snap ring during disassembly procedures.*

Control Valve Housing & Steering Gear Overhaul (Chevrolet Trucks): Control valve housing forms steering gear top cover, and can be removed by removing attaching bolts. *For steering gear overhaul, see "Saginaw Ball Bearing Worm & Nut" (Manual Steering Gear) in this section.*

POWER STEERING PUMP: Saginaw Vane Type With Integral Reservoir. *See 1961 Final Data, Page 390.*

POWER CYLINDER

CHEVROLET TRUCK

POWER CYLINDER: Disassembly - *NOTE - The only repair to make in the field on the power cylinder is to replace piston rod seals.* Before removing piston rod seal parts from rod end of power cylinder, clean the exposed portion of seal cavity with clean solvent, brush and compressed air. Remove snap ring. To dislodge scraper, washer, dust seal, seal back-up washer and "U" cup seal, use air hose and apply pressure to cylinder port (right hand port looking down), and seal the left hand port. Remove seal parts from rod.

Cleaning & Inspection: Clean all parts in solvent and dry with compressed air. *CAUTION - Do not use wast to wipe off spool or inside bore of valve housing.* Protect spool edges and bore of valve housing from damage during disassembly and reassembly. Inspect parts for nicks and burrs and excessive wear. Check cylinder scraper washer for fit on piston rod, which should be .0001-.0035". Replace if worn.

Reassembly: Assemble open side of "U" cup seal over the rod and into bearing cavity, seal back-up washer, dust seal (with open side away from seal cavity), and scraper washer. Slide parts in place on rod and lock in place with snap ring.

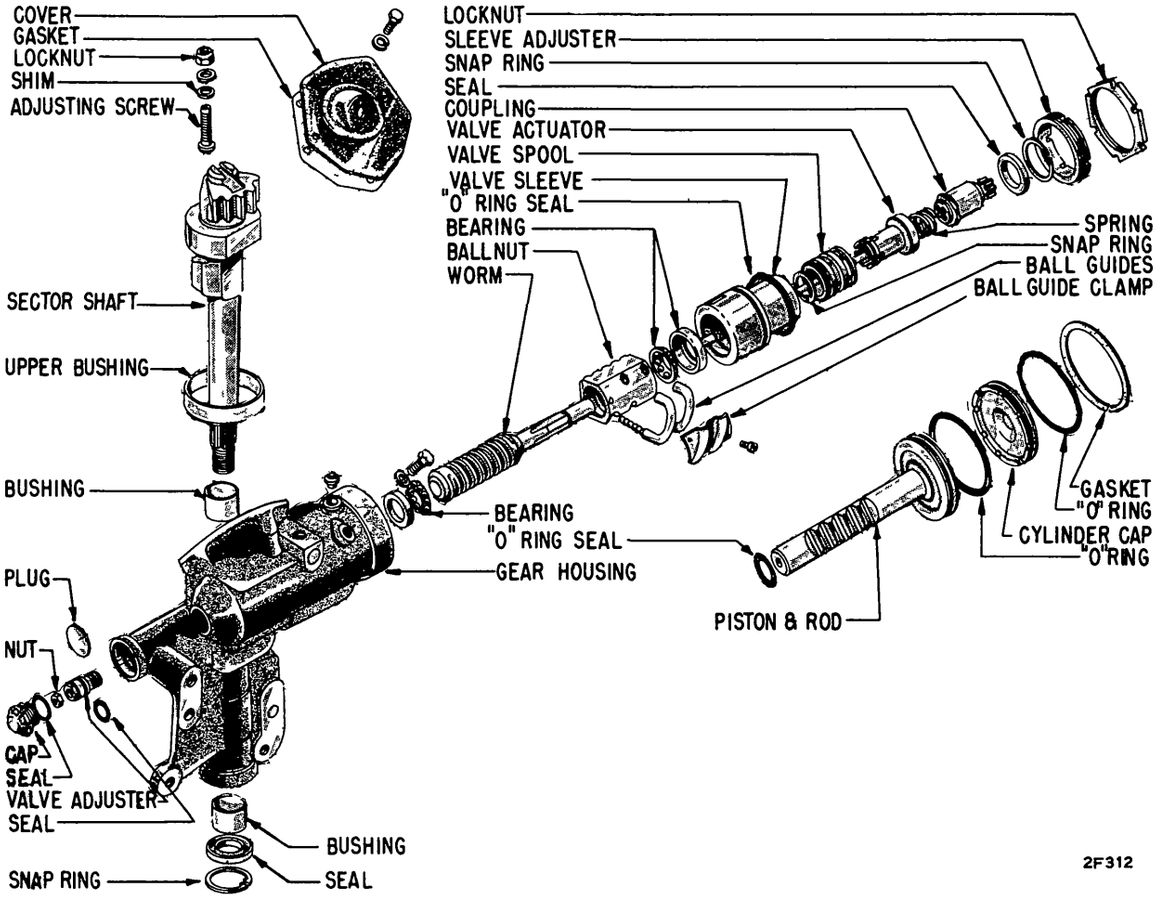
LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING

Linc ln C ntinental (1962)
Thund rbird (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961-62 LINCOLN CONTINENTAL NOISE IN POWER STEERING CORRECTIONS:* 1) If caused by upper part of flexible coupling loose on steering shaft, loosen setscrew and pry **slightly** up on upper part of coupling and tighten setscrew to 18-22 ft. lbs. *CAUTION - Do n t put xcessiv prel ad on steering shaft upper bearing and n fl xibl part f coupling.*
2) Reduce sector adjusting screw-to-sector clearance to minimum. Adjust worm bearing preload to 5-8 inch-lbs., and sector mesh load to 8-10 inch-lbs. greater than worm bearing preload setting. *NOTE - These specificati ns sup rsede pr vious specifications of 3-6 inch-lbs. w rm b aring pr l ad.* Adjust valve spool centering. Power piston backlash desired for minimum noise is .0015".

►*1962 LINCOLN CONTINENTAL POWER STEERING FLUID LEAK AT INLET HOSE SEAT CORRECTION:* May be caused by housing porosity at inlet hose sealing area. To correct, install new type oil resistant "O" ring, Part No. C2AZ-3B699-A, in inlet hose seat in housing. Install "O" ring carefully to prevent damage when hose fitting connected. *CAUTION - Install this new seal only on units that l ak, and on units with seal installed in producti n (gr n paint at inlet boss area) whenever inl t hos disc nn ct d.*



DESCRIPTION: Piston type hydraulic assist power unit having a torsion bar operated control valve combined with a ball nut and worm steering gear enclosed in a single housing. Hydraulic fluid under pressure is supplied to steering gear by a positive displacement type pump. Design and operation are similar to previous models.

PUMP BELT ADJUSTMENT: Lincoln Continental - No adjustment. Pump is mounted on engine front cover and driven by engine crankshaft.
Thund rbird - Use a suitable belt tension gauge and adjust pump mounting bracket for 120-150 lbs. (new belt), 90-120 lbs. (used belt) tension. *NOTE - Used belt is any b lt op rated for 15 minutes or longer.*

LUBRICATION: Check fluid level in reservoir every 6000 miles. Fluid should be at "F" mark on dipstick. Use only Automatic Transmission Fluid Type "A", Suffix "A", or Ford & Lincoln Lubricant C1AZ-19582-A.

BLEEDING SYSTEM: If air is in system due to low oil level in pump reservoir, or to disassembly of gear, fill pump reservoir to proper level, start engine, turn on windshield wipers on Lincoln Continental, and turn steering wheel through its entire travel three or four times to allow air to escape. Recheck fluid level and add fluid as required. *CAUTION – Do not hold wheels against their stops when bleeding system.*

HYDRAULIC PRESSURE TEST: Connect a pressure gauge with a hand shut–off valve in pressure line between pump and steering gear (pressure gauge must be between pump and shut–off valve). With shut–off valve on gauge fully open, allow steering fluid to come to operating temperature (cycle gear from stop to stop), then note gauge readings with wheels at full left and full right positions. Pressure should be 700–850 lbs. (Thunderbird), 1120–1250 lbs. (Lincoln Continental). If pressure less than minimum, close gauge valve and note reading. *CAUTION – Do not leave valve closed for more than 15 seconds.* If pressure still less than minimum, pump is faulty. If pressure increases, steering gear is at fault.

"TORSION BAR" POWER STEERING ASSEMBLY (EXPLODED)

ADJUSTMENTS (LINCOLN CONTINENTAL)

Worm Bearing Preload & Sector Mesh Adjustments: 1) Disconnect pitman arm from sector shaft and drain fluid from steering gear housing and from reservoir. *NOTE – Fluid in system will cause incorrect readings.* Remove steering wheel and horn ring. *NOTE – Correct readings cannot be obtained with steering wh l and horn ring installed as segment typ h rn ring caus s ass mbly to be unbalanced.* Lock two nuts on steering shaft and attach an inch–pound torque wrench to upper nut. Turn shaft to either stop, back off ¼ turn, and measure torque required to keep shaft turning at a constant rate for one complete turn. This is worm bearing preload and should be 5-8 inch-lbs. *NOTE - This supersedes previous specification of 3-6 inch-lbs.* To adjust, loosen worm bearing adjuster locknut and turn adjuster as necessary. *NOTE - Always make final adjustment in tightening direction.*
2) Turn steering shaft so ball nut and sector are centered (approximately two turns from either stop), then note torque required to turn shaft through center position. Torque should be 8-10 inch-lbs. greater than for worm bearing preload (above). To adjust, loosen sector shaft adjusting screw locknut and turn adjusting screw as necessary.

Valve Spool Centering: 1) Place steering gear on a bench near fender and insert a 3/8" drive, 3" extension into flexible coupling and retain extension with setscrew. Remove adjuster cap and install a 7/16" midget socket and a 9/16" offset box end wrench on adjuster. Connect a pressure gauge between pressure line from pump and inlet port (upper hole) of steering

CONTINUED ON NEXT PAGE

LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING (Cont.)

gear. Disconnect return line from windshield wiper control valve lower connection and attach line to outlet port of steering gear. Make sure shut–off valve on gauge is fully open.

2) Start engine and bring gear housing to operating temperature (cycle from stop to stop), check and add fluid if necessary. Turn gear coupling to left turn position, attach an inch–pound torque wrench to extension in coupling, then turn torque wrench so pressure gauge reads 300 lbs. Note torque wrench reading. Repeat for right turn position. Torque reading for both positions should be equal within 3 inch–lbs. To adjust, loosen adjuster locknut and turn adjuster in direction of low reading. For example, if reading low in left turn position, turn adjuster toward left turn position. *NOTE – Only slight movement of adjuster is necessary to change valve spool position.* Tighten locknut and recheck.

(THUNDERBIRD)

Valve Spool Centering: Install an inch–pound torque wrench on steering shaft (unnecessary to remove steering wheel), bring power steering fluid to normal operating temperature (cycle from stop to stop), and have engine idling. With front wheels straight ahead, measure torque necessary to make a right turn and a left turn. Difference in readings between turns should not be more than 3 inch–lbs. If difference more, remove adjuster cap, loosen locknut and turn adjuster in direction of low reading. For example, if reading low in left turn position, turn adjuster toward left turn position. Tighten locknut and recheck adjustment.

Worm Bearing Preload & Sector Mesh Adjustments: 1) Disconnect pitman arm from steering arm–to–idler arm rod. Loosen sector shaft adjusting screw locknut and back out sector shaft adjusting screw. With an inch–pound torque wrench on steering shaft (unnecessary to remove steering wheel), note torque required to rotate wheel **very slowly** through one complete turn from center position. This is worm bearing preload and should be 2-4 inch-lbs. To adjust, loosen bearing adjuster locknut and turn adjuster as necessary. Tighten locknut and recheck.

2) Center steering wheel and turn sector shaft adjusting screw in until 6 inch-lbs. maximum torque is required to turn steering wheel through center position. Turn wheel slowly, no backlash allowed at 30° on either side of center. *NOTE - When adjusting, always turn adjusting screw in one direction to reach adjustment. If screw turned too far, back out one full turn and readjust.*

TROUBLE SHOOTING

See 1958 Final Data, Page 390, or later Manual editions.

STEERING WHEEL & HORN BUTTON REMOVAL & INSTALLATION

Lincoln Continental: To remove cap from steering wheel hub, press down on cap and turn counterclockwise. Remove steering shaft nut, attach a suitable puller to steering wheel, and remove wheel and horn ring assembly. To install, align mark on wheel hub with mark on shaft. Install wheel and horn ring and torque steering shaft nut to 25–35 ft. lbs. Stake the nut.

Thunderbird: Unsnap hub cap from horn ring, remove steering wheel nut, and pull steering wheel and horn ring with a suitable puller. To install, reverse removal procedure, torque nut to 25-35 ft. lbs., and stake the nut.

STEERING GEAR REMOVAL & INSTALLATION

Lincoln Continental: Disconnect hoses from steering gear and tie hoses higher than reservoir. Raise car and remove transmission linkage splash shield. Remove left exhaust manifold–to–resonator pipe. Remove pitman arm from sector shaft. Remove transmission linkage rods from equalizer shaft and force shaft outward. Loosen setscrew locking flexible coupling to steering shaft. Remove steering gear attaching bolts and remove steering gear. To install, reverse removal procedure and make sure sector shaft is centered in gear. Torque steering gear attaching bolts to 35–50 ft. lbs., and pitman arm attaching nut to 100–130 ft. lbs.

Thunderbird: Disconnect fluid lines from steering gear, plug gear openings and cap lines. Remove pivot bracket clamp bolts, bracket upper mounting nut and flat washer, then remove pivot bracket. Remove cotter pin and steering shaft retainer pin. Disconnect pitman arm from sector shaft. Remove steering gear housing mounting bolts and remove housing. To install, reverse removal procedure. Torque gear mounting bolts to 35-50 ft. lbs., pitman arm attaching bolt to 110-150 ft. lbs., pivot bracket clamp bolts to 19-23 ft. lbs., and pivot bracket stud nut to 9-12 ft. lbs.

OVERHAUL

See 1958 Final Data, Page 390, or later Manual editions, and note the following:

1) When installing torsion bar sleeve bearing in sleeve, bearing must be pressed in so there is .095-.105" clearance between upper surface of bearing and seal seat surface of sleeve.

2) During and after reassembly, check worm bearing preload and sector mesh adjustments, and valve spool centering according to "Adjustments" above.

HYDRAULIC PUMP

Lincoln Continental: *See 1960 Final Data, Page 404, or later Manual edition, and note the following:*

Pump Pressure - 1120-1250 lbs.

Bleeding System - Turn on windshield wipers in addition to the procedure listed.

Thunderbird: *See 1958 Final Data, Page 398, or later Manual editions.*

THUNDERBIRD MOVABLE STEERING COLUMN

DESCRIPTION: Consists of a lateral movement mechanism at instrument panel with a flexible steering shaft coupled to steering gear torsion bar. Steering column tube lower end pivots on a bracket fastened to steering gear housing.

OPERATION: With steering column in straight ahead position and transmission selector lever in any position other than "P", column is locked to brake pedal support assembly by a pawl–type lever controlled by selector tube. Two coil springs assist pressure from selector tube and provide positive engagement of pawl in lock plate. When selector lever moved to "P" position, latch type bracket fastened to selector tube disengages pawl from locking plate. Steering column assembly can now be moved about 10" to right. When column is moved over, transmission cannot be shifted. When column moved back to straight ahead position, pawl engages locking plate. Transmission can now be shifted.

ADJUSTMENTS: Track–To–Column Bracket – Track notched edge must be centered under bracket notch for full distance of track travel. To adjust, loosen track–to–pedal support bolts.

Slide Tension: Adjust friction between track and steering column bracket by loosening or tightening nuts on cam type friction adjustment bolts. *Both bolts must be adjusted equally.*

Lock Plate: Adjust engagement of lock pawl in lock plate, by loosening lock plate mountings and adjust cam bolt and screws so lock pin clears bottom of lock plate by no more than 1/32" for the full travel. Pawl must be fully engaged in lock plate when column is locked.

Stops: With selector lever out of "P" position and nylon button of detent spring in its track center notch, position stop bracket against bumper. Pawl pin must engage fully and also clear corner of notch as pin enters or leaves. There should be no lateral movement of column as pawl pin engages or disengages. *NOTE – On air conditioned cars, spring projects left of its attaching bolt and left notch in track is used. If right shroud hits air conditioning unit, adjust right stop as necessary.*

TROUBLE SHOOTING: Binding, Rough, or Rasping Column Movement: Track–to–column bracket misaligned; Lock plate rubbing pawl; Shroud interferes with instrument panel.

Hard Column Movement: Slide tension out of adjustment; Track–to–column bracket misaligned; Lock plate rubbing pawl.

Transmission Shift Into Reverse With Column At Extreme Right: Lock plate out of adjustment.

Poor Shift Into or Out of Park: Left stop out of adjustment; Lock pawl arm binding in pivot bushing.

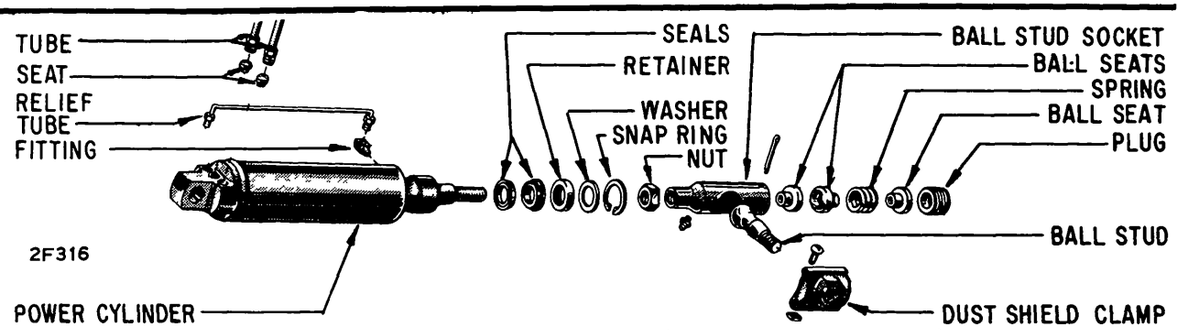
Lateral Looseness In Column When Locked: Lock pawl arm loose in pivot bushing; Pivot bracket loose at steering gear.

Vertical Looseness In Column When Locked: Loose track or braces; Pivot bracket loose at steering gear; Slide tension out of adjustment.

Right Shroud Hits Air Conditioning Unit: Right stop bolt on track out of adjustment.

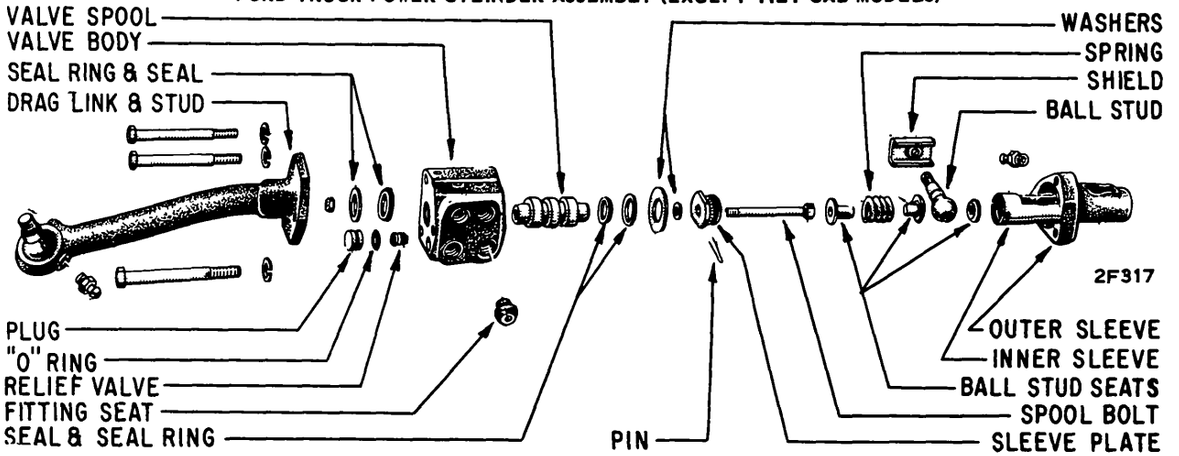
FORD TRUCK LINKAGE TYPE POWER STEERING

F rd Trucks, Exc pt Tilt Cab M d ls (1962) ℂ
F rd Trucks, Tilt Cab M dels (1962) ℂ
ℂ - Power cylinder used.
ℂ - Booster (rack & piston) cylinder used.



DESCRIPTION: Linkage type with control valve assembly connected directly to steering gear pitman arm. On Tilt Cab Models, the operating cylinder is a "rack & piston" booster type cylinder connected between pitman arm and wheel spindle. On other models, the hydraulic power cylinder is anchored to left side of front axle with the piston rod connected to center of spindle connecting rod. The only basic differences between the two units is in the construction of the operating cylinders.

LUBRICATION: Check fluid level in reservoir every 4000 miles (On Highway), 500 miles (Off Highway). Fluid should be at "F" mark on dipstick or within 1" of top of reservoir. Check fluid at normal operating temperature. Use only Automatic Transmission Fluid Type "A", Suffix "A"; or Ford Lubricant C1AZ-19582-A.



ADJUSTMENT: Pump Driv Belt – ¼" belt deflection midway between pulleys. Tighten belt adjusting bolt to 30–35 ft. lbs.

TESTING: Turning Eff rt – With front wheels properly aligned and tire pressure correct, place car on dry concrete, set brakes, then proceed as follows: With engine at normal idle speed, turn wheel to right and left several times to bring fluid to normal operating temperature. Hook a spring scale to rim of steering wheel and measure pull required to turn wheel at least one complete turn in both directions. Pull should be 35–65 lbs., and about equal in both directions.

Pump Pr ssur : Install pressure gauge, Tool T56L–33610–D, between pump hose and pump outlet with pressure gauge between pump and shut–off valve of tool. Run engine at idle speed (with shut–off valve open) for two minutes to normalize oil temperature. With wheels in straight ahead position, pressure should be no higher than 700 lbs. with engine at 900 RPM. If pressure higher, check for faulty pump or control valve. Increase engine speed to 3000 RPM and slowly close shut–off valve of gauge. Pressure should be about 1150 lbs. when shut–off valve fully closed. *CAUTION– Do n t l av shut–off valve closed for more than 15 seconds.* If the pressure is less, then the pump is faulty. If pressure increases but does not reach maximum, inspect pump, control valve, and power cylinder. If pressure is within limits and power steering is not satisfactory, trouble is in control valve or power cylinder.

FORD TRUCK POWER CYLINDER ASSEMBLY (EXCEPT TILT CAB MODELS)

FORD TRUCK POWER STEERING CONTROL VALVE ASSEMBLY (TILT CAB MODELS)

TROUBLE SHOOTING: *See 1959 Final Data, Page 391, or later Manual editions.*

REMOVAL & INSTALLATION: Power Steering Pump – Remove as much fluid as possible through reservoir filler opening. Disconnect pressure hose from pump and return line from cooler, and tie hoses to prevent fluid loss. *NOTE – It is easier on Tilt Cab Models to disconnect hoses after pump removed from mounting bracket.* Loosen adjusting bracket bolt and pivot bolt and remove pump belt. Remove pump attaching bolts and remove pump and reservoir as an assembly. To install, reverse removal procedure.

Control Valve (Except Tilt Cab): Drain reservoir, disconnect hoses from control valve, then disconnect ball studs and piston mounting bolts. Remove control valve. To install, reverse removal procedure.

Control Valve (Tilt Cab): Remove hoses from valve, then disconnect studs from idler arm and sector shaft arm. Remove control valve and drag link. To install, reverse removal procedure.

OVERHAUL: *See 1959 Final Data, Page 391, or later Manual editions.*

POWER STEERING PUMP: Eaton Roller Type - See *1958 Final Data, Page 398, or later Manual editions.*

BUICK SPECIAL & OLDSMOBILE F-85 3-SPEED SYNCHRO-MESH

Buick Special (1962)
Oldsmobile F-85 (1962)

DESCRIPTION: Same design as used on previous models.

REMOVAL & OVERHAUL: *See 1961 Final Data, Page 395.*

TRANSMISSION CONTROL ADJUSTMENT: *NOTE - Before adjusting linkage, make sure that shift equalizer is properly aligned and is not binding. Check to see that equalizer pin which is welded to underbody side rail goes through outboard side of equalizer at right angles and that it is located in center of hole in equalizer by rubber washer. If necessary to adjust alignment of pin, bend bracket to desired position. Be careful not to break the weld.* Place transmission in neutral and loosen shift rod clamps at transmission and equalizer. Loosen the lever retaining ring bolt on mast jacket at lower end of steering column, then install fixture J-8992 on mast jacket. Position second and third shift lever against fixture. Tighten second and third adjusting clamp on equalizer (make sure lever is against fixture), to 10-12 ft. lbs. Move first and reverse shift rod until a good cross-over point is obtained. To do this, lift shift control lever at steering wheel several times until no interference is felt when moving lever from second-third to first-reverse neutral position. When lever is released in first-reverse neutral position it should spring down to second-third neutral position. Hold lever midway in this cross-over position and tighten adjusting clamp. Recheck for smooth cross-over operation. Remove fixture and retighten retainer ring bolt.

CHEVROLET & PONTIAC 3-SPEED SYNCHRO-MESH

Chevy II (1962)
Chevrolet Pass. Cars (1962)
Chevrolet Trucks, ½ & ¾ Ton (1962) Light Duty
Corvette (1962)
Pontiac (1962)

DESCRIPTION: Same design as used on previous models.

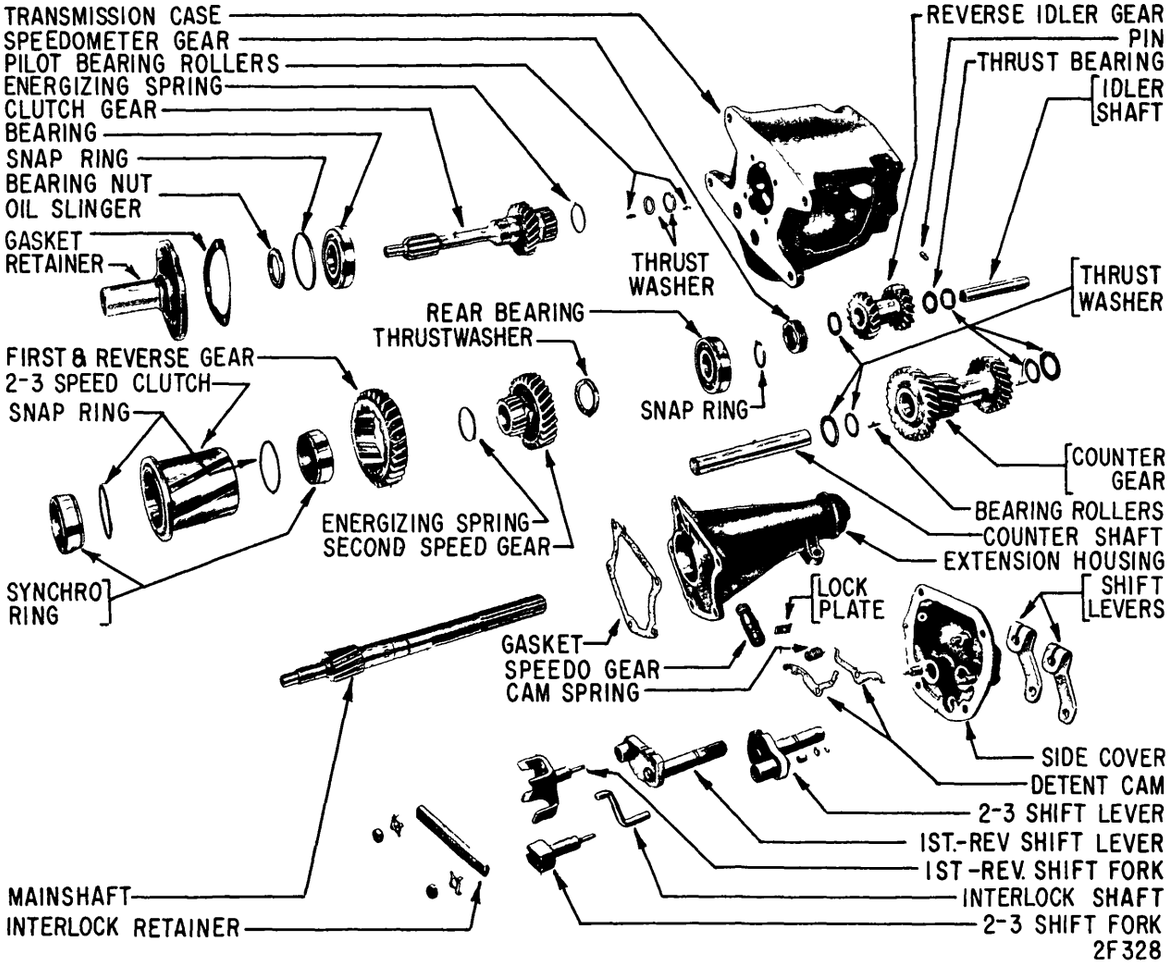
REMOVAL & INSTALLATION

REMOVAL: Drain transmission and remove propeller shaft. *NOTE - On Chevy II, Pontiac, and Chevrolet Trucks, disconnect rear universal and slide shaft to rear. On Chevrolet Pass. Cars, remove bolts attaching center support to frame, then disconnect rear propeller shaft and slide shaft assembly to rear to disengage from transmission.* Disconnect speedometer at transmission and shifter rods at transmission levers. Support rear of engine (Exc. Chevrolet Trucks) with a floor jack, then remove transmission support crossmember from transmission and frame members (Chevy II & Chevrolet Pass. Cars); disconnect at transmission bracket (Pontiac). *NOTE - On Chevrolet Pass. Cars, retain shims found between transmission mounting block and support for installation in same location when transmission is reinstalled.* Remove upper transmission attaching bolts and install suitable guide pins in these holes, then remove lower attaching bolts. *NOTE - If vehicle is equipped with overdrive, disconnect overdrive wires and controls.* Slide transmission straight back on guide pins (on Pontiac, tilt rear of transmission upward to disengage bracket studs from transmission support) until transmission shaft clears clutch assembly, and remove from vehicle.

INSTALLATION: Reverse removal procedure.

OVERHAUL

DISASSEMBLY: 1) Remove transmission side cover and gasket. Do not disassemble cover unless necessary for replacement of parts. Remove clamp, bracket and insulator from extension housing (if so equipped), then disconnect extension from transmission.



2) Carefully pull extension and mainshaft assembly out of transmission case, leaving second and third speed clutch assembly and first and reverse sliding gear in case. *CAUTION - Do not force mainshaft. Slowly rotate mainshaft and second speed gear to obtain alignment of synchronizing clutch teeth and splines on mainshaft. Be careful not to allow needle bearings in clutch gear to drop into case.*

3) Slide first and reverse gear from second and third speed clutch and remove through side opening in case, then remove second and third speed clutch from clutch gear and remove the 24 rear and 14 larger front pilot bearing rollers and thrust washer from inside clutch gear.

4) Remove front bearing retainer and gasket, then remove countershaft by tapping it from front to rear of case, using a suitable "dummy" shaft. Lower countergear and "dummy" shaft into bottom of case.

5) Remove clutch gear bearing snap ring, then tap shaft toward rear, moving gear and bearing assembly into case. Remove through side opening or through rear of case. *NOTE - On Chevrolet Pass. Cars (Exc. Chevy II)*

CONTINUED ON NEXT PAGE

CHEVROLET & PONTIAC 3-SPEED SYNCHRO-MESH (TYPICAL)

CHEVROLET & PONTIAC 3-SPEED SYNCHRO-MESH (C nt.)

with 6 Cyl. Eng. or with v rdriv , clutch g ar as- s mbly can b r mov d by pulling it out front of case aft r b aring r tain r and gasket have been removed.

6) Remove countergear from case and remove "dummy" shaft, then remove 25 needle bearing rollers and thrust washers from each end of countergear. Tap reverse idler shaft lock pin into shaft (pin is shorter than shaft diameter), then use a drift punch and tap rear of idler shaft, driving out case plug ahead of shaft. *CAUTION - Do not turn shaft while removing as lock pin may drop down b tw en idler gear bushings.*

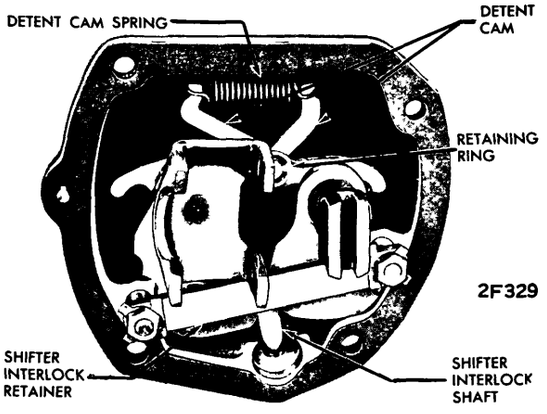
7) Remove reverse idler gear, front thrust washer, radial roller thrust bearing and rear thrust bearing washer.

8) To remove mainshaft from rear extension, remove speedometer driven gear assembly, then ex pand rear bearing snap ring and tap mainshaft forward and out of extension.

SUB-ASSEMBLY OVERHAUL

Inspecti n: Wash all parts thoroughly, then inspect case for cracks and front face of case for burrs. Check gears and shafts for wear or damage. Check first and reverse sliding gear for free movement on clutch sleeve and check clutch sleeve for free movement on mainshaft.

Mainshaft: Disass mbly - Press speedometer drive gear off mainshaft using a suitable split plate in an arbor press. Remove bearing retaining snap ring and press bearing off shaft. Remove second speed gear thrust washer and second speed gear.



R ass mbly - Coat bore of second speed gear with transmission lubricant, then slide gear on shaft and install thrust washer with oil grooves toward gear. Install a new bearing with groove in outer diameter toward second speed gear, then select one of four selective fit snap rings (see table below) so endplay of bearing on shaft is a maximum of .004" (use thickest ring that will enter snap ring groove in shaft). Start speedometer drive gear on shaft with chamfered inner diameter of gear toward bearing, then press gear on shaft until forward face of gear is 7/8" (Exc. Pontiac); 53/64" (Pontiac) from rear face of bearing.

R ar B aring Snap Rings

Thickness	Part No.
.086-.088"	3707188
.089-.091"	3707189
.092-.094"	3707190
.095-.097"	3707191

Clutch G ar B aring: R m val - Place clutch gear in a vise with soft jaws and remove bearing retainer nut and oil slinger with Tool J-0933. *NOTE - Retaining nut and oil sling r is a on -pi ce steel casting machined with a l ft hand thread and is locked in place on clutch g ar ass mbly by being staked into a hole provided for that purpos .* Install clutch gear and bearing in transmission case and install snap ring on bearing. Support rear of case in an arbor press and press shaft from bearing, then tap bearing from case.

Installati n - Press clutch bearing on clutch gear with an arbor press (ring groove of bearing toward front of clutch gear). Install combination bearing retainer nut and oil slinger and tighten it securely with Tool J-0933.

SIDE COVER ASSEMBLY

SYNCHRONIZER RING ENERGIZING SPRINGS

Lock retaining nut oil slinger in place by staking it into hole provided with a center punch, being careful not to damage threads of shaft. *CAUTION - Bearing must turn as freely after it is installed on shaft as it turned before being installed.*

Clutch Sleeves & Synchronizer Rings: Disassembly - Remove first and reverse sliding gear, then turn synchronizer ring in clutch sleeve until ends of ring retainer can be seen through slot in clutch sleeve. Use a suitable pair of snap ring pliers (Tool J-0932) and expand retainer into counterbore in clutch sleeve, then slip ring out of sleeve. Check cones for wear or for looseness in clutch sleeve. *NOTE - If cones are damaged in any way, replace clutch sleeve assembly and both rings.* Inspect rings for smoothness then place ring in synchronizer cones and check with thumbs to see that rings do not rock. Excessive rocking would indicate a poor fit.

Reassembly: Install synchronizer ring retainers in counterbores in ends of clutch sleeve, then use a suitable pair of snap ring pliers (Tool J-0932) in slot in clutch sleeve and expand each retainer in counterbore. Lubricate each synchronizer ring with light oil and install in clutch sleeve. *CAUTION - Mak sur retain rs s at in groove all th way ar und rings s rings willturn fre ly.* Install first and reverse sliding gear on clutch sleeve.

►*SYNCHRONIZER ENERGIZING SPRING REPLACEMENT CAUTION:* One of the ends of these springs is slightly offset. Each spring must be assembled in its groove in clutch gear and second speed gear with the offset or locking end between the third and fourth teeth of either of the two banks of teeth on these gears, thus keeping spring from turning in its groove. If necessary to replace energizing springs, be careful not to distort springs by expanding them too far when sliding them over clutch gear teeth and second speed gear.

Transmission Extension Oil Seal & Bushing Replacement: Pry out oil seal and drive bushing into case using a suitable tool. Drive a new bushing in from rear of case until bushing is slightly below counterbore for seal. Coat inner diameter of bushing with transmission lubricant, then install a new seal.

►*REVERSE IDLER GEAR INSPECTION NOTE:* Clearance between idler shaft and gear bushing should be .002-.004". If not within limits, replace gear and shaft. Bushings are not serviced separately.

Side Cover: Disassembly - Remove nuts and locks from shifter interlock retainer and remove retainer, then remove detent cam spring to release detent cam. Remove both shifter shafts and shift fork assemblies. Remove retaining ring and remove detent cam, then remove shifter interlock shaft..

Reassembly - Reverse disassembly procedure. *NOTE - When cover is installed on transmission, flanged side of first-reverse shifter fork must face rear of transmission.*

REASSEMBLY: 1) Coat reverse idler thrust washers and bearing with grease, then position thrust bearing against rear of gear, (end with chamfered gear teeth), and position large thrust washer against bearing. Position small thrust washer at front end of gear.

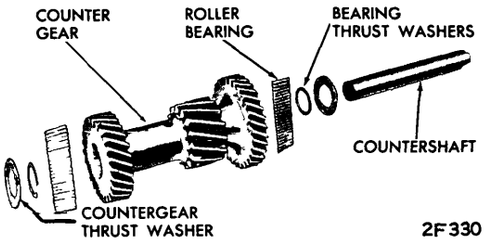
2) From rear of case, install idler shaft, aligning lock pin hole in shaft with hole in case, and tap shaft in until front of shaft is flush with inner side of rear boss. Position reverse idler gear assembly in case so radial roller thrust bearing is toward rear of case and gear is lined up with shaft. Use a soft hammer and tap shaft in until lock pin holes are lined up.

3) Coat new idler shaft lock pin with sealer and drive it in approximately 1/16" beyond flush with case. Peen hole slightly to secure lock pin. Install new idler shaft expansion plug in front of case.

4) Coat roller bearing area at each end of countergear with grease and insert a suitable "dummy" shaft into gear. Install 25 roller bearings over "dummy" shaft at each end of gear, then apply grease to bearing thrust washers and countergear thrust washers and place bearing thrust washers, followed by countergear thrust washers, at both ends of case, making sure that tangs on countergear thrust washer face out. With "dummy" shaft in position, place countergear assembly in bottom of case.

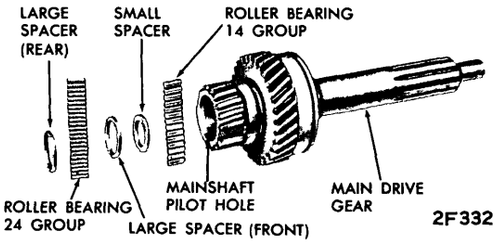
CONTINUED ON NEXT PAGE

CHEVROLET & PONTIAC 3-SPEED SYNCHRO-MESH (C nt.)



5) From inside case, push clutch gear assembly through opening in front face of case, then use a brass drift and tap the assembly in until bearing locating groove is outside front of case. *NOTE - On Chevrolet Pass. Car with 6 Cyl. Engine or Overdrive, install clutch assembly from front of case.* Install clutch gear bearing snap ring in groove and tap the assembly to rear until snap ring is seated against face of case. Install bearing retainer and gasket. Gasket must not protrude beyond edge of retainer. *NOTE - Retainer can be installed in one position as holes in retainer are unevenly spaced.* Apply sealer to retainer bolts, then install bolts and special lockwashers and tighten to 12-15 ft. lbs.

6) Turn transmission case so top side is downward while guiding countergear assembly into position so that idler gear, clutch gear and countergears mesh properly. *CAUTION - Do not allow thrust washers at ends of countergear to become dislodged.* Lubricate and start countershaft in case from rear, making sure that flat on end of shaft is horizontal and toward bottom of case (except transmission with overdrive); horizontal and toward top of case (transmission with overdrive). *NOTE - Flat on shaft must be as indicated to permit installation of extension housing or overdrive adapter.* Align countergear with shaft and use a soft hammer to tap shaft through, pushing "dummy" shaft out front of case until flat on end of shaft is flush with rear face of case.



7) Coat pilot holes in clutch gear to retain pilot needle bearings, then insert 14 large bearings and the small inner diameter spacer. Insert large inner diameter front spacer, followed by 24 large needle bearings. Insert large inner diameter rear spacer with chamfered side out.

8) Install synchronizing clutch assembly (shoulder to front), through rear opening of case, then line up two inner lugs of clutch sleeve synchronizing ring with two wide grooves in clutch gear and slide clutch assembly onto clutch gear. Through side opening of case, insert first and reverse sliding gear, positioning wide inner bevel and small round depression toward rear. Guide first and reverse gear onto clutch, then position transmission case so clutch gear shaft is downward (place transmission on suitable pedestals so end of shaft clears working surface of bench).

9) Install mainshaft assembly in extension housing, then spread mainshaft bearing snap ring and tap front end of mainshaft with a soft hammer until snap ring seats in bearing groove. Install a new gasket on transmission case, then align clutch splines on mainshaft with clutch splines on second speed gear so as to receive the two inner lugs of second and third speed clutch synchronizing ring. *NOTE - Mark splines with red lead for later identification.* Lower mainshaft assembly through opening at rear of transmission case, making sure two inner lugs of synchronizing ring engage previously marked grooves of mainshaft and second speed gear. *CAUTION - Use care when lowering main-*

COUNTERGEAR ASSEMBLY

CLUTCH GEAR ASSEMBLY

shaft assembly into transmission to prevent needle roller bearings from falling into mainshaft pilot hole. Sudden weight on synchronizer rings may cause them to lock up.

10) Rotate extension housing to line up with case, then install attaching bolts and lockwashers, applying sealing compound to threads of bolts, and tighten finger tight. Turn transmission, top side up, on bench, then maneuver second and third speed clutch until extension housing fits flush against transmission case. Tighten attaching bolts to 40-45 ft. lbs. Install speedometer gear and side cover.

SHIFT LINKAGE ADJUSTMENT

TRANSMISSION CONTROL ADJUSTMENT: Chevy II - Loosen swivel assemblies on shift rods at transmission levers, then move both of the transmission shift levers to the neutral position. *NOTE - Check for neutral position by starting engine with clutch disengaged, then release clutch slowly.* Move selector lever on steering column to neutral and align first and reverse shifter tube lever with second and third shifter tube lever on mast jacket at lower end of steering column. *NOTE - Shift tube key is engaged with slot on second and third shift tube lever when selector lever is in neutral position.* Adjust swivels at end of shift rods for free entry into transmission shift levers, making sure that shifter levers at lower end of steering column are in proper alignment. Move selector lever through all positions and check adjustment.

Chevrolet Pass. Cars (Exc. Corvette): With transmission control rods disconnected at lower end of steering column, move both transmission levers to neutral position. Move transmission selector lever to neutral position and engage the second-third shift lever at the lower end of the steering column with relay lever. Center levers in the mast jacket by measuring from the edge of the slot in the jacket to the edge of the slot in spacer at each side of lever, then adjust swivel of second-third shift rod for free entry in hole in lever and install retainer. Move first-reverse lever on tube until lug on lever lines up with slot in relay lever (pull relay lever to make sure lug mates with slot), then adjust swivel of first-reverse shift control rod for free entry into hole in lever and install retainer. Check shifts in all positions for smooth action and overtravel.

Chevrolet Truck: Check clearance between lower edge of gearshift lever and upper edge of support. If clearance not 3/32" to 1/8", remove upper control shaft assembly from steering column and screw upper support up or down as necessary for proper clearance, then replace upper control shaft assembly. Measure clearance between end of gearshift lever and underside of steering wheel rim which should be 3¾" ± 1/8". If not within limits, loosen gearshift control shaft and housing assembly clamp bolts and move housing assembly (with upper and lower control shafts and gearshift lever) as necessary for proper clearance, then tighten clamp bolts. Loosen second–third speed control rod swivel clamp at housing outer lever and adjust swivel so gearshift lever is in horizontal plane. Remove housing cover to make sure shift gates in inner levers are aligned. If necessary to adjust, loosen first–reverse control rod swivel clamp at housing and adjust swivel until shifter gates are aligned.

Pontiac: Position selector lever in neutral. then disconnect shift rods at transmission. Line up shift levers at lower end of steering column so they move freely back and forth (neutral position with slots lined up). With shift levers on transmission in neutral detent, adjust trunnion at idler lever (second–third), and at shift lever (first–reverse) for free entry into shift levers, then tighten trunnion locknuts to 5–10 ft. lbs. Move selector lever into first gear and check key at first–reverse shift lever at lower end of steering column. Key should just clear lower side of opening in steering column. Shift selector lever to third gear and check key at second–third shift lever. Key should again just clear lower side of opening. Lubricate linkage joints and check shift pattern.

CHEVROLET & PONTIAC 3-SPEED HEAVY DUTY

Chevrolet Trucks, ½, ¾, 1-T n (1962) H avy Duty Pontiac (1962) See Note.

►*1962 PONTIAC TRANSMISSION NOTE: This transmission is standard equipm nt on Star Chief, B nn vill (Exc. Safari), Grand Prix mod ls, heavy duty chassis, taxi cabs and police cars.*

DESCRIPTION: Transmission is same design as previous models.

SHIFT LINKAGE ADJUSTMENT: Same as for standard 3-speed synchro-mesh.

TRANSMISSION REMOVAL: Same as for standard three speed transmission. *See "Ch vr l t & Pontiac 3-Speed Synchro-mesh" in this secti n.*

OVERHAUL: *See 1958 Final Data, Pag 406, or lat r Manual diti n and n t th f llowing:*

Ch vr l t Truck: Front bearing retainer now incorporates a lip type seal. The former bearing washer (special oil sealing type) has been eliminated.

CHEVROLET TRUCK 4-SPEED SYNCHRO-MESH

Ch vr l t Trucks ½, ¾, 1, 1½-T n (1962)

DESCRIPTION: Four speed, constant mesh, synchro-mesh (second, third & fourth), sliding gear (low reverse), of same design as used on previous models.

REMOVAL OF TRANSMISSION: Drain lubricant, then remove parking brake lever. *NOTE - Not necessary to r mov parking brak l ver on Series 10 Trucks.* Remove propeller shaft. Slide open end of Tool J-8109 over shift lever and engage lugs of tool in open slot of retainer, then press down on tool and turn it to left to disengage lugs on retainer and remove shift lever. Remove screws and slide steering column jacket grommet up jacket, then remove accelerator pedal and floor mat. Remove transmission cover. On Forward Control models, remove front and rear floor pans. On all models, remove speedometer cable at transmission. Remove two upper transmission attaching bolts and install guide pins, J-1126, then remove flywheel lower pan and lower transmission attaching bolts. Slide trans straight back on guide pins until clear of clutch assembly and remove transmission.

OVERHAUL: *S "Ch vrolet Truck 4-Speed Helical G ar (Synchro-m sh) in Transmission Section of Manual and not th following:*

Third G ar Mainshaft B aring Installation: To insure proper initial lubrication when installing third gear mainshaft bearing, it is important to place grease on that area of mainshaft on which the bushing will be placed.

Design Changes: A needle bearing replaces the roller bearing and spacer at front countergear position. New design ball bearings are used at clutch gear, mainshaft rear bearing, and rear countergear positions. A spline lock feature is used for third and fourth gear clutch assembly. A new disc-shaped magnetic chip collector is bonded to inside of transmission case.

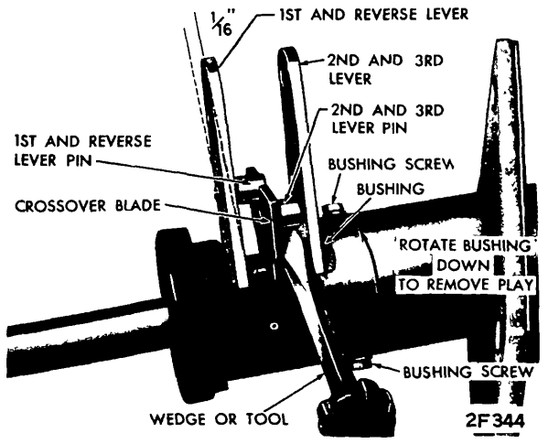
►*COUNTERGEAR FRONT BEARING INSTALLATION NOTE:* This bearing cannot be installed with Tool J-994. Install bearing flush with front of transmission case by tapping or pressing on a steel plate or other flat surfaced tool positioned to cover entire front face of bearing assembly. If a bearing that is intended to be re-used is removed from case, it should be tapped out of case using a tool that will provide full circle contact on rim of bearing assembly rear face. *Distortion of bearing will result if bearing is n t removed and installed as directed.*

CHRYSLER CORP. 3-SPEED SYNCHRO-MESH

D dg & Plym uth 6 Cyl. & V8 (1962)
Lanc r & Valiant (1962)

►*TRANSMISSION LUBRICATION NOTE: SAE-80 Multi-Purpos G ar Lubricant r Automatic Transmission Fluid Typ "A" (Suffix "A") may be used.*

DESCRIPTION: Transmission is same design as used on corresponding previous models.



►*OPTIONAL SYNCHRO-MESH TRANSMISSION NOTE:* An optional three-speed heavy duty transmission identified by the breather being located on top of transmission case, and by a riased hump at front cover, is available on some models. *See "Chrysler Corp. Heavy Duty 3-Sp d Synchro-m sh" in this section.*

REMOVAL OF TRANSMISSION: Drain lubricant, remove propeller shaft, speedometer housing and cable, then disconnect parking brake cable and backup light switch wires. Install a suitable support under engine and raise engine slightly. Remove rear support crossmember attaching bolts. Support transmission with a jack and remove bolts attaching transmission to clutch housing. Slide transmission to rear until pinion shaft clears clutch disc before lowering transmission, then remove from under car.

OVERHAUL: *S 1960 Final Data, Page 407, or later Manual editi n and not th following.*

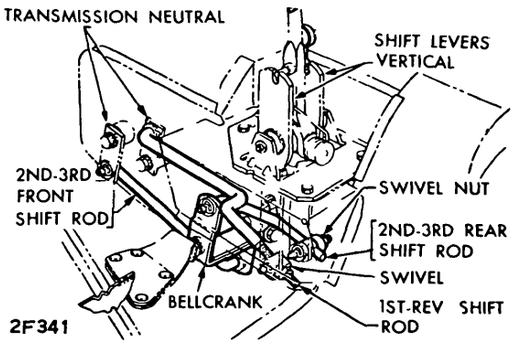
S c nd Sp d G ar Endplay: .002-.011".

TRANSMISSION CONTROL ADJUSTMENT: With 2nd and 3rd control rod disconnected from lever on end of steering column and 1st-reverse control rod disconnected from lever on transmission, position both levers on transmission in neutral. *CAUTION - Make sure n utral d t nt balls are properly engaged.* Check axial freedom of shift levers in steering column. If outer end of levers move axially more than 1/16", loosen the two upper bushing screws and rotate plastic bushing (downward) until all freeplay of levers is removed, then tighten bushing screws securely. Install a wedge or suitable tool between crossover blade and 2nd-3rd lever, so that crossover blade is engaged with both lever crossover pins. Adjust swivel on end of 2nd-3rd control rod until stub shaft of swivel enters hole in steering column lever, then secure swivel to lever and tighten locknut to 70 inch lbs. *NOTE - During the above adjustment, 2nd-3rd shift control rod should also be adjusted to position selector lever at steering wheel so it is 5° (116" wheelbase cars), 10° (106" wheelbase cars) above horiz ntal (transmission in neutral).* Slide clamp and swivel (on end of 1st-reverse shift rod) until swivel stub enters hole in transmission lever and secure in position. Determine mid-backlash position in linkage and tighten clamp bolt to 100 inch lbs. Remove positioning wedge or tool from crossover blade and lever, then move selector lever through all positions to check adjustment and crossover smoothness.

STEERING COLUMN SHIFT ASSEMBLY

CHRYSLER CORP. 3-SPEED HEAVY DUTY SYNCHRO-MESH

Chrysl r 300 (1962)
Chrysler Newport (1962) Std.
Dodge Custom 880 (1962) Std.
Dodge (Exc. Custom 880) & Plymouth (1962) Hvy Duty
Plymouth (1962) Hvy. Duty



►*TRANSMISSION PRODUCTION CHANGE & SERVICE REPLACEMENT PARTS CAUTION:* Transmissions built after Dec. 18, 1961, identified by the building date 12-18-61 (or later), have "rolled" splines at forward end of transmission mainshaft, instead of the milled splines formerly used. As a result of this change, transmission mainshaft, clutch gear, and clutch gear snap ring are not interchangeable individually with their respective earlier parts. However, the new parts are interchangeable with other transmission parts provided all three new parts are replaced at the same time.

DESCRIPTION: Transmission is same design as used on corresponding previous models.

REMOVAL & OVERHAUL: *See 1961 Final Data, Page 399.*

TRANSMISSION CONTROL ADJUSTMENT: Dodge & Plymouth (Steering Column Mounted) - See "Chrysler Corp. 6 & V8 Std. 3-Speed Synchro-mesh" in this section.

Chrysler 300, Newport & Dodge Custom 880 (Floor Mounted): Remove screws holding upper boot and retainer to floor pan and slide boot up on gearshift lever. Disconnect shift rods at lower end of shift assembly levers, then place shift levers on transmission in neutral position. With crossover pin in shift control lever engaged in 2nd-3rd lever, the gap from crossover pin to 1st-reverse lever should not exceed .055". Clip corssover pin tool over 2nd-3rd end of crossover pin so that pin engages both shift levers. *NOTE - A suitable wedge can be used at the same location to engage crossover pin in both levers if tool is not available.* With shift levers on shift assembly vertical and shift levers on transmission in neutral position, adjust swivel on end of 1st-Reverse shift rod so it freely enters hole in shift lever. Repeat this procedure for 2nd-3rd shift lever-to-bellcrank rod. When adjustment completed, tighten swivel nut to 20 inch pounds, then remove crossover pin tool or wedge. Replace upper boot and check shift in all positions

FLOOR MOUNTED GEARSHIFT ASSEMBLY

FORD & MERCURY 3-SPEED SYNCHRO-MESH

Ford Fairlane & Galaxie (1962)
Mercury Meteor & Monterey (1962)

►*1962 MERCURY MONTEREY HARD SHIFTING INTO INTERMEDIATE CORRECTION:* This condition may be caused by interference between intermediate and high shift rod and clutch release lever. If correct adjustment of shift linkage (see below) does not eliminate the interference, remove high-intermediate shift lever from transmission and place in a vise, then bend lower end of lever about 3/16" outward (in relation to transmission case), reinstall and adjust.

►*1962 & EARLIER COUNTERGEAR & THRUST WASHER REPLACEMENT CAUTION:* Beginning approximately July 1961, a new countergear without oil grooves in thrust faces entered production and for service replacement on earlier models. A new thrust washer, Part No. C1AR-7119-A, having oil grooves must be used with the later type countergear. For service replacement, there must be oil grooves in either gear thrust face or thrust washer surfaces. Do not reassemble unless one surface has oil grooves.

DESCRIPTION: Three-speed synchro-mesh transmission similar to design used on previous models except for the new interlock mechanism that prevents shifting transmission until clutch is fully disengaged.

REMOVAL OF TRANSMISSION: Drain transmission and remove propeller shaft. Disconnect speedometer cable and shift rods at transmission. On cars with overdrive, disconnect overdrive wires and control cable. Disconnect parking brake cable and support engine with a jack, then remove engine rear support and crossmember as a unit. Remove transmission-to-flywheel housing attaching bolts and install two guide pins in lower bolt holes. Move transmission to rear until it clears clutch assembly and remove from car.

ADJUSTMENT: *NOTE - Clutch linkage and pedal height must be correctly adjusted before adjusting transmission interlock.*

Gearshift Linkage: With transmission in neutral, loosen locknut on each lever (at lower end of steering column). On Fairlane & Meteor, center levers in retainer on steering column (selector lever should be approximately 10° above horizontal), then tighten lever locknuts. On Galaxie, position selector lever horizontal. On Monterey, position selector lever 7½° above horizontal. Tighten high intermediate rod, then tighten low-reverse rod in a position so that cross-over operation is smooth.

Clutch Pedal Linkage & Height: Disconnect interlock shift rod at interlock shift lever, then measure total travel of clutch pedal. *NOTE - Measure distance from steering wheel to clutch pedal with pedal fully released, then again with pedal fully depressed.* If travel is not within specifications, move clutch pedal bumper and bracket up or down until travel is correct (6 5/8-6 7/8"). *CAUTION - Always check and adjust total travel before checking free travel.* With clutch pedal against its bumper (pedal released), measure distance between assist spring eye centers which should be 10". With engine idling, depress clutch pedal just enough to take up the free travel and note reading on tape (distance between steering wheel and clutch pedal). The difference between this reading and the reading where pedal is released should be 15/16-1 1/16". If not within specifications, adjust clutch pedal-to-equalizer rod. To increase free travel, loosen rearward adjusting nut and tighten forward nut. To reduce free travel, loosen forward nut and tighten rearward nut. Tighten both nuts against trunnion after adjustment. With transmission in neutral and interlock pawl snugly engaged, connect interlock rod. As a final check, measure pedal free travel with transmission in neutral and engine running at 3000 RPM. If free travel at this speed is not ½", readjust clutch pedal-to-equalizer rod as necessary. *CAUTION - Free travel must be exactly as specified.*

Interlock (On Transmission): With interlock shift rod disconnected at equalizer bar (Fairlane & Meteor); at interlock lever (Galaxie & Monterey), proceed as follows: Place transmission in neutral, then loosen bolts attaching notched plate (Fairlane & Meteor), pawl plate (Galaxie & Monterey). Position plate so it fits snugly into shift lever projection or notch, then tighten plate bolts. Shift transmission into low and into neutral to check operation of interlock. Adjust length of interlock rod so that low-reverse shift lever is engaged by interlock until clutch pedal enters overtravel area. If necessary, readjust plate on interlock lever for a snug fit. With transmission in neutral, connect interlock rod and check shift linkage operation. *NOTE - If interlock is properly adjusted, it should be impossible to clash low-reverse transmission gears with clutch pedal fully released.*

OVERHAUL: *See 1960 Final Data, Page 410, or later Manual edition and note the following:*

Bolt Torque Specifications: As follows:

Location	Ft. Lbs. Torque Ford	Mercury
Extension Housing-to-Case	37-42	42-50
Shift Cover-to-Case	12-15	14-19
Shift Lever-to-Shaft	12-15	14-19
Front Bearing Retainer	12-15	19-25

COMET & FALCON 3-SPEED SYNCHRO-MESH

Comet (1962)
Falcon (1962)

DESCRIPTION: Three-speed, constant mesh, synchromesh (second & high), sliding gear (low & reverse), All helical gear type of same design used on previous models.

REMOVAL OF TRANSMISSION: Remove propeller shaft then disconnect speedometer cable and gearshift rods at transmission. Remove extension housing-to-support bolt (on Falcon Station Wagon, remove nuts from insulator retaining bolts and remove brake cable support). Place a jack under flywheel housing and raise rear of engine slightly. *NOTE - On Falcon Station Wagon, loosen two engine rear support bolts on right side and remove bolts from left side.* Remove transmission mounting bolts and install two guide pins in lower holes, then move transmission to rear to clear input shaft and guide pins, and remove from car. *NOTE - To prevent oil leakage after propeller shaft removal, install Tool T60K-7657-A (Falcon), 7657-G (Comet). Tool must be removed before transmission can be removed from car.*

OVERHAUL: *See 1960 Final Data, Page 406, or later Manual edition.*

FORD TRUCK 3-SPEED SYNCHRO-MESH

Ford Trucks (1962)

DESCRIPTION: Same design as used on previous models.

REMOVAL OF TRANSMISSION: Drain lubricant, disconnect speedometer cable, propeller shaft, and gearshift linkage at transmission. On propeller shaft type parking brake, disconnect cable clevis at cam and remove cable conduit clamp. On models with overdrive transmission, disconnect wires and control cable at transmission. On 4—Wheel Drive models, remove transfer case shift lever bracket from transmission. On all models, remove transmission attaching bolts and install guide studs, then pull transmission rearward until input shaft clears clutch assembly and remove transmission.

OVERHAUL: *See "Ford Truck 3-Speed Light & Medium Duty" or "Ford Truck 3-Speed Heavy Duty" in Transmission Section of Manual.*

FORD TRUCK 4-SPEED SYNCHRO-MESH

Ford Trucks (1962)

DESCRIPTION: Same design as used on previous models.

REMOVAL OF TRANSMISSION: On all models except Tilt—Cab, remove floor mat and accelerator pedal, then remove transmission cover plate. Disconnect parking brake and remove gearshift housing. On Tilt—Cab models, disconnect parking brake rod at transmission and remove rear cross—shaft housing. On all models, disconnect drive shaft and speedometer cable, then remove two upper transmission attaching bolts and secure jack to transmission. Remove remaining transmission attaching bolts and slide transmission rearward to clear clutch assembly and remove from truck.

OVERHAUL: *See "Ford Truck 4-Speed (Synchro-mesh)" in Transmission Section of Manual.*

FORD ECONOLINE TRUCK 3-SPEED SYNCHRO-MESH

Ford Econoline Trucks (1962)

DESCRIPTION: Same design transmission as used on previous models.

REMOVAL OF TRANSMISSION: Drain transmission and remove propeller shaft, then disconnect speedometer cable and shift rods at transmission. Support engine with a jack and remove rear support anchor bolt and nut, then lower engine to clear support. Remove transmission attaching bolts and move transmission to rear to clear clutch assembly and remove from truck.

TRANSMISSION CONTROL ADJUSTMENT: Loosen trunnion nuts at transmission shift levers enough to allow rods to slide in trunnions. Insert a ¼" drill rod through pilot hole in shift tube floor mounted bracket until it just enters adjustment hole in both upper and lower shift lever, then place transmission shift levers in neutral position and tighten trunnion nuts. Remove ¼" rod and check operation in all shift positions.

OVERHAUL: *See 1961 Final Data, Page 402.*

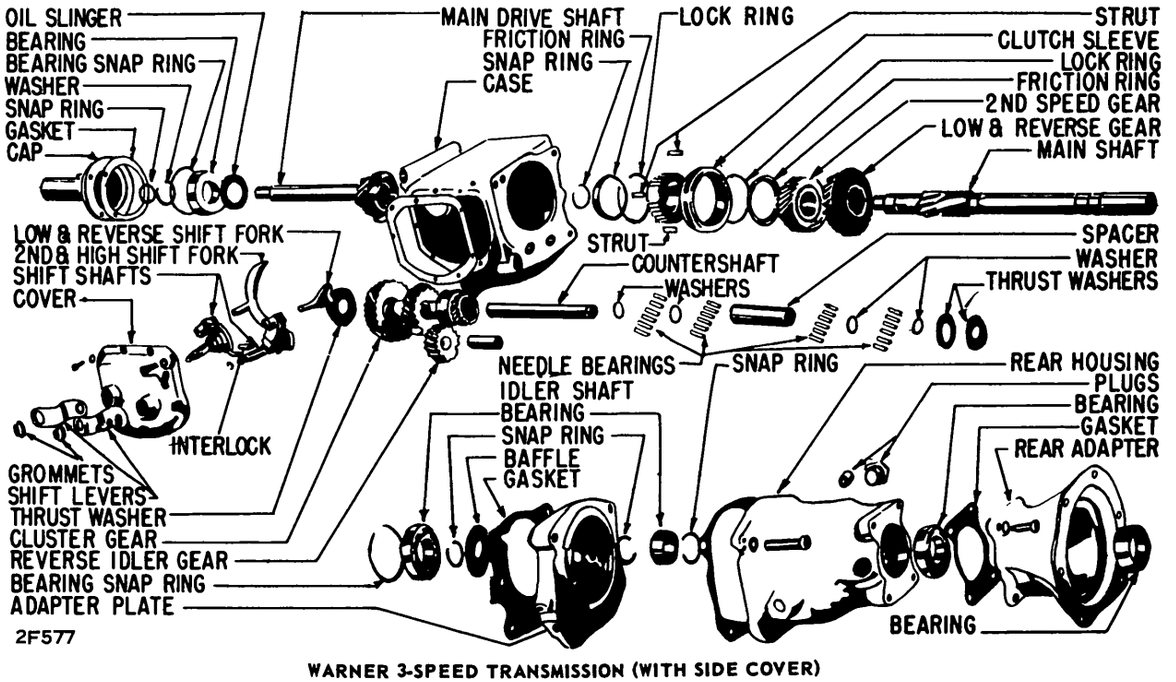
►*NOTE: Transmission model number is cast in side of transmission case.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 STUDEBAKER REMOTE CONTROL SHIFT TUBE ASSEMBLY PRODUCTION CHANGE & LINKAGE ADJUSTMENT PROCEDURE CHANGE:* Beginning with Car Serial No. 62S-14689 (6 Cyl.) and No. 62V-10406 (V8), a new shifter tube assembly which requires different shift linkage adjustment, is being installed in production. *See "Transmission Control Adjustment" below.*

►*1962 STUDEBAKER T-86 & T-96 TRANSMISSION SYNCHRONIZER BLOCKER RING PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* New blocker rings, Part No. 1555429 having three machined grooves across face of clutching surface are being used in production and may be used for service replacement on previous transmissions.



►*1962 WILLYS 4-WHEEL DRIVE TRANSMISSION MAINSHAFT NUT TIGHTENING CAUTION:* When attaching transfer case input shaft to transmission mainshaft, tighten the slotted mainshaft nut to a minimum of 80-100 ft. lbs. then tighten nut just enough further to line up slots in nut with cotterpin holes in mainshaft. **Do not tighten nut beyond this point.**

DESCRIPTION: Same design as used on previous models.

TRANSMISSION REMOVAL: Rambler – On Rambler American, disconnect rear spring front brackets from floor pan, brake hose bracket, and brake cable at equalizer. On other models, disconnect brake tube bracket from floor pan, parking brake cable at equalizer, and cable housing at torque tube bracket, then disconnect torque tube from transmission. On all models, disconnect shock absorber at lower mounting and move rear axle assembly to rear, disengaging drive line from transmission. Disconnect shift levers, speedometer cable (and overdrive cable and wires if so equipped). Remove transmission attaching bolts and install two guide pins, Tool J-1434, in upper bolt holes, then slide transmission back to clear clutch assembly

Studebaker: Disconnect propeller shaft at rear joint flange and slide it out of transmission housing. Disconnect rods at transmission levers, and speedometer cable at transmission housing, then remove speedometer pinion. Remove clutch operating shaft, bracket, and bearing at transmission, then support transmission and remove attaching bolts. Move transmission back to clear clutch assembly and remove from car.

Willys (2-Wheel Drive): Disconnect shift rods at transmission levers, and speedometer cable at transmission

WARNER 3-SPEED TRANSMISSION (WITH SIDE COVER)

(and overdrive cable and wires if so equipped). Disconnect propeller shaft at front universal. Remove support at rear of overdrive and take out overdrive governor. Position jack under engine for support and remove frame crossmember with insulators attached. Back out transmission attaching screws as far as possible yet support transmission, then pull transmission back to provide an opening between it and bell housing. Insert a long screwdriver through opening in side of bell housing and pry clutch release fork from engagement with release bearing carrier. Remove transmission attaching screws and pull transmission back to clear bell housing, then remove from car.

Willys (4-Wheel Drive): Drain transmission and transfer cases, then remove access cover from floor pan and remove gearshift housing (Exc.) models with remote control). On Remote control models, disconnect shift linkage at transmission. On all models, remove transfer case shift lever pivot pin, shift levers and springs. *NOTE – If equipped with power take-off, remove shift lever plate and lever.* Disconnect propeller shafts at transfer case (disconnect end of power take-off shaft at transfer case if so equipped). Disconnect speedometer cable at case, then disconnect hand brake cable. On Forward Control models, disconnect clutch release cable at bellcrank. On all models, place jacks under transmission and engine and remove nuts attaching rear mounting to frame crossmember, then remove transfer case snubbing rubber bolt at crossmember. Remove engine rear support crossmember, then remove transmission attaching bolts. Force transmission to right side to disengage clutch control lever tube ball joint, then lower jacks under engine and transmission and slide transmission and transfer case toward rear until clutch shaft clears bell housing.

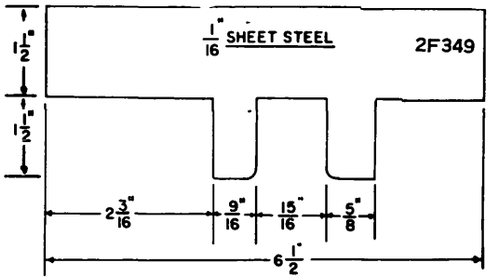
OVERHAUL: *See 1959 Final Data, Page 398, or later Manual edition.*

TRANSMISSION CONTROL ADJUSTMENT: Adjust various systems as follows:

►*RAMBLER AMERICAN "E-STICK CLUTCH & SHIFTING NOTE: For adjustment of this unit, see "Rambler "E-Stick" Automatic Clutch".*

►*STUDEBAKER SHIFT LINKAGE ADJUSTMENT CHANGE: Shift linkage adjustment procedures are different for early and later cars. See below.*

►*RAMBLER SHIFT LINKAGE ADJUSTMENT NOTE: "Ainsworth" type and "Douglas" type shift systems are used. Adjustment procedures are different.*



RAMBLER: Ainsworth Type - *NOTE - On this type unit, shift levers are actuated by a shift gate slot engaging pin on shaft lever.* Remove pins from gearshift rod trunnions and transmission levers, and disconnect rods. Line up both levers at lower end of steering column and insert a 7/16" screwdriver blade between upper shift lever and shift gate, then pry gate downward to align lower lever pin with upper lever pin and lock both ends of lever pins in slot in shift gate. Insert Tool J-8698 between second-high shift lever and shift gate and remove screwdriver. Move operating levers and aligning tool down until bottom edge of tool contacts cutout section of jacket tube (this is neutral position). Adjust trunnions on rods so they will freely enter into transmission shift levers (with shift levers in neutral). Install retaining pins and washers and lubricate trunnions with light oil, then remove tool and lubricate operating levers, lever spacer and nylon bushing at bottom of steering column tube. Check gearshift operation in all positions.

CONTINUED ON NEXT PAGE

WARNER 3-SPEED SYNCHRO-MESH (Cont.)

Douglas Typ : *NOTE - On this typ unit, shift l v rs actuated by lugs on shifter tube engaging in shift levers.* Raise car on a hoist and disconnect shifter rods at transmission levers, then place transmission levers in neutral detent position. Install aligning tool J-9230 (if necessary, fabricate tool locally as indicated in illustration, bending it into a 2 1/8" circle to fit around jacket tube) on bottom of jacket tube to hold both operating levers in neutral position. Adjust trunnions on both shifter rods to line up with holes in transmission shift levers, then secure trunnions with flat washers and cotter pins. Remove tool and check shift lever operation.

STUDEBAKER: *NOTE - On early cars before Serial No. 62S-14689 and 62V-10406, check to make sure that a spring washer is located between large flat washer on upper end of shift rods and remote control insulators. If spring washers are missing, install Spring Washer Part No. 192057, between flat washers and lever insulators with concave side of spring toward flat washer.* Disconnect both rods at transmission levers , then place levers in neutral position. Index hand lever support at upper end of steering column by placing a pencil mark above hand lever support socket, then locate center of travel by moving shift lever to extreme left and place a pencil mark on steering jacket upper bracket opposite index mark on hand lever support. Repeat this indexing procedure on the right hand side, then place hand lever index mark at the mid-position between the two marks on upper bracket and mark this position on upper bracket to indicate neutral. With second and high shift lever engaged (hand lever in neutral away from steering wheel), adjust second and high shift rod so neutral marks on hand lever support and upper bracket line up. *NOTE - Do not hold hand lever while making this adjustment.* Move shift lever to second, to high, then back to neutral and recheck adjustment. Neutral marks should line up with hand lever at rest and transmission in neutral. With an assistant holding lever in neutral, and with low and reverse shift lever engaged (hand lever up toward steering wheel), adjust low and reverse shift rod so that "neutral" index marks on hand lever support

RAMBLER SHIFT ADJUSTING GAUGE

and upper bracket line up. Adjust rod so there is no freeplay and clevis pin enters shift lever with a slight drag on forward side of hole (Cars before Serial No. 62S-14689 & 62V-10406); enters shift lever freely (Cars after above serial numbers). Secure all clevis pins and tighten clevis locknuts, then check shift operation in all positions. *NOTE - On early cars (before Serial No. 62S-14689 & 62V-10406), if resistance is encountered at crossover point from low to second, shorten low and reverse rod as necessary, up to 10 turns from neutral index.*

WILLYS: 2-Wheel Drive Models - Place shift levers in neutral position and disconnect both control rods at transmission levers. On all models, except those with 6-226 Engines, install a ¼" rod through aligning holes in steering column. On models with 6-226 Engine, position Tool W-259 on slot and insert a 3/16" rod through steering colhmn shift levers and index rod in slot at top of gauge. On all cars, adjust steering column end of shift rods so that lower ends will enter transmission levers freely. If shift pin strikes edges of slot in lever clutches, disconnect low-reverse rod at transmission lever (rear lever) and lengthen or shorten rod slightly so pin will engage both slots freely.

Forward Control Models: With gearshift lever in neutral, loosen jam nut at rear end of remote control rods, then remove rods from transmission shift levers. Make sure levers on transmission are in neutral position, then adjust length of control rods so they easily slip into holes in transmission shift levers. Replace cotter pins and tighten jam nuts and check shift for smooth operation.

OLDSMOBILE (EXCEPT F-85) 3-SPEED SYNCHRO-MESH

Oldsmobile, Exc. F-85 (1962)

DESCRIPTION: Same design transmission as used on previous models.

REMOVAL OF TRANSMISSION: Drain transmission and disconnect control rods and speedometer cable at transmission. Remove propeller shaft, then remove four transmission-to-clutch housing bolts and slide transmission rearward until main shaft clears clutch housing. Remove transmission from under car.

TRANSMISSION CONTROL ADJUSTMENT: Shift Lever Adjustment - Place outer lever on transmission in second gear position (outer lever forward, inner lever to rear), then disconnect shift rod from steering column lower shift lever at clevis. Hold steering column lower shift lever upward against its stop in mast jacket, then install clevis pin through lower shift lever from bottom side and adjust clevis so it slides freely over pin. Shorten shift rod by turning clevis **5½ turns.** Install clevis pin and cotter pin, and tighten clevis locknut.

Cross Shift Linkage Adjustment: Disconnect cross shift rod from steering column cross shift lever. With transmission selector lever on transmission against its stop (rearward), adjust upper clevis so that clevis pin will easily enter hole in cross shift lever at lower end of steering column. Remove clevis pin and lengthen rod by turning clevis **5 turns.** *NOTE - This should bring selector lever at steering wheel within 4 7/16" ±1/4" of front face of wheel.* Install clevis pin and cotter pin, then tighten clevis locknut.

OVERHAUL: *See 1957 Final Data, Page 369, or later Manual edition.*

WARNER 4-SPEED (WILLYS) SYNCHRO-MESH

Willys 4-Wheel Drive Models (1962)

DESCRIPTION: 4-Speed synchro-mesh (2nd, 3rd, & 4th), sliding gear (low & revefse). Low & reverse gears are spur type; others are helical type. *NOTE - 4-Speed can be identified by its length of 11 7/8".*

DISASSEMBLY: Remove transmission-to-transfer case adapter plate and gasket, then remove oil seal from plate. Proceed as follows:

1) Remove control housing assembly from top of transmission case, then mark blocking rings, synchronizer gears, and synchronizer sleeves on both synchronizing units with lacquer or an electric pencil to insure installation in original positions. Remove transmission-to-bellhousing adapter plate and front bearing retainer.

2) Slide low speed gear toward rear of transmission case, then disengage reverse gearshift arm from reverse idler gear and remove arm from case mounting pin. Move low speed gear back into neutral position, then remove snap rings from forward end of main drive gear shaft and outer race of transmission front bearing. Remove front bearing with a bearing puller, and remove oil slinger.

3) Remove snap ring from outer bearing race of transmission rear bearing, then drive main shaft rearward by striking end of main drive gear shaft with a lead hammer. Install bearing puller plates and remove rear bearing. Separate main drive assembly from main drive gear being careful not to lose any of the main shaft pilot rollers. Remove main shaft assembly out of case, then remove main drive gear from case and remove main shaft pilot rollers.

4) Mark relation between synchronizer gears and splines on main shaft, then remove snap ring which holds third and high synchronizer assembly on main shaft. Remove snap ring holding second speed synchronizer assembly on main shaft, then slide second speed synchronizer and second speed gear off shaft. *CAUTION - When sliding second speed gear off shaft, be careful not to lose any of the bearing rollers.* Remove two remaining snap rings, spacer and thrust washer from main shaft.

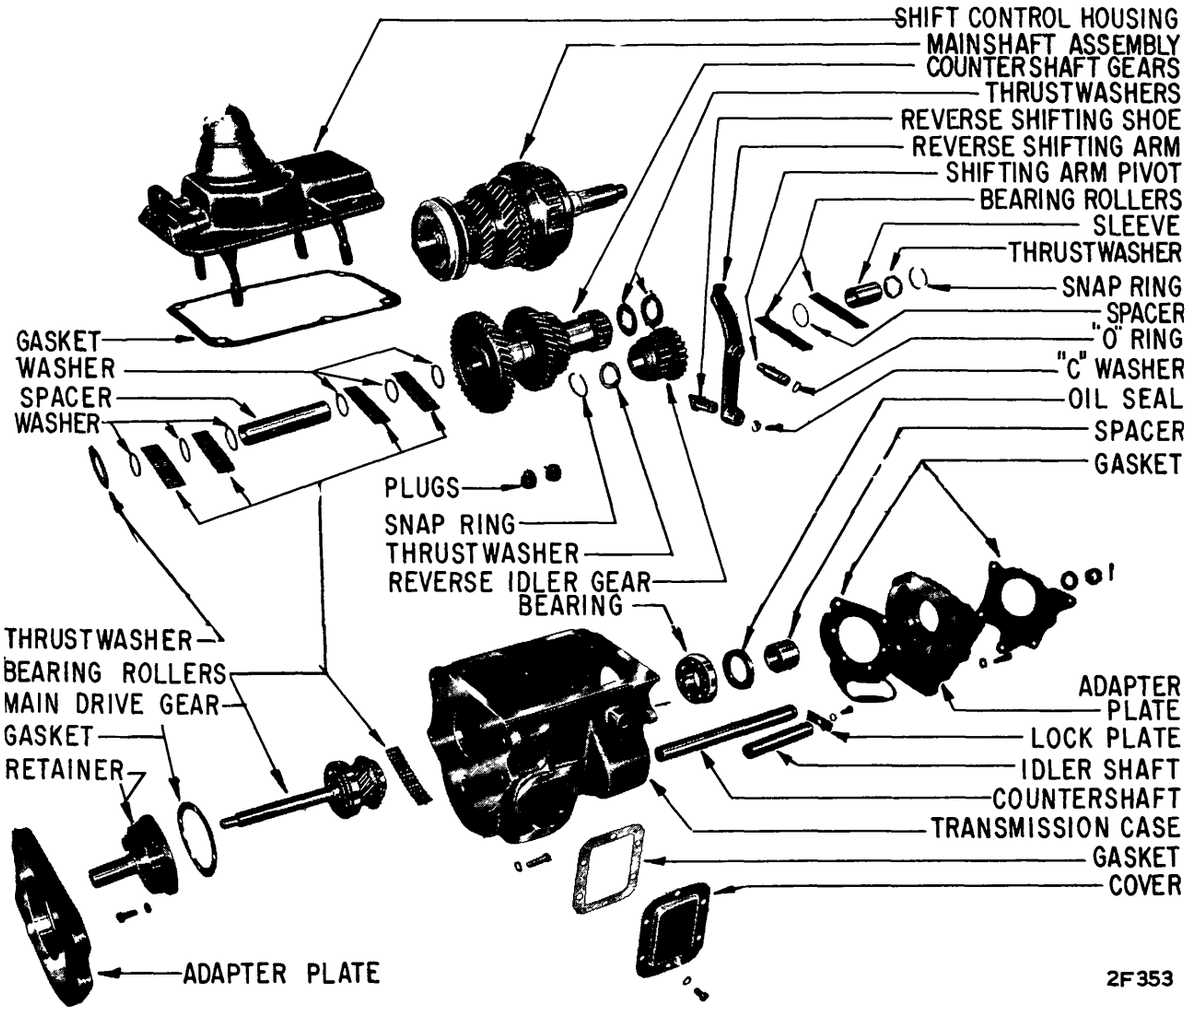
5) Remove two large lock rings holding synchronizer clutch hub in direct and third clutch sleeve and push hub out of sleeve. If second speed synchronizer assembly is to be disassembled, wrap the assembly in a cloth to prevent losing the lock balls and springs, then push gear out of sleeve in the direction opposite the shift fork groove. Remove cloth and lift balls, springs and plates out of the gear.

CONTINUED ON NEXT PAGE

WARNER 4-SPEED (WILLYS) SYNCHRO-MESH (C nt.)

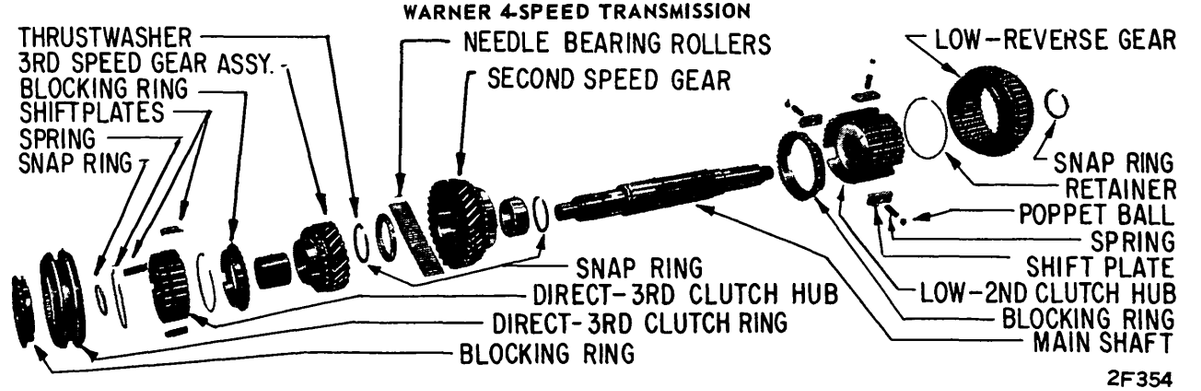
6) Remove lock plate for countershaft and idler gear shaft, then use a pry bar in slot of reverse idler gear shaft to loosen the shaft. Slip reverse idler gear shaft out of housing and gear and remove idler gear assembly from transmission case.

7) To remove countershaft, use a heavy brass drift and drive countershaft towards rear of case. When countershaft end is just about even with inside of transmission case, use a dummy shaft to force it the rest of the way. *NOTE - A dummy shaft can be made from a piece of 1 1/8" diameter rod cut to 9.850" long. Break sharp edges with a file.* Keep dummy shaft in contact with countershaft at all times to prevent dropping bearing rollers or thrust washers. With dummy shaft in position, place transmission case on its side and carefully roll countershaft gear cluster out of case.



8) Complete disassembly by removing dummy shaft, thrust washers, four sets of bearing rollers, and spacer.

9) To disassemble reverse idler gear assembly, remove one of the snap rings and tap out the washer, both sets of bearing rollers, center spacer, and sleeve. Remove remaining snap ring.



10) On floor mounted gearshift models if it is necessary to disassemble transmission control housing, proceed as follows: Remove screws from shifter forks, then remove expansion plugs from front and rear of gearshift lever base. Remove center (third & direct) shifter rail first, driving it out rear of lever base. As rail is withdrawn, remove interlock pin from crossover hole in rail, then, before rail is completely removed, place a finger over hole to prevent loss of poppet ball and spring. Remove low & second shift rail in same manner. Remove shifter rail lock balls and springs, then with a piece of wire, push two shifter rail interlocks out of pockets in center section of gearshift base. A spring loaded plunger located in end of reverse shifter rail prevents shifting into reverse accidentally. If necessary to replace this part, remove cotter pin from end of shifter rail assembly and at the same time hold finger over hole to prevent loss of spring. Shake out ball and spring and remove plunger. Compress spring until "C" washer groove just clears end of casting and remove "C" washer.

11) On Forward Control models if it is necessary to disassemble transmission control housing, proceed as follows: Place shift rails in neutral position and remove lock screws from both gearshift forks and the reverse shift rail end. Remove expansion plugs from rear of control housing, then remove snap rings from 1st and 2nd shift rail and drive shift rail out of housing. *NOTE - Before shift rail is removed from center section of housing, place a finger over the hole to prevent loss of poppet ball and spring.* Remove 3rd & 4th and reverse shift rails in same manner. Remove poppet balls and springs. With a piece of wire, push the two shift rail interlock plungers out of pockets in center section of housing.

REASSEMBLY: Reverse disassembly procedures.

WARNER 4-SPEED TRANSMISSION

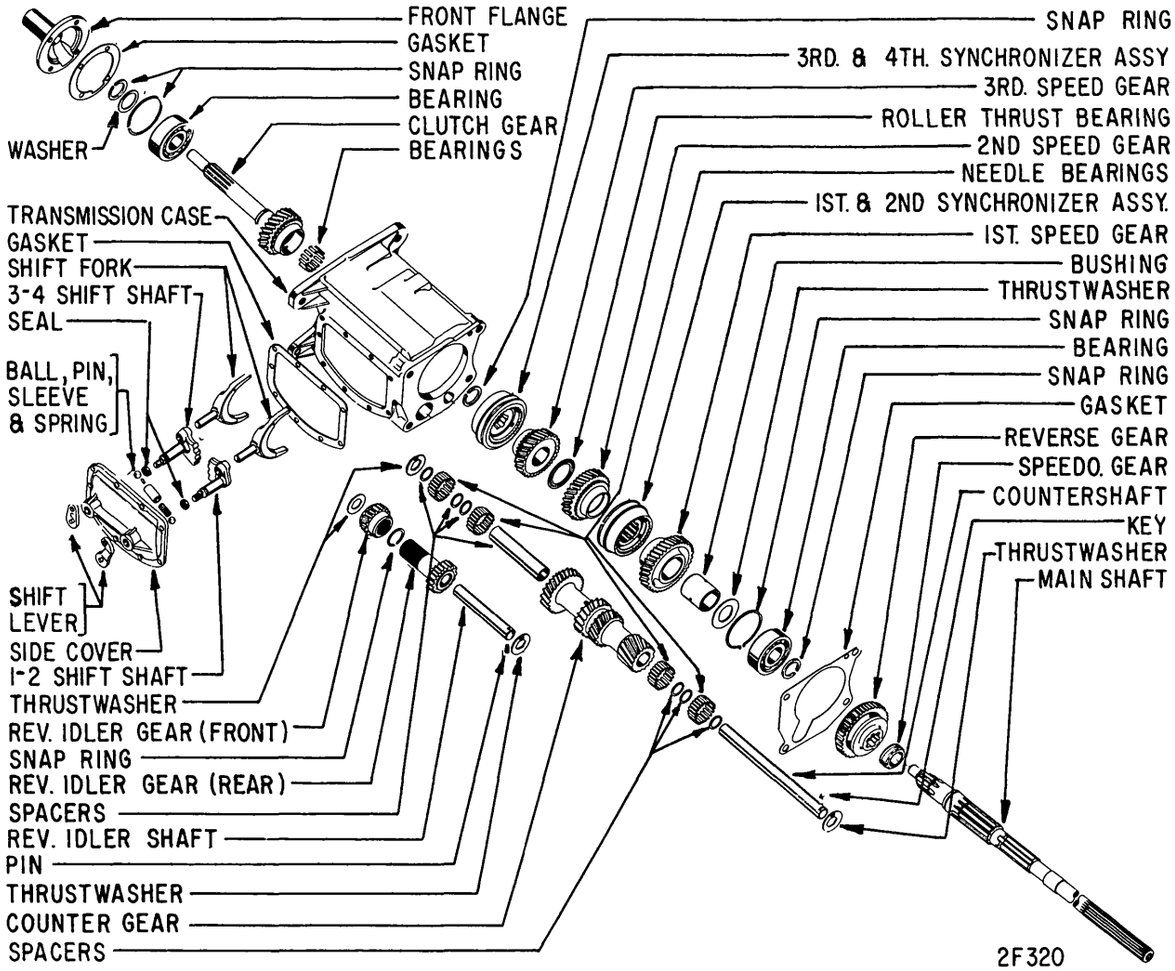
WARNER 4-SPEED SYNCHRO-MESH

Buick Special (1962)
Chevrolet Pass. Cars (1962)
Chevy II (1962)
Corvette (1962)
Ford Galaxie (1962)
Mercury Monterey (1962)
Oldsmobile F-85 (1962)
Pontiac (1962)
Studebaker (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 PONTIAC HARD 3-4 SHIFT CORRECTION:* If the hard shift condition continues to exist after correct gear shift linkage adjustment (see *"Transmission Controls" below),* drain transmission and remove side cover. Check for excessive wear on shoulders of forware speed shift fork and for binding of poppet springs and detent balls located between shifter shaft and detent plate assembly. If shift fork is worn excessively or if detent balls fail to seat properly, replace necessary parts. In the event shift fork is not excessively worn, check to make sure 3rd and 4th gear synchronizing rings operate freely and are not locked up or cocked.



►*1962 PONTIAC CAR SERIAL NUMBER NOTE (CARS WITH 4-SPEED SYNCHRO-MESH):* Car serial numbers are stamped on top of 4-Speed transmission case to facilitate recovery in event car or transmission is stolen.

►*1962 STUDEBAKER CLUSTER GEAR AND MAIN DRIVE PINION REPLACEMENT CAUTION:* Two transmission models are used in production and differ only in number of teeth in main drive pinion and in cluster gear. If replacement is necessary, make sure proper part is installed. Cluster Gear, Part No. 1553083 must be used with Main Drive Pinion, Part No. 1553088 (27 Teeth). Cluster Gear, Part No. 1555476 must be used with Main Drive Pinion, Part No. 1555475 (25 Teeth).

►*1962 STUDEBAKER PROPELLER SHAFT INTERFERENCE WITH FLOOR PAN (J8 & Y8 MODELS) CORRECTION:* Remove the ¼" spacer washers which are installed between engine rear insulator and clutch housing.

DESCRIPTION: 4-speed helical gear type (except reverse), with constant mesh, synchro-mesh in all forward speeds. Sliding gear (reverse).

REMOVAL: Buick, Pontiac & Oldsmobile - Drain transmission, then remove boot retainer screws and slide boot over shift lever. Disconnect speedometer cable at transmission. Disconnect shift control rods from shift levers on transmission, then remove manual shift lever and bracket assembly from extension housing. Remove complete drive line assembly and support rear of engine. On Buick, remove transmission mounting plate bolts and washers, then remove support-to-underbody bolts and remove transmission support. On Pontiac, remove transmission extension bracket to crossmember retaining nuts. On all models, remove two top transmission-to-clutch housing bolts and insert guide pins in these holes. Remove lower transmission-to-clutch housing bolts and slide transmission straight back on guide pins (on Pontiac, tilt rear of transmission upward to disengage bracket studs from crossmember support). *NOTE - On long wheelbas Pontiac models it is necessary to remove crossmember support before removing transmission.*

WARNER 4-SPEED SYNCHRO-MESH TRANSMISSION

Chevrolet & Corvette: Disconnect speedometer cable at transmission, then disconnect shift rods at shift levers and remove shift assembly from extension housing. On all models except Corvette, remove bolts attaching center support to frame member, then remove propeller shaft and bearing assembly. On Corvette, disconnect propeller shaft at rear universal and remove it from transmission. On all models, support rear of engine and remove transmission support crossmember. Remove two top transmission-to-clutch housing bolts and install guide pins in these holes. Remove lower attaching bolts and slide transmission straight back on guide pins until shaft is clear of clutch assembly and remove transmission.

Ford & Mercury: Remove transmission gear shift lever boot retainer, then remove shift lever retaining bolts and remove lever from shift assembly. Remove propeller shaft and disconnect speedometer cable from extension. Disconnect parking brake cable at equalizer bar and support engine with a transmission jack. Remove bolts retaining extension housing to engine rear support, then raise rear of engine with transmission jack and remove crossmember and engine rear support as a unit. Support transmission on a jack and remove transmission-to-clutch housing bolts. Install two guide pins in lower bolt holes and slide transmission to rear until input shaft clears clutch housing. *CAUTION - Do not depress clutch pedal while transmission is removed.*

Studebaker: Drain transmission, then disconnect and remove shift assembly. Disconnect crossmember under transmission and slide it to rear along exhaust pipes for clearance. Disconnect propeller shaft at rear and remove from transmission. Remove speedometer and drive pinion from case, then remove transmission attaching bolts. Pull transmission to rear until shaft clears clutch assembly, and remove transmission from under car.

CONTINUED ON NEXT PAGE

WARNER 4-SPEED SYNCHRO-MESH (C nt.)

OVERHAUL

SPEEDOMETER DRIVEN GEAR: *(NOTE - This gear may be removed with transmission in car).*

Removal: Disconnect speedometer cable, remove lock plate-to-housing bolt and lockwasher, then remove lock plate. Insert screwdriver in lock plate slot in fitting and pry fitting, gear and shaft from housing. Pry "0" ring from groove in fitting.

Installati n: Install new "0" ring seal in groove in fitting and insert shaft. Hold assembly so slot in fitting is toward lock plate boss on housing and install in housing. Push fitting into housing until lock plate can be inserted into groove and attached to housing.

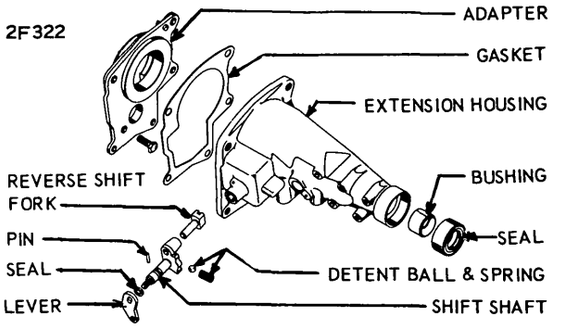
SIDE COVER: *(NOTE - Side cover can be removed with transmission in car after shift rods have been disconnected and transmission drained).*

Rem val: Remove nine bolts from side cover and remove side cover, gasket, and shifter forks.

Disassembly: Remove outer shifter lever clamp bolts and pull levers from shaft. Carefully push shifter shafts into cover, allowing detent balls to fall free, then remove shifter shafts. Remove interlock sleeve, interlock pin, and poppet spring.

R assembly: Install interlock sleeve and one shifter shaft. Place steel detent ball into sleeve followed by poppet spring and interlock pin. Start second shifter shaft into position and place second detent ball on poppet spring. Compress ball and spring with screwdriver and push shifter shaft fully in. With synchronizers in neutral and shifter forks in place, lower side cover into place. Install bolts (using sealer on lower right bolt), and tighten evenly.

MAINSHAFT OIL SEAL: *(NOTE - Seal may be removed with transmission in car).*



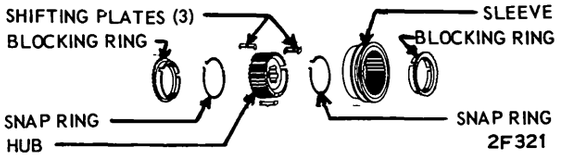
R m val: Remove nuts and bolts retaining rear universal joint trunnion bearings to drive flange. Lower rear end of propeller shaft and slide front flange off mainshaft. Remove mainshaft oil seal using a suitable tool.

Installation: Press new seal into place in extension *(CAUTION - Do not force seal against seat in extension).* Install propeller shaft and connect rear universal joint.

TRANSMISSION CASE: Disassembly - Remove side cover (above), remove front bearing retainer bolts, remove retainer and gasket. Drive retainer pin from reverse shifter lever boss and pull shifter shaft out far enough to disengage shifter fork from reverse gear. Remove bolts attaching extension case to rear bearing retainer plate, then tap extension with a soft hammer, in a rearward direction. When reverse idler shaft is out as far as it will go, move extension to left so reverse fork clears reverse gear and remove extension case and gasket. Remove rear reverse idler gear and tanged thrust washer and front reverse idler gear and flat thrust washer. Remove speedometer gear, using a puller, and reverse gear. Remove self locking bolt attaching rear bearing retainer to transmission case, then carefully remove entire mainshaft assembly. Unload needle bearings from clutch gear and remove fourth speed synchronizer blocker ring. Remove clutch gear retaining snap ring and spacer, then press clutch gear out of bearing toward inside of case. Tap front bearing and snap ring out of case from inside. From front of case, press out countershaft, then remove countergear and thrust washers. Remove the 80 rollers, 6.050" spacer, and roller spacers from countergear.

Cleaning & Inspection: Wash case inside and out with cleaning solvent and inspect for cracks. Inspect front face which fits against clutch housing for burrs. Remove any burrs with a fine cut mill file. Wash front and rear bearings in solvent and blow dry with air. Check for roughness, then oil them with light engine oil. Check clutch and countergear needle bearings and countershaft for wear.

EXTENSION CASE: Disassembly - Drive rear idler shaft lockpin into boss until it falls into clearance hole in shaft. Pry out extension plug at end of shaft and press shaft from extension. Remove shifter fork from shifter shaft, then drive shifter shaft into case, allowing ball detent to drop into case. Remove shaft and detent ball spring.



TRANSMISSION EXTENSION (TYPICAL)

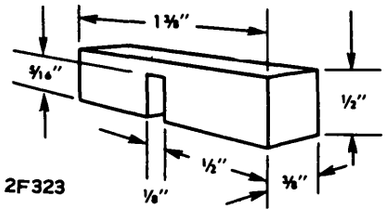
MAINSHAFT: Disassembly - Remove mainshaft front snap ring, third and fourth speed clutch synchronizer assembly, third speed gear and synchronizer blocker ring, second and third speed gear spacer (needle roller bearing), and second speed gear and blocker ring. Spread rear bearing snap ring and press off the retainer. Remove mainshaft rear snap ring. Support first and second speed synchronizer assembly and press on rear of mainshaft to remove rear bearing, first speed thrust washer, first speed gear and synchronizer blocker ring, second speed synchronizer assembly, and first speed gear sleeve.

► *SYNCHRONIZER ASSEMBLY CAUTION:* Synchronizer hubs and sliding sleeves are a selected assembly and should be kept together as originally assembled (the three keys and two energizing springs may be replaced if worn or broken). To remove keys and springs, push hub from sliding sleeve. The keys will fall out and the springs can be removed. Reinstall by placing the two energizing springs in position (one on each side of hub), so that tanged end of each spring falls into same keyway in hub. Place keys in position and hold them in place while sliding hub into sleeve.

R assembly: From rear of mainshaft, assemble first and second gear synchronizer assembly on mainshaft (tapered end of clutch sleeve toward first speed gear), use

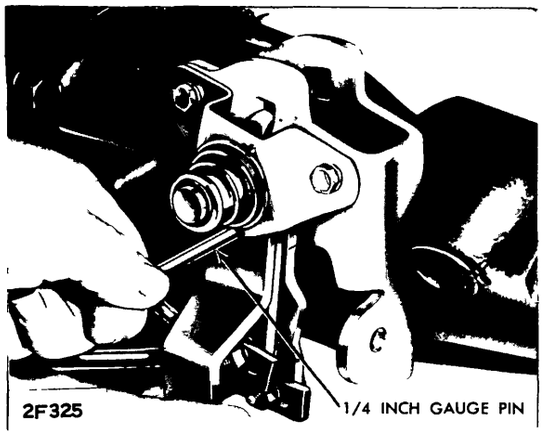
SYNCHRONIZER ASSEMBLY (TYPICAL)

a suitable tool to press first gear sleeve on shaft in an arbor press. Install first speed gear synchronizer blocker ring so that notches in ring correspond with keys in synchronizer hub. Install first speed gear (with hub toward front) and first speed gear thrust washer (grooves in washer must face toward gear). Press rear bearing on shaft (snap ring groove toward front of transmission) using a suitable tool. Choose correct selective fit snap ring (available in thicknesses of .087", .093", .099") that will produce a clearance of 0-.005" between rear face of bearing and front face of snap ring. *CAUTION - Always use a new snap ring when reassembling transmission and do not expand ring further than is necessary for assembly.* From front of mainshaft, install second speed gear synchronizer blocker ring so that notches in ring correspond to keys in synchronizer hub. Install second speed gear with hub of gear toward back of transmission, and install second and third speed gear spacer (needle bearing). Install third speed gear with hub to front of transmission, and the third speed gear synchronizer blocker ring (notches to front of transmission). Install third and fourth speed gear synchronizer assembly (hub and sliding clutch sleeve taper toward the front) making sure that keys in synchronizer blocker ring correspond to notches in third speed gear synchronizer blocker ring. Install snap ring (.086-.088" thick) in groove in front of third and fourth synchronizer assembly. *NOTE* - With correct size snap ring, the third speed gear will have correct amount of endplay which should be .010-.015" maximum, with the third and fourth speed clutch hub forward against the snap ring. Install rear bearing retainer plate. Spread the selective snap ring (use largest ring that will fit in groove) on plate to allow it to drop around rear bearing, and press on end of mainshaft until snap ring engages groove in rear bearing. Install reverse gear with shift collar to rear. Press speedometer drive gear onto mainshaft using a suitable press plate. Position speedometer gear to get a measurement of 4½" from center of gear to flat surface of adapter plate (Exc. Ford, Mercury & Studebaker); 8 7/8" (Mercury), 4 13/16" (Studebaker) from rear surface of adapter plate to rear face of speedometer gear; 9¼" (Ford) from rear face of speedometer gear to end of output shaft.



EXTENSION CASE: Reassembly - Place ball detent spring into detent spring hole and start reverse shift shaft into hole in boss. Place detent ball on spring and, holding ball down with a suitable tool, push shifter shaft into place and turn until the ball drops into place in detent on shifter shaft detent plate. Install shifter fork *(NOTE - Do not drive shifter shaft locking pin into place until ext nsion case has been installed on transmission cas).* Line up locking pin hole in rear idler shaft with hole in boss. Install idler shaft and lock

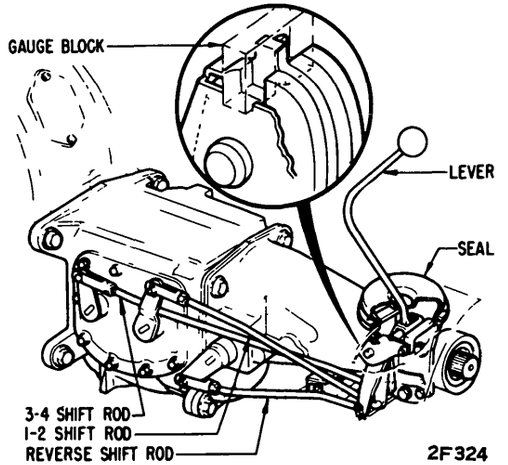
CONTINUED ON NEXT PAGE



WARNER 4-SPEED SYNCHRO-MESH (C nt.)

in place with pin. Install new expansion plug behind idler shaft, using sealing compound on plug.

TRANSMISSION CASE: Reassembly - Install roller spacer (6.050" long) in countergear, then, using heavy grease to retain them, install 20 rollers in first gear end of countergear, two .050" spacers, 20 more rollers, and a .050" spacer on top of second race of rollers. Install the same amount of rollers and spacers in the same order in the other end of countergear. Rest transmission on its side with side cover opening upward. Place countergear tanged thrust washers in position, retaining them with heavy grease and making sure that tangs are resting in notches in case. Set countergear in place in bottom of case, making sure that tanged thrust washers are not moved out of position. Press front bearing onto clutch gear, with snap ring groove in front, using a suitable tool. Install spacer washer and selective fit snap ring in groove on clutch gear ahead of front bearing. Install clutch gear and bearing assembly through side cover opening and into position in transmission front bore. Tap lightly into place with a plastic hammer. Place snap ring in groove in front bearing. Lift countergear, mating fourth speed gear of cluster with clutch gear, then install countershaft into position from rear of case (*NOTE* - Be sure thrust washers remain in place). Install woodruff key in end of countershaft and press shaft into place until shaft is flush with rear face of case. Attach a dial indicator to case so contact button of indicator rests against face of a gear on countergear cluster and check endplay of countergear which should not be in excess of .025". Install the fourteen pilot roller bearings into clutch gear, using heavy grease to retain them in place. Using heavy grease, place gasket into position on front face of rear bearing retainer. Install fourth speed synchronizer blocker ring on clutch gear with notches toward rear of transmission. With front face of transmission case facing down, install the mainshaft assembly into case, making certain that notches on fourth speed synchronizer blocker ring correspond to keys in synchronizer assembly. Install self locking bolt attaching rear bearing retainer to transmission case



SHIFT LINKAGE GAUGE BLOCK (EXC. FORD & MERCURY)

FORD & MERCURY SHIFT LINKAGE ADJUSTMENT

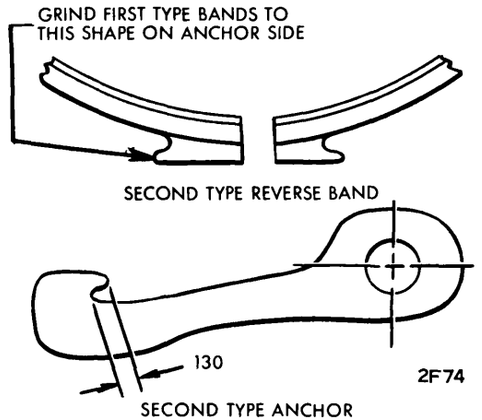
and tighten to 20-30 ft. lbs. Using heavy grease, install flat thrust washer onto rear face of rear idler thrust boss. Shift transmission into second gear and carefully install the small half of the reverse idler gear into place along side of thrust washer (notches toward rear). From rear of case, insert rear half of reverse idler gear, engaging notches of portion of gear within transmission case. Using heavy grease, place gasket into position on rear face of rear bearing retainer. Install remaining thrust washer into place on rear idler shaft, making sure that tang on thrust washer is in notch in idler thrust face of the extension. Retain thrust washer in place with heavy grease. With transmission facing downward, forward speed gears in neutral, and the reverse shifter shaft as far forward as possible, lower the extension case onto transmission case. Engage reverse shifter fork with the reverse gear flange and lower the extension case into position while moving reverse shifter shaft rearward. Install three extension and retainer-to-case attaching bolts and tighten to 35-45 ft. lbs. Install one extension-to-retainer bolt and tighten to 20-30 ft. lbs. Use a sealing compound on lower right hand attaching bolt. Move shifter shaft to line up groove in shaft with holes in boss and drive in the locking pin. Install shift lever. Install front bearing retainer, gasket and four attaching bolts, using sealing compound on bolts. Tighten to 15-20 ft. lbs. Install shifter fork in each synchronizer (first and second speed gear shifter fork must have its flat surface facing the reverse idler thrust boss). Place both synchronizers in neutral, then install side cover gasket and carefully lower side cover into place. Install attaching bolts and tighten evenly to avoid distortion of cover. *NOTE - Use a sealing compound on side cover lower right hand bolt.*

SHIFT LINKAGE ASSEMBLY (EXC. FORD & MERCURY)

SHIFT LINKAGE ADJUSTMENT

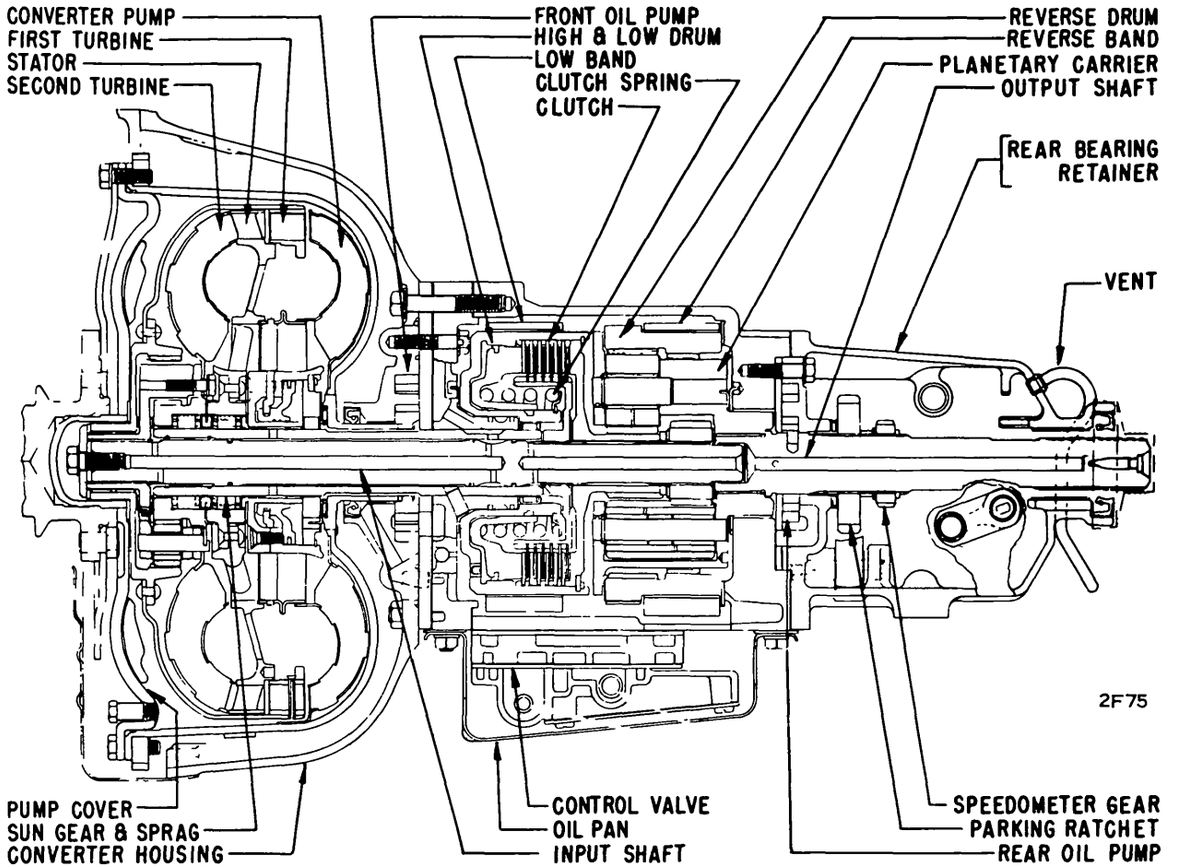
All Models (Exc. Ford & Mercury): *NOTE - The gauge block (see illustration) will facilitate adjustment, however, the adjustments can be made by having an assistant hold manual shift lever in neutral position.* Remove transmission gearshift lever seal from floor pan, then place transmission in neutral and install gauge block. Remove cotter pin, anti-rattle washer and clevis pin at each shift lever. On each shift rod, adjust threaded clevis to permit free entry of clevis pin into hole in transmission shift lever. Reconnect clevises to shift levers, then remove gauge block and check shifts. If roughness still exists, determine rod and clevis requiring adjustment by sighting along the slot where gauge block was used.

Ford & Mercury: Place shift lever in neutral, then raise car on a hoist and insert a ¼" drill or alignment rod into alignment hole (located in center of shift levers on extension housing). If rod will not enter, check for bent or bellied connecting rods. If rods are correct shape, check for loose lever locknuts at rod ends. Adjust linkage by loosening rod-retaining locknuts and moving the levers until ¼" drill or rod will enter alignment holes. *NOTE - Make sure transmission shift levers are in neutral and the reverse shifter lever is in neutral detent. If there is any doubt about location of neutral position, disconnect shift rods at retaining locknuts and rotate each forward-speed shift lever through its three positions until the center (neutral) detent is positively located. Move reverse shift lever forward until positive engagement is felt. Install shift rods and tighten locknuts.* Check operation of shift for smooth crossover.



BUICK TWIN TURBINE AUTOMATIC TRANSMISSION

Buick L Sabr , Invicta, Electra (1962)



►CHANGES, CAUTIONS, CORRECTIONS

►*1962 TWIN TURBINE TRANSMISSION CODE NUMBER NOTE:* A code number consisting of a letter followed by a number is stamped on lower edge of reaction shaft flange directly to rear of high (left) accumulator. This number should be used as identification when ordering parts or for service procedure changes.

►*1962 TWIN TURBINE TRANSMISSION REAR BAND & ANCHOR PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* Later production reverse band and anchor assemblies have been changed so as to have a more shallow "hook" than earlier assemblies. If necessary to use a later type anchor with first type band on any earlier transmission (except 1958-59 Triple Transmissions), it will be necessary to grind down band lip on "anchor side" as indicated in illustration.

LATER 1962 REAR BAND & ANCHOR

BUICK TWIN TURBINE AUTOMATIC TRANSMISSION SECTIONAL VIEW

DESCRIPTION

DESCRIPTION: Twin turbine torque converter and automatic transmission of same design as used on previous models.

LUBRICATION

Check fluid level every 1,000 miles. Drain and refill every 25,000 miles.

►*CAUTION: Fluid must be warm and engine must be idling when checking fluid level. Make sure transmission is at normal operating temperature before draining.*

Checking Fluid L vel: With transmission fluid at normal operating temperature and transmission selector lever in "P" (Park) position with engine idling, check fluid level on dipstick. Add recommended fluid as necessary to maintain fluid level between "ADD OIL" and "FULL" marks on dipstick. *NOTE - One pint of fluid will raise level from "ADD OIL" mark to "FULL" mark. Do not overfill.*

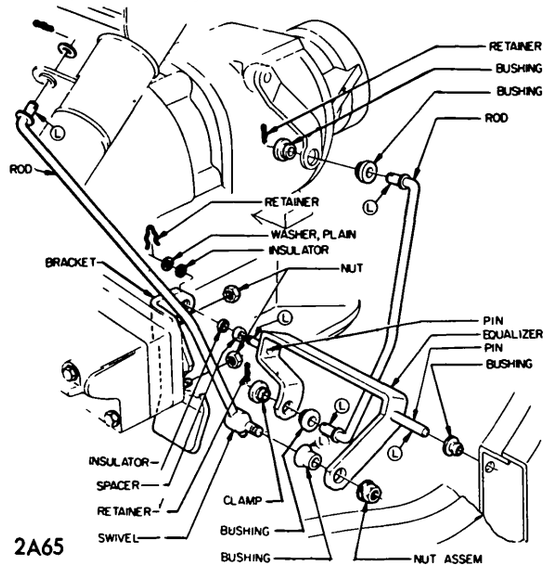
Draining & Refilling: Remove bell housing cover, then loosen one converter drain plug. Rotate converter until opposite drain plug is straight down and remove this plug to allow converter to drain. Remove filler pipe fitting from oil pan and allow oil pan to drain. *CAUTION - Do not remove accumulator caps.* Remove oil pan and oil screen clean thoroughly and reinstall. Tighten oil pan bolts to 10-12 ft. lbs. Install converter drain plug and tighten both plugs securely. Tighten oil filler fitting to 30-35 ft. lbs., then install bell housing cover. Install 3 qts. of recommended fluid in transmission, then with engine idling, transmission selector lever in "P" (Park), add sufficient fluid to bring level on dipstick between "ADD OIL" mark and "FULL" mark. With transmission at normal operating temperature, fluid level should be at "FULL" mark.

R commended Fluid: Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity: Approximately 12 qts. (refill). A completely dry transmission requires an additional 1 3/4 pints.

LINKAGE ADJUSTMENT

Throttle Linkage & Stator Control Linkage: *See CARBURETOR on Car Model pages.*



Manual Shift Linkage: Place transmission selector lever in "P" (Park) position, then raise car and loosen clamp nut at lower end of upper rod. Move transmission manual lever several times to make sure lever is in "Park" detent, then tighten clamp nut. To check adjustment, distance from "Drive" detent to "Drive" stop should be approximately equal to distance from "Low" detent to "Low" stop. *NOTE - If pointer does not line with "D" on dial with transmission manual lever in "Driv " detent, remove lower steering column housing, th n either loosen dial pointer setscrew or carefully b nd pointer to line up pointer with "D" in "Drive" rang . Tighten setscrew.*

Neutral Safety Switch: Place transmission selector lever in "N" (Neutral), then insert a 3/32" drill through gauging hole in operating lever and through gauging hole in switch body. *CAUTION - D not all w s l ctor l v r to move out of position.* If drill will not go through

CONTINUED ON NEXT PAGE

BUICK TWIN TURBINE (C nt.)

holes or is not parallel to center line of steering column, loosen switch mounting screws and move switch as necessary for alignment, then tighten screws and check operation. *NOTE - Engine should start in "P" (Park) r "N" (Neutral) only.*

MANUAL SHIFT LINKAGE

BAND ADJUSTMENT

►*BAND ADJUSTMENT NOTE: Bands cannot be adjusted with transmission installed in car. Adjustment is ordinarily required only at time of overhaul.*

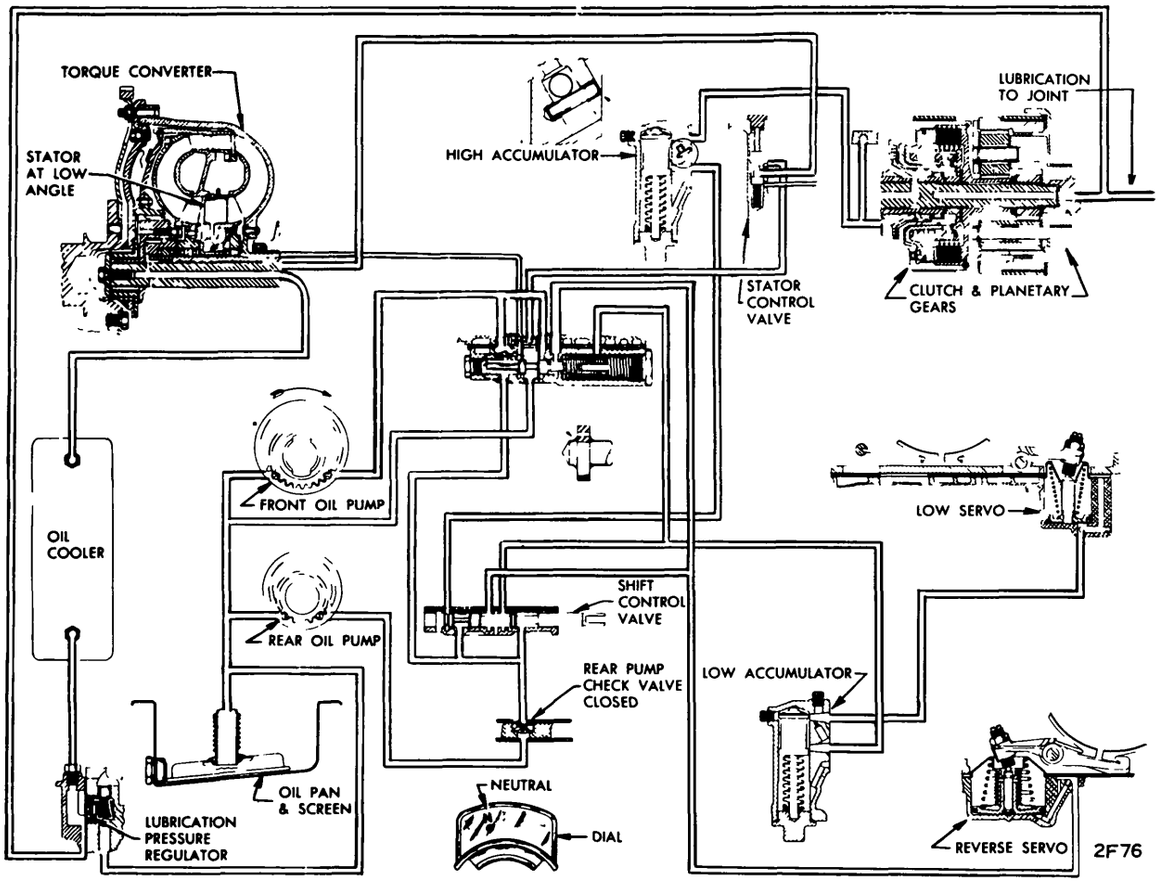
L w & Reverse Band Adjustment: Remove band adjusting cover, then loosen locknut and turn adjusting screw clockwise until considerable resistance is felt indicating that band is in full contact with drum (low) or ring gear (reverse). Back off screw until just a trace of play can be felt by prying up on locknut with a screwdriver. From that point, back off screw **6 complete turns** and tighten locknut finger tight. Note position of adjusting screw slot, then tighten locknut to 20-25 ft. lbs. Remove torque wrench and check to make sure that adjusting screw did not turn. Install band adjusting cover with a new gasket.

TESTING

If performance not satisfactory, make following tests **with transmission thoroughly warmed up and at operating t mperature:**

Oil Level: Check oil level, add fluid as necessary to bring level up to FULL mark on dipstick, recheck performance with correct oil level. If car has been losing oil at rate of 1 pint or more each 1000 miles, make thorough check for oil leaks.

Manual C ntr l Linkag : Check and adjust manual control linkage. See Linkage Adjustment.



Hydraulic Control System Pressures: Use Transmission Oil Pressure Gauge J-2575. Support rear end of car solidly with wheels off floor so that transmission can be operated. Remove transmission cover in floor pan for access to pressure take-off points.

Connect gauge and make tests as follows:

Front Oil Pump - Connect pressure gauge at pipe plug opening on left side of transmission case. Run engine at 500 RPM, check pressure with selector lever in **Low, Drive, and Reverse ranges.** Repeat tests at 1000 RPM, and at 1800 RPM **in Low and Reverse only.** See table below for correct pressures. Low or erratic pump pressures indicate air leaks in suction lines, improper pressure regulator valve action. or excessive pump clearances.

Front Oil Pump Pressures

Selector Lever–	Low	Drive	Reverse
500 RPM	120 lbs.	90 lbs.	120 lbs.
1000 RPM	180 lbs.	90 lbs.	
1800 RPM	180 lbs.	90 lbs.	

BUICK TWIN TURBINE AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

High & L w Accumulator - Connect pressure gauge at pipe plug opening on top of accumulator body (**High**–left side of car); (**Low**–right side of car). Place selector lever in **Drive Range** (High Accumulator Test); **L w Range** (Low Accumulator Test). Run engine and check pressures at speeds indicated in tables below. Low accumulator pressure may be caused by leakage past accumulator body gasket. If accumulator pressure more than 10 lbs. lower than front pump pressure, check for leakage between accumulator and multiple disc clutch and for restricted or plugged metering orifice in accumulator dump valve.

Accumulator Pr ssur s

Selector Lever–	Low	Driv
500 RPM	115 lbs.	80 lbs.
1000 RPM	175 lbs.	85 lbs.
1800 RPM	175 lbs.	85 lbs.

Stat r - Connect pressure gauge at pipe plug opening on left end of reaction shaft flange. Test pressure in **Driv Rang** at 500 RPM, 1000 RPM, and 1800 RPM.

CONTINUED ON NEXT PAGE

BUICK TWIN TURBINE (C nt.)

Stat r Pressures

Select r Lev r -	Drive
500 RPM	10 lbs.
1000 RPM	65 lbs.
1800 RPM	75 lbs.

TROUBLE SHOOTING & DIAGNOSIS

►*EXCESSIVE DYNAFLOW WHINE CORRECTION: (This c nditi n is usually the result of excessive clearanc b tw n input shaft and bearing in the reaction shaft).* If transmission is to be disassembled to correct whine, perform the following:

1) Remove converter cover, twin turbine assembly, and sun gear, then mount dial indicator on end of input shaft with indicator button contacting reaction shaft. Position indicator button 90° to left of top center (facing end of shaft) then move input shaft away from and toward indicator while noting the gauge reading. Repeat this check at 45° to left of top center. If dial reading exceeds .005", excessive clearance exists between input shaft and bearing in reaction flange.

2) Before replacing bearing, remove reaction flange assembly and input shaft and observe the following: (a) Inspect bearing surface on input shaft. If surface appears abnormally rough or scored, replace input shaft; if not, polish journal area with crocus cloth. (b) Inspect the two oil seal rings toward rear of input shaft and the mating surface in the reaction shaft for scoring or other damage. If reaction shaft or input shaft shows evidence of scoring or other damage, replace worn or damaged parts.

3) If inspection reveals that condition of reaction shaft and input shaft are satisfactory, replace only the input shaft bearing (see Overhaul data).

4) If input shaft, reaction flange, or the bearing requires replacement, it will be necessary to replace the converter sun gear and planet pinions. *NOTE* - When installing reaction flange service bushing, be sure the assembly is supported on rear end of reaction shaft to prevent distortion of aluminum reaction flange.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With s l ct r in any Range (rear wheels free). If car will n t m v for 1-8 minutes after standing over night - Check front pump oil pressure (see Testing) after allowing car to stand for several hours. If zero pressure noted, check pump for excessive clearances allowing pump to lose its prime. Check alignment of of bell housing and converter primary pump hub.

►*CAUTION: If this condition found, inspect Clutch and Bands for xcessive wear due to slippage caused by low oil pressure.*

If car will n t mov aft r extended operation in Reverse - Check for air leaks in pump suction line (at rear oil pump gaskets), or excessive clearance in front pump (at pump gears and covers). Check alignment of bell housing and converter primary pump hub.

2) With s lector in any Rang (rear wheels l ck d). Parking lock engaged. Broken parts in transmission or rear axle. Parking brake applied.

3) With s l ct r in Driv Rang . Check front oil pump pressure and High Accumulator pressure. If OK, check for sticking Low Band Anchor Piston, remove and inspect Clutch for worn or sticking clutch plates, leaking clutch seal rings. If High Accumulator pressure pressure low, also check rear pump Check Valve for correct installation and proper seating, check for leaks at accumulator body gasket, reaction flange gasket, clutch piston outer seal and clutch ball check valve, and leaks at sealing rings on reaction shaft flange and low drum.

4) With selector in Reverse Range. Check reverse band for displaced operating strut caused by too loose adjustment, improper installation, or broken band anchor (indicated by free up and down movement of band operating lever). If band assembly OK (no free movement of lever), check servo operation by running engine and shifting into Reverse. Remove Valve & Servo Body and check for reverse servo piston seal leaks.

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, or poor acceleration).

1) In all Speed Ranges. Low oil level. Incorrect manual control linkage adjustment. Air leak in oil pump suction pipe at oil screen sealing ring. Low front oil pump pressure caused by wear or excessive clearances in in pump. Leaks at front pump cover or reaction shaft flange, pressure regulator valve. Valve & Servo Body gasket. Pressure regulator valve defective.

2) In Drive Range. Incorrect manual control linkage adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, check for leaking clutch sealing rings, sticking clutch piston, worn or sticking clutch plates.

3) In Low Range. Incorrect manual control linkage adjustment. Incorrect low band adjustment. Low band and drum worn or scored. If Low Accumulator pressure If Low Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, remove Valve & Servo Body and check for gasket leaks or leaks at low servo piston seal.

4) In Reverse Range. Incorrect manual control linkage adjustment. Reverse band out of adjustment, strut out of place, or anchor broken. If front oil pump pressure low, remove Valve & Servo Body and check for gasket leaks and leaking reverse servo piston seal.

CAR CREEPS (Forward or Backward).

1) Creeps forward with selector in Neutral. Incorrect manual control linkage adjustment. Sticking low servo piston (check by removing low band adjustment cover), Sticking clutch caused by warped, binding, or incorrectly assembled clutch plates (not stacked properly with "dish" in same direction).

If Car Creeps only when engine accelerated to 2500 RPM - Check clutch vent ball checks in clutch piston and reaction shaft flange.

2) Creeps forward with selector in Reverse or backward with selector in Low. Incorrect manual control linkage adjustment.

SHIFTS ARE ROUGH

1) Low-to-Drive Shift. Incorrect Low Band adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket and for dump valve or accumulator piston sticking down (top land of piston should be visible through top port in body). Sticking low band anchor piston (remove Valve & Servo Body to check), or incorrect piston location (see piston shimming data in Valve & Servo Body Reassembly). Valve & Servo Body gasket leaks. Clutch plates worn or binding.

EXCESSIVE CHATTER OR CLUNK ON STARTING

►*CAUTION: Slight "clunk" when shifting into Low or Reverse is normal, and slight chatter when car starting to move in reverse (disappearing as soon as car in motion) is also normal.*

1) In Low & Reverse Range. Incorrect Low or Reverse Band adjustment. Engine and transmission mountings loose or incorrectly adjusted, thrust pad at transmission mounting broken (see Engine Mountings in Buick Special Data). Clutch plates warped, sticking, or incorrectly assembled (not stacked properly with "dish" in same direction). Reverse ring gear bushing worn. Planet pinion needle bearing rough.

NOISE IN TRANSMISSION.

►*CAUTION: Hum or low whine in Neutral or Parking is normal (due to free rotation of all planetary g ars) and slight hum in Low and Reverse may be expected.*

1) Buzzing Noise. Low oil level. Front pump check valve hanging up on edge of gasket between valve and servo bodies. If noise noticed in Parking or Neutral, pressure regulator valve clearance in body may be excessive or orifice in valve land oversize (correct by replacing valve and body).

2) Clicking Noise. If noticed in all ranges, may be caused by foreign material in converter. If noticed only when car in motion, may be caused by parking lock pawl contacting ratchet wheel due to incorrect manual control linkage adjustment.

3) Abnormal Hum or Whine (see Caution above). If noted in all ranges, may be caused by worn parts or excessive front pump clearances (front pump noise will increase in Low and decrease at car speeds above 45 MPH. in Direct Drive). Check front pump for excessive clearances by testing for low pump pressure. If noise noted in all ranges except Direct Drive, may be caused by trouble in planetary gears (gears locked out in Direct Drive).

4) Squealing or Screeching following installation f of Front Oil Pump. Pump driving gear installed backward.

►*CAUTION: Above condition must be corrected WITHOUT FURTHER OPERATION OF TRANSMISSION or sev re damage will result.*

TRANSMISSION REMOVAL & INSTALLATION

Transmission Assembly: Removal - **1)** Raise car and place on jack stands, then disconnect exhaust pipes. Remove converter housing cover and drain converter, then remove oil filler pipe and drain transmission. Disconnect cooler lines. *NOTE - If transmission is being removed to correct clutch or band troubles, cooler and lines must be flushed with air and oil to remove residue.*

2) Remove flywheel-to-converter bolts and disconnect speedometer cable, stator control rod (at accumulator), and lower shift rod at lever. Disconnect propeller shaft at rear companion flange. *NOTE - Mark shaft and flange so parts can be reassembled in same position. Support shaft up out of way to prevent damage to center joint caused by weight of shaft.*

3) Place transmission jack or hoist in position and adjust it to securely support transmission, then remove center bearing support bolts and slide propeller shaft rearward and disengage it from transmission. Remove

CONTINUED ON NEXT PAGE

BUICK TWIN TURBINE (C nt.)

bolts attaching rear mounting pad to rear bearing retainer, then raise engine and transmission assembly just enough to take load off transmission support (crossmember) and remove support. *CAUTION - If shims are used between support and frame side rails, note number of shims and location, so they may be reinstalled in same position.*

4) Place a jack under rear of engine lower crankcase and lower transmission just enough so converter housing bolts can be reached, then with engine and transmission supported by separate jacks, disconnect converter housing from engine. Move transmission rearward and disengage hub of converter pump cover from crankshaft and remove transmission from under car.

Installation: Reverse removal procedure and note the following: Turn flywheel so one converter attaching bolt hole is straight up, then install transmission, aligning converter bolt holes with holes in flywheel. Install and tighten all converter housing-to-engine bolts to 45-55 ft. lbs. Tighten flywheel-to-ring gear bolts to 30 ft. lbs. Tighten rear bearing-to-mounting pad bolts to 50-60 ft. lbs.

TRANSMISSION OVERHAUL

OVERHAUL: *See 1960 Final, Page 414, or later Manual edition and note the following:*

Reaction Shaft Flange, Oil Pump, Accumulators & Clutch: Removal - Compress low band with Tool J-9478 to remove band from case.

Rear Bearing Retainer, Rear Bushing, Parking Lock, and Speedometer Drive Gear: Removal - *NOTE - These units can be removed with transmission in car by removing oil pan and disconnecting propeller shaft.* Disconnect valve operating rod from upper operating rod (if not previously done), then remove retainer-to-case bolts, retainer and gasket. Remove speedometer gear and ratchet wheel retaining ring with snap ring pliers and remove speedometer drive gear, shims and spacer.

Disassembly - Remove spring from detent roller lever and support, then remove nut at adjusting lever. Pull roller lever and support assembly into bearing retainer and remove. *NOTE - Inspect "0" ring on support shaft and replace it damaged.* Remove cotter pin and clip from valve operating rod. *NOTE - If valve operating rod does not have a hole for installation of cotter pin, install later type valve operating rod and parking lock operating rod.* Thread parking lock operating rod ball stud out of lever. Thread a ¼" - 20 bolt into pawl shaft and withdraw shaft from retainer. Pull lever shaft from retainer in same manner, then remove parking lock pawl and lever assembly from retainer. Drive roll pin out of cross shaft and remove cross shaft and lever assembly and cross sleeve and lever. *NOTE - Inspect cross shaft seal and lever and replace if seal is worn or damaged. If bearing is worn so excessive freeplay exists between it and cross shaft, mark position of bearing in retainer and drive out bearing with a drift. Press a new bearing into place to same position as original b aring. Inspect output shaft bushing and if necessary, drive it out with Tools J-7273-7 and J-7013-1.*

R ass mbly - If new output shaft bushing is to be installed, drive bushing into position (flush with counterbore) with Tools J-7273-7 and J-7013-1. Coat outer diameter of new seal with Permatex and install with Tool J-8864. Lubricate cross shaft seal and position it in recess over cross shaft bearing with lip inward. Hold valve operating lever and shaft in position inside retainer and slide cross shaft through bushing and seal inside valve operating lever and sleeve Line up holes and install roll pin. Install detent roller lever and support, then assemble linkage adjusting lever on support shaft and install nut and lockwasher. Install detent spring, then assemble parking lock operating rod to operating lever assembly using a lockwasher under ball end hex. *NOTE - Full pivoting ball end of rod must be assembled to operating lever.* Position pawl levers and rod assembly in retainer and slide pawl and lever shafts into place making sure that tapped holes are outward. Attach parking lock operating ball end to upper lever using a lockwasher under ball end hex. Assemble valve operating rod to valve operating lever with a clip and cotter pin. *NOTE - If rod does not have a cotter pin hole, replace rod with later type.*

Rear Oil Pump & Lubrication Oil Pressure Regulator Valve: Removal - Do not remove lube oil pressure regulator valve. Use compressed air and solvent to clean valve.

Valve & Servo Bodies: Disassembly (Valve Body) - Remove lower valve operating lever and linkage adjusting lever-to-upper lever shaft and remove levers. Remove safety nuts and washers from studs and lift valve body and gasket from servo body, then remove shift control valve from valve body. Remove rear pump delivery check valve and spring from servo body. Cover large pressure regulator valve plug with a wadded cloth and pull plug retaining pin out of valve body. *CAUTION - Use care when removing retaining pin as there is heavy spring pressure behind plug.* Remove two springs and spring seat. Remove small plug retaining pin, then thread a ¼" - 20 capscrew into plug and remove plug from valve body. Remove pressure regulator valve. Remove valve body plate and gasket, then remove front pump delivery check valve and spring.

Reassembly (Valve Body) - Place front pump delivery check valve spring in body with large end down and place check valve on spring with ridged side up. Install valve body plate and a new gasket, making sure that check valve is seated against plate and not caught under gasket. Check oil orifice in pressure regulator valve and land to make sure it is clear, then install valve with land outward. Assemble "0" ring on small plug and install plug with tapped hole outward and install short retaining pin with shoulder of pin toward valve body plate side of body. Assemble spring seat on inner spring and install springs and seat into valve body through large plug openig. Clamp a drift or dowel in a vise and position a 1" inside diameter pipe nipple over the dowel. Position plug and "0" ring over spring ends and against dowel. Slide pipe nipple over plug so that when pressure is exerted to compress springs into valve body, plug will not slip off dowel. Push valve body toward dowel to push plug into valve body. Install long retaining pin with shoulder toward valve body plate side of valve. Install shift control valve with slotted end on same end of valve as large pressure regulator plug. Install rear pump delivery check valve in its seat in servo body, ridged face inward, and place valve spring on valve with large end up. Install a new gasket and the valve body on servo body, using care to keep pump delivery check valve spring below gasket, then install lock washers and safety nuts on two studs adjacent to control valve and tighten nuts evenly to 11-15 ft. lbs. Insert valve operating upper lever shaft through bearing in servo body, then with upper lever pointing toward reverse servo, place lower lever with linkage adjusting lever on shaft so that forked end of lower lever engages shift valve pin, then install lockwasher and nut.

Planetary Gear Set: Installati n - Install reverse ring gear thrust washer and planet carrier rear thrust washer in case, then compress ends of reverse band with band installing clip, Tool J-2595, and install in case. *NOTE - When installing band, make sure that heavy side of band is in correct position so that it will attach to reverse anchor and not to strut.* Remove clip, then rotate servo band toward servo opening. Insert anchor through opening and engage with hooked end of band, then rotate band and anchor back to normal position. Hold band operating lever (with offset end) in place with strut shoulder toward inside of case and insert anchor shaft through case, anchor, and lever. *NOTE - Tapped end of shaft must be outward. If adjustment screw is not centered in servo opening, the low band operating lever has been installed by mistake.* Install reverse ring gear slipper in case, then install assembled planetary gearset.

Low Band, Clutch & Input Shaft: Installation - To install low band, compress ends with Tool J-9478.

Reaction Shaft Flange, Front Oil Pump & Accumulator: Installation - To check endplay, assemble a suitable dial indicator support to transmission case. *NOTE - A 3/8" - 16 bolt with a .312" rod welded to head makes good arrangement.* Assemble dial indicator so plunger bears on end of output shaft. Push shaft forward with some force and rotate a few turns to squeeze grease from thrust surfaces. Set dial indicator at zero, then pull output shaft rearward and check indicator reading. If reading is more than .040", select a thicker washer for installation forward of needle thrust bearing and recheck endplay. If reading is less than .020", select a thinner washer and recheck. Endplay should be between .020" and .040".

Valve & Servo Body Assembly & Oil Pan: Installation - To adjust control valve, check position of groove in first land of valve which should be flush with boss of valve body. If edge of groove is not flush, loosen bolt and nut on adjustment lever and move to position valve correctly, then tighten nut and recheck valve position.

Speedometer Driven Gear & Positiv Park Stop: Installation - Check "0" ring seal on speedometer driven gear and replace if necessary. Lubricate "0" ring and gear and install in case, then install driven gear retainer and lever stop *(see "Manual Linkage Adjustment" above). NOTE - If transmission not originally equipped with lever stop to prevent over travel in "P" (Park) position, install a new stop.*

BUICK SPECIAL AUTOMATIC TRANSMISSION

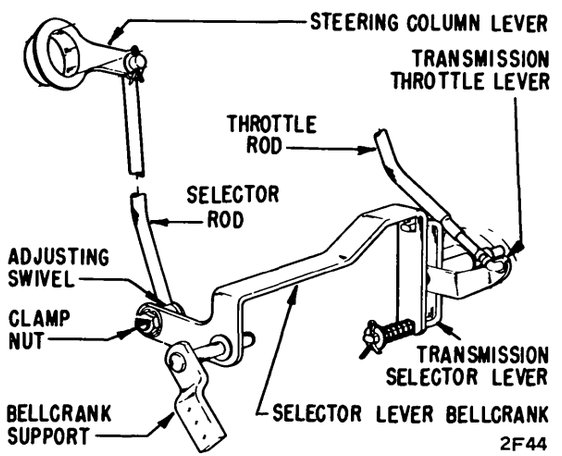
Buick Special, Series 4000 & 4100 (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR: The engine cannot be started by pushing (or pulling) car. If necessary, a "booster" battery must be used.*

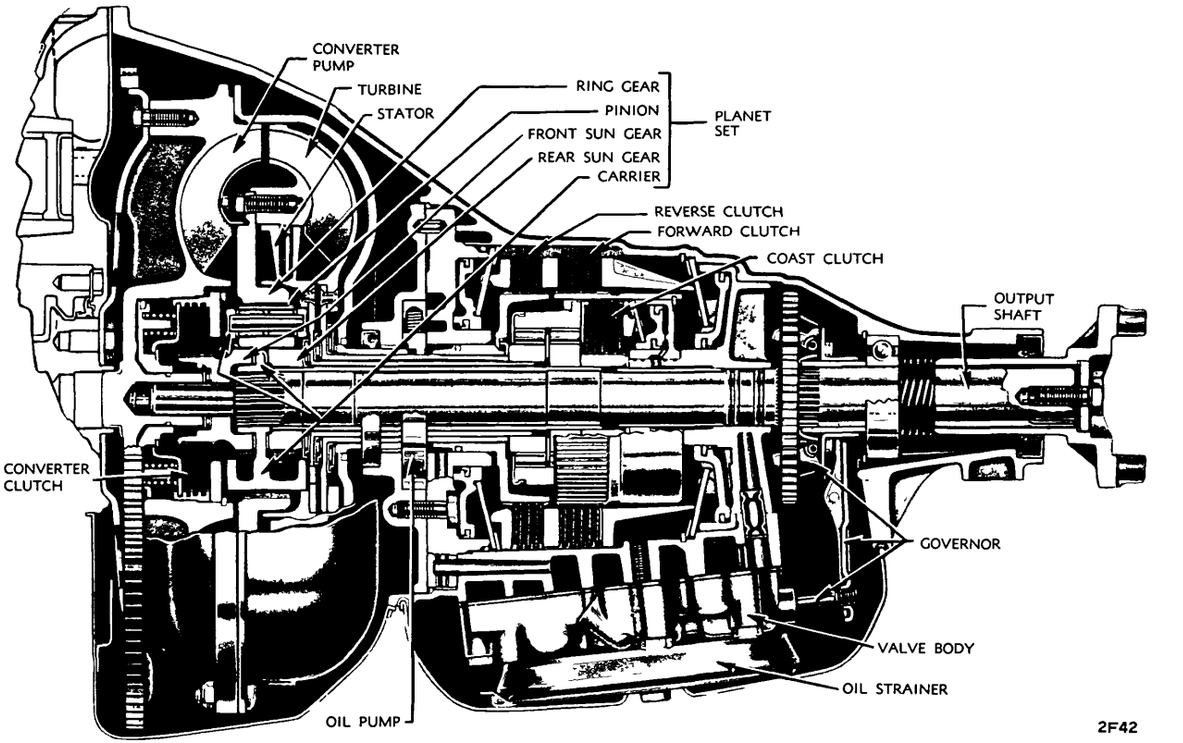
►*TOWING BUICK AUTOMATIC TRANSMISSION CARS:* Cars may be towed (or pushed) for short distances with transmission in "N" (Neutral) and at a speed not to exceed 25 MPH. If cars are to be moved any extended distance, rear wheels should be raised off ground or the drive line should be disconnected at the rear. *CAUTION - When drive line is disconnected, it must be suitably supported to prevent damage to center universal joint.*

►*1962 BUICK SPECIAL TRANSMISSION COMPANION FLANGE REMOVAL OR SEAL REPMACEMENT NOTE:* When companion flange is removed or companion flange is removed or companion flange seal is installed, fill space between lips of seal with a good grade wheel bearing grease to prevent entrance of moisture.



DESCRIPTION: Two-speed hydraulically controlled transmission and air cooled torque converter assembly of same design as used on previous models. *For detail description, see 1961 Final Data, Page 404.*

OPERATION: *See 1961 Final Data, Page 404.*



LUBRICATION

LUBRICATION: Check fluid level every 1000 miles, drain and refill every 25,000 miles.

Checking Fluid Level: Check level with transmission at normal operating temperature. With engine idling and transmission selector lever in "P" (Park) position, transmission oil level should be at "Full" mark on dipstick (dipstick located under right side of hood in engine compartment). If oil level is below "Add" mark, add sufficient Automatic Transmission Fluid Type "A" (Suffix "A") to bring level to "Full" mark. *CAUTION - Do not fill transmission above "Full" mark.*

MANUAL SELECTOR LINKAGE

BUICK SPECIAL AUTOMATIC TRANSMISSION SECTIONAL VIEW

Draining & Refilling: *CAUTION - Accurate foot pound and inch pound reading torque wrenches must be used.* Remove single bolt and seal attaching oil pan to transmission case and drain transmission, then remove oil pan and seal. Remove two oil strainer strap bolts and remove strainer and "O" ring seal. Install a new strainer and "O" ring seal and tighten strainer strap bolts to **100 inch pounds exactly.** DO NOT OVERTIGHTEN. Clean oil pan and install a new seal on oil pan being careful not to stretch seal, then install oil pan and seal, oil pan bolt and seal, and tighten oil pan to case bolt to 15-20 ft. lbs. DO NOT OVERTIGHTEN. Add 5 pints of oil to transmission, then start engine and allow to idle in neutral. Immediately add oil to bring level up to ½" below full mark. With engine at normal operating temperature, add oil to bring level up to full mark on dipstick.

Capacity - Approximately 6 qts.

LINKAGE ADJUSTMENT

ADJUSTMENTS: Throttle Linkage - *See CARBURETOR on Car Model page.*

Manual Linkage: Loosen adjusting swivel on selector lever bellcrank and place transmission selector lever in neutral detent. Move shift lever against neutral stop and tighten adjusting swivel clamp nut.

TESTING

TESTING: Road Test - With throttle and manual linkage properly adjusted and engine at normal operating temperature, accelerate from a stop with accelerator pressed just to detent. Upshift should occur smoothly at 40-45 MPH. If upshift occurs at speeds other than those specified, see "Trouble Shooting & Diagnosis" below.

TROUBLE SHOOTING & DIAGNOSIS

TROUBLE SHOOTING & DIAGNOSIS: Upshift At Too Low Speed - Governor valve not adjusted properly or is sticking. Shift valve or shift valve regulator sticking. Throttle valve pressure too low (worn or broken spring or valve sticking).

Upshift At Too High Speed: Governor valve not adjusted properly or is sticking. Shift valve or shift valve regulator sticking. Throttle valve pressure too high (valve sticking).

Slow Engagement of Converter Clutch: Converter pressure regulator valve sticking (lowering converter pressure too slowly).

Fast Engagement of Converter Clutch: Converter charging pressure too low. Converter pressure regulator valve sticking.

CONTINUED ON NEXT PAGE

BUICK SPECIAL AUTOMATIC TRANSMISSION (C nt.)

TRANSMISSION REMOVAL & INSTALLATION

Removal: 1) Raise car and support front and rear, then disconnect exhaust crossover pipe at both ends and at transmission, then remove pipe.

2) Remove universal joint "U" bolts and slide front propeller shaft rearward to separate universal joint at transmission. Support weight of propeller shaft.

3) Place a jack under transmission and fasten securely to transmission, then remove transmission mounting pad to crossmember bolts. Remove transmission support crossmember to frame rail bolts and remove crossmember.

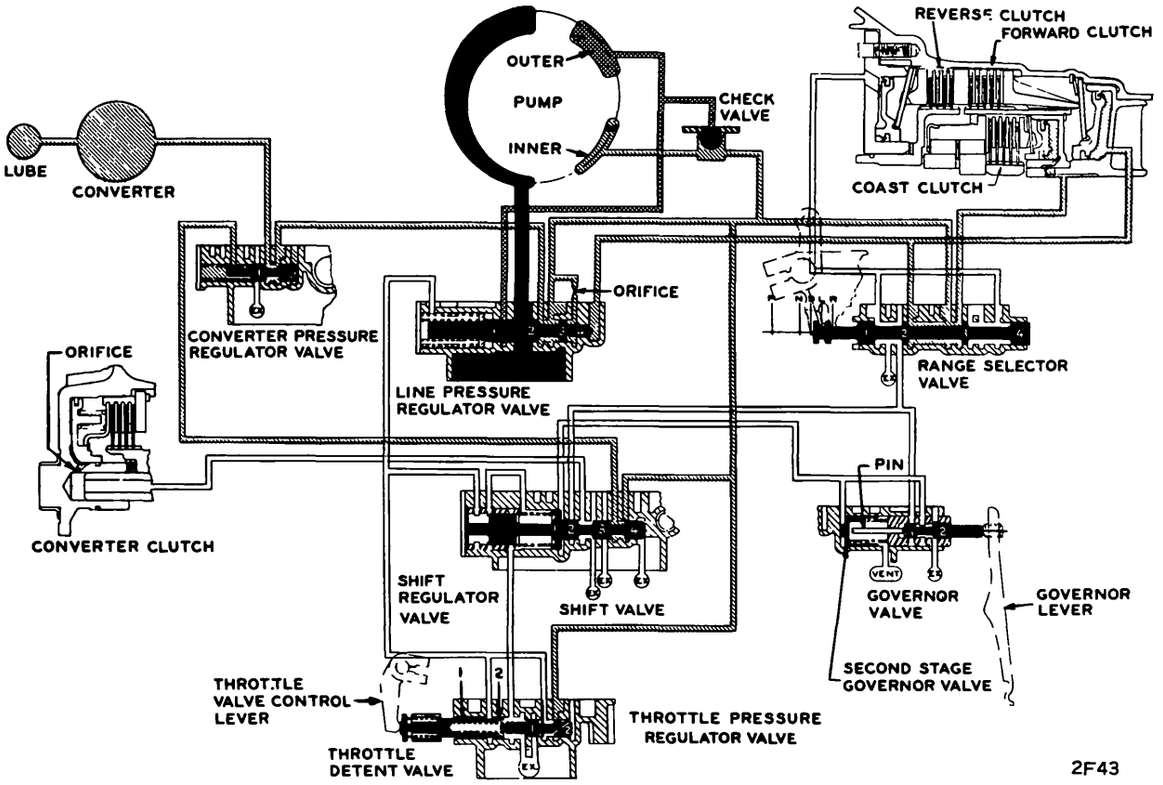
4) Disconnect speedometer cable, then remove shift linkage equalizer from transmission range selector outer lever. Remove transmission filler pipe, then support engine at oil pan and remove transmission converter housing cover.

5) Mark flywheel and converter for reassembly in same position, and remove three converter pump to flywheel bolts. Remove transmission case to engine block bolts.

6) Move transmission to rear for clearance between converter pump and engine crankshaft, then lower transmission out of car.

Installation: 1) Install transmission on a suitable jack and raise transmission into position for installation on engine. Rotate converter to align it with marks made on flywheel and converter when removed.

2) Install transmission case to engine block bolts and tighten to 30-35 ft. lbs. *CAUTION - Do not overtighten.* Install flywheel to converter pump bolts and tighten to 18-25 ft. lbs.



3) Install transmission support crossmember and install transmission to mounting pad bolts, then remove transmission jack and engine support. Install transmission converter housing cover.

4) Install filler pipe and clamp using a new "O" ring seal. Reconnect speedometer cable, then connect front propeller shaft to transmission companion flange and install "U" bolts. Reinstall exhaust crossover pipe and refill transmission. *See "Draining & Refilling" above.*

TRANSMISSION OVERHAUL

►*OVERHAUL NOTE: See 1961 Final, Page 404 and note the following:*

TORQUE CONVERTER & GEARSET REMOVAL & DISASSEMBLY: *See 1961 Final Data, Page 406, and note the following:* After removal of front sun gear, needle thrust bearing and two selective fit needle bearing races, remove planet carrier retaining ring using a thin bladed screwdriver to pry ring out of groove.

BUICK SPECIAL AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

COMPANION FLANGE & SEAL: Installation - When installing seal, coat outer diameter of seal with Permatex to prevent possible leakage.

RANGE SELECTOR LEVERS & SHAFT, THROTTLE VALVE CONTROL LEVERS & SHAFT, & PARKING LOCK ACTUATOR: Removal - Use a 3/8" socket and 7/16" wrench to remove screw and nut attaching lever to shaft. Slide inner lever off shaft and remove, then slide outer lever and shaft out of range selector shaft. Check "O" ring and remove if worn or damaged. Use the same tools and remove screw and nut attaching range selector inner lever to shaft. Slide range selector inner lever off shaft, then remove inner lever and parking lock assembly. Check "O" ring and remove if worn or damaged. If parking lock actuator is bent or damaged, or if range selector requires replacement, pry retainer off actuator rod. To install, reverse removal procedure.

COAST & OVERRUNNING CLUTCH, FORWARD CLUTCH PACK, RELEASE SPRING & APPLY LEVERS: Installation - *See 1961 Final Data, Page 409, and note the following:* With transmission case in a vertical position, install forward clutch levers, then install forward clutch release spring flat on levers (inner edge of spring downward). Position spring centering tool J-9313 over coast clutch support to rest on levers and center spring. Install spring retainer over spring and press down and outward to slightly compress spring and position retainer in groove of case. *CAUTION - It is necessary that retaining ring be installed correctly.* Check to make sure ring is in groove all the way around. Remove tool J-9313.

TORQUE CONVERTER & GEAR SET: Reassembly & Installation - *See 1961 Final Data, Page 410, and note the following:*

9) Place planet carrier over rear sun gear with tanged thrust washers in place at front and rear. *NOTE - Deeper pocket of carrier "down" toward rear sun gear and splined portion "up".* Use a small screwdriver to install retaining ring in groove of output shaft. Assemble new converter pump oil seal to pump (do not twist square seal). Lubricate and install needle thrust bearing and two select fit bearing races into front sun gear. Retain in place with chassis lubricant. *NOTE - The .030" bearing race must be toward sun gear.*

TRANSMISSION VENT: Replacement & Disassembly - Remove vent assembly from case by pulling straight up. To reinstall, reverse removal procedure. To remove float from vent pipe, remove cotter pin and slide float out of tube. Wipe off float and clean tube in solvent. To reassemble, install float, pointed end first, then install cotter pin.

CHEVROLET (CAST IRON) POWERGLIDE

Chevrolet Pass. Cars, 6 Cyl. 235" Eng. (1962)
Chevrolet Pass. Cars, V8 283" Eng. (1962)
Chevrolet Trucks (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR:* Place selector lever in "N" (Neutral) position. When car reaches a speed of 16-20 MPH, move selector lever to "L" (Low) position to crank engine. After engine starts, move selector lever to "N" (Neutral).

►*TORQUE CONVERTER OVERHAUL NOTE: Both "welded" and "bolted" type torque converters are used in production on a mixed basis. Welded type torque converters, identified by a "W" suffix on transmission serial number, cannot be disassembled for overhaul.*

►*1962 POWERGLIDE "HIGH" CLUTCH PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* This new clutch assembly, identified by 12 tangs on Low Sun Gear Flange (in place of 6 tangs on previous assemblies) entered partial production beginning Dec. 12, 1961. This new clutch assembly can be used for service replacement on all 1962 model transmissions. *DO NOT USE on earlier models.*

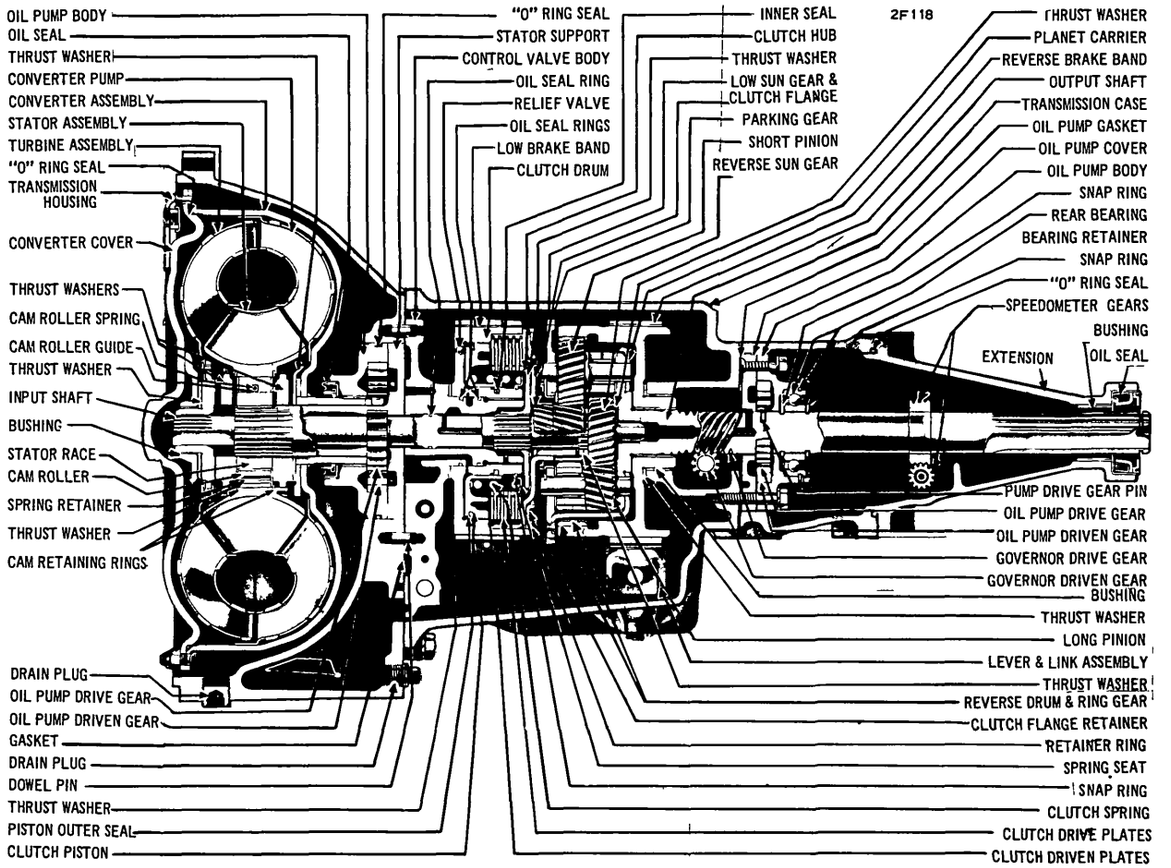
DESCRIPTION

DESCRIPTION: Transmission design is the same as for previous models having "waved" High Clutch drive plates, clutch hub thrust washer having an extruded center section, and a counterbored Low Sun Gear & Clutch Flange Assembly. In addition, the control valve body has a shorter length oil delivery sleeve (31/32") than previous models which had an oil delivery sleeve measuring 1 3/32" from end of sleeve to face of oil ring groove boss.

OPERATION: Same as for previous models.

LUBRICATION

Checking Fluid Level: Check fluid level every 1,000 miles. *NOTE - Periodic draining & refilling is not required. See "Draining & Refilling" below.*



Recommended Fluid: Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity: Approximately 4½ qts. (after transmission drained). 10½ qts. (Pass. Cars); 10 qts. (Trucks) after overhaul with transmission and torque converter dry.

Draining & Refilling: *NOTE - Draining & refilling of transmission is not recommended other than for transmission repairs.* Remove transmission oil pan drain plug (no drain plug on converter). To refill transmission, install drain plug, then pour in 3½ qts. of recommended fluid. Operate engine with transmission selector lever in "N" (Neutral) until fluid warms up, then add sufficient fluid to raise level to "FULL" mark on dipstick. DO NOT OVERFILL. If converter was emptied, follow above procedure and add approximately 7½ qts. of fluid after transmission is at normal operating temperature.

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment: *See CARBURETOR on car models pages.*

POWERGLIDE (CAST IRON) SECTIONAL VIEW

Manual Control Linkage: Place manual selector lever in "D" (Drive) position, then loosen clamp nut on shift control rod at its attachment to shift control lever on mast jacket. Place shift lever on transmission in "D" (Drive) position, then adjust position of clamp on shift control rod for free entry into shift lever on mast jacket and tighten clamp nut. Shift transmission into all ranges and check operation.

Neutral Safety Switch: Located on steering column mast jacket under instrument panel. Place selector lever in "N" (Neutral) position and loosen two screws securing neutral safety switch retainer. While holding ignition switch in "Start", adjust position of neutral safety switch until engine starts cranking. Hold switch in this position and tighten retaining screws. Check adjustment for cranking with selector lever in "N" and "P" positions.

BAND ADJUSTMENT

►*BAND ADJUSTING NOTE: Band adjustment not ordinarily required in service (bands adjusted when reassembling transmission). Reverse band adjustment requires removal of Servo Cover Assembly (see "Disassembly" below).*

Low Servo Band: Adjusting screw located on left side of transmission under adjusting screw cover. To adjust band, remove adjusting screw cover and tighten low servo adjusting screw to 5-7 ft. lbs. using a torque wrench (Tool J-5853). *NOTE - Rotate input and output shafts simultaneously to properly center low band on clutch drum.* **Back adjusting nut off 4 turns, then** tighten locknut securely and install adjusting screw cover. *CAUTION - Adjusting screw must be backed off exactly as specified, after torqueing to 5-7 ft. lbs.*

Reverse Servo Band (Reverse Piston Linkage): *CAUTION - Band adjustment must be verified by actual measurement of reverse piston travel.* Rotate reverse drum to center it in reverse band, then use Tool J-4277 and tighten adjusting screw to 5-7 ft. lbs., **then back screw off 2½ turns.** Check for proper adjustment as follows: Measure distance from face of reverse piston outward to side of case with the piston in its retracted position (inboard) with a small scale and record this dimension. Pull reverse piston outward to its full travel by grasping its hub with a pair of pliers, then again measure distance from face of piston to outboard

CONTINUED ON NEXT PAGE

CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)

side of case. The difference between these two measurements should be 3/32-5/32". If travel is too great, tighten adjusting screw. If too little, loosen adjusting screw. Recheck piston travel after adjustment. Tighten adjusting screw locknut to 20-25 ft. lbs.

TROUBLE SHOOTING

CLOSE THROTTLE DOWNSHIFT "CLUNK": May be caused by: High engine idle speed. Faulty downshift timing valve (replace valve). High mainline pressure caused by Vacuum Hose to modulator leaking or disconnected. Modulator diaphragm ruptured. Sticking valve (pressure regulator booster valve, pressure regulator valve, or modulator valve).

MOMENTARY RUN AWAY IN LOW UP TO 30 MPH (WIDE OPEN THROTTLE ACCELERATION): May be caused by a broken forced throttle cushion valve spring retainer. Check mainline pressure which will be lower just prior to shift, and the stall pressure will be low if the faulty transmission operation is caused by a broken retainer. *See "Closed & Forced Throttle Valve Spring Retainer Production Change" above.*

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, poor acceleration, or engine runs away on turns).

1) In all Speed Ranges - Low oil level. Incorrect control linkage adjustment. Air leak in oil pump suction pipe. Low front oil pump pressure.

2) In Drive Range - Incorrect control linkage adjustment. Damaged or leaking clutch piston seal (worn or burned clutch plates resulting from partially engaged clutch).

3) In Low Range - Incorrect control linkage adjustment. Low Band out of adjustment. Sticking accumulator valve, modulator lever, or modulator valve. Damaged or worn Low Servo Piston Ring resulting in poor band application or excessive oil leakage into clutch apply circuit causing partial clutch application and possibly burned clutch plates (check by connecting pressure gauges to Low Servo Apply and to High Clutch test points - there should be no pressure indicated at High Clutch point with selector lever in "L").

CAR CREEPS (Forward or Backward):

1) With Control Lever in Neutral - Incorrect control linkage adjustment. Clutch piston vent valve stuck closed. Clutch plates sticking or incorrectly assembled (not "stacked" in correct order).

2) Creeps forward with Control Lever in Reverse or backward with Lever in Low - Incorrect control linkage adjustment.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With Control Lever in any range (rear wheels free). If this occurs at other times than after reversing car, see causes listed under EXCESSIVE SLIPPAGE above. If this occurs only after reversing car (indicating loss of front pump pressure) check: Rear pump air leakage into front pump suction line (causing front pump to lose its prime). Rear pump gasket leakage. Front pump clearance excessive.

2) With C ntr l L v r in any rang (r ar wheels locked). Parking pawl lock engaged. Broken parts in transmission- Parking brake applied.

3) With C ntrol Lever in Driv Range (rear wheels free). If engine runs away and transmission is hot, check for: Low radiator water level, clogged oil cooler, sticking thermostatic valve, or dragging Low Range Band (causing over-expansion of clutch parts due to excessive heat).

SHIFTS ARE ROUGH:

1) Low-to-Drive Shift (car in motion). Incorrect Low Band adjustment. Clutch plates worn or binding. Modulator control lever or piston sticking (will cause excessive pressures). Accumulator dump valve orifice plugged.

If engine speeds up during this shift.- Check for incorrect low band adjustment and worn or binding clutch plates.

2) Drive-to-Low Shift. Incorrect Low Band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

3) Neutral-to-Reverse. Incorrect reverse band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

CHATTERS WHEN STARTING:

1) In Low Range. Incorrect Low Band adjustment. Worn or rough band, scored drum. Clutch not disengaging properly due to distorted or binding plates, sticking clutch piston, sticking piston vent valve, or damaged or worn Low Servo Piston Ring allowing oil leakage into clutch apply circuit and causing partial clutch application (see tests for Excessive Slippage in Low Range above).

2) In Drive Range. Incorrect Low Band or Reverse Band Adjustment. Bands worn or rough, drums scored.

3) In Reverse Range. Incorrect Reverse Band adjustment. Worn or rough band, scored drum. Reverse ring gear and drum bushing worn or damaged.

REVERSE OPERATION JERKY OR DRAGGING.

1) Clutch plates are incorrectly assembled (not "stacked" properly) or sticking. Clutch piston vent valve stuck closed.

REVERSE CANNOT BE ENGAGED WITH ENGINE RUNNING: If reverse can only be engaged when engine not running, check for accumulator snap ring being out of place (allowing accumulator valve and body to be forced against clamp nut on parking lock lever shaft and apply spring assembly, blocking shift into reverse). *NOTE* - Above condition will not prevent shift into Low Range).

DRIVE-TO-LOW or LOW-TO-DRIVE SHIFT DIFFICULT: May be caused by improperly drilled high clutch feed orifice in valve body resulting in slow clutch application in Drive Range and slow clutch release when shifting from Drive to Low (restricted orifice will cause slow oil flow). Check by connecting pressure gauges to Low Servo Apply and to High Clutch (low servo release side) and noting pressures as follows:

1) Move selector from Neutral to Drive with engine idling. If pressure builds up much more rapidly on Low Servo Apply gauge than on High Clutch gauge, a restriction in the passage (undersized orifice) is indicated.

2) Move selector from Drive to Low. Pressure in High Clutch gauge drops slowly,oil drainage from clutch is restricted. *NOTE* - This will result in slow Low Band application and clutch drag (may cause burned clutch plates).

HIGH CLUTCH PLATES BURNED OR CLUTCH FAILURE:

►*CAUTION: When High Clutch failur n ted, following tests should be made befor transmissi n removed, and transmission should also be carefully xamined after removal and disassembly.*

1) Connect pressure gauges to Low Servo Apply, High High Clutch (low servo release side), and to Reverse Servo points. Operate engine to supply oil pressure.

2) Place selector lever in Drive position and note pressure build-up in High Clutch gauge. Slow build-up indicates restriction in high clutch apply orifice resulting in clutch slippage and burned plates.

3) Place selector lever in Low position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage past Low Servo Piston Ring resulting in partial clutch application and burned clutch plates.

4) Place selector lever in Reverse position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage between the converter "out" and low servo "release" channels in valve body or damaged Housing-to-Valve Body gasket. This condition will cause partial clutch application and burned clutch plates.

NOISE IN TRANSMISSION:

1) Buzzing Noise (All Ranges). Low oil level. Pump gear interference with crescent in pump. Pump check valve not seating.

2) Ringing Noise in Converter. Low oil level. Air leak in pump suction line (pump not seated properly) resulting in low oil level in converter. Pressure regulator valve stuck (closing converter inlet port). Leakage in oil line between front pump and regulator valve.

3) Clicking Noise. Incorrect manual linkage adjustment (causing interference between parking lock pawl and gear).

4) Whining Noise. Transmission gear teeth worn. Pump gear clearance excessive or pump gear bushings worn.

FUEL CONSUMPTION EXCESSIVE:

1) Transmission Causes. Converter stator freewheeling cams and roller incorrectly assembled. Clutch piston vent valve stuck open.

TRANSMISSION OIL BEING FORCED OUT OF FILLER PIPE: Caused by aeration and foaming of the oil due to one or more of the following:

NOTE - This condition may also cause Loss of Power and Lower Stall Speed (due to converter turbulence and lower pressures in control circuits).

1) Oil level too high allowing planet carrier to revolve in oil and aerate it. Correct by lowering oil level to correct point (see LUBRICATION) and driving car for 5 miles to work out air bubbles.

2) Oil suction pipe split, seal damaged, bore for suction pipe in housing too deep, or suction pipe retainer ears bent (preventing proper compression of the seal) resulting in air leaks in oil suction line.

3) Sand hole in suction bore of transmission case or housing or in suction cavity in valve body resulting in air leaks in oil suction.

CONTINUED ON NEXT PAGE

CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)

TESTING

►*TESTING NOTE: Befor making tests, bring fluid level in transmission up to FULL mark on dipstick, then operat transmission and bring up to normal operating t mp ratur .*

ROAD TEST: Road test car to determine transmission shift points as indicated in tables below.

TRANSMISSION SHIFT POINTS (CARS)

Sel ct r In "D" (Drive)

6 Cyl. Engine

Thr ttle P siti n	Upshift	Downshift
Light Throttle	12-15 MPH	10-13 MPH
To Detent	27-44 MPH	13-17 MPH
Through Detent	44-49 MPH	41-48 MPH

283" V8 Engine (Air Cond.) ①

Thr ttle P siti n	Upshift	Downshift
Light Throttle	12-15 MPH	10-13 MPH
To Detent	37-50 MPH	13-17 MPH
Through Detent	50-56 MPH	47-53 MPH

283" V8 Engine ②

Throttle Positi n	Upshift	Downshift
Light Throttle	13-16 MPH	11-14 MPH
To Detent	40-55 MPH	14-19 MPH
Through Detent	55-61 MPH	51-58 MPH

① - 3.36-1 axle ratio. ② - 3.08-1 axle ratio.

TRANSMISSION SHIFT POINTS ① (TRUCKS)

½-Ton, 6 Cyl. ③

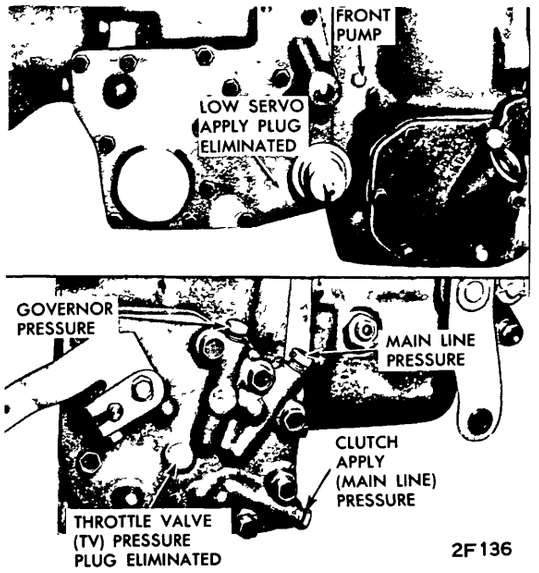
Thr ttl Position	Upshift	Downshift
Light Throttle ②	11-14 MPH	9-12 MPH
To Detent	25-40 MPH	12-16 MPH
Through Detent	40-45 MPH	38-44 MPH

½-T n V8 ③

Thr ttl P siti n	Upshift	Downshift
Light Throttle ②	11-14 MPH	9-12 MPH
To Detent	34-44 MPH	12-16 MPH
Through Detent	46-52 MPH	43-49 MPH

¾-T n 6 Cyl. ④

Thr ttl P sition	Upshift	Downshift
Light Throttle ②	11-14 MPH	9-12 MPH
To Detent	25-40 MPH	12-15 MPH
Through Detent	40-45 MPH	37-44 MPH



¾-T n V8 ④

Thr ttl P siti n	Upshift	Downshift
Light Throttle ②	11-14 MPH	9-12 MPH
To Detent	34-44 MPH	12-15 MPH
Through Detent	46-51 MPH	43-48 MPH

① - Shift speeds given in table will vary slightly for tire sizes other than indicated.
② - Closed throttle position for "downshift" speeds.
③ - 6.70-15 tires. ④ - 7.00-17 & 7.50-17 tires.

►*STALL TEST CAUTION: D not stall test transmission.*

PRESSURE TESTS: *NOTE - Throttle valv test plug and low servo apply test plug have been eliminated.* Install pressure gauge hose to test fittings (see illustration) at front pump, governor, main line, and clutch apply.

PRESSURE TEST POINTS

Gauge lines should be run into driving compartment by pushing aside steering column mast jacket seal, and connected to Gauge Set J-4872-A.

Wide Open Throttle Upshift: This shift should occur at 82-90 lbs. pressure (V8 Eng.), 68-74 lbs. pressure (6 Cyl. Eng.) as indicated on main line gauge. After shift is completed, pressures on both main line and high clutch gauges should indicate similar readings. If pressures are correct and clutch slippage is felt, mechanical trouble in clutch is indicated. If high clutch pressure is more than 5 lbs. lower, check for leak in high pressure line between low and drive valve body and high clutch.

Idle Pressure in "Drive" Range: *NOTE - In addition to oil pressure gauges, a vacuum gauge is required for this test.* With parking brake applied and shift selector lever in "D" (Drive) range, adjust engine idle speed until a steady 16" of vacuum is indicated on vacuum gauge. Main line pressure should be 60-70 lbs. (V8 Eng.), or 55-65 lbs. (6 Cyl. Eng.). If pressures not within this range, check the following: Pressure regulator valve, Vacuum modulator valve, or stuck Booster valve. Leak at low servo piston ring (between ring and bore). Leakage at valve body-to-case gasket. Leakage between valve body and housing. Front pump clearances not correct. Leak at low drive valve body (check gasket and shifter valve). Check passages in transmission housing for porosity. Loosen suction screen connection.

Manual Low Range Pressure: Connect a tachometer to engine, then place transmission selector lever in "L" (Low) range and adjust engine speed to 1000 RPM with car stationary. Main line pressure should be 114-127 lbs. (V8 Eng.), 70-80 lbs. (6 Cyl. Eng.). Pressure not within specified ranges indicate following possibilities: Partially plugged oil suction screen. Broken or damaged ring in low servo. Pressure regulator valve stuck. Leak at valve body-to-case gasket. Leak between valve body and housing. Leak at servo center. Front pump clearances not correct.

Driv Rang Overrun (Coast) Pressure: With car coasting in "D" (Drive) range at 20-25 MPH and engine vacuum at approximately 20" hg, main line pressure should be 47-53 lbs. (all models).

Governor Pressure: Governor pressure is relative to transmission output shaft speed and can be checked in terms of MPH by referring to following table.

Governor Pressure ①

Speed	Pressure	Speed	Pressur
5 MPH	2-4 lbs.	35 MPH	47½-53½ lbs.
10 MPH	8½-13 lbs.	40 MPH	55-62 lbs.
15 MPH	21-27½ lbs.	45 MPH	63½-71½ lbs.
20 MPH	31½-34½ lbs.	50 MPH	73½-82 lbs.
25 MPH	35½-40 lbs.	55 MPH	84-93½ lbs.
30 MPH	41-46 lbs.	60 MPH	95½-106 lbs.

① - Governor pressures for cars with 3.08-1 rear axle ratio will be approximately 2 lbs. lower than specified in table.

Reverse Pressure: With parking brake applied and vacuum hose disconnected, place selector lever in "R" (Reverse) and adjust engine idle speed to 1,000 RPM. Pressure reading on front pump gauge should be 240-275 lbs. (V8 Eng.), 167-191 lbs. (6 Cyl. Eng.).

TRANSMISSION REMOVAL

►*TRANSMISSION REMOVAL NOTE:* Transmission and torque converter are removed as an assembly. Use special tool to retain converter while assembly is being removed.

REMOVAL: Raise car and drain transmission, then remove oil filler tube. Disconnect oil cooler lines, vacuum modulator hose, and speedometer drive cable fitting at transmission. *NOTE - Tie all lines out of way.* Disconnect body ground strap, then disconnect manual shift and throttle valve control rods at transmission levers. Disconnect propeller shaft at transmission, then install suitable transmission lifting equipment on transmission. Disconnect engine rear mount on transmission extension and remove transmission support crossmember. *CAUTION - Remove any shims which may be installed between extension mounting boss and cr ss member as these shims must be installed at time of transmission installation.* Remove flywheel cover and remove flywheel-to-converter attaching bolts (rotate converter using a remote control starter button). Lower rear of transmission slightly so that three upper transmission housing-to-engine attaching bolts can be removed. *NOTE - Use a universal socket and approximately a 39" extension.* Remove upper bolts. *CAUTION - When lowering rear of transmission, be car ful not to allow distributor housing to be forced against firewall.* Support engine at oil pan rail with a jack, then remove remainder of transmission-to-engine attaching bolts. Move transmission to rear and downward. *NOTE - At this point, install converter holding to l J-5384. DO NOT tip front of transmissi n d wnward until holding tools hav b n install d.* Remove transmission from below car.

CONTINUED ON NEXT PAGE

CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)

TRANSMISSION DISASSEMBLY

DISASSEMBLY: 1) Place transmission assembly in a suitable holding fixture and remove converter assembly, then drain converter. *NOTE - If transmission has been removed for replacement of front pump seal, see "Front Pump Seal Replacement" under OVERHAUL below.* 2) Remove transmission low and drive body assembly and gasket. *NOTE - Do not remove throttle valve outer lever assembly at this time as it holds throttle valve inner lever assembly to cover.* Remove vacuum modulator and pushrod, then remove servo cover bolts and lockwashers, and remove servo cover assembly and gasket. *CAUTION - Reverse servo and spring, pressure regulator valve spring and low servo piston return spring exert pressure against this cover. Be careful when removing cover and maintain pressure against it to prevent cover breakage.*

3) Remove reverse servo spring, pressure regulator valve spring and remove pressure regulator valve. Remove servo cover locating screw if it did not come out with servo cover. Remove low band adjusting screw cover, then loosen low band adjusti ng screw locknut with Tool J-4277, and tighten low band adjusting screw to hold clutch assembly in place. *CAUTION - Make sure low piston assembly does not fall out of bore.*

►*LOW BAND ADJUSTING SCREW NOTE:* Low band adjusting screw has a ¼" Allen head. Remove screwdriver retainer and special screwdriver from Tool J-4277, and use a ¼" Allen wrench in its place.

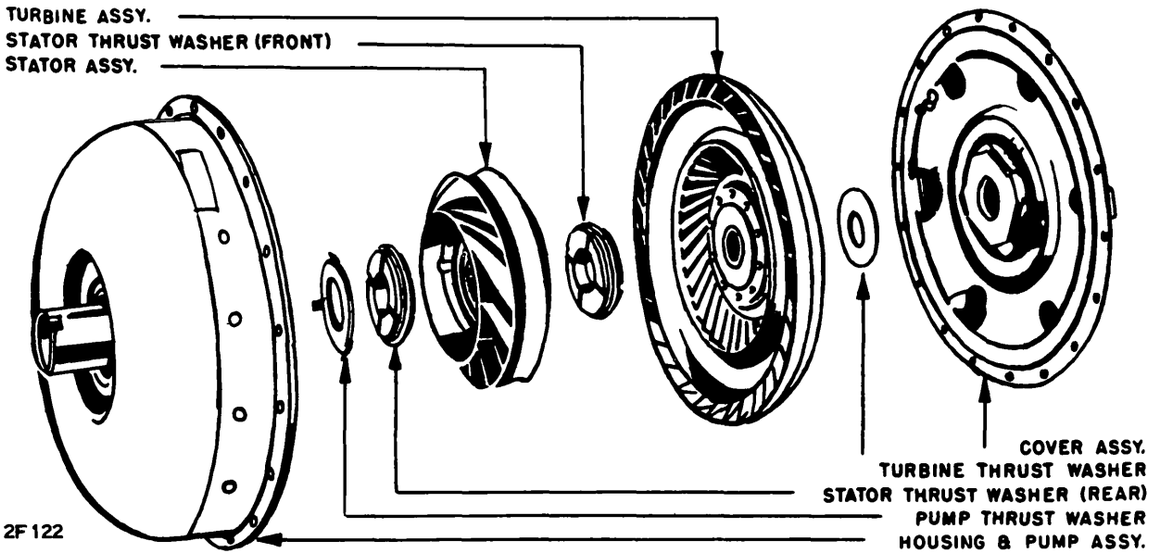
4) Working from inside converter housing, remove converter housing-to-transmission case self-locking bolt. Remove exterior transmission-to-converter housing bolts and lockwashers and install two 3/8" - 16 x 3 3/4" guide pins (part of Tool J-3387), then shift transmission into "Low" range and carefully separate transmission from converter housing. Remove valve body-to-transmission case gasket.

5) Remove manual valve from valve body and manual lever from converter housing, then remove bronze thrust washer from clutch hub on valve body. Remove all bolts and lockwashers attaching valve body to converter housing and front pump to valve body. Remove valve body and gasket.

6) Remove oil baffle and pickup pipe suction screen, then install front pump driver, Tool J-4263-5, and remove pump assembly from converter housing. Back off low servo adjusting screw and remove transmission input shaft, clutch assembly, and low sun gear thrust washer from transmission case as an assembly.

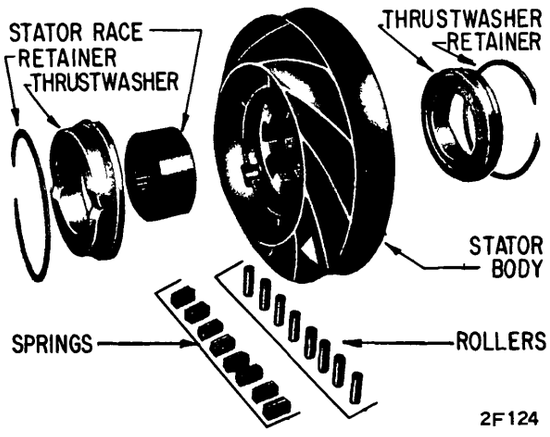
7) Remove input shaft snap ring from behind low sun gear thrust washer and remove thrust washer. Remove low servo band, strut assembly, low servo piston and piston return spring. Remove speedometer driven gear retainer screw and lockwashers, then remove retainer and speedometer driven gear, fitting, and "O" ring seal.

8) Remove governor cover-to-transmission case attaching bolts and lockwashers and remove cover and gasket. Remove governor assembly, allowing it to turn in clockwise direction when removing from bore. Use Tool J-3383 and engage parking lock spring, then rotate spring to unhook end from case. Remove spring and parking lock pawl. Disconnect short manual shift rod from parking lock lever and remove parking lock lever. Remove parking lock lever shaft assembly and oil seal from case.



9) Remove extension oil seal with Tool J-5859, then remove extension assembly from transmission case. Use Tool J-5814 and remove speedometer drive gear from output shaft. Remove rear bearing locating rear snap ring from transmission output shaft. *CAUTION - Do not attempt to remove planet carrier assembly until transmission rear bearing locating snap rings, retainer and bearing are removed.* Remove rear bearing from output shaft with Tool J-5814; then remove rear bearing locating front snap ring. *CAUTION - Make sure bearing locating front snap ring is removed.*

10) Working from rear of transmission case, position the "O" stamped on face of output shaft at top center (this aligns drive pin in output shaft with eyebrow opening in rear oil pump cover). Remove planet carrier assembly through front of transmission case. *CAUTION - Do not drive on end of output shaft, and be careful not to lose rear oil pump drive pin located in output shaft.*



11) Remove rear drum and thrust washer, then use Tool J-4277 to loosen reverse servo adjusting screw locknut. Back off adjusting sctew and remove reverse brake band assembly and reverse servo piston. Remove rear pump assembly and gasket, then remove lubrication pressure relief valve from transmission case.

TRANSMISSION UNIT OVERHAUL

►*"O" RING SEAL NOTE:* Replace all "O" ring seals during overhaul or whenever one is removed. To insure proper installation of "O" rings, make sure all parts are clean and that sharp edges or burrs are removed. Be careful not to twist seals during installation. Before assembly, lubricate "O" ring seals with Automatic Transmission Fluid.

TORQUE CONVERTER ASSEMBLY

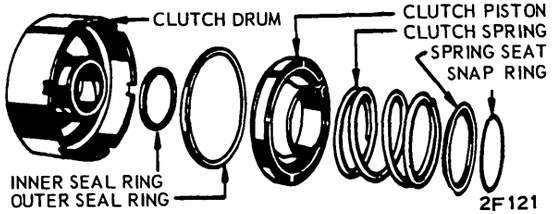
STATOR ASSEMBLY

CONVERTER & STATOR: *NOTE - W ld d c nv rt rs, which cannot be overhaul d, are used in part producti n and are identified by 'a "W" f ll wing transmission serial number. If this typ c nvert r is leaking, small welds may be made to correct leakag .*

Di sassembly: Remove converter cover attaching lock nuts and bolts, then remove converter cover, turbine assembly and converter pump thrust washer. *CAUTION - Do not pry cover off with a scr wdriv r.* Remove thrust washer from turbine hub, then remove "O" ring seal from converter cover. Remove front cam retaining snap ring and remove front stator thrust washer. *CAUTION - When s parating parts f stat r, mak sur cam roll rs and springs are not l st.* Remove stator race, cam rollers, springs, and overrun cam from stator body.

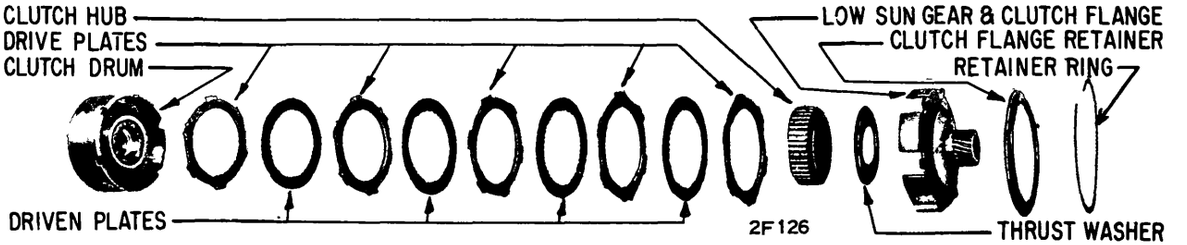
CONTINUED ON NEXT PAGE

CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)



Remove rear cam retaining snap ring and remove rear stator thrust washer.

In sp ction: Wash all parts in solvent and blow dry with air, then inspect all parts for galling, wear or scoring. Check vanes for looseness or damage. Replace parts as necessary.



C nv rter C ver Bushing Replacement: Insert converter cover bushing remover, Tool J-5381, in bore of bushing and turn puller screw clockwise to remove bushing. Place new bushing on pilot end of converter cover bushing replacer, Tool J-5382, and press bushing into place with an arbor press.

Reassembly: Place stator body face down on bench and install the rear stator thrust washer (the front and the rear stator thrust washers are the same), then install the retaining snap ring, making sure that it is fully seated in the groove. *NOTE - Front of the stat r is identified by th word "Front" cast on stator body. Stator van s ar also thicker at the fr nt.* Reverse stator body and key overrun cam to stator body. Assemble cam rollers and springs in overrun cam with open end of springs toward hub. *NOTE - Inc rr ct ass mbly will cause excessive wear between springs and rac .* Coat stator race and Tool J-5390 with a light film of oil, then place stator race on pilot end of loading tool and carefully rotate stator over tapered end of tool and stator race, being careful not to dislodge rollers. Install front stator thrust washer and retain with cam retaining snap ring. Check operation of stator which should free wheel in clockwise direction (when viewed from fr nt) and lock up in a counter-clockwise direction. Place converter pump on bench and install thrust washer on converter hub, making sure tabs are engaged in notches of hub flange. Install stator assembly with front toward converter pump cover, then install thrust washer on turbine hub and and assemble turbine to converter pump. Install a new "O" ring seal on converter cover, then align blue stripe on converter cover with blue stripe on converter pump and install cover. Install attaching bolts and locknuts and tighten to 20-25 ft. lbs.

CLUTCH: Disass mbly - Remove clutch flange retainer ring and flange, then remove low sun gear and clutch flange assembly from clutch drum. Remove clutch hub thrust washer, hub, and clutch plates from clutch drum. Place clutch drum in arbor press and install piston spring compressor J-5133 to compress clutch release spring. Remove clutch spring snap ring, then release pressure slowly and remove clutch spring seat and spring. Rap clutch drum, face down on wood surface to remove clutch piston. Remove piston outer ring seal

CLUTCH DRUM ASSEMBLY

MULTIPLE DISC CLUTCH

from piston and inner seal from hub of clutch drum.

Inspection: Wash all parts in solvent and blow dry with air. Inspect brake drum surface for excessive wear, scoring or burning. Check drum bushing for scoring or excessive wear. Check steel ball in clutch drum drum that acts as a relief valve. Make sure ball is free and that orifice leading to front of drum is open. Check fit of clutch flange in drum slots. There should be no appreciable radial play between these two parts. Check low sun gear for nicks or burrs. Check clutch plates for burring, pitting, or metal pickup. Check to see that composition plates are a free fit over clutch hub and that steel plates are a free fit in clutch flange. Check for excessive wear on friction facing of drive plate teeth, and for interference of teeth and spring. If clutch relief valve check ball in clutch drum is loose enough to come out or not loose enough to rattle, replace clutch drum as an assembly. *CAUTION - Replacement or restaking of ball should not be attempted.* If new clutch plates are required, make sure they are the new design identified by a green dye stripe. New drive (faced) plates are waved and the steel driven plates are flat. **Do not mix new waved face plates with the steel reaction plates used in past model transmission.**

Reassembly: Install new piston outer ring seal on clutch piston being careful not to stretch seal (lip of seal should be installed so it is toward pressure side of piston). Install new piston inner ring seal on inner hub of clutch drum with lip of seal toward bottom of piston pocket. Place a small amount of transmission fluid on inner diameter of clutch drum and onto seals, then carefully install piston into clutch drum using a piece of feeler stock to insure seating of outer ring seal in drum. Install clutch spring and seat, then place entire unit in an arbor press. Use Tool J-5133 and compress spring and install snap ring. *CAUTION - When compressing spring, be careful spring seat does not hang up in snap ring groove, causing damage to spring seat and groove.* Place clutch hub with thrust washer on clutch flange with open side of clutch hub upward, then install five steel and four composition plates alternately, starting with a steel plate. Assemble clutch drum over clutch flange, then invert and install clutch flange retainer and retainer ring. Check endplay with a feeler gauge between clutch flange drive lug and drive slot in drum. Maximum endplay is .013". *NOTE - Retainer rings are available in thicknesses of .055", .064", .073" to control endplay of sun gear and clutch flange assembly in clutch drum.*

SERVO COVER: Disass mbly - Remove pressure regulator reverse booster valve only.

Inspecti n: Wash all parts in solvent and blow dry with air, making sure that all the passages are blown out and are open. Inspect cover for nicks or cracks which might result in leakage. Use a small punch or similar tool, then, working through opening in bypass disc seat, exert pressure on lubrication bypass disc to make sure disc and spring are free to operate. Check disc for seating properly on its seat. *NOTE - Do not remove seat unless there is evidence of damag .* Inspect pressure regulator reverse booster valve for free operation in bore of booster valve sleeve. *CAUTION - Do not push down on booster valve sleeve as sleeve has been properly located by servo cover l - cating sleeve.*

Reverse Booster Valve & Sleeve Replacement: If valve is stuck tight in sleeve, apply air pressure to modulator passage (this may or may not blow out sleeve along with valve). To remove sleeve, form a hook end on a piece of 3/32" rod and insert hook into feed hole in large diameter bore. *CAUTION - This operation will damaged bore of sleeve and sleeve should not be reused.* Remove booster sleeve limit spring with needle nose pliers, and discard. Place a new limit spring in bottom of servo cover bore with wide tabs seating on bottom of bore. Install "O" rings on new booster valve sleeve and push into bore so that end of sleeve is 13/32" below finished face of servo cover. *CAUTION - Do not push sleeve in beyond 13/32".*

Reassembly: Install reverse booster valve.

LUBRICATION BYPASS VALVE ASSEMBLY REPLACEMENT: Use a suitable tool and remove steel bypass disc seat, then remove disc and spring. Inspect bypass disc for burrs or damage, and spring for distortion or damage. Inspect walls of bypass cavity for roughness, nicks, or burrs. Also make sure that bypass spring seats properly in bottom of cavity. Insert bypass disc in its cavity to make sure its movement is not restricted, then remove disc from cavity. *NOTE - If either disc or spring are damaged, replace as necessary.* Install bypass disc spring in its cavity in servo cover, then install disc. With servo cover inner surface facing upward, position a new bypass disc seat over its opening in cavity and press into place using a socket of proper size. *NOTE - It should be flush to .005" below inner surface of cover. Under no circumstances should old bypass disc be reinstalled.*

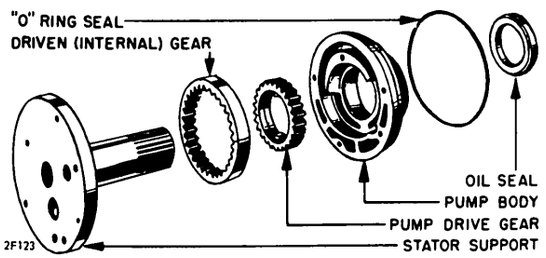
FRONT PUMP: Disassembly - Remove stator support from pump body, then remove pump gears, being careful not to damage them. These gears are not heat treated. Remove "O" ring seal from pump body.

Inspection: Wash all parts in solvent and blow out all passages. Inspect all parts for nicks, scoring or other damage. If necessary to replace seal, pry it out and replace using Tool J-6839 to drive new seal

CONTINUED ON NEXT PAGE

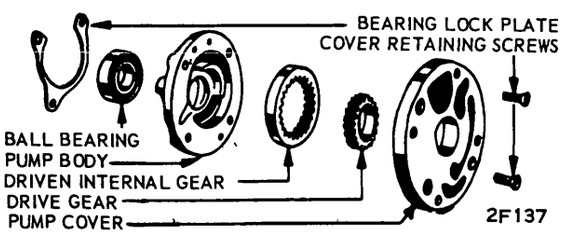
CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)

into position. Be sure stamped steel plug is properly installed in drill hole in edge of stator support *(see "Front Pump" illustration)*. When properly installed, plug will allow oil flow from hole in rear face of stator support toward hub. Inspect pump body bushing for galling or scoring. Check clearance between pump body bushing and converter pump hub. Maximum clearance should be .005". With all parts clean and dry, install pump gears and check clearance between outer diameter of driven gear and body. This clearance should be .0035-.0065". Check clearance between inner diameter of driven gear and crescent which should be .003-.009". With a scale placed across gears and pump body, check clearance between scale and gears. Clearance should be .0005-.0015".



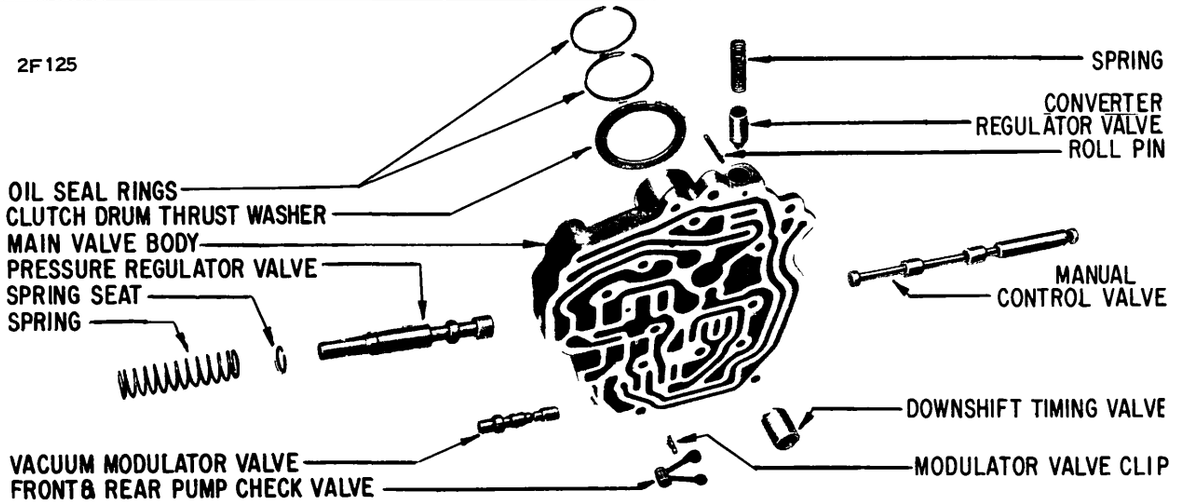
Reassembly: Install new "O" ring seal in pump body, then remove gears from body, lubricate with transmission fluid and reinstall. Assemble stator support through drive gear, aligning attaching holes.

FRONT PUMP SEAL REPLACEMENT: With transmission installed in holding fixture and converter removed, screw Tool J-6793 into bore of old seal and pull seal by driving outward with a sliding hammer. Lightly hone any burrs that may exist in front pump bore, then position new front pump seal in bore and drive it into position with Tool J-6839. *NOTE - Outer diameter of seal should be coated with a non-hardening sealer before installation.*



REAR PUMP: Disassembly - Remove pump body plate and lubrication hole pin from pump body.

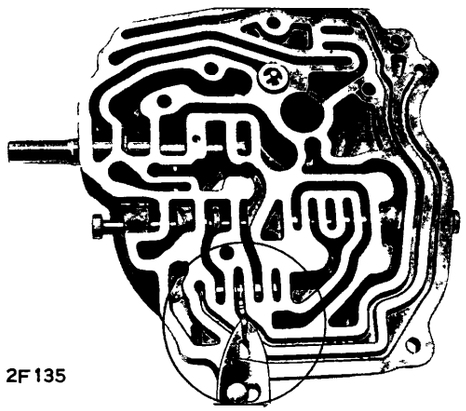
Inspection: Same as for front pump (see above).



Reassembly: Lubricate gears with transmission fluid and install in pump body, then install lubrication pin in body with headed end toward body plate. *CAUTION - Make sure this pin is properly installed. If omitted, leaks may result because of over-lubrication.* Install pump body plate and tighten screws to 3½-5 lbs.

FRONT PUMP ASSEMBLY

REAR OIL PUMP



MAIN CONTROL VALVE ASSEMBLY

MAIN VALVE BODY: Disassembly - Use needle nose pliers and remove hairpin retainer from vacuum modulator valve, then remove valve from body. Place valve body assembly face down on two blocks of equal thickness, then drive out converter pressure regulator valve retaining pin and remove valve and spring from bore. Remove two clutch drum oil seal rings from oil delivery sleeve. Remove front and rear oil pump check valve from valve body. *NOTE - Downshift timing valve must not be removed unless replacement is necessary as indicated by poor "coast" downshift. Make sure all linkage adjustments are correct before downshift timing valve is considered faulty.* Remove manual control valve.

Inspection: Wash all parts in solvent, air dry, and blow out all passages. *CAUTION - Make sure that drilling immediately below vacuum modulator valve is plugged with a stamped metal plug.* Check all valves for nicks, burrs, scoring, galling or other damage and make sure valves move freely in respective bores. Check springs for distortion or damage. Check oil seal rings for nicks and burrs and for freeness in ring grooves. Install rings in clutch drum bore and make sure hooked ring ends have clearance.

Downshift Timing Valve Replacement: Pry out old valve assembly with a small pin punch being careful not to damage bore in valve body. Use an arbor press and a 7/16" socket and press new downshift timing valve into valve body until tip on check ball end of valve assembly is flush to .015" below surface of valve body.

Reassembly: Place valve body face down on wood blocks, then assemble converter pressure regulator valve spring in valve. Install this assembly in valve body and install retaining pin. Install manual valve, then install vacuum modulator valve and attach retaining clip in valve groove. Install spring clip on pressure regulator valve and insert valve into bore in valve body. Install front and rear oil pump check valve in valve body, making sure it is flush with or below valve body face. Install the two clutch drum oil seal rings in ring grooves of oil delivery sleeve.

VACUUM MODULATOR VALVE CLIP LOCATION

LOW & DRIVE VALVE BODY: *DO NOT disturb or tamper with throttle valve inner l ver adjustm nt unl ss it is necessary to install new parts that would aff ct this adjustment. See "Throttl Valve Inn r Lev r Adjustment" below, if adjustment is n c ssary.*

Disassembly: Remove valve body from side cover (hold valve body in one hand and with a soft faced hammer, tap in inner side of cover until it is free of locating pins). *CAUTION - Exert pr ssur n det nt valv wh n separating valve body fr m c v r t pr v nt loss or damage of parts.* Remove detent valve, spring, spring seat and throttle valve spring regulator assembly. Remove throttle valve retainer clip, then remove throttle valve and spring. Use special snap ring pliers, Tool J-5403, and remove low and drive regulator cap retainer. Remove low and drive regulator valve cap, sleeve, and valve as an assembly, low and drive valve inner and outer springs, and low and drive valve. Remove low and drive body end plate and gasket. Remove throttle valve control outer lever assembly, then remove

CONTINUED ON NEXT PAGE

CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)

throttle valve lever shaft shield and throttle valve inner lever assembly. Remove throttle valve lever shaft seal from counterbore in cover.

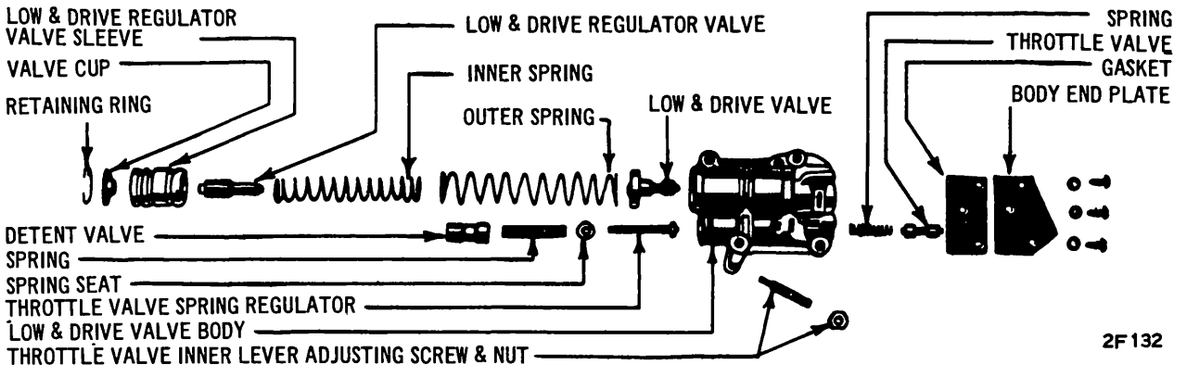
Insp ctI n: Inspect all valves, seats, and parts for nicks, burrs, scoring or damage. Make sure all valves operate freely in their respective bores. Check all springs for distortion or damage. Inspect throttle valve inner lever assembly shaft for galling and lever for tightness on shaft. Check shaft for freeness in bore in side cover. If detent valve stop in cover is distorted or damaged, replace with a new stop. Replace locating pins in valve body if distorted or damaged. *NOTE - One locating pin should b in valve body and the other in sid c v r.* Inspect mating surfaces for nicks or burrs.

R assembly: Install low and drive valve in valve body bore. *CAUTION - L w and drive valve must be guided into its b r in valv body to prevent damage to bore as foll ws: Ins rt a pi c f brake tubing into valve shank bore in r ar f valv b dy, engaging protrusion on end f shank in pening in tube, then slowly move valve into its prop r position.* Install low and drive regulator inner and outer springs in valve body bore, then assemble low and drive regulator valve and cap to low and drive regulator valve sleeve. Install this assembly in valve body bore, making sure that inner spring is properly seated on seat of low and drive regulator sleeve. Compress low and drive valve assembly into valve body bore and install retainer, using Tool J-5403, so it is properly seated in groove of bore. Install throttle valve spring and valve in valve body bore, then install throttle valve clip. *NOTE - This clip prev nts vertrav l f thr ttle valve.* Install low and drive body end plate and gasket and tighten screws to 1½-2½ ft. lbs. Install throttle valve spring regulator assembly in valve body bore and make sure it is seated on throttle valve spring. Install detent valve spring and detent valve in valve body bore, threading pin of throttle valve spring regulator assembly through opening in detent valve. Place side cover in vise, face up and align locating pin hole in low and drive body assembly and locating pin in side cover. Exert pres-pressure on valve body to keep locating pin in locating hole, and at the same time compress detent valve into valve body bore. Rotate valve body counterclockwise until locating pin in valve body enters locating hole in side cover. *CAUTION - Be sure face of det nt valv is r sting against detent valve stop pin in sid cov r.* Install low and drive body attaching bolts and lockwashers and tighten to 3½-5 ft. lbs. Install throttle valve inner lever assembly to side cover, then install new seal over shaft and into counterbore in cover. Install shield, then install throttle valve control outer lever assembly on inner lever shaft. From the underside, install outer lever attaching bolt and tighten securely.

THROTTLE VALVE INNER LEVER ADJUSTMENT: Rotate throttle valve inner lever until it just contacts face of detent valve, then hold lever in this position and turn adjusting screw until it just contacts flat surface of step in lever. **Back ff one c mpl t turn and tight n l cknut secur ly.**

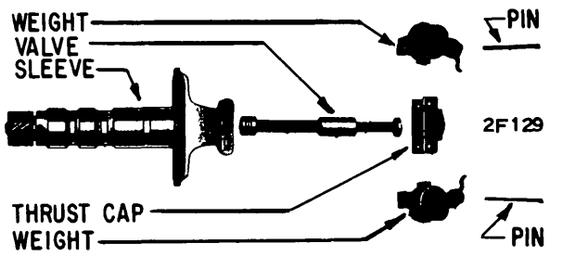
GOVERNOR: *NOTE - Exc pt f r driv g ar, g v rnor ass mbly is furnish d only as a compl t unit. If n c s-sary to disassemble for cleaning, proceed as follows:*

Disassembly: Cut off one end of each governor weight pin, then remove pins, governor thrust cap, governor weight assemblies and governor valve from governor sleeve.



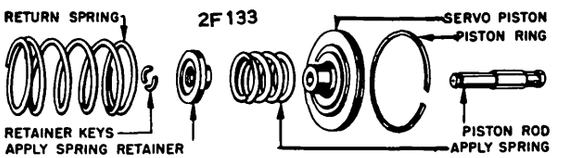
Inspection: Inspect governor sleeve, valve, and gear for nicks, burrs, scoring, or damage. Check sleeve and valve for free operation in bores. Check drive gear for looseness on sleeve and governor weight for distortion or damage. Check weights for free operation in their retainers but do not disassemble weights. Check valve opening at entry and exhaust (.020" minimum). Bend tangs on governor weights as necessary.

Governor Driven Gear Replacement - With governor weights and valve removed (see above), drive out governor gear retainer split pin with a small punch. Support governor on 3/16" plates installed in exhaust slots of governor sleeve, then place in an arbor press and use a long punch to press gear out of sleeve. To install, clean out any chips in governor sleeve, then support governor (gear end of sleeve upward) on 3/16" plates installed in slots of sleeve. Position new gear in sleeve and with a suitable socket, press gear into sleeve until nearly seated, then carefully remove any chips that might have shaved off gear hub and press gear in until it bottoms on shoulder. *CAUTION - A socket must be used to prevent damage to thrust button on end of gear.* While supporting governor in arbor press, use a No. 24 (.152") drill and drill a new hole 90° from existing hole (through sleeve and gear). Wash governor assembly thoroughly to remove any chips.



Reassembly: Install governor valve in bore of sleeve, then align governor weight pin holes in thrust cap, weight assemblies, and sleeve and install new pins. Crimp both ends of pins and check weight assemblies for free operation on pins.

REVERSE SERVO & LOW SERVO PISTONS: Remove reverse servo piston ring from piston and install in reverse piston bore. Check ring gap which should be .005-.010". If gap is greater, replace ring. Assemble reverse servo piston ring on piston. Remove and check low servo piston ring in same manner. Install ring on low servo piston and insert feeler gauge between side of ring and one wall of groove. Clearance should be .0005-.005".



PLANET ASSEMBLY & INPUT SHAFT: *NOTE - Do not disass mbl unl ss insp ction indicates videnc of w ar r damag .*

LOW & DRIVE VALVE BODY ASSEMBLY

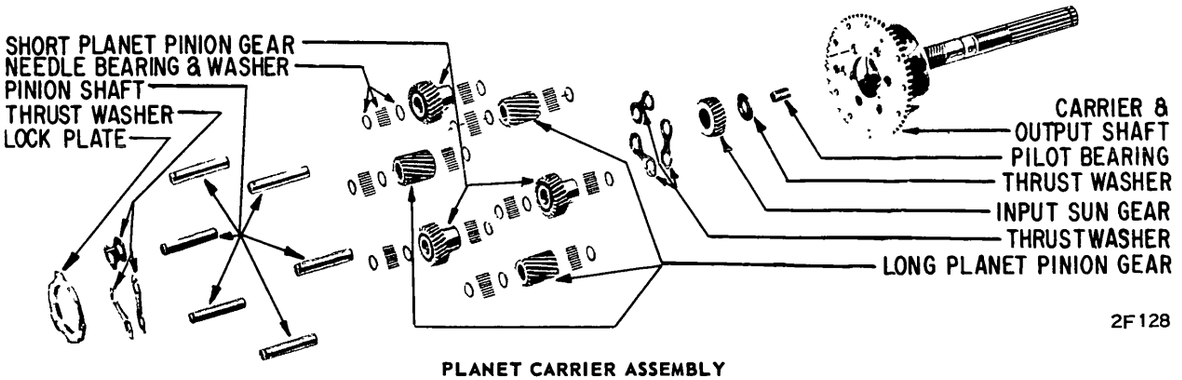
GOVERNOR ASSEMBLY

REVERSE SERVO PISTON ASSEMBLY

Inspection: Inspect reverse brake drum outer diameter for scoring or burning. Check internal gear for tooth damage and drum hub bushing for scoring or damage. Inspect planet pinion for nicks or other tooth damage, then check end clearance of all planet pinions which should be .006-.030". Check input sun gear for tooth damage and rear thrust washer for wear or damage. Inspect output shaft bearing surface for nicks or scoring and inspect input pilot bushing. Inspect input shaft splines for nicks or damage and check fit in clutch hub and reverse sun gear. Check fit of splines in turbine hub. Check oil seal rings for damage. Rings must be free in input shaft ring groove. Remove ring and insert in valve body bore and check to see that hooked ends have clearance. Replace ring on shaft.

Disassembly: Place planet carrier assembly in a vise so that parking lock gear end faces upward, then use a prick punch and mark each pinion shaft and planet carrier assembly for installation of parts in same location. Remove pinion shaft lock plate screws and rotate lock plate counterclockwise to remove it. Starting with a short pinion, and using a short steel drift, drive on lower end of pinion shaft until shaft is raised above

CONTINUED ON NEXT PAGE



CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)

press fit area of output shaft flange. Feed Tool J-4599 into short planet pinion from lower end, pushing planet pinion shaft ahead of it until tool is centered in pinion and pinion shaft is removed from the assembly. Remove short planet pinion, tool, needle bearings and spacers. *CAUTION - Do not lose needle bearings. Twenty bearings are used in each end of pinion and are separated by a spacer.* Remove long planet pinion adjacent to removed short pinion in same manner. Repeat the above procedure for removal of remaining pinions. Remove input sun gear and thrust washer.

R assembly: *NOTE - Before reassembly, inspect needle bearings and replace all bearings if wear or damge is indicated. Inspect input shaft pilot roller bearing installed in base of output shaft. If damaged, pry out and r place, using pilot end of input shaft as a press tool.* Use Tool J-4599 and assemble needle bearing spacer and needle bearings (twenty at each end) in a long planet pinion, using cup grease to hold needle bearings in position. Position long planet pinion, with Tool J-4599 centered in pinion assembly and with thrust washers at each end, in planet carrier. *NOTE - Oil grooves in thrust washers must be toward gears. Long planet pinions are located opposite closed portions of carrier, while short planet pinions are located in openings.* Feed second Tool J-4599 in from top, picking up the upper thrust washer and planet pinion and pushing the first Tool J-4599 out lower end. As first tool is pushed down, check to make sure it picks up lower thrust washer. Select proper pinion shaft (as marked at disassembly), then lubricate shaft and install it from top, pushing Tool J-4599 ahead of it. Turn pinion shaft so slot or groove at upper end faces center of assembly. With a brass or soft drift, drive pinion shaft until lower end is flush with lower face of planet carrier. Follow the above reassembly procedure and assemble and install a short planet pinion adjacent to the installed long pinion. *NOTE - Thrust washers already installed with long pinion also suffice for this short pinion as both pinions are paired together on one set of thrust washers.* Install input sun gear thrust washer and input sun gear. Assemble and install remaining planet pinions in pairs, by installing long pinion and then adjacent short pinion. Check end clearance of planet gears which should be .006-.030". Place pinion shaft-lock plate in position, then with extended portions of lock plate aligned with slots in pinion shafts, rotate lock plate clockwise until three attaching screw holes are accessible. Install attaching screws and tighten to 2½-3 ft. lbs.

TRANSMISSION CASE & REAR BUSHING: Check case for cracks and inspect rear bushing for wear or damage. Replace bushing if necessary.

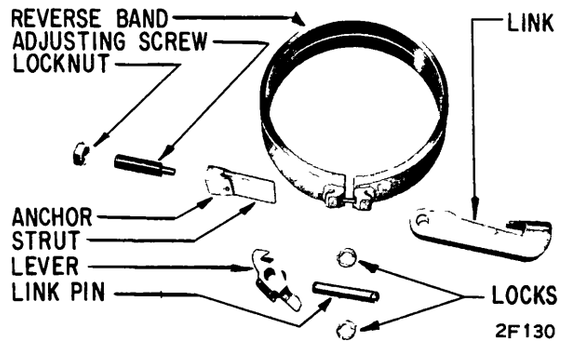
Bushing Replacement: Place transmission case in an arbor press with rear of case upward, then use a cape chisel to cut bushing and remove from case. Install rear bearing in its bore in rear oil pump assembly and install rear pump in case to serve as a pilot when installing new bushing. Place transmission case in an arbor press with front of case upward, then place a new bushing on Tool J-7559, with square end of bushing against shoulder of tool. Insert in case, entering pilot of tool in rear bearing, and press bushing into place.

PLANET CARRIER ASSEMBLY

TRANSMISSION EXTENSION HOUSING: Check housing for cracks and inspect rear bushing for wear or damage. Replace bushing if necessary.

Bushing Replacement: With extension housing in an arbor press with rear of case upward, press old bushing out with Tool J-5778. Place a new bushing on pilot end of Tool J-5778 and press bushing into place.

LOW & REVERSE BRAKE BANDS: Inspect bands for wear, cracks, and scored or burned lining. Inspect linkage for wear. Replace parts as required.



TRANSMISSION & CONVERTER HOUSING REASSEMBLY

TRANSMISSION: Rear Oil Pump - Install two 5/16" - 18 x 3" guide pins (part of Tool J-3387) in pump attaching bolt holes, then place a new gasket over guide pins and install pump. Align suction and delivery holes, install bolts and tighten to 12½-15 ft. lbs.

Lubrication Pressure Relief Valve: Clean valve and make sure openings are not obstructed and that valve disc and spring operate freely. Install valve in mounting hole in rear of transmission case and tighten securely.

Reverse Servo Piston, Band & Drum: Compress piston ring with Compressor, Tool J-3365, then install servo piston in case with notch in shaft toward front of case. Install reverse band and lever assembly, then install anchor and strut assembly and thread adjusting screw in until it indexes with hole in anchor. Install thrust washer on hub of reverse drum and install drum into case and reverse band.

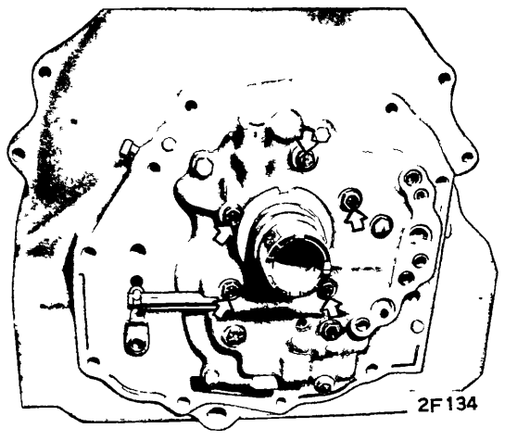
Planet Carrier: Rotate rear pump drive slot to top of pump, then fill drive pin hole in output shaft of planet carrier assembly with cup grease and install drive pin. *CAUTION - Make sure drive pin does not fall out of shaft during assembly.* Install planet carrier assembly including steel thrust washer on shaft in drum, positioning the "O" stamped on face of output shaft of planet carrier assembly at top center. *NOTE - This aligns drive pin in output shaft with drive slot in internal gear of rear pump.* Install rear bearing locating front snap ring in groove in output shaft, then install rear bearing assembly, using Tool J-5814. *NOTE - Groove in outer diameter of rear bearing should be to r ar of transmission.* Install rear bearing retainer in groove in outer diameter of rear bearing and attach to rear oil pump, then tighten screws to 9-11 ft. lbs. Install rear bearing rear snap ring in its groove in output

REVERSE BAND ASSEMBLY

shaft. Use Tool J-5814 and install speedometer gear on output shaft, centering gear on raised ground surface of shaft so it will mesh properly with speedometer driven gear. Install a new "O" ring seal on speedometer driven gear fitting, then assemble gear in fitting and install the assembly in extension housing. Tighten retainer attaching screw to 3½-5 ft. lbs. Position a new "O" ring seal on extension housing, then install extension housing on transmission case. Tighten attaching screws to 15-18½ ft. lbs. Install transmission extension oil seal with Tool J-5154.

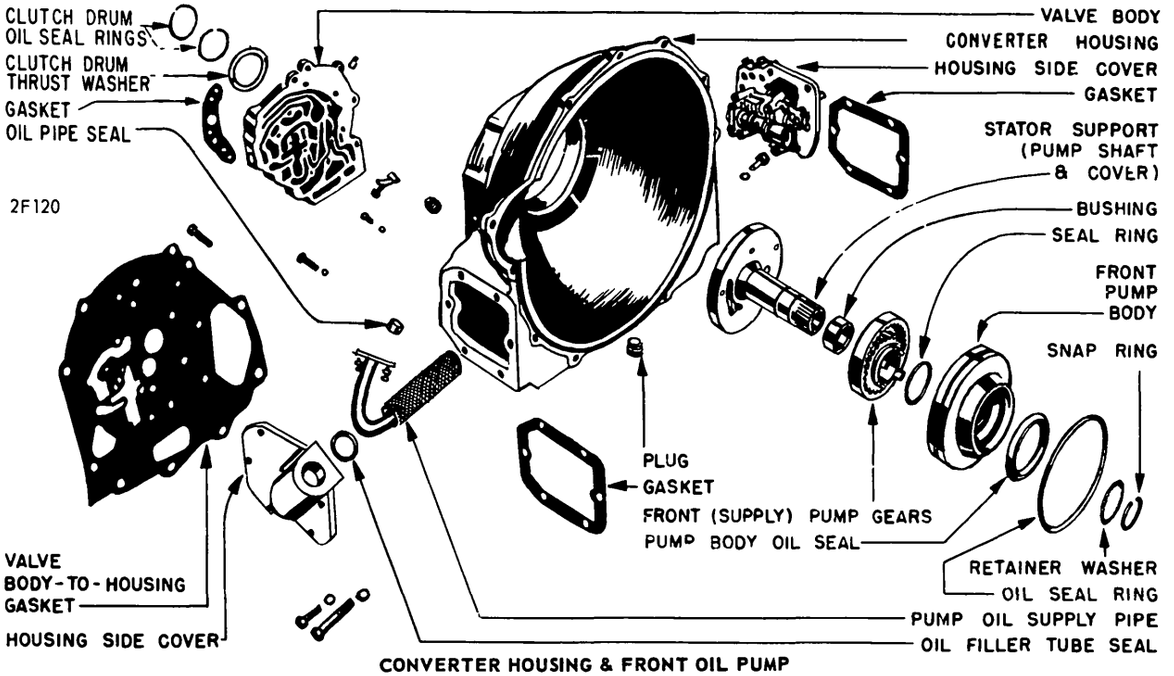
Reverse Band Adjustment: Adjust reverse band at this point. See *BAND ADJUSTMENT* above.

Transmission Endplay Check & Adjustment: *NOTE - The gauging procedure is new and r quir s the r work of Tool J-4260 as follows: Pr ss low sun g ar pilot pins from tool bar, then remove spring and spring r tainer from gauge rod. Install a steel ball (similar to Rochester Carburetor pump outlet check ball) under end of gauge rod setscrew in tool bar. Slide gaug collar (J-4260-15) onto gauge rod between tool bar and knurl d end of rod* Hold the tool bar solidly across the front face of transmission case and push gauge rod into firm contact with the front face of the input sun gear, then tighten setscrew in tool bar to lock gauge rod. Slide gauging collar down rod until it seats on tool bar. Securely tighten collar thumbscrew against rod and remove tool with setting retained. *NOTE - The above tool setting was obtained without low sun gear washer positioned*



CONTINUED ON NEXT PAGE

CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)

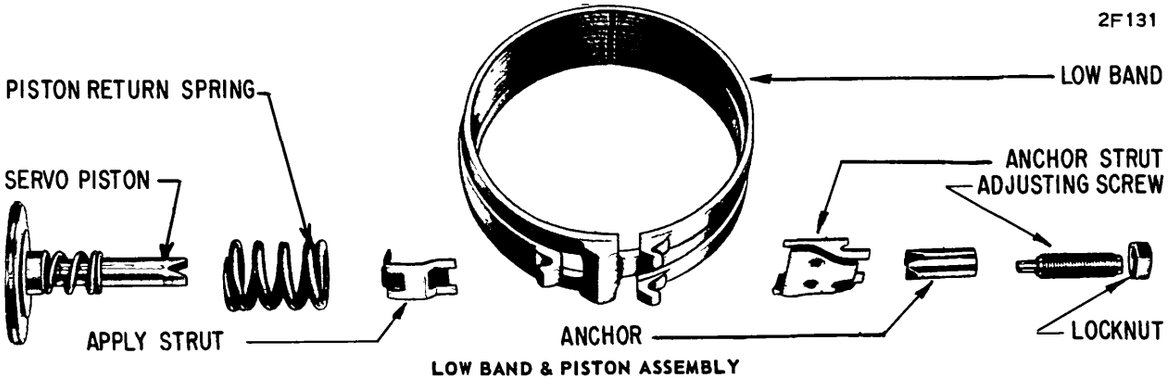


against input sun g ar. Place transmission main valve body assembly on a sheet of glass or a smooth table top, then install a clutch drum thrust washer on valve body and lower clutch assembly onto stack. Center low sun gear thrust washer on top of low sun gear. *NOTE - If low sun g ar is flang d type, insert washer flange in inn r diam t r f low sun gear.* Place pre-set Tool J-4260 on top of low sun gear thrust washer, with gauge rod down through center of clutch and valve body so rod end rests on glass or table top. Loosen setscrew in tool bar and allow bar to drop onto low sun gear thrust washer. Use a feeler gauge and measure clearance between top side of bar and bottom face of gauging collar. This dimension represents clearance in transmission and should be .025-.050". If clearance is not within limits, substitute a new clutch drum thrust washer of proper thickness to bring clearance within limits. Clutch drum thrust washers are available in thicknesses of .061", .078", .106". After proper thrust washer has been obtained, remove clutch assembly and thrust washer from oil delivery sleeve.

Parking L ck Mechanism: Install parking lock lever shaft and apply spring assembly in case, then install small lip seal over end of parking lock lever shaft and into counterbore of case with lip of seal toward inside of case. Install flat washer and parking lock lever on end of parking lock lever shaft, pushing lever onto shaft to obtain .000-.010" clearance between lever and washer. Connect short manual shift rod to parking lock lever and tighten clamp screw to 5-7 ft. lbs. Install parking lock pawl over pawl support rod and install parking lock pawl spring. Wind up pawl spring with Tool J-3383, so that spring catches on inside of case.

C nv rter Housing: Install two ¼" - 20 x 3½" guide pins (part of Tool J-3387) in valve body attaching holes in converter housing, then install oil baffle and sump screen. Install a new valve body gasket on converter housing, then install valve body over guide pins and tighten attaching bolts to 7½-10 ft. lbs. (see illustration for attaching bolts which are indicated by **absence of arrows**). *NOTE - L w r left bolt directly over manual valve bore is a self-locking bolt. Make sure this bolt is in proper position.* Tighten all bolts in a criss-cross manner, then check for free operation of manual and pressure regulator valve. Align holes in stator support assembly with holes in front oil pump body and install two ¼" - 20 x 3½" guide pins (part of Tool J-3387) in front pump, then install pump to converter housing with Tool J-4263-2. *NOTE - When installing pump. line up suction and delivery holes on left side of pump.* Install five bolts through valve body and into pump and tighten to 7½-10 ft. lbs. (see illustration for attaching bolts which are indicated by **arrows**). *CAUTION - After tightening bolts, check pressure regulator and manual valve for free operation.* Check and make sure front oil pump operates freely. Install two 5/16" - 18 x 3" guide pins (part of Tool J-3387) in converter housing as guides for low and drive valve body, then install new gasket. Install low and drive valve body over guide pins and tighten bolts and lockwashers to 15-18½ ft. lbs.

MAIN CONTROL VALVE BODY ATTACHING BOLTS



CONVERTER HOUSING & FRONT OIL PUMP

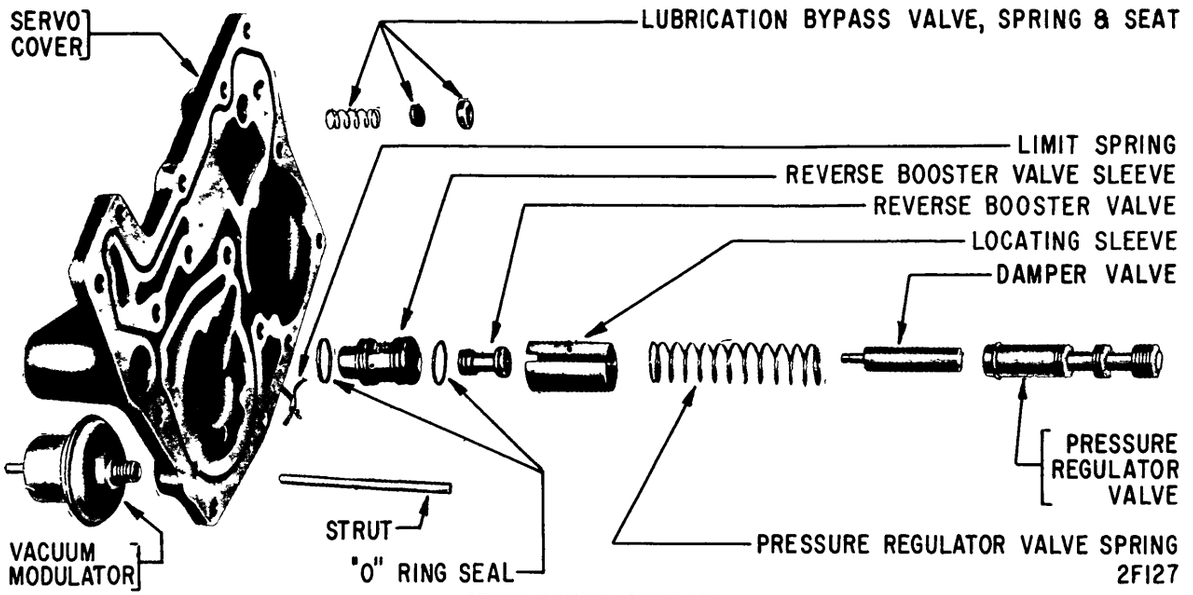
Input Shaft & Clutch Assembly: Install input shaft to clutch unit, then install low sun gear bushing on input shaft spline, bottoming bushing against shoulder on shaft. Assemble low sun gear thrust washer into planet carrier by tilting washer slightly to permit flange to enter behind short planet pinions. If necessary, retain washer in position with petroleum jelly. Install clutch and input shaft assembly into case, aligning thrust washer on input shaft and indexing low sun gear with short pinions in planet carrier.

Low Servo Piston & Band Assembly: Install low servo piston release spring on servo piston rod and install piston and spring into case using ring compressor,

CONTINUED ON NEXT PAGE

LOW BAND & PISTON ASSEMBLY

CHEVROLET (CAST IRON) POWERGLIDE (C ntinu d)



Tool J-3365, then install low brake band over clutch drum. Place apply strut in piston shaft slot with other end of apply strut engaging brake band. Place brake band anchor strut assembly in brake band groove, then engage slotted end of anchor over strut, locating other end of anchor over adjusting screw. *NOTE - Do not adjust band at this point.*

Governor: Install governor assembly in bore in transmission case, allowing it to rotate in a counterclockwise direction as driven gear of governor meshes with drive gear of output shaft. Be careful not to damage gear teeth. Install two 5/16" - 18 x 3" guide pins (part of Tool J-3387) as guides for g overnor cover and install a new gasket. Install governor cover over guide pins and tighten attaching bolts to 9-11 ft. lbs.

Transmission-to-Converter Housing Assembly: 1) Install manual valve in valve body and manual valve inner lever in converter housing, indexing lever pin with pickup slot in valve. Set manual valve so end of valve protruces 1 11/16" from face of valve body (this places valve in "Low" position). Install a new valve body-to-case gasket.

2) Raise transmission manual lever to top detent position ("Low" position) to align reaction lever so it will index with manual valve inner lever. Place clutch drum thrust washer over oil delivery sleeve, then install two 3/8" - 16 x 3 3/4" guide pins (part of Tool J-3387) in converter housing. Push transmission case and converter housing together, checking to see that reaction lever indexes with manual valve inner lever, then install case-to-housing bolts and lockwashers and tighten to 29-37½ ft. lbs.

3) From front of converter housing, install special self-locking bolt and tighten to 29-37½ ft. lbs. Install two 5/16" - 18 x 3" guide studs (part of Tool J-3387) as guides for servo cover, then install a new servo cover gasket. Install servo cover locating sleeve in bore of servo cover. *CAUTION - Do not exert any downward force on reverse booster valve sleeve.* 4) Install pressure regulator valve and spring, and reverse servo return spring. Install servo cover on guide pins, then applying pressure to cover to compress springs, make sure locating sleeve is in alignment with pressure regulator valve bore. Secure cover with bolts and lockwashers but do not tighten. *NOTE - Use a non-hardening sealer under head of bolt installed directly above vacuum modulator.*

SERVO COVER ASSEMBLY

5) Before servo cover attaching bolts are tightened, vacuum modulator hole in servo cover and the through hole in transmission case must be aligned. *CAUTION - Failure to install servo cover with these holes concentric to each other causes vacuum modulator strut to bind, resulting in improper pressures, harsh shifts, and possible clutch failure.* To properly align servo cover, proceed as follows:

6) Use a defective vacuum modulator which has been separated at diaphragm and screw the threaded half into modulator hole in servo cover. Slide a standard 15/64" drill through both modulator hole and strut holes in case. Drill should slide freely through both holes if alignment is correct; otherwise shift by tapping laterally or vertically on edges of servo cover with a soft hammer. When alignment is correct, tighten all servo cover bolts to 15-18½ ft. lbs., then remove vacuum modulator half-body and 15/64" drill. Install strut and modulator. *CAUTION - B sur pr ssur r gulat r valve spring and reverse serv r turn spring s at prop r-ly in their locations in servo c v r.*

7) Adjust low servo *(see "Band Adjustment" abov)*, then install c nverter assembly in converter housing, aligning from pump drive gear lugs with drive slots in converter pump hub. *CAUTION - Aft r conv rter is installed, check to insure ngag m nt of c nv rt r pump hub drive slots in lugs f front pump driv gear by measuring from front fac f c nvert r-to-flywhe l attaching bracket to bolt circl flang f conv rt r housing. This distance should b 9/16" r l ss.* Install converter holding tool J-5384 on converter housing.

TRANSMISSION INSTALLATION

INSTALLATION: Reverse transmission removal procedure and note the following: Install exactly the same number (and thickness) of shims between extension mounting boss and crossmember as were removed. *NOTE - These shims maintain corr ct drive lin angl .* Fill transmission and adjust linkage.

CHEVROLET (ALUMINUM) POWERGLIDE

Chevr let Pass. Cars, 327" Eng. (1962)
Chevy II, 4 & 6 Cyl. (1962)
C rvette (1962)

►CHANGES, CAUTIONS, CORRECTIONS

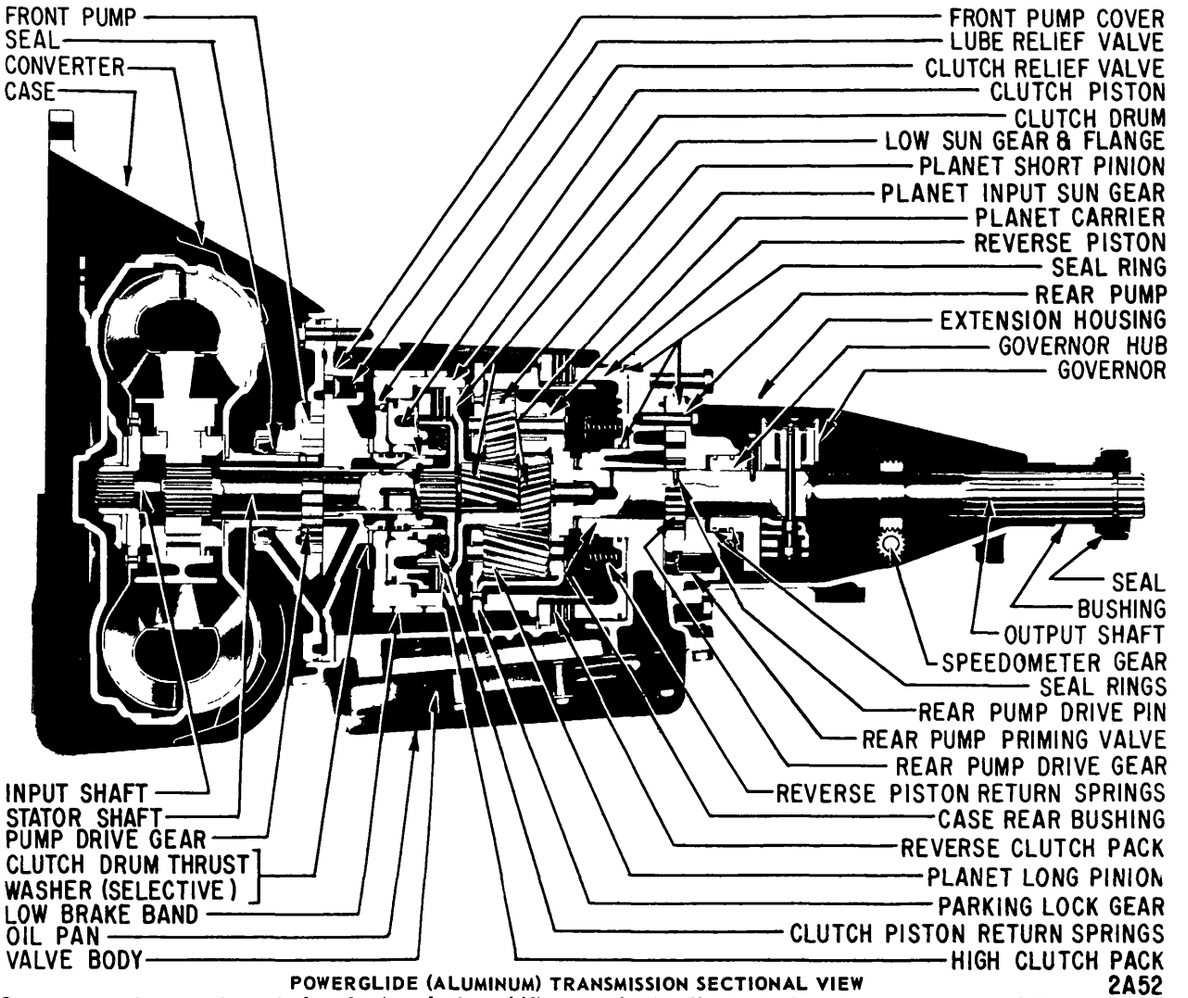
►*1962 ENGINE SPEED INCREASE OR RUNAWAY AT HIGHER SPEED NOTE:* This condition which could occur during upshifts or forced downshifts may be caused by low oil level, improper band adjustment or a stuck vacuum modulator valve. If this condition is diagnosed as low oil level on early cars, check for correct transmission fluid dipstick (see below).

►*1962 TRANSMISSION FLUID LEVEL DIPSTICK PRODUCTION CHANGE & FLUID LEVEL NOTE:* A new dipstick, Part No. 3818930 (Chev. Pass. & Chevy II); No. 3818931 (Corvette), identified by a formed "bridge" (to keep it centered in filler tube) is used in production and for service replacement. The new dipstick has the "Full" mark located approximately ½" higher than on earlier dipstick. Replace with later dipstick.

DESCRIPTION: New design 2-speed planetary type transmission with hydraulic control. With transmission selector lever in "D" (Drive), shifting between 1st and 2nd speed is automatic. The transmission case is a one-piece aluminum casting and the torque converter assembly is a welded unit. Two clutch assemblies ("Drive" & "Reverse") are disc type with multiple "coil" release springs. The "Low" band is actuated by a servo unit. The control valve assembly is located at bottom of transmission case and is accessible when oil pan is removed.

LUBRICATION

Ch cking Fluid L v l: Check fluid level every 1,000 miles. With transmission at normal operating temperature, selector lever in "N" (Neutral), fluid level should be at "FULL" mark on dipstick. *NOTE – Periodic draining and r filling of transmission is not required. S e "Draining & R filling" below.*



R comm nd d Fluid – Automatic Transmission Fluid Type "A" (Suffix "A").

Draining & R filling: *NOTE – Periodic draining and refilling of transmission is not required.* If necessary to remove transmission for repairs, drain and refill as follows: Carefully loosen oil pan bolts and drop one end of pan so fluid will drain out. To refill transmission, remove dipstick and pour in sufficient fluid to bring level up to "Full" mark on dipstick. Start engine and operate at normal idle speed, then shift transmission selector lever through all ranges. Run engine at 800-1000 RPM with transmission in "N" (Neutral) until fluid warms up, then add fluid as required to raise level to "Full" mark on dipstick. DO NOT OVERFILL. **Capacity –** 1½ qts. (refill after oil pan removed). Total capacity including torque converter is 7½ qts. (Chevy II); 9 qts. (Chev. Pass. Cars & Corvette).

LINKAGE ADJUSTMENT

Throttl Linkage: *See CARBURETOR on car model pages.*

Manual Control Linkage: *NOTE - To check shift linkage for proper adjustment, stop engine and move selector lever to a position where transmission DRIVE detent is felt. Slowly release l ver to fe l if shaft l ver tang freely nt rs lock plate. Ch ck REVERSE d tent in a similar manner. If tang do s not freely enter lock plate in both detents, adjust linkag .*

POWERGLIDE (ALUMINUM) TRANSMISSION SECTIONAL VIEW 2A52

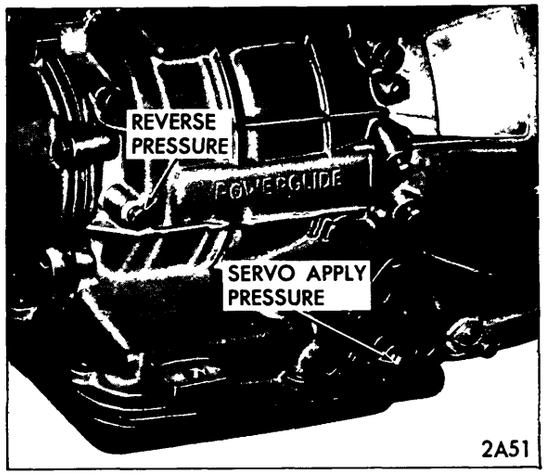
Corvette - Disconnect control rod at selector shift lever, then loosen clevis nut at bellcrank end of rod. Place bellcrank and selector shift lever in PARK position, then adjust control rod at clevis so control freely enters hole in selector shift lever.

Except Corvette - Place selector lever in "D" (Drive) range, then disconnect shift control rod at its swivel attachment on lower end of mast jacket. Place shift lever on transmission in "D" (Drive) position (first detent position clockwise from fully counterclockwise detent position), then hold shift lever at lower end of mast jacket against DRIVE stop of lock plate (with control rod through swivel) and tighten clamp nut. Check transmission selector lever in all ranges.

Neutral Safety Switch (Except Corvette): Place transmission selector lever in "N" (Neutral), then loosen two screws securing neutral safety switch retainer. While holding ignition switch in "Start" position, adjust position of neutral switch until engine turns over. Hold switch in this position and tighten retainer screws. Check adjustment for engine cranking in "N" (Neutral) and "P" (Park). Engine must not start in any other selector lever position.

BAND ADJUSTMENT

►*LOW BAND ADJUSTMENT CAUTION: Low band adjustment is not ordinarily required in service (adjustment is made when transmission is overhauled).* Tighten low servo adjusting screw located on left side of transmission case to **40 inch pounds.** *NOTE – Input and output shafts must be rotated simultaneously to properly center low band on clutch drum.* Back off adjusting screw EXACTLY four complete turns, and tighten locknut.



THROTTLE VALVE ADJUSTMENT

►*THROTTLE VALVE ADJUSTING NOTE:* No provision is made for checking throttle valve pressures. However, if operation of transmission is such that some adjustment of throttle valve is indicated, pressures may be

CONTINUED ON NEXT PAGE

CHEVROLET (ALUMINUM) POWERGLIDE (Continu d)

raised or lowered by adjusting the position of the jam nut on throttle valve assembly (on control valve body). To raise throttle valve pressure 3 psi, back off jam nut one full turn. This increases the dimension from jam nut to throttle valve assembly stop. Tightening the jam nut one full turn lowers throttle valve pressure 3 psi. A difference of 3 psi. in throttle valve pressure will cause a change of approximately 2 to 3 MPH in wide open throttle upshift point. Small pressure adjustments can be made by partial turns of jam nut. The

PRESSURE TEST POINTS

end of throttle valve adjusting screw has an Allen head so screw may be held stationary while jam nut is moved. *CAUTION – Use care when making this adjustment since no pressure point is provided to check throttle valve pressure.*

TESTING

PRESSURE TESTS: *CAUTION – Stall tests that allow engine vacuum to drop below 10" Hg. are not recommended.* Connect pressure gauge hoses at low servo apply (main line), and reverse test points (see illustration), then run gauge lines into driving compartment by pushing aside mast jacket seal. Tie lines out of way and connect to gauge set J-4872-4. Test as follows:

Wide Open Throttle Upshift Pressure Test: Wide open throttle upshift should occur at 79-86 lbs. (Chevy II, 4-Cyl.), 92-101 lbs. (Chevy II, 6 Cyl.), 85-95 lbs. (Chevrolet 327" Eng.), as indicated on low servo apply (main line) gauge.

Idle Pressure Table

Engine	Main Line Pressure 10" Hg.	16" Hg.
Chevy II (4-Cyl.)	78-86 psi	61-69 psi
Chevy II (6-Cyl.)	86-96 psi	63-74 psi
Chevrolet 327" Eng	85-95 psi	62-73 psi

►*NOTE: If pressures are not within the above range, check for oil circuit leakage.*

SHIFT SPEEDS (MPH)

THROTTLE POSITION	Chevy II 4-Cyl. Upshift	Chevy II 4-Cyl. Downshift	Chevy II 6-Cyl Upshift	Chevy II 6-Cyl Downshift	Chevrolet ① 327" Eng. Upshift	Chevrolet ① 327" Eng. Downshift	Chevrolet ② 327" Eng. Upshift	Chevrolet ② 327" Eng. Downshift	Corvett ① 327" Eng. Upshift	Corvett ① 327" Eng. Downshift
Closed	10-13	9-12	12-15	10-13	14-16	11.5-15	12-15	10.5-14	12-15	11-14
To Detent	34-43	18-27	38-47	19-30	48-58	17-25	49-60	16-25	50-62	16-26
Through Detent	42-48	39-46	47-53	43-50	59-65	55-63	59-66	56-63	61-68	58-65

① - Std. Eng. with 3.08-1 rear axle ratio. ② - High performance engine with 3.36-1 rear axle ratio.

Idle Pressure in "Drive" Range Test: *NOTE – In addition to pressure gauges, connect a vacuum gauge to engine intake manifold.* With parking brake applied and selector lever in "D" (Drive), low servo apply (main line) pressure should be as indicated in table.

Manual "Low" Range Pressure Test: Connect a tachometer to engine, then apply parking brake and place selector lever in "L" (Low) and adjust engine speed to 1000 RPM, with car stationary. Low servo apply (main line) pressure should be 89-98 lbs. (Chevy II, 4-Cyl.); 126-131 lbs. (Chevy II, 6-Cyl. & Chevrolet 327" Eng.).

►*NOTE: If pressures are not within specified ranges, check for one or more of the following conditions: Partially plugged oil suction screen. Broken or damaged ring in low servo. Pressure regulator valve stuck. Leakage at valve body-to-case gasket. Leak between valve body gaskets. Leak at servo center. Front pump clearances not correct.*

Drive Range Overrun (Coast) Pressure Test: With car coasting in "D" (Drive) range at 20-25 MPH with engine vacuum at approximately 20" Hg., low servo apply (main line) pressure should be 48-54 lbs. (all models).

TROUBLE SHOOTING

ENGINE SPEED FLARES ON STANDSTILL BUT ACCELERATION LAGS: Low band partially applied. Low oil level. Clogged oil suction screen. Improper band adjustment. Servo apply passage blocked. Servo piston ring broken or leaking. Band facing worn. Low band apply linkage disengaged or broken. Converter stator not holding. *NOTE – This last condition (stator not holding) is a very rare occurance.*

ENGINE SPEED FLARES ON UPSHIFT: Low oil level. Improper band adjustment. Clogged oil screen. High clutch partially applied, blocked feed orifice. High clutch plates worn. High clutch seals leak. High clutch piston hung up. High clutch drum relief ball not seating. Vacuum modulator line plugged.

NO UPSHIFT: Low band not releasing because of one or more of the following malfunctions: Stuck low-drive valve. Defective governor. No rear pump output caused by stuck priming valve, sheared drive pin or defective pump. Throttle valve stuck or not adjusted properly. Manual valve lever not adjusted properly.

UPSHIFTS HARSH: Incorrect throttle valve linkage adjustment. Improper low band adjustment. Vacuum modulator line broken or disconnected; diaphragm leakage; or valve stuck. Hydraulic modulator valve stuck.

CLOSED THROTTLE (COAST) DOWNSHIFTS HARSH: Improper low band adjustment. High engine idle speed. Downshift timing valve not operating properly. High mainline pressure because of vacuum modulator failure or because of hydraulic modulator valve sticking. Check for sticking pressure regulator valve.

NO DOWNSHIFT: Sticking low-drive shift valve. Low-drive shift plug stuck. High governor pressures or low throttle valve pressure.

CLUTCH FAILURE – BURNED PLATES: Low band adjusting screw backed off more than specified. Improper order of clutch plate assembly. Extended operation with low oil level. Clutch drum relief valve stuck. Abnormally high speed upshifts which may be due to improper governor action or operating transmission at high speed with selector lever in "L" (Low).

CAR CREEPS IN DRIVE: Idle speed too high.

NO DRIVE IN REVERSE: Incorrect manual lever adjustment. Reverse clutch piston stuck. Reverse plates worn out. Reverse clutch leaking excessively. Blocked reverse clutch apply orifice.

CAR CREEPS IN NEUTRAL: Incorrect manual lever adjustment. High clutch or low band not released.

IMPROPER SHIFT POINTS: Incorrectly adjusted throttle linkage or throttle valve. Governor defective. Rear pump priming valve stuck.

UNABLE TO PUSH START: Rear pump drive gear not engaged with drive pin on output shaft. Drive pin sheared off. Rear pump priming valve not sealing.

OIL FORCED OUT OF FILLER TUBE: Oil level too high. Water in oil. Leakage in pump suction circuits.

TRANSMISSION REMOVAL

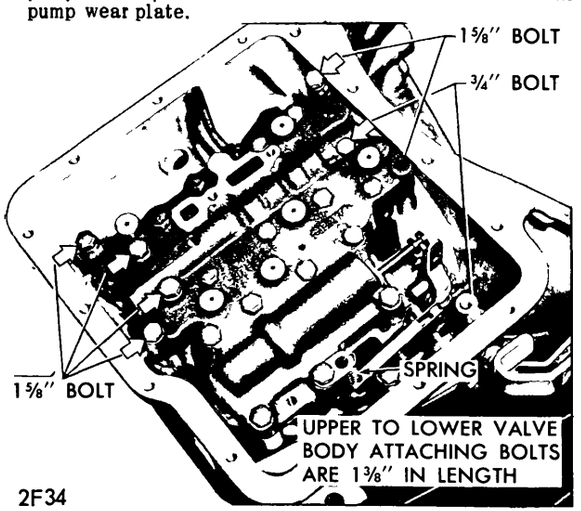
►*TRANSMISSION REMOVAL NOTE: Transmission and torque converter must be removed from car as an assembly. Keep front of transmission upward during removal to prevent converter falling out. After removal, immediately install a suitable holding tool (J-9549) or a length of wire which may be stretched across bell-housing opening.*

TRANSMISSION ASSEMBLY REMOVAL: Raise car and drain oil pan, then replace pan, using several bolts. On Standard Chevrolet, remove oil cooler lines, then on all models, remove modulator and speedometer drive cable fitting at transmission (tie lines out of way). Disconnect control lever rods at transmission and remove propeller shaft from transmission. Attach a suitable lifting device to transmission and disconnect engine rear mount on transmission extension, then remove transmission support crossmember. On Std. Chevrolet & Corvette, remove any shims that may be found between extension mounting boss and crossmember. *CAUTION - The same number of shims removed must be used when transmission is installed.* Remove converter underpan and scribe flywheel-converter relation-

CONTINUED ON NEXT PAGE

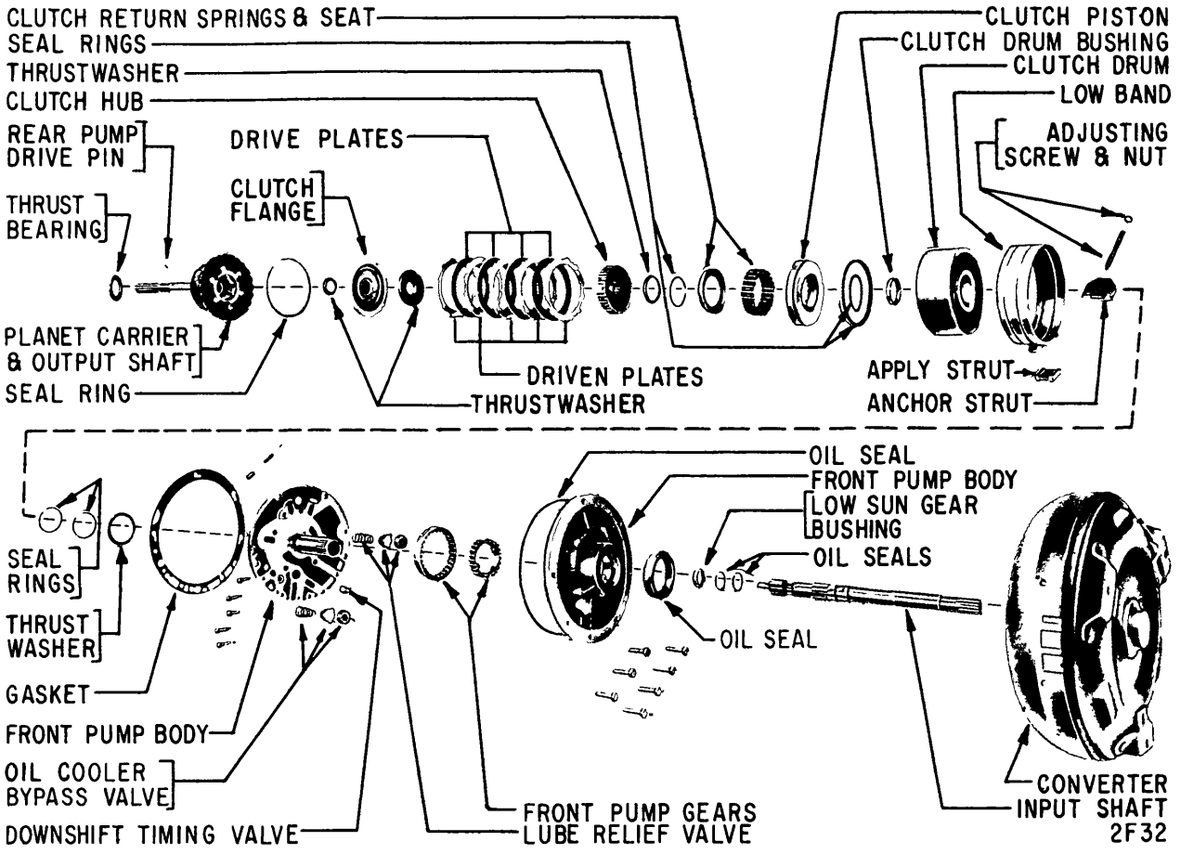
CHEVROLET (ALUMINUM) POWERGLIDE (Continued)

ship for use at installation, then remove flywheel-to-converter attaching bolts. Support engine at oil pan rail with a jack or other suitable support, then lower rear of transmission slightly so that upper transmission housing-to-engine attaching bolts can be reached using a universal socket and a long extension and remove upper bolts. *CAUTION - On V8 engines, use care not to lower rear of transmission too far as distributor housing may be forced against dash.* Remove remainder of attaching bolts, then remove transmission by moving it slightly to rear and downward, then out from under car. *CAUTION - Make sure converter moves toward rear with engine. If it does not, pry it free of flywheel.*



TRANSMISSION DISASSEMBLY

►*DISASSEMBLY NOTE: Mount transmission assembly in a suitable holding fixture such as J-3289-01 and adapters J-9506. Clean all parts in solvent and blow dry with air. DO NOT use wiping cloths. Make sure solvent being used will not damage rubber seal rings or clutch plate facings.*



1) Remove speedometer driven gear (if replacement is necessary). Loosen capscrew and retainer clip holding driven gear in extension. Remove extension housing attaching bolts and remove extension from transmission case, then remove speedometer drive gear from output shaft. *NOTE - Speedometer drive gear is a press fit on shaft and must be removed with Tool J-5814.*

2) Remove "C" clip from governor shaft on weight side of governor, then remove shaft and governor valve from opposite side. Also remove the two "Belleville" type damping springs. Loosen governor drive screw and remove governor assembly over end of output shaft.

3) Remove rear pump attaching bolts and remove pump body and drain back baffle extension seal ring, then remove pump drive and driven gears. *CAUTION - When* pump drive gear is removed, drive pin may fall out if hole is on bottom and shaft is horizontal. **Remove oil pump drive pin if it does not fall out.** Remove rear pump wear plate.

VALVE BODY ATTACHING BOLTS

TRANSMISSION ASSEMBLY NO. 1

4) Rotate holding fixture until front of transmission is facing up, then remove front oil pump attaching bolts. Remove front oil pump and stator shaft assembly and the selective fit thrust washer with Tool J-9539 (or two 3/8" - 16 x 10" bolts and suitable sliding weights). Install tools in the two threaded holes provided in pump body. Remove pump seal ring and gasket.

5) Release tension on low band adjustment, then with transmission horizontal, grasp transmission input shaft and carefully work it and clutch drum assembly out of transmission case. *NOTE - Do not lose low sun gear splined bushing from input shaft. Low sun gear thrust washer may remain in planet carrier.* Remove low brake band and struts.

6) Make sure rear oil pump drive pin has been removed, then remove planet carrier and output shaft thrust bearing (caged) from front of transmission. Remove reverse ring gear if it did not come out with planet carrier. Use a large screwdriver and remove reverse clutch pack retainer ring, then lift out reverse clutch plates. *NOTE - On Chevy II transmissions, also remove the "Belleville" type cushion spring.*

7) Install Tool J-9542 through rear bore of case with flat plate on rear face of case and turn down wing nut to compress rear piston spring retainer and springs, then remove snap ring, tool, retainer and 17 piston return springs. Remove rear piston by applying air pressure to reverse port in rear of transmission case, then remove inner and outer seals.

8) Remove servo cover, piston and spring. Rotate holding fixture so transmission is upside down, then remove oil pan and gasket. Remove vacuum modulator, gasket and valve. Remove two bolts attaching detent guide plate to valve body and transmission case, then remove guide plate and range selector detent roller spring. Remove remaining valve body-to-transmission case attaching bolts (see illustration) and carefully lift out valve body and gasket, disengaging servo apply tube from transmission case as valve body is removed. If necessary, the throttle valve, shift and parking actuator assembly levers, and parking pawl and bracket may be removed.

TRANSMISSION UNIT OVERHAUL

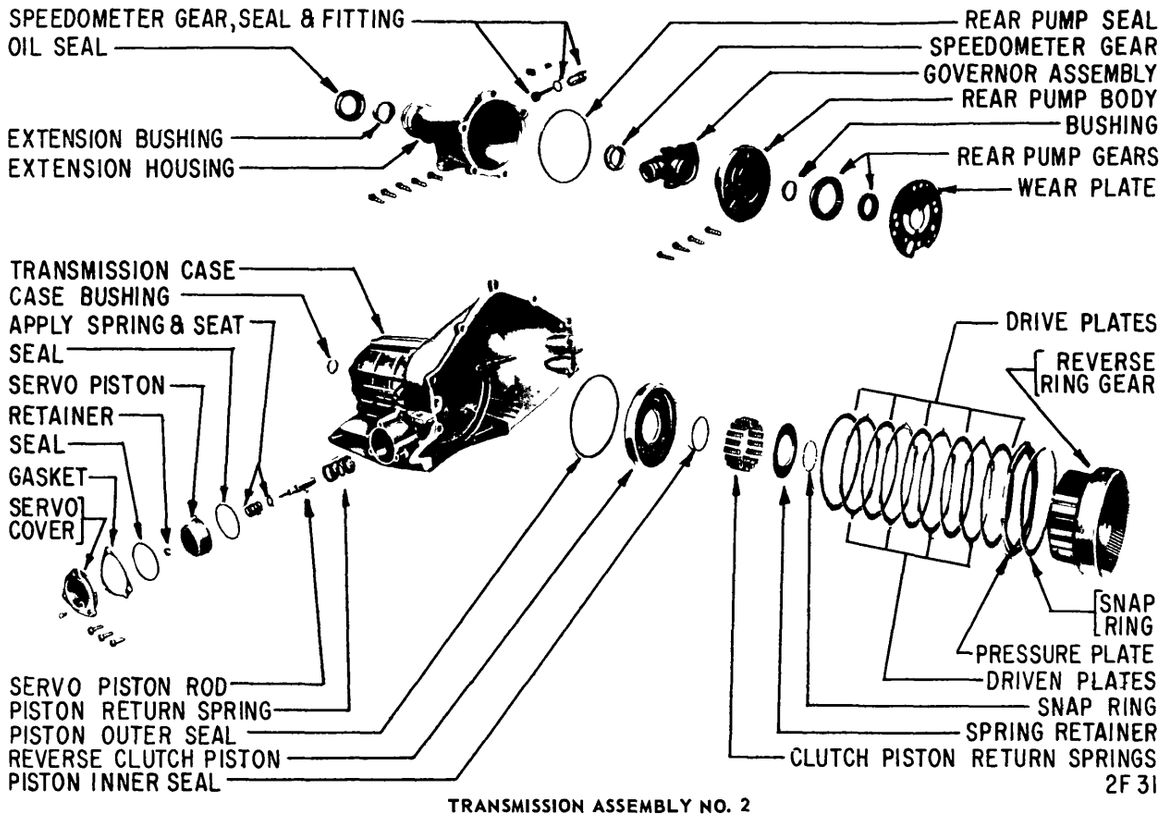
FRONT PUMP: Seal Replacement - Remove pump from transmission, then pry out and replace seal. Drive new seal into place, fully seating it in counterbore with Tool J-6839. If no further work is required on pump,

CONTINUED ON NEXT PAGE

CHEVROLET (ALUMINUM) POWERGLIDE (Continued)

install it in transmission case. *NOTE - Outer diameter of seal should be coated with a non-hardening sealer before installation.*

Disassembly: Remove bolts attaching pump cover-to-body and remove cover, then remove pump gears. *CAUTION - Do not drop or nick pump gears. These gears are not heat treated.* Remove rubber seal ring from pump body.



Inspection: Inspect all parts for nicks, scoring, or damage and check operation of pump priming valve. Check clearance between body bushing and converter pump hub. This clearance should be .005" maximum. *NOTE - If bushing is damaged, replace front pump body.* Check converter hub for nicks or burrs that might damage front pump seal or bushing. Replace if necessary. If necessary, remove oil seal and install a new seal, using Tool J-6839, seating seal fully in counterbore. *NOTE - Coat outer diameter of seal with non-hardening sealer before installation.* Check condition of oil cooler bypass (if so equipped) and lube relief valve. Replace valves if leaking. With parts clean and dry, check clearance between outer diameter of driven gear and body. Clearance should be .0035-.0065". Clearance between inner diameter of driven gear and crescent should be .003-.009". Gear end clearance, measured with a feeler gauge and straightedge, should be .0005-.0015".

Reassembly: *NOTE - If transmission not completely disassembled and only the front pump was removed for repairs, remove input shaft, clutch drum, low band and struts (see "Transmission Disassembly" above).* Install downshift timing valve, conical end out, into place in pump cover, then lubricate pump gears with transmission fluid and install in pump body. Carefully set pump cover in place over body and loosely install two attaching bolts. Place pump assembly, less rubber seal ring, **upside down** into pump bore of case (using guide pins) and install remaining cover-to-pump body attaching bolts and tighten to 15-20 ft. lbs. Remove pump assembly from case bore. *NOTE - If transmission not completely disassembled and only front pump was removed for repairs, proceed as follows; otherwise set pump assembly aside for installation at a later point:* Replace clutch drum and input shaft, low band and struts (see *"Transmission Reassembly" below).* Replace rubber seal ring in its groove in pump body and install pump assembly **right side upward** in place in transmission case bore, using a new gasket. *CAUTION - Be sure selective fit thrust washer is in place.* Install attaching bolts, using new "O" rings on bolts.

CONVERTER & STATOR: This is a welded assembly and cannot be disassembled for service. Check seams for stress or breaks and replace converter if necessary.

REAR PUMP: *NOTE - Disassembly and reassembly of rear pump is covered under "Transmission Disassembly" and "Transmission Reassembly". When installing rear pump priming valve, retain washer, spring, and valve in bore with retaining seat, installed with small hole first.*

Bushing Replacement: If necessary to replace rear pump bushing, remove bushing with Tool J-9557 (and handle J-7079). Install bushing with Tool J-6582, pressing or driving bushing in from front of pump.

TRANSMISSION ASSEMBLY NO. 2

CLUTCH DRUM: Disassembly - *CAUTION - Do not allow machined face of clutch drum to become scratched, scored, nicked, or otherwise damaged. Protect this surface at all times.* Remove retainer ring and low sun gear and clutch flange assembly from clutch drum, then remove hub rear thrust washer. Remove clutch hub, then remove clutch pack and hub front thrust washer. Remove spring retainer with Tool J-9542, or if using an arbor press, use Tool J-5133 and adapter ring, J-7782. Compress springs far enough to allow removal of retainer snap ring; then, release tension on springs and remove retainer and 24 springs. *NOTE - When using Tool J-9542, place a piece of cardboard or cloth between tool and front side of clutch drum as a protection for machined surface.* Lift up on piston with a twisting motion to remove from drum, then remove inner and outer seals.

Inspection: Wash all parts in solvent and blow dry with air, then check drum for scoring or excessive wear. Check steel ball in clutch drum (acts as a relief valve), making sure it is free to move in hole and that the orifice leading to front of drum is open. If clutch relief valve check ball in clutch drum is loose enough to come out or not loose enough to rattle, replace clutch drum as an assembly. *CAUTION - Do not attempt to replace or restake ball.* Check fit of clutch flange in drum slots (there should be no appreciable play between these two parts). Check low sun gear for nicks or burrs, and bushing for wear. Check clutch plates for burning and wear.

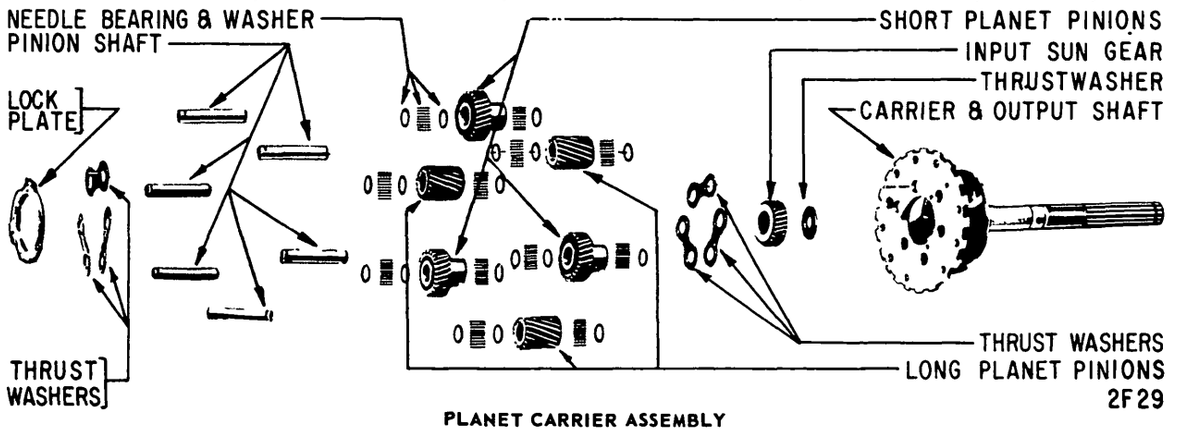
Bushing Replacement: Remove old bushing with Tool J-9546, using care not to damage bushing bore or machined surface on front of clutch drum. Use the same tool to install bushing. Press bushing into clutch drum from machined face side of drum, pressing only far enough so that tool meets drum. *CAUTION - Do not force tool against drum machined face.*

Reassembly: Install new piston inner seal in hub of clutch drum with lip of seal downward (toward front of transmission), then install a new piston seal in clutch piston, with lip of seal toward clutch drum (front of transmission). Lubricate seals with automatic transmission fluid and install piston in clutch drum with a twisting motion. Place 24 springs in position on piston, then place retainer in position on springs. Use Tools J-5133 and J-7782 and an arbor press (or use Tool J-9542 as a hand operation), and depress retainer plate and springs far enough to allow installation of of spring retainer snap rings in its groove on clutch drum hub. Install hub front washer with its lip toward clutch drum, then install clutch hub. Install steel reaction plates and faced drive plates, beginning with a steel reaction plate, in the following order: **4 Cyl.** - 3 steel plates and 2 faced plates installed alternately.

CONTINUED ON NEXT PAGE

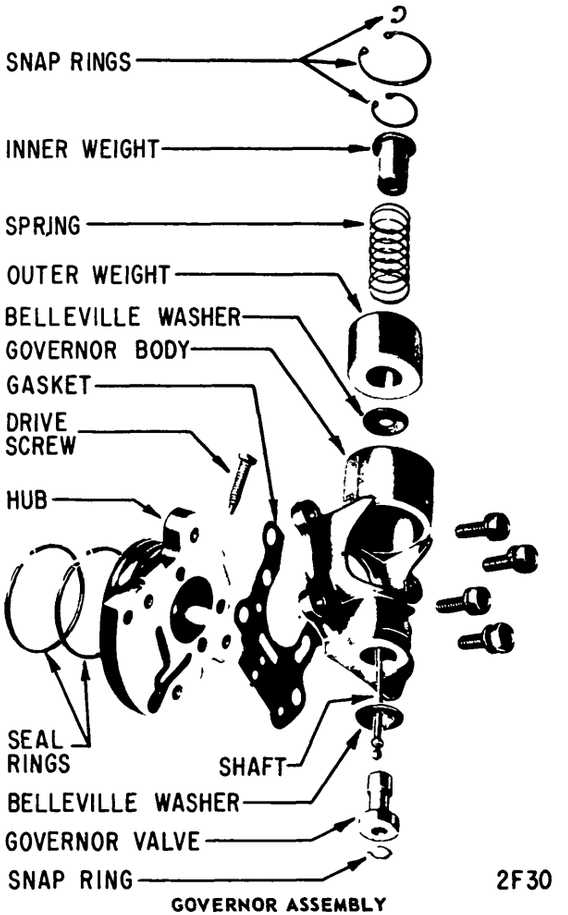
CHEVROLET (ALUMINUM) POWERGLIDE (Continued)

6 Cyl. - 4 steel plates and 2 faced plates installed: Steel, faced, steel, steel, faced, steel. **V8 Engs.** - 5 steel plates and 4 faced plates installed alternately. Install rear hub thrust washer with its flange toward low sun gear, then install low sun gear and flange assembly and secure with retainer ring. When installed, openings in retainer ring should be adjacent to one of the lands of clutch drum. Check assembly by turning clutch hub to be sure it rotates freely.



LOW BAND: Inspection - Check lining for scoring or burning and bands and lining for cracks. Check band linkage for excessive wear.

PLANET ASSEMBLY & OUTPUT SHAFT: *NOTE - It is not necessary to disassemble planet assembly unless inspection indicates damage or wear.*



Inspection: Inspect planet pinions for nicks or other tooth damage. Check clearance of planet gears which should be .006-.030". Check input sun gear for tooth damage, and input sun gear rear thrust washer for damage. Inspect output shaft bearing surface for wear, nicks, or scoring, and inspect input shaft bushing. Inspect input shaft splines for nicks or damage and check fit in clutch hub and input sun gear. Check fit of splines in turbine hub. Check oil seal rings for damage (rings must be free in input shaft ring grooves). Remove ring and insert in stator support bore and check to see that hooked ring ends have clearance. Replace ring on shaft.

Disassembly: Place planet carrier assembly in a fixture or a vise so that front (parking lock gear end) of the assembly faces upward, then using a prick punch or similar tool, mark each pinion shaft and hole in planet carrier assembly so that, when reassembling, each pinion shaft will be reinstalled in same location from which it was removed. Remove pinion shaft lock plate screws and rotate lock plate sufficiently counterclockwise to remove. Starting with a short pinion, and using a soft steel drift, drive on lower end of pinion shaft until pinion shaft is raised above press fit area of output shaft flange. Feed Tool J-4599 into short planet pinion from lower end, pushing planet pinion shaft ahead of it until tool is centered in pinion and pinion shaft is removed from the assembly. *NOTE - Tool J-4599 comes in two pieces, both alike. Only one piece is used for disassembly. Two pieces are used for reassembly.* Remove short planet pinion from the assembly, then remove tool, needle bearings and spacers from pinion. *CAUTION - Do not lose any of the needle bearings. Twenty needle bearings are used in each end and are separated by a bearing spacer in the center.* Use this same procedure and remove the adjacent long planet pinion that was paired by thrust washers to short pinion. Remove upper and lower thrust washers. Remove and disassemble remaining planet pinions in pairs, by first removing a short pinion, then the long adjacent pinion. Remove input sun gear and input sun gear thrust washer. Wash all parts in solvent and blow dry with air, then recheck all parts for wear, nicks, or tooth damage. Inspect bearings and if worm, replace all bearings. If pinion shafts are worn, replace shaft. Inspect input shaft bushing installed in base of output shaft. If damaged, thread Tool J-9534 into bushing and pull bushing out, using a sliding hammer. Press new bushing in so it is flush or below surface with pilot end of input shaft as the pressing tool.

Reassembly: Use Tool J-4599 and assemble needle bearing spacer and needle bearings (20 in each end) in one of the long planet pinions. Use cup grease to aid in assembly and hold needle bearings in position. Position the long planet pinion with Tool J-4599, centered in pinion assembly, and with thrust washers at each end, in planet carrier. *CAUTION - Oil grooves in thrust washers must be toward gears. Long planet pinions are located opposite closed portions of carrier, while short pinions are located in the openings.* Feed the second Tool, J-4599 in from top, picking up the upper thrust washer and planet pinion and pushing the already installed Tool J-4599 out the lower end. As first tool is pushed down, check that it picks up lower thrust washer. Select proper pinion shaft (marked at disassembly), then lubricate shaft and install it from the top, pushing assembly tools ahead of it. Turn pinion shaft so that slot or groove at upper end faces center of the assembly. With a brass or soft steel drift, drive pinion shaft in until lower end is flush with lower face of planet carrier. Follow the same procedure and install a short pinion in planet carrier adjacent to long planet pinion now installed. *NOTE - Thrust washers already installed with long planet pinion also suffice for the short planet pinion as the two pinions are paired together on one set of thrust washers.* Install input sun gear thrust washer and install input sun gear. Assemble and install remaining planet pinions in pairs, by first installing long planet pinions and then the adjacent short pinion. Check end clearance of planet gears which should be .006-.030". Place pinion shaft lock plate in position, then with extended portions of lock plate aligned with slots in planet pinion shafts, rotate lockplate clockwise until three attaching screw holes are accessible. Install lock plate attaching screws and tighten to 2½-3 ft. lbs.

PLANET CARRIER ASSEMBLY

GOVERNOR ASSEMBLY

GOVERNOR: *NOTE - Governor assembly is a factory balanced unit. If body replacement is necessary, the two sections must be replaced as a unit.*

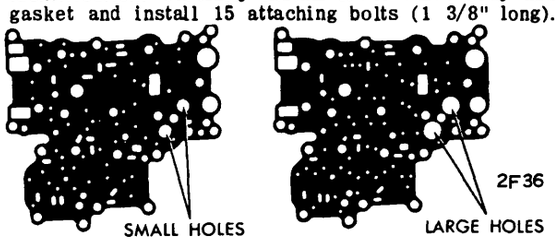
Disassembly: *NOTE - Governor valve and shaft were disassembled during removal.* Remove outer weight assembly by sliding toward center of body, then remove inner weight retainer snap ring and remove inner weight and spring. If necessary, remove the four body assembly bolts and separate body, hub, and gasket, then remove seal rings.

Inspection: Clean with solvent and blow dry with air.

CONTINUED ON NEXT PAGE

CHEVROLET (ALUMINUM) POWERGLIDE (C ntinu d)

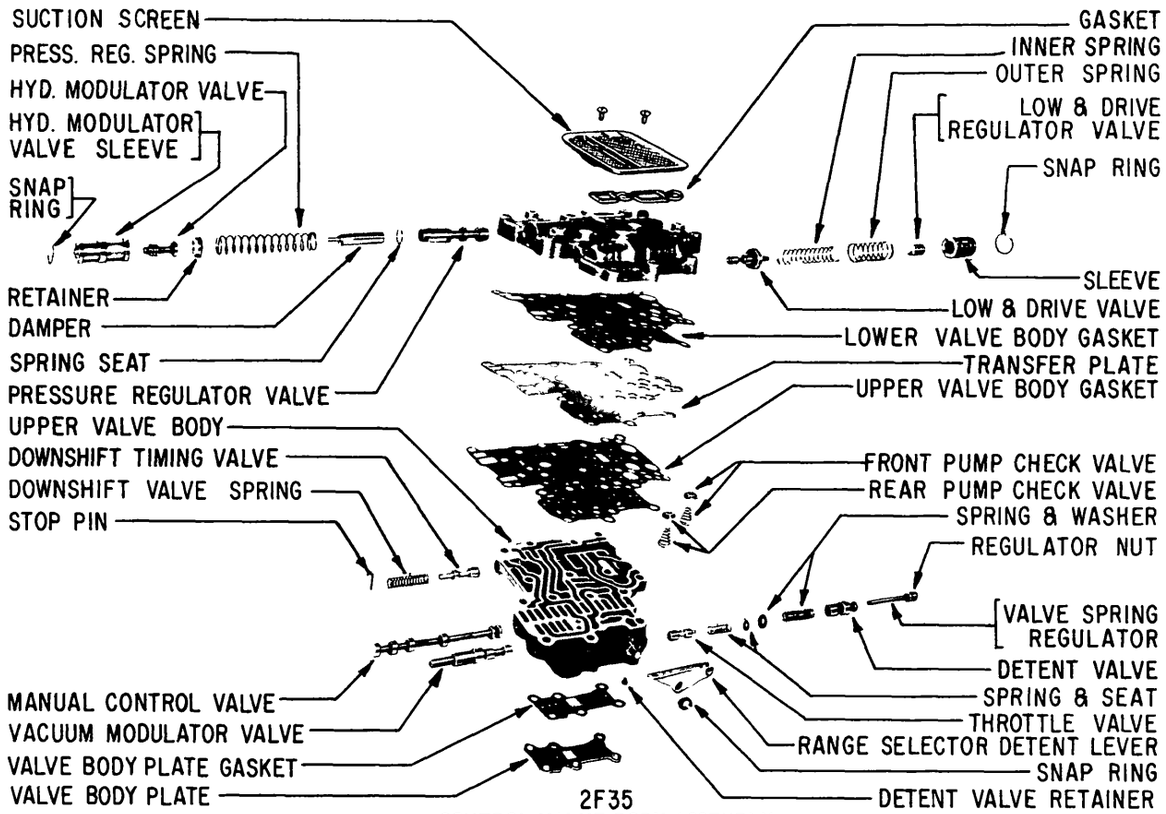
Check the assembly and replace any bent, damaged, or scored parts.



R assembly: Reassemble governor weights and install in body bore. Replace seal rings on hub. *NOTE - Further assembly is made when it is installed in transmission (see "Transmission Reassembly" below).*

VALVE BODY: *NOTE - If valve body is to be removed with transmission in car, the vacuum modulator and valve, oil pan and gasket, guide detent plate and range selector detent roller spring must be removed in order to remove valve body (see "Transmission Disassembly" above).*

Di sassembly: Remove manual valve, suction screen and gasket, then remove valve body bolts and carefully remove lower valve body and transfer plate from upper valve body. Remove front and rear pump check valve and springs, then from upper valve body, remove throttle valve and detent valves and downshift timing valve as follows: To remove throttle valve and detent valve, wedge a thin screwdriver under head of retaining pin and remove pin, then remove detent valve assembly and throttle valve spring. Tilt valve body to allow throttle valve to fall out. If necessary, remove "C" clip and disassemble detent valve assembly. *CAUTION - Do not disturb setting of adjustment hex nut on detent valve assembly. This is a factory adjustment and should not normally be changed. If adjustment is necessary, see "Throttle Valve Adjustment" above.* To remove downshift timing valve, drive out roll pin and remove valve spring and downshift timing valve. From the lower valve body, remove low-drive shift valve snap ring and tilt valve body to remove low-drive regulator valve sleeve and valve assembly, valve spring seat, valve springs and shifter valve. Remove snap ring from pressure regulator valve bore, then tilt valve body to remove hydraulic modulator valve sleeve and valve, pressure regulating valve spring seat, spring, damper valve, spring seat and valve.



Inspection: Clean all parts in solvent and make sure there is no foreign material preventing proper valve operation. Check all valves and bores for burrs or other damage that could cause valves to hang up.

R assembly: Replace valve components in proper bores, reversing disassembly procedure *(see "Valve Body Assembly" illustration for correct order)*, and note the following: Place front and rear pump check valves and springs into place in upper valve body and install gasket and transfer plate. *NOTE - Upper and lower valve body gaskets are different. See illustration for identification.* Carefully install lower valve body and gasket and install 15 attaching bolts (1 3/8" long).

LOWER VALVE BODY UPPER VALVE BODY

CONTROL VALVE BODY GASKETS

CONTROL VALVE BODY ASSEMBLY

Tighten to 8-11 ft. lbs.

VACUUM MODULATOR: Inspection - Check modulator valve for nicks and burrs. If any nicks or burrs cannot be properly repaired with a stone, replace valve. Check vacuum modulator with a vacuum source for leakage. Other repairs to vacuum modulator are not possible; replace as an assembly.

TRANSMISSION CASE: Inspection - Wash case with clean solvent, air dry, then blow out all passages with air. Inspect case for cracks, and case rear bushing for damage or excessive wear. *CAUTION - This is a precision bushing and if damaged or worn excessively, it must be replaced.* Check shifter shaft seal. If leakage or damage is indicated, pry out old seal and install a new one so it is firmly seated in counterbore of case.

Rear Bushing Repl cement: Remove bushing by driving or pressing from within case using Tool J-9557 and handle J-7079. Drive a new bushing into place from rear of case using Tool J-9557 and handle J-7079. *CAUTION - Install bushing only until shoulder of tool contacts rear face of case. Do not use excessive force or aluminum case may be damaged.*

TRANSMISSION REASSEMBLY

►*REASSEMBLY NOTE: Us only transmission fluid r p trol um jelly as lubricants r t r tain b arings or rac s during ass mbly. Lubricat all b arings, s al rings and clutch plates befor ass mbly.*

1) Install parking lock pawl and shaft and insert a new retaining roll pin (early transmissions) or "E" ring (later transmissions) into shaft. Install parking lock pawl pull-back spring over its boss to rear of pawl. *NOTE - Short leg of spring should locat in hole in parking pawl.* Install parking lock pawl reaction bracket with its two bolts, then fit actuator assembly between parking lock pawl and bracket.

2) Insert outer shift lever into case, being careful of shaft seal, and pick up the inner shaft lever and parking lock assembly, then tighten Allen head nut. Insert outer throttle valve lever and shaft special washer and "O" ring into case and pick up inner throttle valve lever. Tighten Allen head nut.

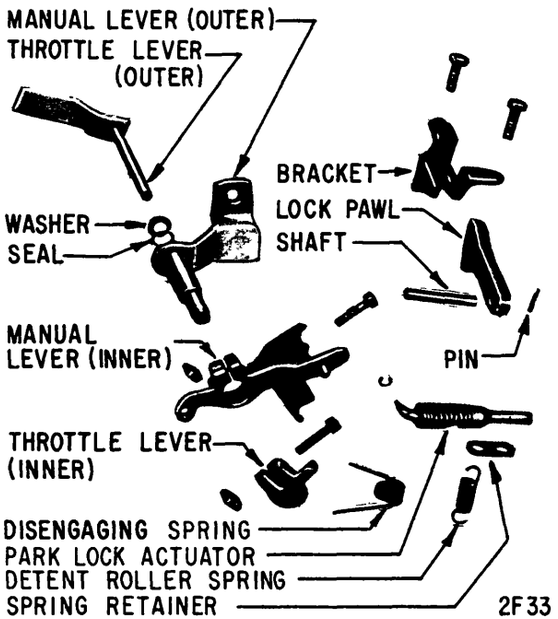
3) Install inner and outer rear piston seals on reverse piston, then lubricate piston and case with transmission fluid and install piston into case. If necessary, carefully slide a feeler gauge around outer diameter of piston to start seal ring into bore.

4) With transmission case turned so it is facing upward, install 17 reverse piston return springs and their retainer ring. Carefully install Tool J-9542 over retainer ring and through rear bore of case. With flat plate on rear face of case, turn down on wing nut to compress return springs and allow retaining snap ring to be in-

CONTINUED ON NEXT PAGE

CHEVROLET (ALUMINUM) POWERGLIDE (Continued)

stalled, then remove compressor tool. *CAUTION - Be careful when installing spring retainer that mark surface is not damaged by catching on edge of hub or in snap ring groove.*



5) On 4 Cyl. and 6 Cyl. Models, install large Belleville type cushion spring, with small end down. On all models, lubricate and install reverse clutch pack beginning with a reaction (spacer) plate and alternating with the drive plates (faced) until all reaction and drive plates are installed. *NOTE - Plates required for the various engines are as follows: 3 drive and 3 reaction plates (4 Cyl.); 4 drive and 4 reaction plates (6 Cyl.); 6 drive and 6 reaction plates (V8). In all transmissions, the rear reaction plate is a selective fit.* Install reaction plates so notched lug on plate is installed in groove at "7 o'clock" position in case, then install the thick pressure plate which has a dimple in one lug to align with the same slot in case as the notched lugs on other reaction plates. Install clutch plate retainer ring.

6) Check for correct selective reverse reaction spacer plate running clearance as follows: Position transmission so case is horizontal, then use feeler gauge and measure clearance between any reaction plate and adjacent faced plate. *NOTE - Because faced plate is waved, it will be necessary to side feeler gauges in an arc several inches to obtain an average reading.* If proper selective reverse reaction spacer is installed, clearance will be .012-.030" (4 Cyl.); .016-.040" (6 Cyl.); .025-.060" (V8). If clearance is not within specifications, remove reverse clutch pack and install a thicker or thinner selective reverse plate as required, next to piston, then recheck running clearance. Selective plates are furnished in thicknesses of .070"±.002" (Part No. 3799210); .102"±.002" (Part No. 3799212); .134"±.002" (Part No. 3799214).

7) With rear of case downward, align internal lands and grooves of reverse clutch pack faced plates, then engage reverse ring gear with these plates. *NOTE - This engagement must be made by "feel" while turning and jiggling ring gear.* Place output shaft thrust bearing over output shaft and install planetary carrier and output shaft into transmission case.

8) Install low sun gear thrust washer on sun gear in the planetary gear set with flange of thrust washer toward front of transmission and retain it in place with a small amount of petroleum jelly. Move transmission into a horizontal position, then with the two input shaft seal rings in place on input shaft, install clutch drum (machined face first) onto input shaft and install the low sun gear bushing (splined) against shoulder on shaft. Install clutch drum and input shaft assembly into case, aligning thrust washer on input shaft and indexing low sun gear with the short pinions on planet carrier.

9) Remove rubber seal ring from front pump body, then using guide studs, Tool J-3387, install front pump and gasket, and selective fit thrust washer into transmission case. Install two pump-to-case bolts. Check for correct thickness of selective fit thrust washer as follows: Mount a dial indicator so that plunger of indicator is resting on end of input shaft (use Tool J-5492 or suitable support for indicator), then set indicator to zero. Push up on transmission output shaft and note reading on indicator, which should be .030-.054". If reading is within limits, proper selective washer is being used. If not within limits, remove front pump and install a different thickness thrust washer as necessary to obtain specified clearance, then recheck clearance. Selective fit washers are available in thicknesses of .061", .078", .092", .106".

TRANSMISSION LEVER ASSEMBLIES

10) Install servo piston, piston ring, and spring into servo bore, then use a new gasket and "O" ring seal and install servo cover. Make sure that gasket is properly aligned with the three bolt holes and drain back passage in case.

11) Remove front pump and selective fit washer from case, and install low brake band, anchor and apply strut into case. Tighten low band adjusting screw enough to prevent struts from falling out of case. Place seal ring in groove around front pump body and the two seal rings on pump cover extension, then install pump, gasket and thrust washer into case. Remove guide pins and install all pump bolts, replacing any damaged "O" ring seals. Tighten bolts to 13-17 ft. lbs.

12) Turn transmission so output shaft is upward, then install rear pump wear plate, drive pin, and drive gear, indexing gear to drive pin. Install rear pump body and driven gear, drain back baffle and pump-to-case attaching bolts. *NOTE - Bolt holes are offset and pump can be installed in one position only.* Install governor hub in place on output shaft, then install gasket and governor body over output shaft. Install governor shaft and line up properly with output shaft and install body attaching bolts. Tighten bolts to 6-8 ft. lbs. Install governor valve, two Belleville washers (concave side of washers against output shaft), and retaining "C" clips. Center shaft in output shaft bore and tighten governor drive screw.

13) Install speedometer drive gear on output shaft with Tool J-5814, then place extension seal ring over rear pump body and install transmission extension and five retaining bolts and tighten to 20-30 ft. lbs. Replace speedometer driven gear if removed.

14) With transmission upside down, install valve body (servo apply tube and manual valve installed) and a new gasket. Carefully guide servo apply line into its boss in case as valve body is positioned. Install six mounting bolts and the range selector detent roller spring. *NOTE - Position manual valve actuating lever fully forward when installing valve body to more easily pick up manual valve.* Install guide plate, making sure that inner lever picks up manual valve, then install attaching bolts. Tighten valve body-to-transmission case bolts to 8-11 ft. lbs.

15) Install vacuum modulator valve, vacuum modulator and gasket, then install oil pan and new gasket, and tighten attaching screws to 6-9 ft. lbs. Install converter and a suitable holding strap (to keep converter from falling off during transmission assembly installation). Tighten low servo adjusting screw to 40 inch pounds while rotating input and output shaft simultaneously to properly center low band on clutch drum, then back off adjusting screw 4 complete turns, and tighten locknut.

TRANSMISSION INSTALLATION (EXCEPT CORVETTE)

►*INSTALLATION NOTE: The "light" side of converter is indicated by a BLUE stripe painted across ends of converter cover and housing. This marking should be aligned as closely as possible with the WHITE strip painted on engine side of flywheel outer rim which indicates "heavy" side of engine.*

TRANSMISSION ASSEMBLY INSTALLATION: Mount transmission on suitable lifting equipment, then remove converter holding tool. *CAUTION - Do not allow converter to move forward after removal of holding tool.* Raise transmission into position and install transmission case-to-engine upper mounting bolts, then install remainder of mounting bolts and tighten to 25-30 ft. lbs. Remove support from beneath engine, then raise rear of transmission to final position. Align balance marks on converter and flywheel (see "Installation Note" above). If converter and flywheel scribed during removal, align scribed marks. Install converter-to-flywheel attaching bolts and tighten to 15-20 ft. lbs. Install flywheel cover and transmission support crossmember to transmission and frame. Remove transmission lifting equipment and complete installation by reversing removal procedure. Refill transmission *(see "Draining & Refilling" above).*

CORVAIR TRANSAXLE

Corvair (1961)
Corvair 1200 Series Trucks (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*PUSHING CAR TO START ENGINE (AUTOMATIC TRANS.):* Place transmission selector lever in "N" (Neutral) until car reaches 25 MPH, then move selector lever to "L" (Low) until engine starts.

►*TOWING AUTOMATIC TRANSMISSION CARS:* With transmission selector lever in "N" (Neutral), car may be towed at speeds not to exceed 30 MPH.

DESCRIPTION

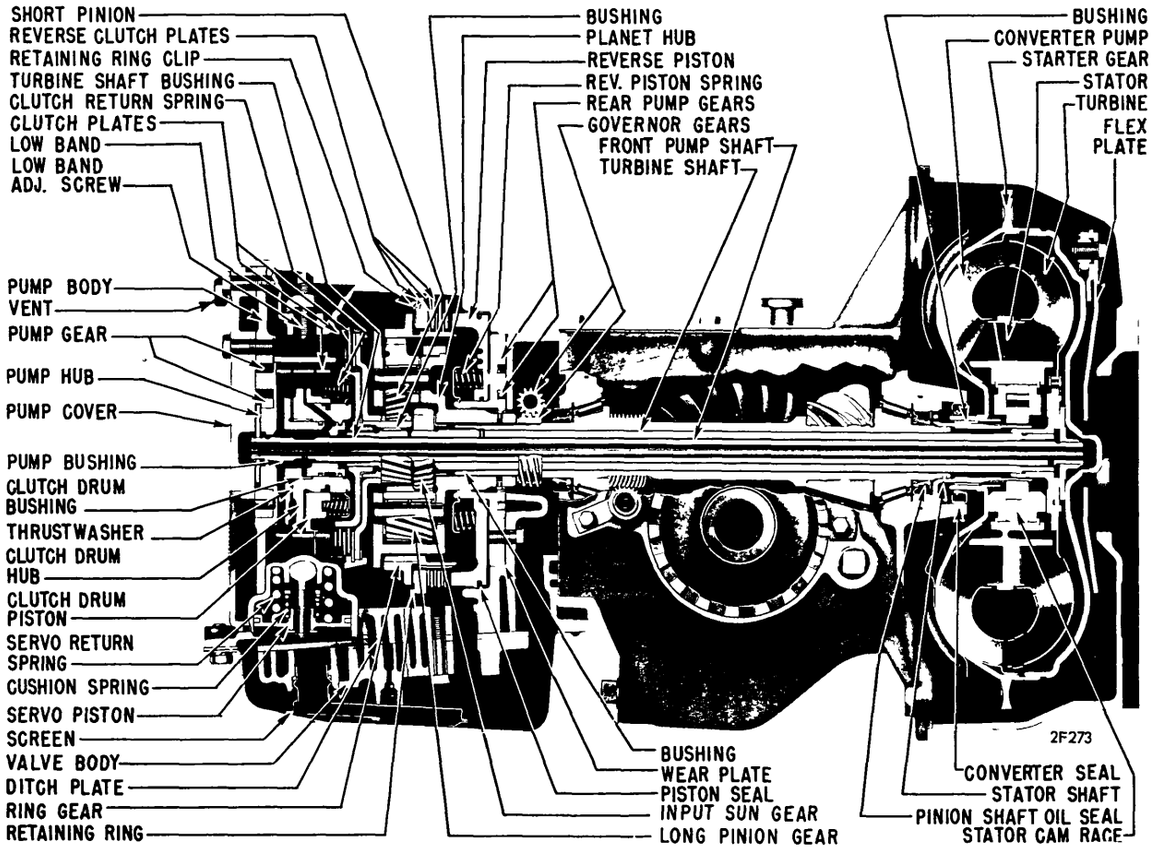
DESCRIPTION: The Transaxle consists of either an integral differential (rear axle) assembly and synchro-mesh transmission; or a differential (rear axle) assembly and a Powerglide transmission as follows:

Differential (Rear Axle) Assembly: Straddle mounted hypoid gear type of new design with transmission input & output shafts running axially through differential pinion shaft. This unit which is contained in a separate carrier housing is located between transmission (either Synchro-mesh or Powerglide) and the engine assembly.

Ratios - 3.27-1, 3.55-1 & 3.89-1. *NOTE - 3.27-1 ratio not used on models with Super Turbo-Air engine. 3.89-1 ratio is standard on 1200 Series (3-Spd. & Powerglide); 3.27-1 (4-Speed).*

Synchro-mesh Transmission: Three-speed and Four-speed Synchro-mesh types integral with rear axle differential carrier. Because of attachment to differential carrier, a hollow mainshaft is used to permit passage of the clutch shaft to front of transmission for engagement of clutch gear with countergear. *NOTE - On three-speed transmission, all transmission gears are interchangeable with conventional Chevrolet 3-Speed Synchro-mesh, except for clutch gear and countergear.*

Transmission Ratios (3-Speed) - 3.50-1 (1st Speed), 1.99-1 (2nd Speed), 1.0-1 (3rd Speed), 3.97-1 (Reverse).



Transmission Ratios (4-Speed) - 3.65-1 (1st Speed), 2.35-1 (2nd Speed), 1.44-1 (3rd Speed), 1.0-1 (4th Speed), 3.66-1 (Reverse).

Powerglide Transmission: Three element torque converter and a hydraulically operated two-speed type automatic shift transmission integral with rear axle differential carrier. Converter torque from the welded type torque converter assembly located between differential carrier and engine is transmitted to transmission through two hollow shafts running through the hollow differential pinion shaft. One shaft runs from converter cover hub to transmission front pump and the other from turbine to transmission input sun gear.

LUBRICATION

Check fluid level in all units every 1000 miles. Drain and refill every 10,000 miles (Rear Axle & Synchro-mesh Trans.). *NOTE - Draining & Refilling of Powerglide Transmission not recommended except for overhaul.*

Recommended Oil (Rear Axle & Synchro-mesh Transmission) - SAE 80 "Multi-Purpose" gear lubricant or SAE 80-90 Multi-Viscosity "Multi-Purpose" gear lubricant. *CAUTION - SAE 90 Viscosity lubricants are not recommended. DO NOT use "Mineral Oil" gear lubricants or any "active sulphur soap" lubricants.* Differential carrier and transmission are connected by internal passages.

CORVAIR POWERGLIDE TRANSMISSION SECTIONAL VIEW

Powerglide Trans. - Automatic Transmission Fluid Type "A" (Suffix "A"). *NOTE - Automatic transmission is sealed off from differential carrier.*

Checking Fluid Level: Rear Axle & Synchro-mesh Trans. With unit at normal operating temperature, check fluid in differential carrier first (plug is adjacent to rear axle universal joint on left side of transmission case). If level is low in differential carrier, also check level in transmission. *NOTE - Fluid should be level with bottom of filler plug hole under operating condition.*

Powerglide Transmission - With transmission at normal operating temperature and transmission selector lever in "N" position, engine idling, check fluid level on dipstick in filler tube at right side of engine near firewall. Add fluid as necessary to bring level to "Full" mark on dipstick, using recommended fluid.

Draining & Refilling: Rear Axle - Drain carrier housing and replace drain plug. Refill housing with 3.1 pints of recommended fluid.

Rear Axle & Synchro-mesh Trans. - Remove drain plug in transmission housing and in differential carrier housing. *NOTE - Transmission drain plug is on left side adjacent to idler arm on side of transmission case.* Refill by adding lubricant to both units (5 pints total).

Powerglide Trans. - *NOTE - Not required except at time of transmission overhaul.* Drain oil by loosening filler tube attaching nut in oil pan. Tighten filler tube nut and add 4 pints of recommended fluid using filler tube and funnel J-4264. Start engine and allow to idle 3-5 minutes in "N", then add sufficient fluid to bring level to "Full" mark. Capacity is 6 pints (approximately) for normal refill. 13 pints (approximately) with transmission and torque converter dry.

ADJUSTMENTS

Transmission Shift Linkage (Synchro-mesh Transmission): *NOTE - Before making any adjustment, lash in system must be taken up by moving shift control rod to rear.* Adjust as follows:

500 & 700 Series (3 & 4-Speed Trans.) - With seat in full forward position, shift transmission to first gear, then loosen coupling clamp nut on transmission shift control rod. Adjust shift lever so distance from lever to edge of seat is ½". Test shifts in all ranges.

900 Series (3 & 4-Speed) - Shift transmission into reverse, then loosen coupling clamp nut on transmission shift control rod. Adjust shift lever so distance between

CONTINUED ON NEXT PAGE

CORVAIR TRANSAXLE (Cont.)

center of gearshift lever housing, rearward, to center of gearshift lever knob is 2¼" (3-Speed Trans.); 3¼" (4-Speed Trans.). Tighten clamp nut and check shift in all ranges.

1200 Series (3 & 4-Speed) - Remove spring from gearshift lever shaft. Rotate gearshift control rod to left side of truck and pull out until third gear is engaged (3-Speed Trans.); fourth gear (4-Speed Trans.), then loosen control rod coupling nut. Insert a 1½" wood block between rod end and front flange of the front crossmember. Remove gauge block and tighten clamp nut, then install spring. Check shift in all ranges.

Clutch Linkage (Synchro-mesh Trans.): *See "Borg & Beck Clutch" in Clutch Section.*

Transmission Throttle Linkage (Powerglide Trans.): *See "Accelerator Control Linkage Adjustment" under CARBURETOR on car model page.*

Manual Linkage (Powerglide Trans.): Drain transmission oil and remove oil pan. Place transmission selector lever in "D" (Drive) range, then insert Tool J-8365 into manual valve bore (end opposite linkage) with tab of gauge upward so it engages forward port of valve body. With tool in place, push forward on manual valve levers. If valve is properly adjusted, tool will be held in place horizontally without being supported. If adjustment is necessary, loosen lockscrew in manual valve linkage (inside transmission) and push manual valve levers forward so Tool J-8365 is held in a horizontal position. Recheck adjustment. Install oil pan and fill transmission with fluid.

Neutral Starter Switch Adjustment (Powerglide Trans.): Loosen two switch mounting screws and place transmission selector lever in "N" (Neutral) position. Turn ignition switch to "Start" position, then move Neutral Switch fore and aft until engine cranking begins. Secure switch in that position. Recheck to make sure engine will not start with transmission selector lever in any position other than "N" (Neutral).

Low Band: Remove parcel shelf behind rear seat and remove plug covering access hole in floor. Loosen locknut and tighten the square head adjusting screw to 40±5 inch pounds, **then back off adjusting screw 4 full turns exactly.** Hold adjusting screw stationary and tighten locknut.

►*ADJUSTING TOOL NOTE:* A wrench for turning the adjusting screw locknut can be made by welding two ¾" tubular steel spark plug wrenches together (end-to-end) so wrench can be installed over adjusting screw locknut. A square socket wrench can be inserted through this tool to engage adjusting screw.

TROUBLE SHOOTING
(AUTOMATIC TRANSMISSION)

NO DRIVE IN ANY SELECTOR LEVER POSITION (CANNOT LOAD ENGINE): Low oil level. Clogged oil suction pipe screen. Broken or disconnected manual cable. Defective pressure regulator valve. Defective line pressure limit valve. Defective front pump. Rear pump check valve and rear pump priming ball not seating (both must occur for possible malfunction). Front pump shaft disengaged at either converter or pump gear. Front pump priming ball not seating.

ENGINE SPEED FLARES ON STANDSTILL STARTS BUT ACCELERATION LAGS: Low band only partially applied caused by one or more of the following conditions: Low oil pressure. Clogged pickup pipe screen. Improper band adjustment. Servo piston apply passage blocked. Servo piston ring broken or leaking. Band facing worn. Low band apply linkage disengaged or broken. Converter stator not holding.

ENGINE SPEED FLARES ON UPSHIFT: Low oil level. Clogged oil suction screen or pipe. High clutch partially applied (blocked feed orifice). Clutch plates worn. Clutch seals leaking. Clutch piston hung up. Clutch drum relief ball not seating. Vacuum modulator hose collapsed.

TRANSMISSION WILL NOT UPSHIFT: Low band not releasing due to one of the following conditions: Stuck low-drive valve. Defective governor. No rear pump output (stuck priming ball, drive pins not engaged, or defective pump). Throttle valve stuck or improperly adjusted. Improperly adjusted manual valve lever.

HARSH UPSHIFT: Incorrect carburetor-to-transmission throttle valve rod adjustment. Improper low band adjustment. Vacuum modulator hose broken or disconnected. Vacuum modulator diaphragm leaks. Vacuum modulator valve stuck. Hydraulic modulator valve stuck.

CLOSED THROTTLE HARSH DOWNSHIFT: Improper low band adjustment. Vacuum modulator hose disconnected or broken. Vacuum modulator diaphragm ruptured. Vacuum modulator valve stuck. Engine idle speed too high. Sticking pressure regulator or hydraulic modulator valves in valve body.

CAR CREEPS EXCESSIVELY IN DRIVE: Idle speed too high.

CAR CREEPS IN NEUTRAL: Incorrect manual valve lever adjustment. High clutch or low band not released.

NO DRIVE IN REVERSE: Manual valve lever adjustment not correct. Cable linkage adjustment not correct. Reverse clutch piston stuck. Reverse clutch plates worn out. Reverse clutch leaking excessively. Blocked reverse clutch apply orifice.

IMPROPER SHIFT POINTS (see "Shift Speed" table below): Incorrect accelerator control linkage adjustment. Throttle valve incorrectly adjusted. Governor defective. Rear pump priming ball stuck.

OIL FORCED OUT OF FILLER TUBE: Oil level too high. Oil pickup pipe split or not sealed causing air entrainment.

UNABLE TO PUSH START: Rear pump drive gear not engaged with drive pins on planet carrier hub. Rear pump defective. Rear pump priming ball not seating.

TESTING

►*TESTING NOTE: Transmission must be at normal operating temperature, fluid level at "F" mark on dipstick, and manual and throttle linkage adjustments must be correct.*

ROAD TEST: Road test car to determine transmission shift points as indicated in table below.

Transmission Shift Speeds

	MPH
UPSHIFTS:	
Minimum Throttle	10–12½
Full Throttle	41–47
Part Throttle (Detent Touch)	34–41
DOWNSHIFTS:	
Closed Throttle	8–12
Full Throttle	38–44
Part Throttle (Detent Touch)	23–30
Manual Low (Inhibited)	41–46

PRESSURE TESTS: *NOTE – Pressure tests can be made by raising rear wheels 3–5" off floor on jack stands.*

►*FRONT PUMP PRESSURE TEST CAUTION: Front pump pressures must be obtained with engine at idle speed (16" Hg.). A very slight increase in engine speed, even that caused by an inaccurately set engine idle speed, will allow rear pump to take over, causing front pump pressure to fall to zero. If no front pump pressure is indicated, check first for proper engine idle speed.*

Front Pump: Remove plug located at "6 o'clock" position in front pump cover (accessible through engine front mount) and connect pressure gauge. With engine at idle speed (approx. 16" of vacuum), pressures should be as follows with selector lever in the indicated range: 81–98 lbs. (Reverse); 47–57 lbs. (Neutral & Drive); 71–82 lbs. (Low). Disconnect vacuum hose at balance tube, then with engine at idle speed, check pressure which should be: 140–157 lbs. (Reverse); 71–82 lbs. (Neutral, Drive & Low). If there is no pressure in front pump, check for stuck pressure regulator, broken or disengaged front pump shaft, or missing plug from front end of front pump shaft. Moderately low front pump pressures in all ranges indicate a restricted front pump inlet. Failure of pressure to raise when vacuum hose disconnected (or high pressures with vacuum hose connected) indicates a stuck vacuum modulator valve, defective vacuum modulator, or a collapsed hose.

Rear Pump: With gauge connected as for "Front Pump" (rear wheels raised), place selector lever in "D" (Drive) and accelerate engine. Front pump pressure should drop to approximately 0–5 lbs. at 20 MPH. If pressure does not drop, rear pump is disengaged or clogged or rear pump check ball is not seating.

Throttle Valve: Remove plug located at "8 o'clock" position in front pump cover (accessible through engine front mount) and connect pressure gauge. Disconnect throttle valve rod at carburetor and vacuum hose at balance tube, then with engine at idle speed, depress accelerator to wide open position. *NOTE – By disconnecting throttle valve rod at carburetor, engine remains at idle speed throughout test.* Pressures should be as follows with selector lever in the indicated range: 0 lbs. (Reverse & Neutral); 52–54 lbs. (Drive); 66–77 lbs. (Low). If pressures not as specified, they can be corrected by adjusting the position of the jam nut located on end of detent valve assembly (part of throttle valve assembly inside transmission case). Insert an Allen wrench in end of adjusting screw and hold screw from turning, then turn jam nut as necessary. To raise pressure, back off jam nut (one full turn is equal to 3 psi). Tightening the nut lowers pressure.

REMOVAL & INSTALLATION

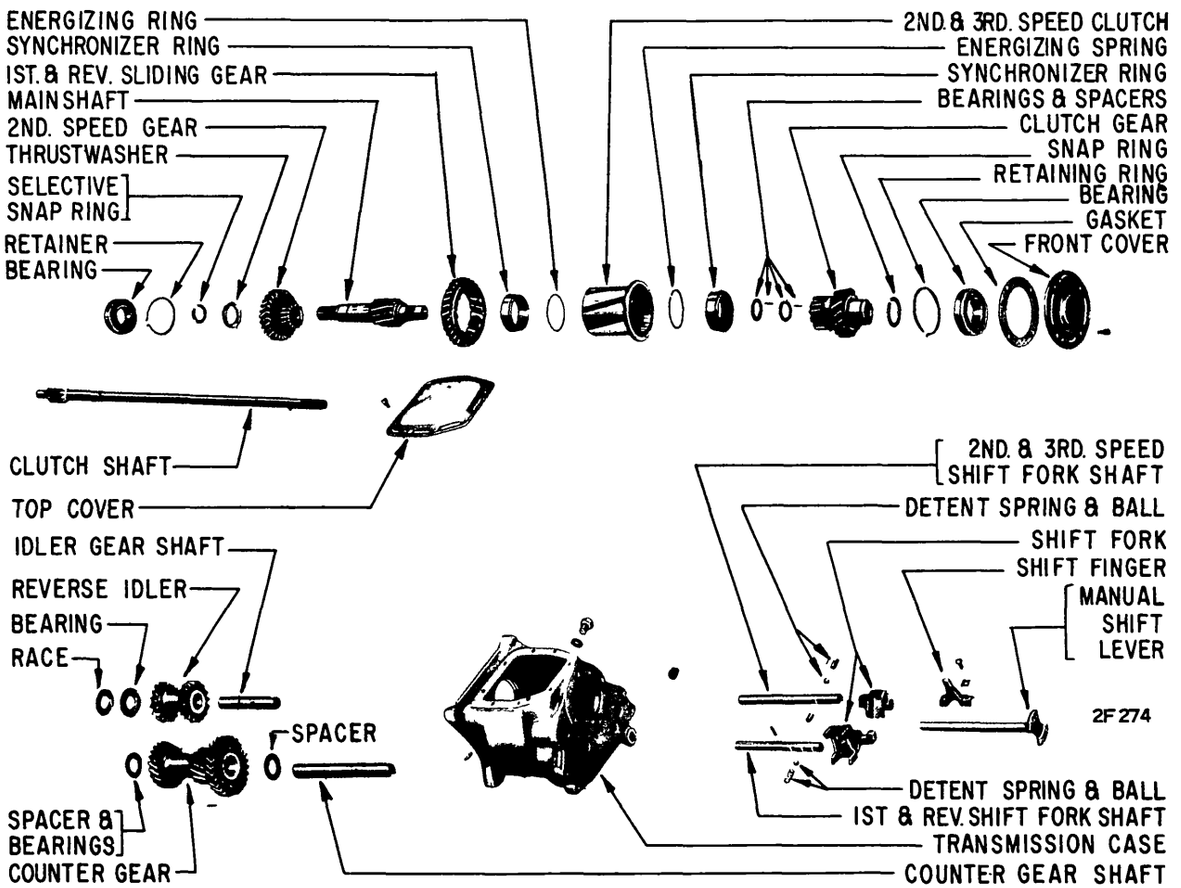
POWER TRAIN (ENGINE, TRANSMISSION & REAR AXLE): This complete assembly must be removed as a unit. *See "Engine" in Corvair Special Data.*

SYNCHRO-MESH TRANSMISSION: Removal - With "Power Train" removed from car, support Transaxle assembly with a chain fall or suitable lift and sling, then drain transmission and differential carrier. Remove starter and the two screws securing clutch pull rod dust seal assembly, then remove pin attaching pull rod to clutch fork. Separate Transaxle from engine by removing attaching bolts securing differential carrier to clutch housing. Pull Transaxle away horizontally to prevent damage to clutch fork. Remove clutch shaft (transmission input shaft). Remove clutch fork and clutch release bearing from differential carrier. *NOTE - Fork is attached to carrier by a ball and socket and spring*

CONTINUED ON NEXT PAGE

CORVAIR TRANSAXLE (C nt.)

retainer. Separate three-speed transmission from differential carrier by removing the four attaching bolts and disengaging transmission output shaft from splines in differential carrier.



Installation: Use a new gasket (hold in place with petrolatum), then couple transmission to differential carrier, being sure to engage splines of transmission mainshaft to internal splines of pinion in differential carrier. Secure transmission to carrier with four bolts (install two bolts on right side from transmission end and the two on left side from carrier end). Tighten bolts to 24-32 ft. lbs. Install clutch release bearing and clutch fork on differential carrier. *NOTE - Clutch release bearing slips over shaft and the fork has a spring retainer and socket which attaches to ball stud on carrier.* Install clutch shaft in Transaxle, then check distance from end of clutch release bearing shaft to end of clutch shaft. If fully engaged, the dimension should be 2 9/16"±1/32". Support Transaxle with a chain fall or other suitable lift and sling, then align attaching bolt holes in carrier and clutch housing. Pilot clutch shaft splines into clutch, then install attaching bolts and tighten securely. Connect clutch pushrod to clutch fork with pin, then position and secure clutch pushrod dust seal assembly. Install starter and fill transmission and differential carrier.

POWERGLIDE TRANSMISSION: Removal - With "Power Train" removed from car, drain transmission, then disconnect hose connecting modulator tube to carburetor balance tube. Remove engine front shield and remove starter. Disconnect converter from engine flex plate by removing the three attaching bolts through the access hole (at 12 o'clock position) in converter housing. Support Transaxle with a chain fall or suitable lift and sling, then remove attaching bolts and lockwashers securing differential carrier to converter housing. Pull Transaxle away from engine and remove converter assembly. Pull turbine shaft out of Transaxle assembly. Place Transaxle on a flat surface and remove screws securing governor assembly and remove governor. Remove three bolts securing transmission to carrier, then carefully pull transmission straight away from carrier to prevent pump shaft from damaging bushings in transmission and pinion shaft. Remove gasket from carrier, then remove governor gear and selective spacers from pinion shaft of carrier.

Installation: *CAUTION - Before connecting Powerglide transmission and differential carrier, determine thickness of thrust washers required at front face of governor gear. See "Rear Selective Thrust Washer" below.* After determining proper size thrust washer, install a new gasket to either carrier or rear face of transmission (hold in place with petrolatum). Align carrier and transmission on a flat surface and carefully guide the pump shaft through differential carrier so as not to damage bushing in pinion, then engage splines of pinion shaft with planet carrier internal splines in transmission. Install governor, then secure the transmission-to-carrier with four bolts. Drive the two bolts from carrier side first (to minimize chance of cocking mating surfaces), then tighten bolts to 24-32 ft. lbs. Install turbine shaft, being careful not to damage its bushings as it is inserted over pump shaft splines. *NOTE - Be sure to engage the two splits of splines (forward splines engage clutch drum and the rear set engage into sun gear in planet gearset).* DO NOT tip rear of Transaxle downward after installation unless converter holding plates are used. Position Transaxle adjacent to engine on a chain fall or similar lift, then remove converter holding plates if installed. Align converter with flex plate, then pilot converter hub onto crankshaft. Align mounting holes in differential carrier and converter housing, then secure top left bolt (11 o'clock position). Install flex plate to converter bolt accessible at the "1 o'clock" position to prevent accidental turning of converter or flex plate and loss of attaching hole alignment. Drive remaining converter housing-to-differential carrier mounting bolts, then install starter. Drive the two remaining converter-to-flex plate bolts through the access hole in converter housing. Install engine front shield, then reinsert filler tube through front shield and connect it to oil pan. Connect vacuum modulator to carburetor balance tube with a short length of hose. Refill transmission *(See "Draining & Refilling" above).*

Rear Selective Thrust Washer: *CAUTION - Any time repairs are made that require the separation of Powerglide transmission and differential carrier, the proper thickness of thrust washer to be used at front face of governor gear must be determined as follows:* Install dial indicator on Support J-8364 and install a 3" indicator extension. Without gasket, place support on rear pump cavity surface of transmission case (transmission front end down) so that dial indicator tip rests on planet carrier hub. Adjust indicator as required to permit maximum indicator travel, then set dial to zero. *NOTE - Transmission must face downward when indicator is zeroed.* Slowly lift indicator and support off rear pump cavity and note its range of needle deflection from zero position. *NOTE - If indicator is properly positioned on support, indicator should not deflect more than .050" (one-half turn) when removed; otherwise raise or lower dial indicator on support post as required and again "zero" gauge.* Place support and dial indicator on governor gear on differential carrier pinion shaft (support J-8364 will fit over pinion shaft), then slowly lower support (indicator tip of dial indicator against machined face of differential carrier housing) so that revolutions of dial indicator can be counted. *NOTE - Measurement starts once the indicator needle reaches "zero".* Fully depress support on governor gear and note indicator reading, then refer to following table for thickness of spacers to be installed on governor gear.

CONTINUED ON NEXT PAGE

3-SPEED SYNCHRO-MESH TRANSMISSION ASSEMBLY

CORVAIR TRANSAXLE (C nt.)

►*NOTE: Aft r sel ct d spacers ar install d n governor gear, recheck measurement. If spacer stack is correct, indicator reading will now be between .025-.045". If not add or remove spacers until reading is within this rang .*

Thrust Spacer Chart

Indicator Reading	No. Req'd	② Spacer Thickness
.025-.046"①	None	
.047-.062"	1	.016" ± .001"
.063-.078"	2	.032" ± .002"
.079-.094"	3	.048" ± .003"
.095-.110"	4	.064" ± .004"
.111-.126"	5	.080" ± .005"
.127-.142"	6	.096" ± .006"
.143-.155"	7	.112" ± .007"

① - If initial indicator reading is below .025", replace thrust washer at clutch hub (front pump) with a .050" thrust washer, then repeat entire rear thrust spacer selection procedure.

② - Spacer, Part No. 6256827 (.016" thick) furnished. Use number indicated.

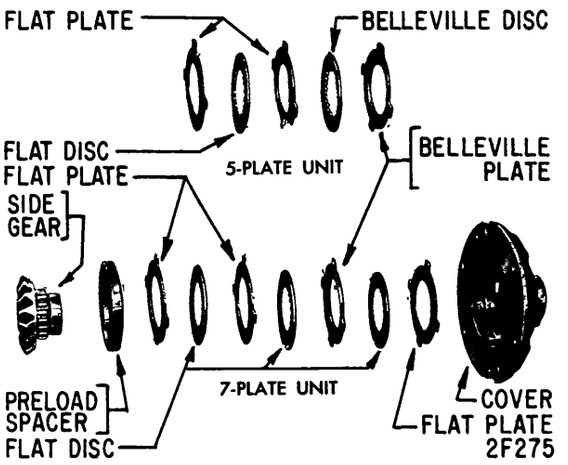
OVERHAUL

STANDARD DIFFERENTIAL CASE

S 1960 Final, Pag 433, or later Manual edition and not th following:

Differential case has been redesigned to accommodate side gears of equal length. Because of this change, universal joint trunnions are unequal in length and the differential pinion shaft has flats on both sides to clear longer universal joint trunnions. A new "pressed on" speedometer gear replaces the former integral gear.

Diff r ntial Sid B aring Installation - Use Tool J-8359 to install side bearings on differential case and cover.



►*DRIVE PINION DEPTH SETTING NOTE (When Installing Service Replacement Drive Pinion):* Ring gear and drive pinion sets manufactured after February 1, 1961 and date coded 2-61 and later will not be marked for pinion mounting distance. On these later service replacement units, select shims using pinion code "14" as indicated in "Pinion Setting Shim Chart" under "Corvair Transaxle" in 1960 Annual Data or later Manual edition.

POSITRACTION DIFFERENTIAL CASE

►*POSITRACTION DIFFERENTIAL UNIT PRODUCTION CHANGE: Early type units consist of seven clutch plat s whil lat r typ units have five plates (see illustration).*

DESCRIPTION: This unit consists of a special differential case which incorporates a multi-plate clutch pack in the right hand side of differential case.

PRELOAD CHECK (ON CAR): If traction is not sufficient under one-wheel slip conditions, check clutch pack pre-load setting as follows: Raise rear of car so both wheels are off ground, then remove wheel and tire assembly from one side only. Install Tool J-8617 with adapter J-2619-4 to rear wheel studs, then back off rear wheel brake adjustment. Rotate axle shaft using a torque wrench while other wheel is held by an assistant. *NOTE - Synchro-m sh transmissi n must b in n utral.* Torque required to turn axle should be a minimum of 15 ft. lbs. (early seven plate clutch); 20 ft. lbs. (later five plate clutch). If torque is below specifications, remove differential assembly and inspect clutch pack.

POSITRACTION DIFFERENTIAL CLUTCH PACK

OVERHAUL: *REMOVAL & INSTALLATION NOTE - See 1960 Final, Page 433, or later Manual edition. Positraction differential case is removed in same manner as for standard differential case.*

Disassembly: Remove differential side bearings with a suitable puller, then remove ring gear attaching bolts and remove ring gear. Mark case and cover with a punch or chisel for proper alignment at reassembly, then remove two flat head screws holding case and cover together. *NOTE - These flat head screws are used during production and it is not necessary to install them at reassembly.* If necessary to disassemble left hand differential gear, pinion shaft, and pinions, see "Standard Differential Case" above. Remove right hand side gear, clutch pack preload spacer and clutch pack.

Inspection: Clean and inspect clutch plates and discs, preload spacer and side gear thrust surfaces for excessive wear, overheating, scoring or surface cracking and replace complete clutch pack if necessary. Clean and inspect preload spacer mating surface on differential case for wear or damage.

Reassembly: Lightly oil clutch plates and side gear, then install clutch plates and discs in the order indicated in illustration. Install preload spacer with chamfered edge upward, then install side gear into clutch pack, making sure splines engage clutch plate splines. Align differential case and cover to marks made at disassembly, then install ring gear. Install ring gear attaching bolts and case and cover together. Tighten bolts to 40-60 ft. lbs. and install side bearing assemblies.

Preload Check (On Bench): Clamp differential assembly in a soft jawed vise, then insert a scrap disassembled axle shaft yoke into one side gear. Slide a piece of 1" x 14" bar stick into yoke, then install a pull scale 12" from differential centerline. Check torque required to rotate yoke and side gear. Torque should be a minimum of 15 ft. lbs. (early 7 plate clutch); 20 ft. lbs. (later 5 plate clutch).

3-SPEED SYNCHRO-MESH TRANS.

S 1960 Final, Page 433, or lat r Manual editi n and not th foll wing: Transmission case has been redesigned to provide piloting on differential carrier pinion front adjusting sleeve. In addition, a cast iron transmission case is used and the transmission mainshaft has been lengthened at output end.

4-SPEED SYNCHRO-MESH TRANS.

See 1961 Final, Page 423.

POWERGLIDE TRANSMISSION

See 1960 Final, Page 433, or later Manual edition and note the following: Line pressure limiting valve has been eliminated and facing material is no longer used on reverse clutch thick reaction ring. On 1200 Series Trucks, transmission oil is cooled by circulating it through a cooler located in left front wheel housing compartment. On these models, a bypass valve located in front pump body allows oil to circulate within the transmission case in the event of any restriction creating a pressure build-up of more than 15 lbs. On all models, the planet carrier assembly can be disassembled for repair as follows:

Planet Carrier: Disassembly - 1) With planet carrier removed from transmission assembly, wash carrier in clean solvent, then blow out all passages and dry with air. Inspect complete unit for damage and wear. Check clearance of planet gears which should be .005-.0035". Place planet carrier assembly in a vise with splined end facing down.

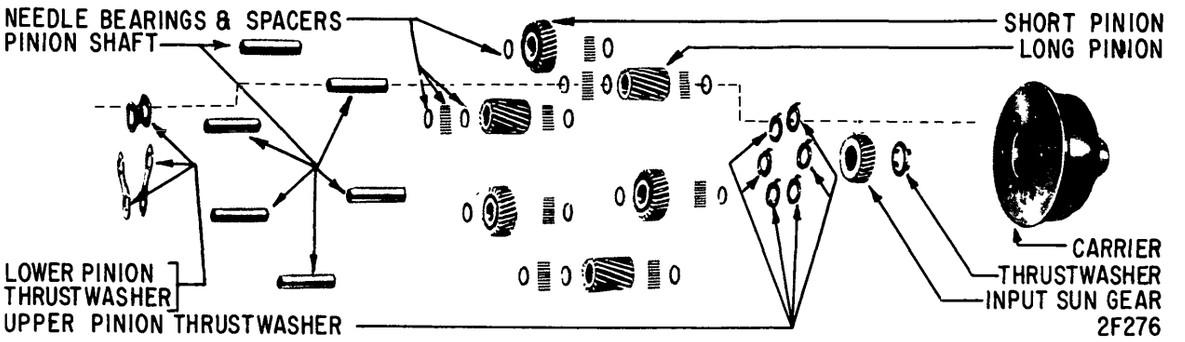
2) Starting with a short planet pinion, and using a soft steel drift punch, drive on upper end of pinion shaft until shaft is driven beyond staked position and press fit area of carrier housing. Feed Tool J-9560-1 into short planet pinion from upper end, pushing planet pinion shaft ahead until tool is centered in pinion. Remove short planet pinion and lower pinion thrust washer from the assembly, then remove pinion shaft.

3) Remove Tool J-9560-1, needle bearings, and needle bearing washers from short planet pinion. *CAUTION - Do not lose any of the planet pinion needle bearings. Twenty long bearings are used with short pinion. Forty short needle bearings are used with long pini ns (twenty on each end with a spacer in the middle).* Remove and disassemble remaining short planet pinions.

4) Remove input sun gear thrust washer, then by following the procedure outlined for removal of short pinions, remove the long planet pinions and upper and lower pinion thrust washers. Wash all parts in solvent and blow dry with air. Recheck all needle bearings and parts and replace as necessary. *CAUTION - If needl bearings are worn, all bearings must be replac d.*

Reassembly: 1) Use Tool J-9560-2 and assemble needle bearing spacer and short needle bearings (20 in each end) in a long planet pinion. *NOTE - Use cup grease to hold needle bearings in position during assembly.* Place a needle bearing washer at each end of planet pinion, then reverse position of planet carrier in vise and position the long planet pinion (with Tool J-9560-2 centered in pinion and with thrust washers at each end) in planet carrier. *NOTE - Oil grooves in thrust washers must be towards gear. Locate short pinions in carri r op nings and l ng pini ns opposit clos d portions of carri r.*

2) Align thrust washers with carrier holes, then select the proper pinion shaft (lubricate it with oil) and in-



CONTINUED ON NEXT PAGE

CORVAIR TRANSAXLE (Cont.)

stall it by tapping with a hammer, pushing Tool J-9560-2 ahead of it. Use a brass or soft steel drift punch and drive pinion shaft until lower end engages staked positions on lower face of carrier.

3) Assemble and install remaining long planet pinions in the same manner, then install input sun gear thrust washer and input sun gear. Follow the same general procedure as outlined for long pinions and assemble and install short pinions in carrier. *NOTE - Paired thrust washers are used on pinion thrust surface toward flanged side of planet carrier, from the short to the long planet pinions while the opposite thrust surface has an individual thrust washer.*

4) Check end clearance of gears which should be .005-.035". Use a chisel or centerpunch and restake pinion shaft at four places on both ends of planet carrier.

POWERGLIDE PLANET CARRIER ASSEMBLY

CHRYSLER CORP. TORQUEFLITE SIX

D dg 6 Cyl. (1962)
Lanc r (1962)
Plym uth 6 Cyl. (1962)
Valiant (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR: (Towing car t start is not r comm nd d because of sudden surge f pow r wh n ngin starts).* Turn ignition switch on, then push the "L" (Low) button in and depress accelerator pedal slightly. After car attains a speed of 15 MPH the transmission will start engine.

►*TOWING TORQUEFLITE CARS: Following procedure is r comm nded.*

Transmissi n Op rating Pr perly – Car may be towed safely in "N" (Neutral) at moderate speeds. For long distance towing (over 100 miles), the propeller shaft should be disconnected.

Transmissi n In p rativ – Tow car with rear end raised or remove propeller shaft.

►*1962 PARKING SPRAG POOR ENGAGEMENT OR OPERATION CORRECTION:* Check adjustment of park sprag cable *(s "Linkage Adjustment" below).* If adjustment is correct, disconnect propeller shaft from transmission output shaft flange and park sprag cable from sprag adapter cover. Push in and hold park sprag adapter in "apply" position using a 3/8" or 7/16" diameter rod approximately 4" long. Apply 150 ft. lbs. torque to output shaft flange nut in a counterclockwise direction. While holding this torque, remove rod used to push in park sprag adapter. If sprag does hold, release sprag adapter and rotate output shaft. Test sprag at four different positions of output shaft. If sprag holds at all four positions under the above conditions, park cable adjustment or park lock control lever adjustment on push button control box is incorrect. If park sprag will not hold at any one position under the above conditions, replace park sprag pawl in transmission.

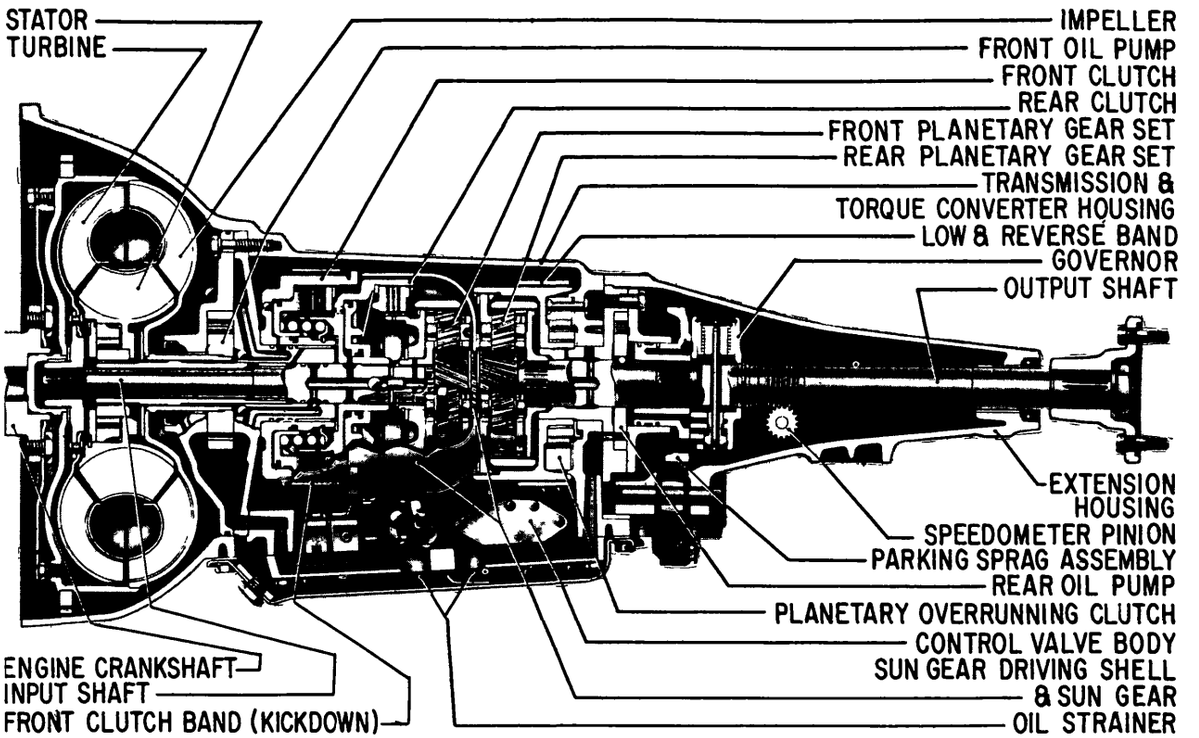
►*1962 FRONT PUMP HOUSING BUSHING PRODUCTION CHANGE & 1960–EARLY 1962 TORQUE CONVERTER HUB "SCUFFING" CORRECTION:* Beginning with Transmission Serial No. 396878, a new babbitt Front Pump Housing Bushing, Part No. 2204953, is used in production and for service replacement to prevent scuffing of torque converter hub. *For installation of bushing, s "Ov rhaul" b low.*

DESCRIPTION: Transmission design is same as used on previous models. On all models, a parking pawl in transmission housing is actuated by a cable connected to a lever below push button range selector unit on instrument panel.

OPERATION: In drive range the transmission shifts through all three gear ratios automatically. Shift points are determined by throttle opening and car speed. If additional acceleration is required while in drive range, the transmission will downshift (depending on speed) to second gear automatically when accelerator pedal is completely depressed. When transmission is in intermediate or second position range, operation is in the first two gears only. The low, or first, position range keeps the transmission in first gear only.

LUBRICATION

Ch cking Fluid L vel: Check fluid level every 1000 miles with transmission at normal operating temperature. Apply parking brake and idle engine, then depress each button, returning to "N" (Neutral) after button is pushed in. Oil level should be between "Full" mark and "Add 1 Pint" mark. *NOTE - If transmission is cold, fluid level should be at "Add 1 Pint" mark.* Add or remove transmission fluid as necessary.



Recommended Fluid - Automatic Transmission Fluid Type "A" (Suffix "A").

►*CHECKING FLUID LEVEL NOTE:* The above specifications are new and supersede previous specifications. If fluid is checked with transmission COLD, fluid level should be at "Full" mark on dipstick.

Draining & Refilling: Drain transmission every 10,000 miles. To drain, remove oil filler tube from transmission oil pan, then remove access plate at flywheel cover and drain torque converter by removing plug. After draining, replace converter plug and oil filler tube and add ten pints (5 qts.) of Automatic Transmission Fluid Type "A" (Suffix "A") through transmission oil filler tube. Start engine and add approximately three more pints with engine idling. Allow engine to idle for two minutes, then operate all pushbuttons, pausing momentarily in each position, and ending with the "N" (Neutral) button pushed in. Check fluid level and add sufficient fluid to bring level to "F" mark on dipstick.

Fluid Capacity: Approximately 14 pints (all models).

►*TRANSMISSION MAINTENANCE NOTE: It is r comm nded that wh n transmission is drained, oil pan should b r moved and cleaned, oil screen clean d, and transmission bands and linkage be adjusted.*

TORQUEFLITE SIX TRANSMISSION SECTIONAL VIEW

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment: *See "Carburetor" on car model pages.*

Manual Control Cable Adjustment: 1) With car raised on a hoist, have an assistant fully depress "R" (Reverse) pushbutton and hold it down. Remove pushbutton control cable adjustment wheel lockscrew at left side of transmission case.

2) Back adjustment wheel off on cable guide (turn counterclockwise) until only three or four threads are showing behind wheel on the guide. *CAUTION – Check wheel for free turning on guide and remove any burrs in threads that might interfere. Lubricate threads with a few drops of transmission fluid.*

3) Hold cable guide centered in hole in transmission case and apply only enough inward pressure to bottom the assembly at reverse detent. While holding cable bottomed, rotate adjustment wheel clockwise until it just contacts case. Turn wheel just enough clockwise to make next adjustment hole in wheel line up with screw hole in case.

4) Counting this hole as number one, continue turning the wheel clockwise until the fifth hole lines up with screw hole in case. Install lockscrew and tighten to 30–50 inch pounds.

Parking Lock Cable Adjustment: To check adjustment, operate parking lock lever from one end of slot in instrument panel to the other. The lever should have clearance at both ends. *NOTE – On hole in parking*

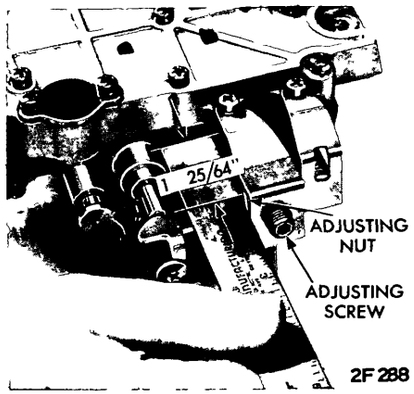
CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE SIX (C nt.)

lock arm is slotted to permit parking lock lever adjustment. To adjust, move lever to fully OFF position, then loosen two nuts attaching lock arm to push button housing. *NOTE – Loosen nuts just enough to free lever arm.* Block locking lever 1/16" from OFF position end of slot, then tighten both nuts on push button housing. Recheck lever travel to be sure clearance exists at both ends of travel. Have an assistant hold parking lock lever on instrument panel in OFF position, then loosen clamp bolt securing cable housing in parking pawl lever cover on bottom of transmission extension housing. Tap end of clamp lightly to release its hold on cable, then pull gently outward on cable housing to limit of its travel and tighten clamp bolt to 10 inch pounds. *CAUTION – Do not use pliers or similar tool to pull outward on cable as cable cover might be damaged.* Check adjustment by allowing car to roll slowly on a slight incline. Parking pawl should freely engage sprag with lever in ON position, and there should be no ratcheting noise with lever in OFF position.

Neutral Safety Switch Adjustment: Raise car and drain approximately two quarts of fluid from transmission, then unscrew neutral safety switch and check to see that switch operating lever is aligned with center of switch opening in case. Place cupped washer and "O" ring over threads of switch, then screw switch into transmission case a few turns. Connect one lead of a test lamp to battery current and the other lead to switch terminal. Screw switch into transmission case until lamp lights, then tighten switch an additional 1/3–½ turn. *NOTE* – Switch must be tight enough to prevent oil leakage. If not, add a thin washer and readjust the switch. Remove test lamp and connect wire to switch. Add fluid to transmission to bring up to proper level.

BAND ADJUSTMENT



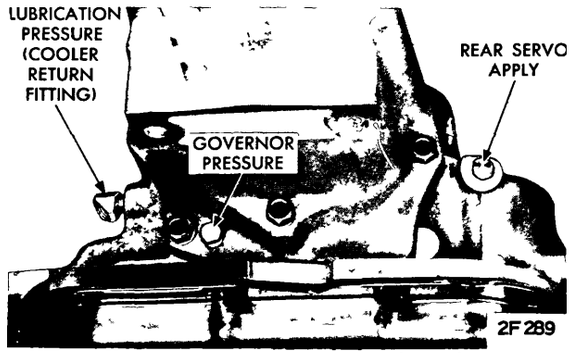
Kickdown (Front) Band: Kickdown band adjusting screw is located on left side of transmission case near throttle shaft lever. Loosen locknut and back off approximately five turns. Check adjusting screw for freeness in transmission case, then tighten adjusting screw to a reading of **47–50 inch pounds** using Tool C–3380 with Adaptor Tool C–3790. Using a reference mark of chalk or colored pencil on corner of adjusting screw square and transmission case, back the adjusting screw out **exactly** 2 turns (225" Engine); 2 5/8 turns (170" Engine). While holding adjusting screw stationary, tighten locknut to 20–25 ft. lbs.

Low-Reverse Band: Drain transmission and remove oil pan, then loosen the adjusting screw locknut and back locknut off approximately five turns. *NOTE – Adjusting screw is located in low-reverse band lever.* Check adjusting screw for free turning in lever, then tighten adjusting screw to a reading of **47–50 inch pounds** using Tool C–3380 and Adaptor Tool C–3790. Back off adjusting screw exactly 5¼ turns (all models) and tighten locknut to 20–25 ft. lbs. *NOTE – Hold adjusting screw from turning while tightening locknut.*

TESTING

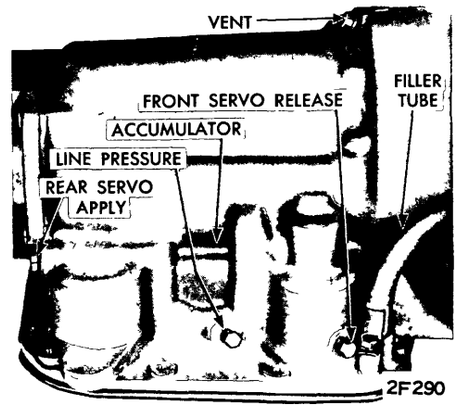
HYDRAULIC CONTROL PRESSURE TESTS: All of the following pressure tests must be made with the transmission at normal operating temperature.

Line Pressure & Front Servo Release Pressure: Install a tachometer on engine, then raise car and position the tachometer so it can be read under the car. Connect two 0–100 psi pressure gauges, Tool C–3292, to pressure takeoff points at top of accumulator and at front servo release (see illustration). With transmission selector lever in "D" (Drive) position, and wheels free to turn, speed up engine slightly until transmission shifts into direct drive. Reduce engine speed slowly to 800 RPM. Line pressure at this time must be 52–60 lbs., and front servo release pressure should be 45 lbs. or higher. Disconnect throttle linkage at transmission lever and hold transmission throttle lever at detent position. Increase engine speed to 3500 RPM with transmission in direct drive. At this point, line pressure should be 90–96 lbs. and front servo release pressure should be 80 lbs. or greater. *NOTE – Open transmission throttle lever when operating engine at speeds in excess of 1500 RPM.* If line pressure is not 52–60 lbs. at 800 RPM, adjust pressure (see below). *CAUTION – Do not adjust line pressure to correct reading at 3500 RPM.*



LINE PRESSURE ADJUSTMENT

Line Pressure Adjustment: Remove valve body assembly from transmission and adjust the "Allen" type screw in end of pressure regulator spring bracket so the measurement between valve body and inner edge of adjusting nut on end of spring is 1 25/64" (see illustration). *NOTE – The above adjustment can be varied to obtain specified line pressure. Turning screw counterclockwise increases pressure.*



Lubrication Pressure: Install a "tee" fitting between cooler return line fitting and fitting hole in transmission case at rear left side of transmission case. Connect a 0–100 psi pressure gauge, Tool C–3292, to "tee" fitting. At 800 RPM, with throttle lever in closed position and transmission in direct drive, pressure should be 5–25 lbs.

Rear Servo Apply Pressure: Connect a 0–300 psi pressure gauge, Tool C-3293, to apply pressure takeoff point at rear servo, then with transmission selector lever in "R" (Reverse) and engine speed at 1600 RPM, the reverse servo pressure should be 230–280 lbs. Not adjustable.

Governor Pressure: Connect a suitable pressure gauge to governor pressure take-off point located on lower left side of extension housing just back of extension housing mounting flange. Governor pressure should be within limits indicated in table below. If pressure not correct, governor valve or weights are sticking.

PRESSURE TEST LOCATIONS (REAR)

PRESSURE TEST LOCATIONS (RIGHT SIDE)

Governor Pressure (Lancer & Valiant 170" Engine)

Governor Pressure	Car Speed (MPH & Axle Ratio) 3.23–1	3.55–1
15 lbs.	16–17	14–15
45 lbs.	29–39	27–35
60 lbs.	59–66	54–60

Governor Pressure (Dodge & Plymouth 225" Engine)

Governor Pressure	Car Speed (MPH) & Axle Ratio 2.93-1	3.23-1	3.31-1	3.58-1
15 lbs.	17-19	16-17	15-17	14-16
45 lbs.	30-39	27-36	27-35	25-32
60 lbs.	63-72	56-65	55-63	50-58

Governor Pressure (Lancer & Valiant 225" Engine)

Governor Pressure	Car Speed (MPH) & Axle Ratio 2.93-1	3.23-1	3.55-1
15 lbs.	17-19	15-17	14-15
45 lbs.	29-38	26-34	24-31
60 lbs.	60-69	55-63	50-57

Throttle Pressure: *NOTE – No provision is made to check throttle pressure. However, if pressure adjustment is made correctly, as indicated below, pressure is assumed to be correct.*

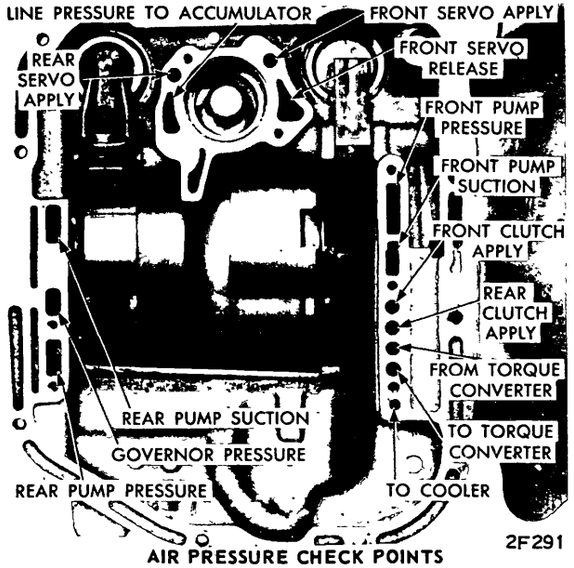
CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE SIX (C nt.)

Throttl Pr ssur Adjustm nt – Remove valve body assembly from transmission, then loosen throttle lever stop screw locknut and back off screw approximately five turns. Insert gauge pin of Tool C–3763 between throttle lever cam and kickdown valve. By pushing in on tool, compress kickdown valve against its spring so throttle valve is completely bottomed inside the valve body. As force is being exerted to compress the spring, tighten throttle lever stop screw finger tight against throttle lever tang with throttle lever cam touching the tool and throttle valve bottomed. *CAUTION – B sure th adjustment is made with spring fully c mpr ss d and valve bottomed in valve body.* Remove tool and tighten stop screw locknut securely.

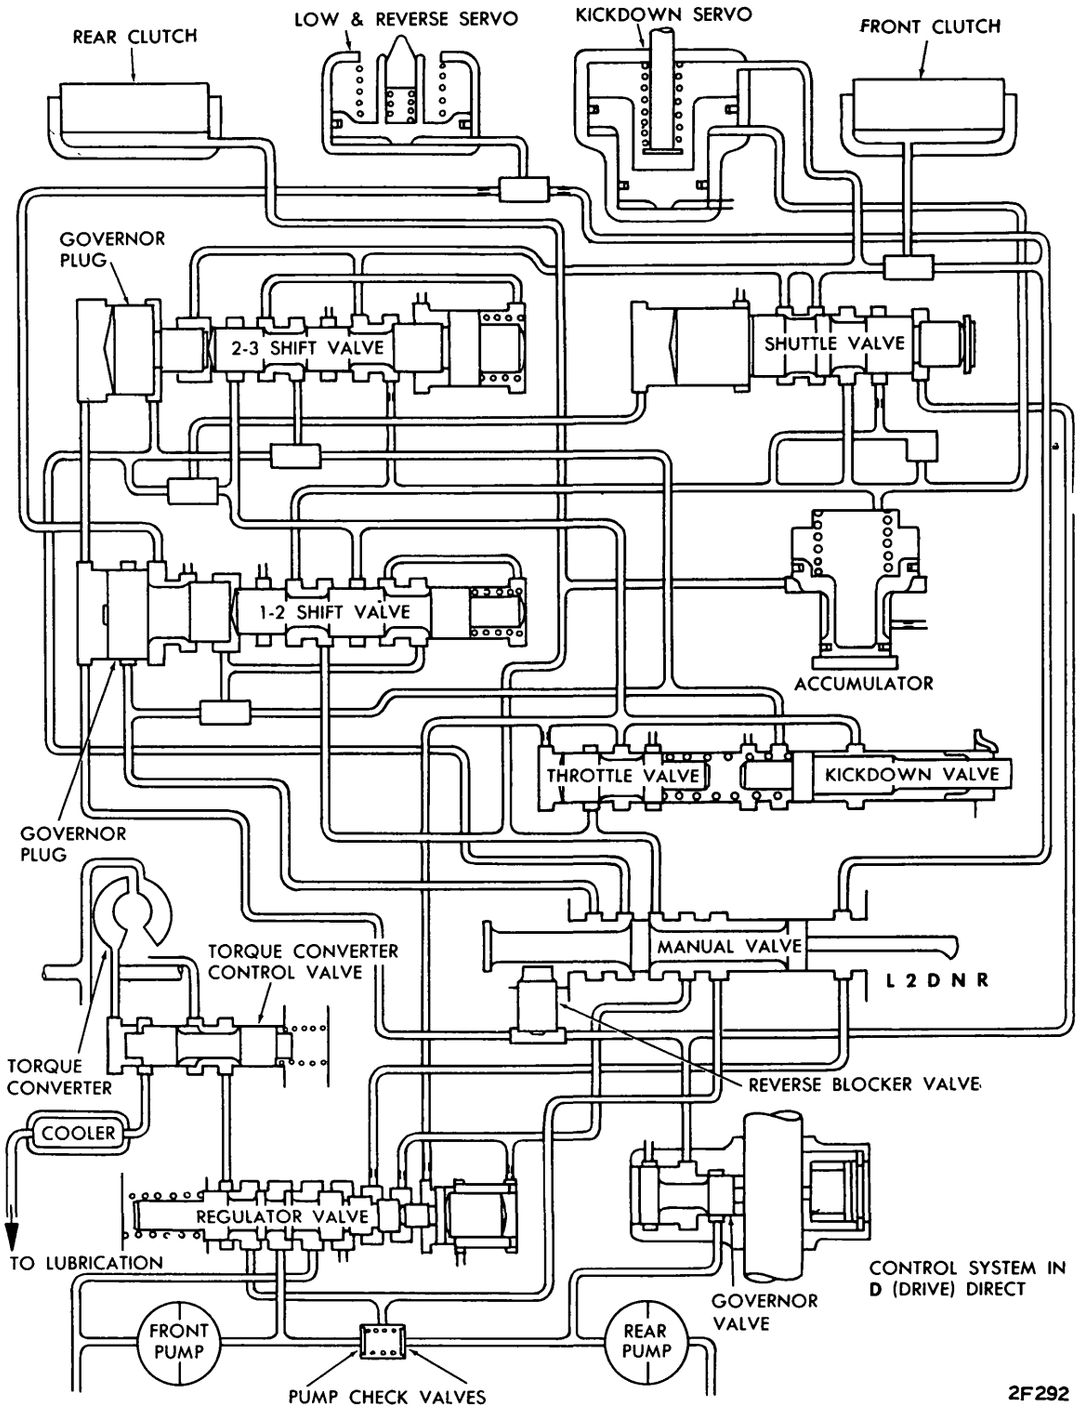
AIR PRESSURE TESTS: Front clutch, rear clutch, kickdown servo, and low-reverse servo may be checked by applying air pressure to their respective passages after valve body assembly is removed. See illustration for location of passages.

Front Clutch: Apply air pressure to front clutch passage and listen for a dull "thud" indicating that front clutch is operating. Hold air pressure on for a few seconds and check system for excessive oil leakage.



R ar Clutch: Apply air pressure to rear clutch passage and listen for dull "thud" indicating that rear clutch is operating. Hold pressure on for a few seconds and check system for excessive oil leakage.

►*NOTE: If a dull "thud" cannot be heard in the clutches, place finger tips on clutch housing and again apply air pressure. Piston mov ment can be felt as clutch is applied.*



Kickd wn Serv : Direct air pressure into kickdown servo "apply" passage. Operation of servo is indicated by a tightening of front band. Spring tension on servo piston should release the band.

Low-R v rs S rv : Direct air pressure into low-reverse servo "apply" passage. Operation of servo is indicated by a tightening of rear band. Spring tension on servo piston should release band.

GEARSHIFT CONTROL UNIT & PARKING LOCK

PUSH BUTTON CONTROL UNIT (ALL MODELS): Removal – Disconnect ground cable from battery, then remove parking handle from lever. Disconnect back-up lamp switch wire connectors (if so equipped). Remove three nuts securing control assembly on instrument panel and carefully work assembly to rear out of cluster. Remove push buttons by pulling them off push button slides, then unscrew two nuts and remove mounting bracket from control assembly. Remove hairpin lock securing gearshift control cable on actuator and remove cable. Disconnect parking lock cable from control and remove parking lock arm from control.

Adjustment: *NOTE – If transmission fails to shift into Neutral when parking lock is applied, check parking lock cable adjustment at transmission before adjusting push button control unit.* Remove overcenter spring and back off lever stop screw. Make sure there is no binding in neutral slide, neutral slide pin and bushing, cam pivot, and that all parts are lubricated. Hold neutral slide in against rocker bar with about 5—10 lbs. load, then loosen locknut and rotate cam so the lever nose just touches neutral slide pin as it passes over pin when moving parking lock lever from OFF to ON position. *NOTE – Only light contact should occur so that lever does not hang up on pin.* Hold cam in this position and tighten locknut to 95 inch pounds, then install overcenter spring. Adjust lever stop screw to obtain .010" clearance between neutral slide pin and lever heel. Tighten lever stop screw locknut securely.

Installation: Install parking lock arm on control unit and secure with washers and nuts. Connect parking lock cable and secure cable in control bracket, then place end of gearshift control cable on actuator and secure with hairpin clip. Secure cable in control bracket. Install mounting bracket on control and tighten nuts securely, then install push buttons in proper order on control actuator slides. Carefully guide control unit into position from rear of instrument housing and tighten retaining nuts securely. Operate push buttons and correct any binding that might exist, then install parking lock control handle and connect back up switch wires.

MANUAL CONTROL CABLE: Removal - Drain 2 quarts of fluid from transmission, then depress "L" (Low) push button. Remove neutral starting switch and remove control cable-to-adjusting wheel lock screw. Insert screwdriver through neutral starting switch opening, then push screwdriver gently against upper projecting portion of cable lock spring and pull outward on cable to remove cable from adapter and transmission case.

Installation: Have an assistant hold the "R" (Reverse) button fully depressed, then back adjusting wheel off until two or three threads are showing behind wheel on guide. Lubricate cable guide with transmission lubricant, insert cable in transmission case, push inward on cable making sure lock-spring engages cable. Adjust control cable *(see "Adjustment" above)*, then fill transmission with recommended fluid.

PARKING LOCK CABLE (TRANSMISSION END): Removal – Loosen parking lock cable clamp bolt where cable enters housing cover, then remove housing cover lower plug. With a screwdriver inserted through plug opening, push gently against projecting portion of lock spring, then withdraw lock cable. *CAUTION – Do not use pliers or similar tools to withdraw cable from adapter cover as cable might be damaged.*

Installation: Place parking lock lever on instrument panel in OFF position, then insert screwdriver through plug opening and position it behind cable adapter stop washer. Hold adapter outward while pushing cable in as far as possible, making sure lock spring engages cable. Gently pull outward on cable to its limit of travel, release and then tighten clamp bolt to 10 inch pounds. Reinstall plug in cover and tighten to 35 inch pounds.

PUSH BUTTON LAMP REPLACEMENT: Lancer & Valiant – Lamp is located just above main light switch on back side of instrument panel. Remove bulb socket from back of instrument panel.

Dodge: Lamp is located on back of instrument panel just above push buttons. Remove bulb socket from rear of instrument panel.

Plymouth: Lamp is located approximately in center of push button cluster. Instrument cluster must be removed, as follows, for access to bulb. Disconnect speedometer cable, and remove heater blower switch and temperature control knobs. Remove instrument cluster retaining screws and lift out cluster assembly. Slide a short piece of tight fitting rubber hose over bulb to remove it from socket.

BACK-UP LIGHT SWITCH REPLACEMENT: All Models - Remove push button control housing assembly, then straighten tabs securing switch to housing. Install switch and bend tabs to retain it in place. Install housing and connect switch and lamp wires.

TORQUE CONVERTER

►*TORQUE CONVERTER NOTE: This is a sealed unit and cannot be disassembled for overhaul. In the event of parts failure in transmission, the torque converter should be flushed as described below.*

FLUSHING TORQUE CONVERTER: With torque converter assembly removed from engine, place it in an upright position and pour two quarts of clean solvent or kerosene into converter through impeller hub. Turn and shake converter so as to swirl solvent through internal parts. *NOTE - Turning turbine and stator with transmission input and reaction shafts will help to dislodge foreign material.* Position converter in its normal operating position with drain plug at lowest point, then drain solvent. Rotate turbine and stator, and shake converter while draining. Repeat the above operation at least once, or as many times as required until solvent is drained out clean. After flushing, shake and rotate converter several times with drain plug out to remove all solvent and dirt. Reinstall drain plug and tighten to 20 ft. lbs.

TRANSMISSION REMOVAL & INSTALLATION

►*TRANSMISSION & TORQUE CONVERTER REMOVAL CAUTION:* Transmission and torque converter must be removed and installed as an assembly to prevent damage to converter drive plate, front pump bushing, and oil seal. *DO NOT allow weight of transmission to rest on plate during removal or installation.*

REMOVAL: 1) Connect a suitable Remote Control Starter Switch (Tool C-763 or equivalent) so engine can be rotated from under car, then disconnect high tension lead from distributor. Raise car on a hoist or support on stands and drain converter and transmission.

2) Mark converter and drive plate for use at reassembly. *NOTE - Crankshaft flange bolt circle, inner and outer circle of holes in drive plate, and the four tapped holes in front face of converter all have one hole offset so these parts will be installed in original position.*

3) Rotate engine to locate two converter-to-drive plate bolts at "5" and "7" o'clock positions and remove bolts, then rotate engine and remove remaining two bolts. *CAUTION - Do not rotate converter or drive plate by prying with a screwdriver or other tool. DO NOT engage starter if drive plate is not attached to converter with at least one bolt or if transmission case-to-engine bolts have been loosened.*

4) Position control cable for removal by depressing "1" (Low) pushbutton, then disconnect negative cable from battery. Remove starter motor assembly, then remove starter neutral safety switch from transmission case. Remove pushbutton control cable-to-transmission adjusting wheel lockscrew and insert a screwdriver through neutral starter switch opening and push gently against upper projecting portion of cable lock-spring, then pull outward on cable to remove it from adaptor and transmission case.

5) Remove throttle link and lever assembly from transmission throttle shaft, then disconnect oil cooler lines

CONTINUED ON NEXT PAGE

CHRYSLER CORP.
TORQUEFLITE SIX (C nt.)

at transmission and remove oil filler tube. Remove speedometer pinion and sleeve assembly, then loosen transmission parking pawl cable clamp where cable enters cover and remove housing cover lower plug. Insert a screwdriver through hole and gently exert pressure against projecting portion of cable lock spring and withdraw cable.

6) Disconnect propeller shaft at transmission and secure out of way. Remove nuts and washers securing transmission extension housing insulator to crossmember, then install support fixture C–3806 and raise engine slightly. Remove crossmember, then place a transmission jack under transmission to support the assembly. Attach a small "C" clamp to edge of bell housing to hold converter in place during removal.

7) Remove bell housing retaining nuts, then carefully work transmission and converter assembly toward rear off engine block dowels and disengage converter hub from end of crankshaft. Remove transmission and converter from under car. To remove converter assembly, remove "C" clamp from edge of bell housing, then carefully slide converter assembly out of transmission.

INSTALLATION: 1) To install converter on transmission, rotate front pump rotors with Tool C–3756 until two small holes in tool handle are vertical, then carefully slide converter assembly over input shaft and reaction shaft, making sure that converter impeller shaft slots are also vertical and engage front pump inner rotor lugs. *CAUTION – Check for full engagement by placing a straight dge across face of case. Surface of conv rter front cov r lug should be at least ½" to rear of straight dg wh n converter is pushed all the way into transmission.* Attach a "C" clamp in same manner as for transmission removal.

2) Coat converter hub hole in crankshaft with wheel bearing grease, then place transmission and converter assembly on jack and raise into position. Rotate converter so mark (made at removal) will align with mark on drive plate. *NOTE – The offset holes are located n xt t 1/8" h l in inner circle of plate. A stamped "V" mark id ntifi s offs t hole in converter front cover.*

3) Carefully work transmission forward over engine block dowels with converter hub entering crankshaft opening. After transmission is in position, install bell housing bolts and tighten to 25–30 ft. lbs. Install and tighten two lower drive plate–to–converter bolts to 270 inch lbs., then install starter motor and connect battery ground cable. Rotate engine with remote starting switch and install remaining two drive plate–to–converter bolts and tighten to 270 inch lbs.

4) Install crossmember and insulator assembly and tighten attaching bolts to 75 ft. lbs., then lower transmission so extension housing rests on, and is aligned, with insulator. Install insulator–to–extension housing bolts and tighten to 35 ft. lbs.

5) Insert a screwdriver through parking lock cover plug opening and position it behind cable adapter stop washer, then hold adapter outward while pushing cable in as far as possible. Make sure lock spring engages cable, then gently pull outward on cable housing to its limit of travel and tighten clamp bolt to 10 inch lbs. Remove screwdriver and install plug. Connect propeller shaft, oil cooler lines and oil filler tube. Install speedometer drive pinion and sleeve, then position throttle lever on transmission throttle and tighten clampscrew.

6) Have an assistant engage "R" (Reverse) push button and hold it firmly depressed. Insert push button control cable in transmission case, then push inward on cable, making sure lock spring engages cable. Install control cable adjusting wheel retaining screw. Install neutral starting switch and connect wire, then install cover plate in front of converter assembly.

7) Install transmission case–to–cylinder block brace. *NOTE – Converter cover plate must be between case and brace with oil line bracket attached in front of brace. Tighten the bolts holding brace to case before attaching brace to cylinder block.* Refill transmission and adjust linkage and cable controls. *See "Adjustment" above.*

TRANSMISSION OVERHAUL

See 1960 Final Data, Page 449, or later Manual edition and note the following:

► *1962 FRONT PUMP HOUSING BUSHING PRODUCTION CHANGE & 1960–EARLY 1962 TORQUE CONVERTER HUB "SCUFFING" CORRECTION:* Beginning with Transmission Serial No. 396878, a new babbitt Front Pump Housing Bushing, Part No. 2204953 is being used in production and for service replacement to prevent scuffing of torque converter hub. Install bushing as follows: With front pump housing removed from transmission, place pump housing (seal face–down) on a smooth firm surface, then place removing head, Tool SP–3551, in bushing and install handle, Tool SP–3549, in removing head. Drive bushing straight down and out of pump housing bore. *CAUTION – Do not cock tool in bore.* Position a new type bushing on installing head, Tool SP–3624, then with front pump housing on a smooth surface, start bushing and installing head in bushing bore. Install handle, Tool SP–3549, in installing head and drive bushing into housing until tool bottoms in pump cavity. *CAUTION – Do not cock tool in bore.* Stake bushing in place with a punch or similar tool (a slight tap at each stake slot location is all that is necessary). Use a narrow blade knife or similar tool and remove burrs or high points around staked area. *CAUTION – Do not use a file or other tool that will remove more metal than is necessary.* Clean pump housing thoroughly and install in transmission.

Front Pump & Torque Converter: Driving lugs on front pump inner rotor are located in center of inner rotor and both faces of lugs are square. The diameter which pilots rotor on converter impeller hub is also located at center of rotor. Converter impeller has two slots to drive rotor instead of two tangs used on previous models. There is no difference between front and rear side of rotor, however, marks (made at time of disassembly) must be aligned when reassembled.

R acti n Shaft Supp rt–t –Fr nt Clutch Thrust Wash r: A fibre thrust washer has been added between reaction shaft support and front clutch assembly. This washer is .043–.045" thick and should be replaced if worn or damaged.

Front Clutch (170" Engine): Three friction discs and the three steel plates are used (replacing the previous four friction discs and four steel plates). Front clutch clearance for the new assembly is .042–.087". *CAUTION – These new discs, Part No. 2205203, ar not interchangeable with those used on previ us models. DO NOT use for replacement on 225" engin transmissions.* A three disc clutch assembly can be used to replace a four disc assembly in any 170" engine transmission providing the following parts are used: Front Clutch Retainer Assembly, Part No. 2205325; Front Clutch Disc Assembly, Part No. 2205203; Front Clutch Piston Spring, Part No. 2205233; Front Clutch Plate 1942403.

Packing Pawl & Lever: Removal – Remove parking lock cable adapter cover from bottom of extension housing and remove adapter from lock lever. Slide shaft out of extension housing to remove lock lever and shim. Slide bushing sleeve out of housing to remove pawl and spring.

Inspection – Check bushing sleeve and shaft for scores and free movement in housing and in pawl and lever. Check roller for nicks, burrs and free turning. Inspect square lug on pawl for broken edges or other damage.

Reassembly – Position parking pawl and spring in housing and insert sleeve. Make sure square lug on pawl is toward the sprag, and the spring is positioned so as to lift pawl away from sprag. Attach cable adapter to lock lever. *NOTE – Make sure adapter is prop rly attached.* Insert small punch through cable opening in adapter cover and into end of adapter. Carefully lower cover into position, feeding adapter into cable opening in cover. Install retaining screws and tighten to 150 inch lbs.

Governor & Parking Sprag: Removal – Remove large snap ring from weight end of governor housing and lift out weight assembly. Remove snap ring from inside governor weight, then remove inner weight and spring from outer weight. If lugs on parking sprag are damaged, remove four screws and separate sprag from governor.

Inspection – Inspect all parts for burrs and wear. Check inner weight for free movement in outer weight, and outer weight for free movement in governor housing. Weights and valves should fall freely when clean and dry. Remove rough surfaces with crocus cloth. Check governor weight spring for distortion. Inspect lugs on sprag for broken edges or other damage.

Reassembly – If parking sprag was separated from governor housing, assemble and tighten screws finger tight. *CAUTION – Make sure oil passages of govern r housing align with passages in sprag, then tight n screws.* Assemble governor weights and springs, and secure with snap ring inside of large governor weight. Place weight assembly in housing and install snap ring.

CHRYSLER CORP.
TORQUEFLITE EIGHT

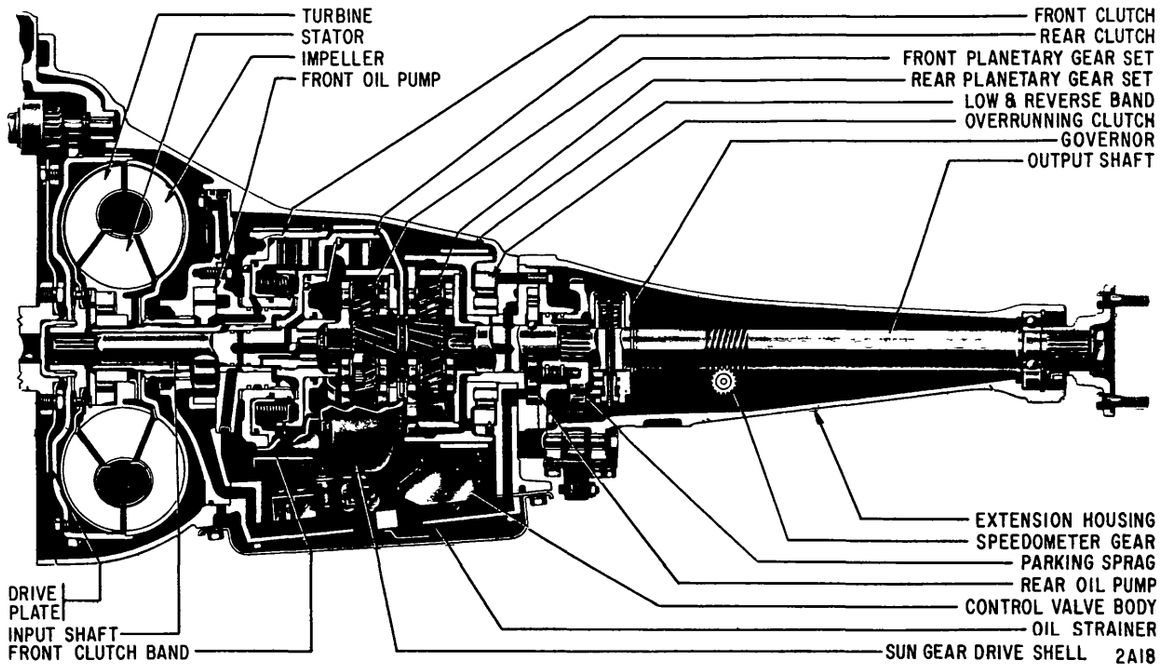
Chrysler & Imperial (1962)
Dodge V8 (1962)
Plymouth V8 (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR: (Towing car to start is not recommended because of sudden surge of power when engine starts).* Turn ignition switch on, then push the "L" (Low) button in and depress accelerator pedal slightly. After car attains a speed of 15 MPH, the transmission will start engine.

►*TOWING TORQUEFLITE CARS: Following procedure is recommended:*

Transmission Operating Properly - Car may be towed safely in "N" (Neutral) position at moderate speeds. For long distance towing (over 100 miles), the propeller shaft should be disconnected.



Transmission Inoperative - Tow car with rear end raised or remove the propeller shaft.

►*1962 (EARLY) TORQUEFLITE EIGHT OIL LEAKAGE AT FRONT PUMP HOUSING AIR VENT CORRECTION:* Attach Baffle, Part No. 2400479, to the two top reaction shaft support bolts inside front pump housing. Baffle will shield vent opening and prevent oil passing through vent. Make sure baffle has sufficient clearance between pump housing and clutch retainer. Transmissions after Serial No. 154439 have the baffle installed in production.

►*1962 TORQUEFLITE EIGHT (EXCEPT CHRYSLER & DODGE 880) PARKING SPRAG POOR ENGAGEMENT OR OPERATION CORRECTION:* Check adjustment of park sprag cable (see "Linkage Adjustment" below). If adjustment is correct, disconnect propeller shaft from transmission output shaft flange and sprag cable from sprag adapter cover. Push in and hold park sprag adapter in the "apply" position using a 3/8" or 7/16" diameter rod approximately 4" long. Apply 150 ft. lbs. torque to output shaft flange nut in a counterclockwise direction. While holding this torque, remove rod used push in park sprag adapter. If sprag does hold, release sprag adapter and rotate output shaft. Test sprag at a minimum of four different positions of output shaft. If sprag holds at all four positions under the above conditions, park sprag cable adjustment or park lock control lever adjustment on the push button control box is incorrect. If park sprag will not hold at any one position under the above conditions, replace park sprag pawl.

DESCRIPTION: Three-speed automatic transmission and torque converter consisting of two multiple disc clutches, an overrunning clutch, two servos and bands, and two planetary gear sets. The torque converter housing and transmission case are an integral aluminum casting. The hydraulic system consists of a front and rear pump, and a single valve body which contains all of the valves except governor valve. Transmission fluid is cooled by circulating through an oil-to-water type cooler located in radiator lower tank. A disposable type filter with an integral relief valve is located in cooler-to-transmission return line. The torque converter is a sealed unit which cannot be disassembled.

OPERATION: Neutral - No clutches are engaged or bands applied.

TORQUEFLITE EIGHT TRANSMISSION SECTIONAL VIEW

Drive: In direct (high), front and rear clutches are engaged and front and rear bands are released. Front planetary pinions cannot rotate, therefore, the front planetary cage (splined to output shaft) rotates output shaft at same speed as input shaft thus obtaining direct drive.

Second: Rear clutch is engaged, driving front annulus gear, pinions and sun gear. At the same time, the front band is applied, holding the front clutch, driving shell and sun gear stationary. With rear clutch engaged, the clutch, front annulus gear and front planetary pinions all rotate clockwise. The applied front band holds the driving shell and sun gear from turning, therefore, with sun gear held stationary, planet pinions roll clockwise around sun gear, turning front planetary cage (splined to output shaft) in same direction at reduced speed.

Low: Rear clutch is engaged and drives front annulus gear, front planetary pinions and sun gear. Low and reverse drum and rear planetary cage are held stationary by rear band and overrunning clutch. With rear clutch engaged, the clutch, front annulus gear, and front planetary pinions all rotate clockwise, which turns sun gear counterclockwise. With rear planetary cage held stationary, sun gear (rotating counterclockwise), rotates rear planet pinion clockwise which turns rear annulus gear (splined to output shaft) in same direction at reduced speed.

Revers : Front clutch is engaged to drive the driving shell and sun gear. Low and reverse drum and rear planetary cage are held stationary by rear band. With front clutch engaged, the clutch, driving shell and sun gear all rotate clockwise. With rear planetary held stationary, the sun gear (rotating clockwise) rotates rear planet pinions counterclockwise, which turns rear annulus gear (splined to output shaft) in reverse direction at a reduced speed.

Breakaway (Car standing, engine perating, and "D" button depressed): Rear clutch is engaged, which drives front annulus gear, front planetary pinions and sun gear. Rear planetary cage is prevented from turning counterclockwise by overrunning clutch. With rear clutch engaged, the clutch, front annulus gear and front planetary pinions all rotate clockwise which turns the sun gear counterclockwise. The sun gear tends to rotate rear planetary cage and drum counterclockwise, which is immediately locked by overrunning clutch. With rear planetary cage held stationary, then sun gear (rotating counterclockwise) rotates rear planetary pinions clockwise which turns rear annulus gear (splined to output shaft) in the same direction at low range ratio.

Kickdown (Direct Drive to Sec nd): In kickdown from direct drive, the transmission shifts back to same power flow as outlined for "Second".

Kickdown (Second to Low): In kickdown from second the transmission shifts back to same power flow as outlined for "Breakaway".

Retarding: When retarding in low gear, the low and reverse drum and rear planetary cage are held stationary by the low and reverse band to provide engine braking.

CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

LUBRICATION

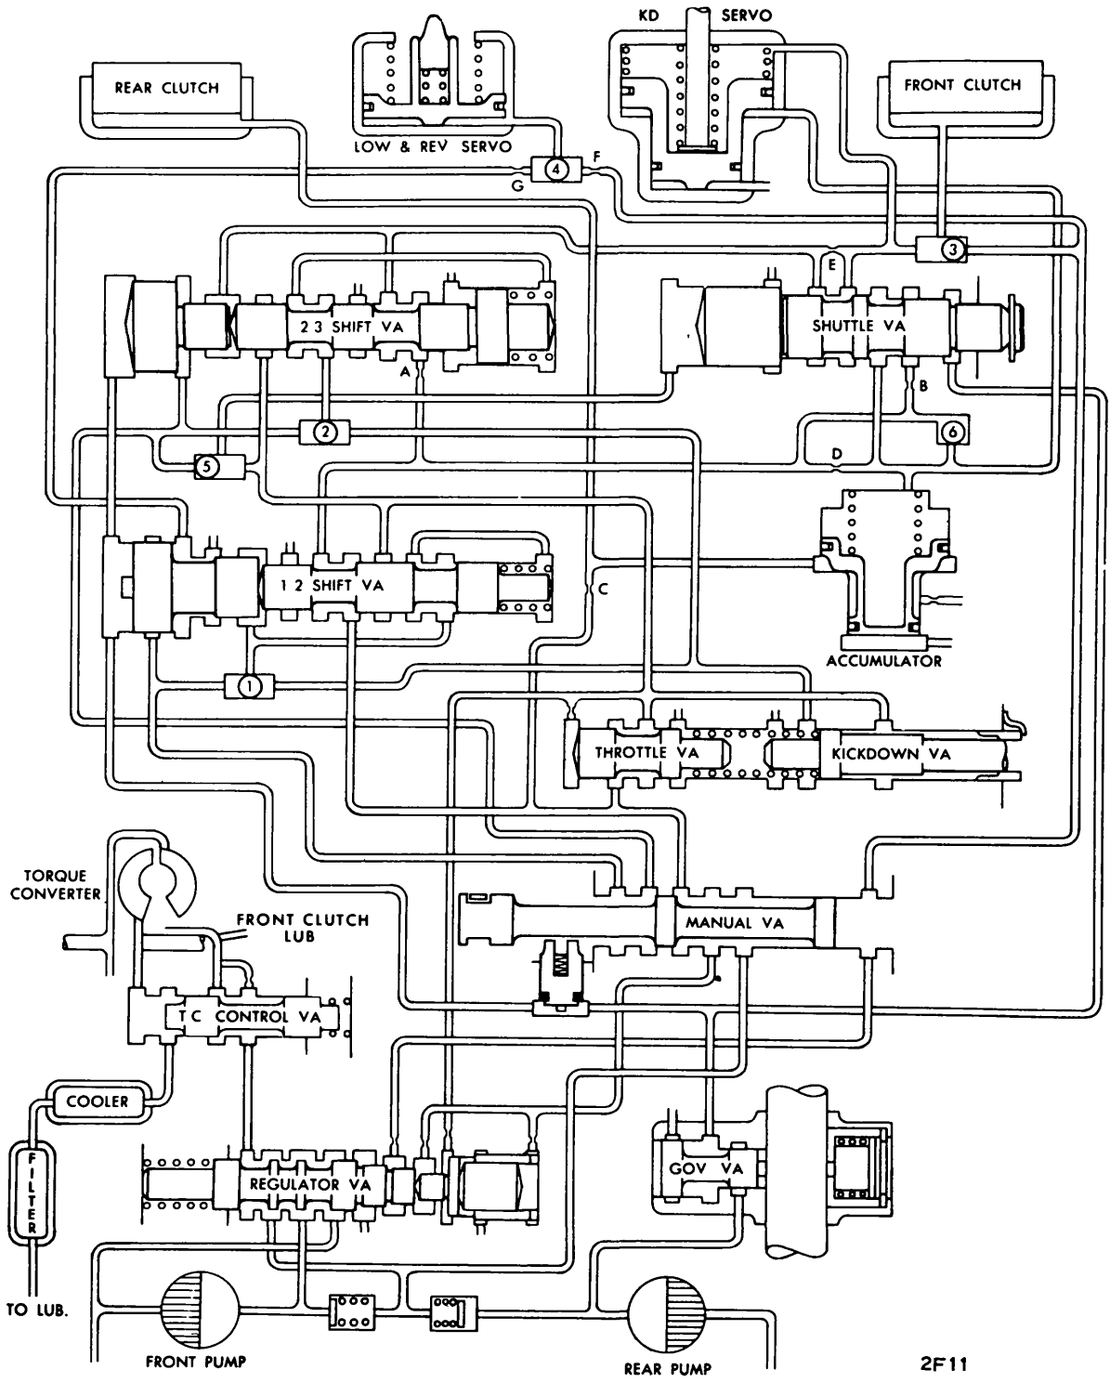
Checking Fluid L v l: Check transmission fluid level every 4000 miles with transmission at normal operating temperature. Apply parking brake and idle engine, then depress each button, returning to neutral after button is pushed in. Fluid level should be between "FULL" mark and "ADD ONE PINT" mark. *CAUTION - Fluid should nev r be abov "FULL" mark with transmissi n at n rmal perating temperature.* If transmission fluid level is checked with transmission cold, fluid level should be at "ADD ONE PINT" mark to 3/8" below "ADD ONE PINT" mark.

R c mm nd d Fluid - Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity - 18 pints (Dodge & Plymouth); 19 pints (Chrysler).

Draining & Refilling: Drain & refill transmission and torque converter every 32,000 miles (more frequently for cars operating in hot weather or with abnormal loads). Remove transmission drain plug, then remove access cover from torque converter housing and drain converter. Remove lower plug from parking sprag cover and allow to drain (except Chrysler). Install and tighten drain plugs, then replace fluid filter (located in oil cooler-to-transmission return line). Pour 8 qts. of recommended fluid into transmission, then start engine and allow it to idle for at least two minutes. Apply parking brake and depress each pushbutton momentarily, ending with neutral button pushed in. Add sufficient fluid to bring level to "ADD ONE PINT" mark on dipstick. Recheck fluid level after transmission is at normal operating temperature. Fluid level should be as indicated in "Checking Fluid Level" above.

►*TRANSMISSION MAINTENANCE NOTE:* It is recommended that when transmission is drained, oil pan should be removed and cleaned, oil screen cleaned, transmission bands adjusted, and pushbutton cable adjusted.



►*CONVERTER FLUSHING NOTE: CAUTION - Converter must be removed from car for flushing. DO NOT rotate conv rt r with start r with transmission removed.* With converter in an upright position, pour two quarts of clean solvent or kerosene into converter through converter hub. Turn and shake converter to force solvent through all internal parts. *NOTE - Turning turbine and stator with transmissi n input and reaction shafts will aid in dislodging foreign material.* Position converter in its normal operating position with drain plug at bottom, then drain converter. Rotate turbine and stator, and shake converter while draining to prevent particles from settling. Repeat flushing operation as many times as necessary. Finally flush any remaining solvent from converter with two quarts of new transmission fluid.

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE:* See *"Carburetor" on car model pag s.*

Manual C ntrol Cabl Adjustment: 1) With car raised on a hoist, have an assistant fully depress "R" (Reverse)

CONTINUED ON NEXT PAGE

HYDRAULIC CIRCUIT DIAGRAM

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

pushbutton and hold it down. Remove pushbutton control cable adjustment wheel lock screw at left side of transmission case.

2) Back adjustment wheel off on cable guide (turn counterclockwise) until only two or three threads are showing behind the wheel on the guide. *CAUTION - Check wheel for free turning on guide and remove any burrs in threads that might interfere. Lubricate threads with a few drops of transmission fluid.*

3) Hold cable guide center in hole of transmission case and apply only enough inward force to bottom the assembly at reverse detent. While holding cable bottomed, rotate adjustment wheel clockwise until it just contacts case. Turn wheel just enough clockwise to make next adjustment hole in wheel line up with screw hole in case.

4) Counting this hole as number one, continue turning the wheel clockwise until the fifth hole lines up with screw hole in case. Install lockscrew and tighten to 75 inch pounds.

Parking Lock Cable Adjustment (Except Chrysler & Dodge 880): To check adjustment, operate parking lock lever from one end of slot in instrument panel to the other. The lever should have clearance at both ends. *NOTE – One hole in parking lock arm is slotted to permit parking lock lever adjustment.* To adjust, move lever to fully OFF position, then loosen two nuts attaching lock arm to push button housing. *NOTE – Loosen nuts just enough to free up lever arm.* Block locking lever 1/16" from OFF position end of slot, then tighten both nuts on push button housing. Recheck lever travel to be sure clearance exists at both ends of travel. Have an assistant hold parking lock lever on instrument panel in OFF position, then loosen clamp bolt securing cable housing in parking pawl lever cover on bottom of transmission extension housing. Tap end of clamp bolt lightly to release its hold on cable, then gently pull outward on cable housing to its limit of travel and tighten clamp bolt to 10 inch pounds. *CAUTION – Do not use pliers or similar tools to pull outward on cable as cable cover might be damaged.* Check adjustment by allowing car to roll slowly on a slight incline. Parking pawl should freely engage sprag with lever in ON position, and there should be no ratcheting noise with lever in OFF position.

Neutral Switch Adjustment: With manual control cable properly adjusted, depress "N" (Neutral) button, then raise car on a hoist and drain approximately 2 quarts of fluid from transmission. Unscrew neutral starting switch from case and check to see that switch operating lever is aligned with center of switch opening in case. Place cupped washer and "O" ring over threads of switch, then screw switch into transmission a few turns. Connect one lead of a test lamp to battery current and other lead to switch terminal. Screw switch into transmission until lamp lights, then tighten switch an additional 1/3 to 1/2 turn. *CAUTION - Switch must be tight enough to prevent oil leakage. If not, add a thin washer and readjust switch.* Remove test lamp and connect wire to switch. Add sufficient fluid to bring level to proper point on dipstick *(see "Checking Fluid Level" above).*

BAND ADJUSTMENT

Kickdown (Front) Band: *NOTE - Kickdown band adjusting screw is located on left side of transmission near throttle lever shaft.* Loosen locknut and back off approximately five turns, then check adjusting screw for free turning in case. Use wrench, Tool C-3380 with adapter, C-3705 and tighten band adjusting screw to 47-50 inch pounds. *NOTE - If adapter, C-3705 is not used, tighten adjusting screw to 72 inch pounds with torque wrench (Tool C-3380).* **Back off adjusting screw 2 turns,** then hold in this position and tighten locknut to 29 ft. lbs.

Low-Reverse (Rear) Band: Raise car and drain transmission fluid, then remove transmission oil pan. Loosen adjusting screw locknut and back off nut approximately five turns. Check adjusting screw for free turning in lever. Use wrench, C-3380 with adapter, C-3705 and tighten band adjusting screw to 47-50 inch pounds. *NOTE - If adapter, C-3705 is not used, tighten adjusting screw to 72 inch pounds with torque wrench (Tool C-3380).* **Back off adjusting screw 3 turns,** then hold in this position and tighten locknut to 35 ft. lbs. Reinstall oil pan using a new gasket, and tighten oil pan bolts to 150 inch pounds. Refill transmission *(see "Draining & Refilling" above).*

TESTING

ROAD TESTING TRANSMISSION: *NOTE - Before road testing, engine must be properly tuned and idle speed set to correct specifications.* With engine at normal operating temperature and fluid at proper level, all shifts and kickdowns should occur within the speed ranges given in "Shift Pattern" tables below.

►*ROAD TESTING NOTE: All shift speeds may vary somewhat due to production tolerances, type of engine, rear axle ratios and tire sizes. All shifts, however, should be smooth, responsive and with ut noticeable engine runaway.*

HYDRAULIC CONTROL PRESSURE TEST & ADJUSTMENT: Line Pressure & Front Servo Release Pressure Test - With transmission at normal operating temperature and in "D" (drive) position with rear

CONTINUED ON NEXT PAGE

SHIFT PATTERN TABLE (MPH)

	CHRYSLER			DODGE & PLYMOUTH			
SHIFT CONDITION	Newport 300 New Yorker	C-300H	Imperial	Standard 2.76-1 Axle	Standard 3.23-1 Axle	Hi-Perf. 2.76-1 Axle	Hi-Perf. 3.23-1 Axle

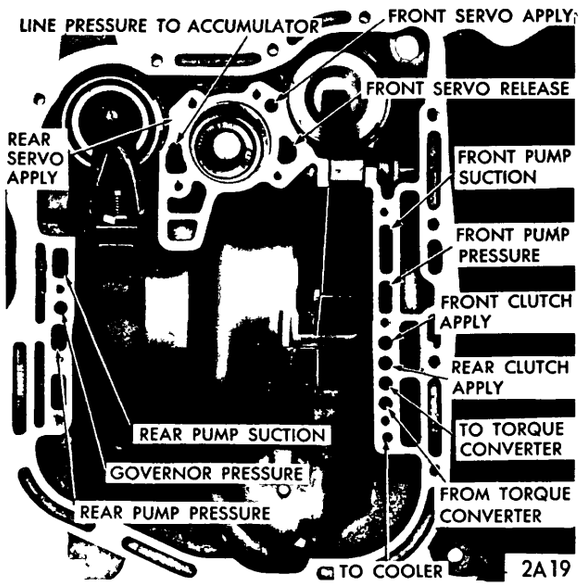
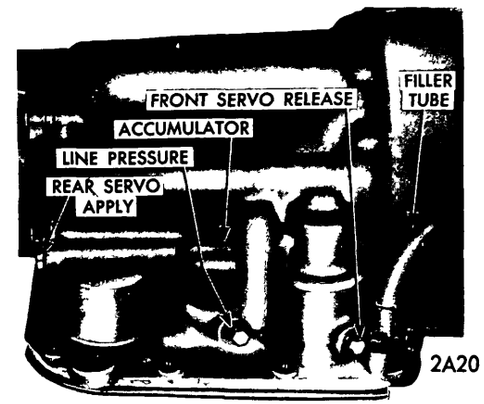
GOVERNOR PRESSURE TESTS



Tests are made with transmission in "D" (Drive) and with wheels free to turn.

CHRYSLER					DODGE & PLYMOUTH				
					Standard Governor		Hi-Perf. Governor		
Newport & 300 (SC1 & SC2)	New Yorker (SC3)	C-300H (SC2-300H)	Imperial (SY1)	Governor Pressure	2.76-1 Axle	3.23-1 Axle	2.76-1 Axle	3.23-1 Axl	Governor Pressure
17-22 MPH	18-23 MPH	16-21 MPH	19-24 MPH	15 psi	18-22 MPH	15-19 MPH	18-22 MPH	15-19 MPH	15 psi
40-51 MPH	41-53 MPH	48-58 MPH	43-55 MPH	50 psi	40-51 MPH	34-43 MPH	51-61 MPH	44-52 MPH	50 psi
58-68 MPH	61-71 MPH	64-73 MPH	62-73 MPH	65 psi	58-68 MPH	50-58 MPH	68-77 MPH	58-66 MPH	65 psi



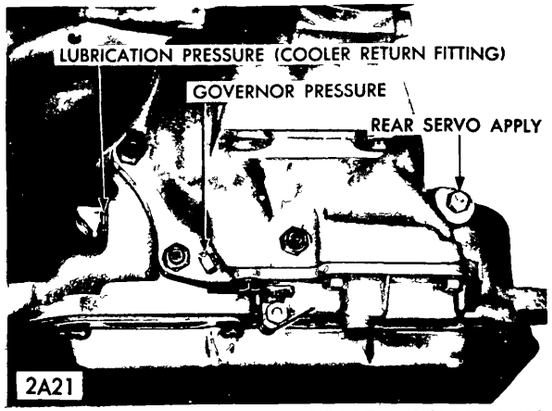
CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

wheels free to turn, install an engine tachometer, then raise car on a hoist and position tachometer so it can be read from under car. Connect two 0-100 psi pressure gauges (Tool C-3292) to pressure take-off points at side of accumulator and at front servo release (see illustration). With control in "D" (drive) position, speed up engine slightly until transmission shifts into direct. *NOTE - Front servo release will be pr ssurized in direct.* Reduce engine speed slowly to 1000 RPM. Line pressure should be 54-60 lbs. and front servo release pressure must not be more than 3 lbs. below line pressure. Disconnect throttle linkage from transmission throttle lever and move throttle lever to full throttle position gradually. Line pressure must rise to a maximum of 90-96 lbs. just before or at kickdown into low gear. Front servo release pressure must follow line pressure up to kickdown point and should not be more than 3 lbs. below line pressure. If line pressure is not 54-60 lbs. at 1000 RPM, adjust line pressure as outlined below. If front servo release pressures are less than pressure specified and line pressures are within limits, excessive leakage in front clutch or front servo circuits is indicated. *CAUTION - Always inspect external transmission throttle lev r f r looseness n valve body shaft when making pressure t sts.*

Line Pr ssure Adjustment: *NOTE - Check and correct throttl pressure adjustment before adjusting line pressure (see b l w).* To adjust line pressure, remove control valve assembly from transmission and measure distance from valve body to inner edge of adjusting nut (this nut is located between spring retainer bracket and end of regulator valve spring) with an Allen screw protruding through retainer bracket. The approximate measurement should be 1 15/16". *NOTE - The Allen adjusting screw may be turned counterclockwise to increase pressure or clockwise to decrease pressure. Turning screw one complete turn changes closed throttle line pressure approximately 1 2/3 psi.*

AIR PRESSURE CHECK POINTS

HYDRAULIC PRESSURE TEST LOCATIONS (RIGHT SIDE)



Lubrication Pressure Test: *NOTE - This test can be made at same time "Line Pressure & Front Servo Release Pressure Test" is made.* Install a tee fitting between cooler return line fitting and fitting hole in transmission case at rear of left side of transmission case (see illustration), then connect a 0-100 psi gauge (Tool C-3292) to tee fitting. With engine operating at 1000 RPM, throttle closed and transmission in direct, lubrication pressure should be 5-15 lbs. *NOTE - Lubrication pressure will be approximately doubled as throttle is opened to maximum line pressure.*

Rear Servo Apply Pressure Test: Connect a 0-300 psi gauge (Tool C-3293) to apply pressure take-off point at rear servo (see illustration). With transmission control in "R" (reverse) position and engine speed at 1600 RPM, reverse servo apply pressure should be 240-280 lbs.

Governor Pressure Test: Connect a 0-100 psi gauge (Tool C-3292) to governor pressure take-off point, located at lower left side of extension near mounting flange. Governor pressures should fall within limits given in tables (below). If governor pressures are incorrect at given car speeds, governor valve or weights are probably sticking. *NOTE - The governor pressure should respond smoothly to changes in car speed and should return to 0-1½ lbs. when car is stopped. High pressure at standstill (above 2 lbs.) will prevent transmission from downshifting.*

Throttle Pressure Test: *NOTE - No provisions are made to test throttle pressure. Incorrect throttle pressure should only be suspected if the part throttle shift speeds are either very delayed or occur too early in relation to car speeds. In which case, the throttle linkage should be adjusted before throttle pressure setting is adjusted.*

Throttl Pr ssure Adjustment: Remove valve body assembly from transmission, then loosen throttle lever stop screw locknut and back off approximately five turns. Insert gauge pin of Tool C-3763 between throttle lever cam and kickdown valve. By pushing in on tool, compress kickdown valve against its spring so the throttle valve is completely bottomed inside valve body. As force is being exerted to compress spring, tighten throttle lever stop screw finger tight against throttle lever tang with throttle lever cam touching the tool and the throttle valve bottomed. *CAUTION - Make sure adjustment is made with spring fully compressed and valve bottomed in valve body.* Remove tool and tighten stop screw locknut.

HYDRAULIC PRESSURE TEST LOCATIONS (REAR END)

AIR PRESSURE TESTS: The front clutch, rear clutch, kickdown servo, and low and reverse servo may be checked by applying air pressure to their respective passages when valve body is removed (*CAUTION - Air supply must be free of all dirt and moisture*). Refer to "Oil Passages in Transmission Case" illustration for location of air passages.

1) Raise car on hoist, drain transmission fluid and remove transmission oil pan.

2) **Front Clutch** - Apply air pressure to front clutch "apply" passage and listen for a dull thud which indicates that front clutch is operating. Hold air pressure for a few seconds and inspect system for excessive leakage.

3) **Rear Clutch** - Apply air pressure to rear clutch "apply" passage and listen for a dull thud which indicates that rear clutch is working. Check for excessive leakage.

►*FRONT & REAR CLUTCH CHECKING NOTE: If a dull thud cannot be heard in the clutches, place fing r tips on clutch housing and again apply air pressure. Movement of piston can be felt as clutch is applied.*

4) **Kickdown Servo** - Direct air pressure into front servo "apply" passage. Operation of servo is indicated by a tightening of front band. Spring tension of servo piston should release band.

5) **Low & Reverse Servo** - Direct air pressure into rear servo "apply" passage. Operation of servo is indicated by tightening of rear band. Spring tension on servo piston should release band.

►*AIR PRESSURE TEST NOTE: If all the above units operate prop rly, "n driv ," "rratic" and "n upshift" conditions ar caus d by troubl in th control valv ass mbly.*

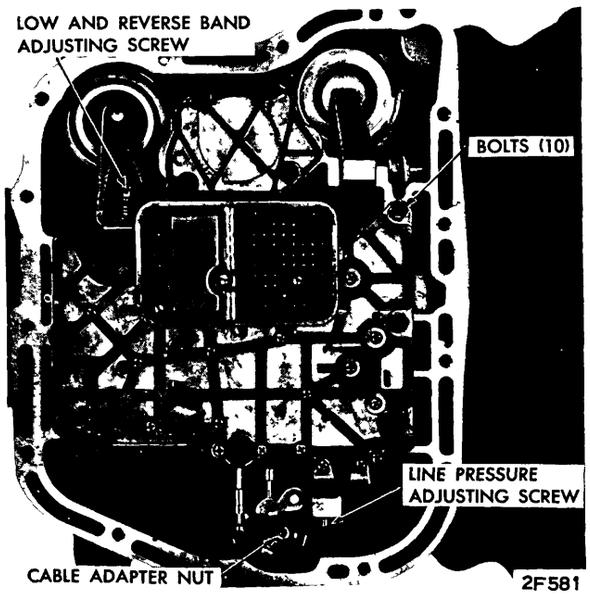
CHRYSLER CORP.
TORQUEFLITE EIGHT (Cont.)



TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Except where noted, the following operations can be performed without removing the transmission from the car.*

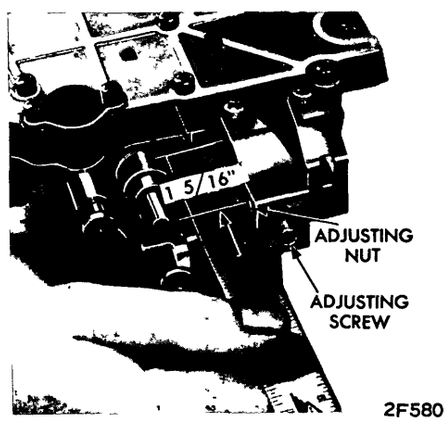
HARSH-NEUTRAL-TO-DRIVE OR NEUTRAL-TO-REVERSE INITIAL ENGAGEMENT: Adjust engine idle speed and low-reverse band. Check accumulator and make air pressure tests. *Transmission must be removed for the following:* Clean and inspect front and rear clutch plates, return spring and piston. Check both circuits for leakage.

DELAYED INITIAL ENGAGEMENT NEUTRAL-TO-DRIVE: Check and adjust fluid level. Adjust gearshift control cable. Check hydraulic pressures. Check accumulator and make air pressure checks. *Transmission must be removed for the following:* Clean and inspect rear clutch plates, return spring and piston. Check input shaft and reaction shaft support seal rings for leakage.

RUNAWAY ON 2-3 AND 3-2 SHIFTS: Check and adjust fluid level, throttle linkage, and gearshift control cable. Check hydraulic pressures and adjust kickdown band. Check kickdown servo and make air pressure tests. *Transmission must be removed for the following:* Check front oil pump. Clean and inspect front and rear clutch plates, return spring and piston. Check both circuits for leakage. Check input shaft and reaction shaft support seal rings for leakage.

TRANSMISSION CASE (BOTTOM)

HARSH 2-3 AND 3-2 SHIFTS: Adjust throttle linkage and kickdown band. Check hydraulic pressures. Check operation of kickdown servo. Check valve body. *Transmission must be removed for the following:* Clean and inspect front clutch plates, return spring and piston.



NO UPSHIFT: Check and adjust fluid level, throttle linkage and gearshift control cable. Check hydraulic pressures. Adjust kickdown band and check operation of kickdown servo. Make air pressure tests. *Transmission must be removed for the following:* Clean and inspect front clutch plates, return spring and piston. Check operation of overrunning clutch. Check input shaft and reaction shaft support seal rings for leakage.

NO KICKDOWN OR NORMAL DOWNSHIFT: Check and adjust fluid level, throttle linkage, gearshift control cable and engine idle speed. Check hydraulic pressures. Adjust kickdown band. Check rear pump. Remove and inspect control valve. Check operation of kickdown servo. Make air pressure tests.

ERRATIC SHIFTING: Make same checks as for "No Kickdown or Normal Downshift" (above) and proceed as follows: *Transmission must be removed for the following:* Check front oil pump. Check input shaft and reaction shaft support seal rings for leakage.

SLIPS IN FORWARD DRIVE ONLY: Check and adjust fluid level and gearshift control cable. Check hydraulic pressures. Check operation of kickdown servo and make air pressure tests. *Transmission must be removed for the following:* Check front pump. Clean and inspect front and rear clutch plates, return spring and piston. Check operation of overrunning clutch. Check input shaft and reaction shaft support seal rings for leakage.

SLIPS IN REVERSE ONLY: Adjust control cable and low-reverse band. Check hydraulic pressures. Check operation of kickdown servo, low-reverse servo, and accumulator. *Transmission must be removed for the following:* Check operation of front pump. Check input shaft and reaction shaft support seal rings for leakage.

HYDRAULIC LINE PRESSURE ADJUSTMENT

SLIPS IN ALL POSITIONS: Check and adjust fluid level. Check hydraulic pressures. Check operation of kickdown servo. *Transmission must be removed for th following:* Check operation of front oil pump. Check input shaft and reaction shaft support seal rings for leakage.

NO DRIVE IN ANY POSITION: Check and adjust fluid level. Check hydraulic pressures. Remove and inspect control valve body assembly. Check operation of kickdown servo. *Transmission must be removed for the following:* Check converter drive plate and front pump.

NO DRIVE IN FORWARD POSITIONS: Check hydraulic pressures, band adjustment, kickdown servo, and low-reverse servo. Make air pressure test. *Transmission must be removed for the following:* Clean and inspect rear clutch plates, return spring, and piston. Check operation of overrunning clutch.

NO DRIVE IN REVERSE ONLY: Check hydraulic pressures. Adjust low-reverse band. Check operation of accumulator. *Transmission must be removed for the following:* Clean and inspect front clutch plates, return spring, and piston.

DRIVES IN NEUTRAL: Adjust gearshift control cable. *Transmission must be removed for the following:* Clean and inspect rear clutch plates, return spring, and piston.

DRAGS OR LOCKS: Adjust kickdown band, low-reverse band, and parking lock. Check operation of transmission oil cooler. Inspect low-reverse servo and accumulator. *Transmission must be removed for the following:* Clean and inspect front and rear clutch plates, return spring, and piston. Inspect planetary gear sets, and overrunning clutch.

SCRAPING, GROWLING OR RATCHETING NOISE: Adjust parking lock. Check operation of transmission oil cooler. Inspect governor, rear oil pump and oil strainer. *Transmission must be removed for the following:* Check converter drive plate, front oil pump, front clutch, planetary gear sets, and overrunning clutch.

BUZZING NOISE: Check and adjust fluid level. Check operation of kickdown servo.

HARD TO FILL, OIL BLOWS OUT FILLER TUBE: Check and adjust fluid level. Remove and inspect control valve body assembly. Check operation of kickdown servo. *Transmission must be removed for the following:* Check front oil pump and transmission vent.

TRANSMISSION OVERHEATS: Check and adjust fluid level. Adjust kickdown band, and low-reverse band. Check operation of transmission oil cooler. Inspect extension housing bushing or bearing. Examine oil strainer and check operation of kickdown servo. *Transmission must be removed for the following:* Check front oil pump. Clean and inspect front and rear clutch plates, return spring and piston.

FAILURE TO PUSH START: Check and adjust fluid level and gearshift control cable. Check hydraulic pressures. Adjust low-reverse band. Check oil strainer and accumulator. *Transmission must be removed for the following:* Check rear clutch, planetary gear sets, and overrunning clutch. Check input shaft and reaction shaft support seal rings for leakage.

STARTER WILL NOT ENERGIZE: Adjust gearshift control cable. Check and adjust neutral starting switch.

CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

GEARSHIFT CONTROL UNIT & PARKING LOCK

PUSH BUTTON CONTROL UNIT (CHRYSLER, IMPERIAL & DODGE 880): R m val – *NOTE – On Imperial models, r mov sp domet r. S "Misc. Electrical" on car model pag .* Disconnect ground cable at battery, then remove pushbutton bezel retaining screws and carefully remove bezel, and rubber or felt seal. Remove all push buttons by pulling them off push button slides, then disconnect backup switch wire connectors (if so equipped). On Chrysler models & Dodge 880, remove four nuts retaining control unit and bracket assembly to instrument panel bracket. Carefully remove the assembly, then remove mounting bracket and disconnect control cable assembly from control unit. On Imperial models, remove four nuts attaching control unit, brackets and lighting panel assembly to instrument panel. Disconnect lighting panel connector and carefully remove control unit from instrument panel. Remove lighting panel and mounting brackets from control units, then disconnect control cable assembly from unit.

Installati n: Reverse removal procedure and check operation of push buttons, correcting any binding of buttons that might exist.

PUSHBUTTON CONTROL UNIT (EXC. CHRYSLER, IMPERIAL & DODGE 880): Removal – Disconnect ground cable from battery, then remove parking handle from lever. Disconnect back–up lamp switch wire connectors (if so equipped). Remove three nuts securing control assembly on instrument panel and carefully work assembly to rear out of cluster. Remove push buttons by pulling them off push button slides, then unscrew two nuts and remove mounting bracket from control assembly. Remove hairpin lock securing gearshift control cable on actuator and remove cable. Disconnect parking lock cable from control and remove parking lock arm from control.

Adjustm nt: *NOTE – If transmission fails to shift into N utral wh n parking lock is applied, check parking lock cabl adjustm nt at transmission before adjusting push button control unit.* Remove overcenter spring and back off lever stop screw. Make sure there is no binding in neutral slide, neutral slide pin and bushing, cam pivot, and that all parts are lubricated. Hold neutral slide in against rocker bar with about 5–10 lbs. load, then loosen locknut and rotate cam so the lever nose just touches neutral slide pin as it passes over pin when moving parking lock lever from OFF to ON position. *NOTE – Only light contact should occur so that l v r do s not hang up on pin.* Hold cam in this position and tighten locknut to 95 inch lbs., then install overcenter spring. Adjust lever stop screw to obtain .010" clearance between neutral slide pin and lever heel. Tighten lever stop screw locknut securely.

Installati n: Install parking lock arm on control unit and secure with washers and nuts. Connect parking lock cable and secure cable in control bracket, then place end of gearshift control cable on actuator and secure with hairpin clip. Secure cable in control bracket. Install mounting bracket on control, and tighten nuts securely, then install push buttons in proper order on control actuator slides. Carefully guide control unit into position from rear of instrument housing and tighten retaining nuts securely. Operate push buttons and correct any binding that might exist, then install parking lock control handle and connect backup light switch wires.

PARKING LOCK CABLE, TRANSMISSION END (EXC. CHRYSLER, IMPERIAL & DODGE 880): Removal – Loosen parking lock cable clamp bolt where cable enters housing cover, then remove housing cover lower plug. With a screwdriver inserted through plug opening, push gently against projecting portion of lock spring, then withdraw lock cable. *CAUTION – Do not use pliers or similar tool to withdraw cable from adapter cover as cable might be damaged.*

Installation: Place parking lock lever on instrument panel in OFF position, then insert screwdriver through plug opening and position it behind cable adapter stop washer. Hold adapter outward while pushing cable in as far as possible, making sure lock spring engages cable. Gently pull outward on cable to its limit of travel, release and then tighten clamp bolt to 10 inch lbs. Reinstall plug in cover and tighten to 35 inch lbs.

PUSHBUTTON LAMP REPLACEMENT: Chrysler & Dodge 880 – Lamp is located in push button bezel. To replace, remove four screws and lift off bezel.

Imperial: Push buttons are illuminated by a panelescent lighting panel. Lighting panel can be replaced by removing control unit and bracket assembly.

Dodge (Exc. 880): Lamp is located on back of instrument panel just above push buttons. Remove socket from rear of instrument panel.

Plymouth: Lamp is located approximately in center of push button cluster. Instrument cluster must be removed, as follows, for access to bulb. Disconnect speedometer cable, and remove heater blower switch and temperature control knobs. Remove instrument cluster retaining screws and lift out cluster assembly. Slide a short piece of tight fitting rubber hose over bulb to remove it from socket.

TRANSMISSION UNIT REMOVAL & INSTALLATION (TRANSMISSION IN CAR)

OUTPUT SHAFT OIL SEAL REPLACEMENT: Disconnect propeller shaft at front flange, then apply parking brake or hold brake drum (Chrysler & Dodge Custom 880); hold transmission flange (Other models). *NOTE– Use Tool C–3281 to hold brake drum or transmission flange.* Remove retaining nut and washer and slide flange or brake drum off output shaft. On models with brake drum, remove brake support grease shield spring and grease shield (being careful not to damage neoprene insulator). On all models, screw taper threaded end of Tool C–748 into seal, then tighten screw of tool to remove seal. To install new seal, position seal in opening of extension housing with lip of seal facing inward, then drive seal into housing with Tool C–3837. Complete installation by reversing removal procedure. Tighten output shaft nut to 175 ft. lbs.

EXTENSION HOUSING: Removal – Remove speedometer drive pinion and sleeve assembly, then remove transmission flange or parking brake drum *(see "Output Shaft Oil Seal Replacement" above).* On cars with parking brake on transmission, disconnect parking brake cable. On all models, drain approximately 2 qts. of fluid from transmission. On models without parking brake on transmission, loosen parking lock cable clamp bolt where it enters housing cover, then remove housing cover lower plug. Insert screwdriver through hole, then while exerting pressure against projecting portion of the cable lock spring, withdraw lock cable. On Chrysler & Dodge Custom 880, remove engine rear mount insulator–to–extension housing bolts. On other models, remove bolts securing extension housing–to–crossmember insulator. On all models, raise engine slightly with a suitable jack and remove crossmember. Remove extension housing attaching bolts and remove extension housing. *NOTE – If necessary, tap extension housing lightly with a soft mallet to loosen from transmission.*

Bearing Replacement – Remove oil seal, then remove bearing snap ring from housing. Drive bearing rearward out of housing with Tool C–3275. To install, drive new bearing into housing with Tool C–3204, then install snap ring and a new output shaft seal.

Installation: Reverse removal procedure and tighten extension housing attaching bolts to 24 ft. lbs.; crossmember bolts to 75 ft. lbs.; insulator–to–extension housing bolts to 35 ft. lbs. On models without parking brake on transmission, install and adjust parking lock cable *(see "Linkage Adjustment" above).*

GOVERNOR & PARKING SPRAG OR SUPPORT: Removal – Remove extension housing, then use a screwdriver and pry snap ring from weight end of governor valve shaft and slide valve and shaft assembly out of housing. Remove large snap ring from weight end of governor housing and lift out governor weight assembly. Remove snap ring from behind governor housing, then slip governor housing and parking sprag (or support assembly) off output shaft. If necessary, remove four bolts and separate governor housing from parking sprag (or support).

Installation: Assemble governor housing to parking sprag (or support assembly) and tighten bolts finger tight. *CAUTION – Make sure oil passage of governor housing aligns with passage in parking sprag (or support).* Position governor housing and sprag (or support assembly) on output shaft, then align assembly so governor valve shaft hole in governor body aligns with hole in output shaft. Slide the assembly into place and install snap ring behind governor housing. Tighten housing–to–parking sprag (or support) bolts to 100 inch pounds and bend ends of lock straps against bolt heads. Assemble governor weights and spring and install snap ring inside large governor weight. Place weight assembly in governor housing and install snap ring. Place governor valve on governor shaft, insert assembly into housing and through governor weights. Install valve shaft retaining snap ring. Check for free movement of valve and weight assembly, then install extension housing.

REAR OIL PUMP: Removal – Remove extension housing, governor and support assembly, then unscrew rear oil pump cover retaining bolts and remove cover. Slide oil pump inner rotor off output shaft. *CAUTION – Inn r rotor is driven by a small ball. Do not lose ball when removing inner rotor.* Remove outer rotor from pump body. *NOTE – If necessary to replace rear oil pump body, it will be necessary to disassemble transmission.*

Inspection: Inspect all parts for damage, nicks, burrs, scoring, or pitting. With gears clean and installed in pump body, place a straightedge across face of rotors and pump body. Clearance between straightedge and face of rotors should be .0015"–.003". Replace parts as necessary.

Installation: Reverse removal procedure and tighten pump cover bolts to 140 inch pounds.

NEUTRAL SAFETY SWITCH: Removal – Drain two quarts of fluid from transmission, then disconnect wire from switch and unscrew switch from case.

Installati n: With gearshift control cable properly adjusted and "N" (Neutral) button depressed, check to

CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE EIGHT (Cont.)

see that switch operating lever is aligned in center of switch opening in case. Place cupped washer and "O" ring seal over threads of switch, then screw switch into transmission case a few turns. Connect one lead of a test lamp to battery current and other lead to switch terminal. Screw switch into transmission case until lamp lights, then tighten switch an additional 1/3 – 1/2 turn. *CAUTION – Switch must be tight nough to prevent oil leakage. If not, add a thin washer and readjust switch.* Remove test lamp and connect wire to switch. Add fluid as necessary to bring level up to proper point *(see "Checking Fluid Level" above).*

VALVE BODY ASSEMBLY & ACCUMULATOR: Removal – Drain transmission fluid and remove oil pan and gasket. Loosen clamp bolt and lift throttle lever, washer and seal off transmission throttle lever shaft. Shift manual lever into "Low" position to expose nut attaching cable adapter to lever, then remove nut and disengage cable adapter from manual lever. Place drain pan under transmission, then remove ten hex-head valve body attaching bolts being careful to hold valve body in position while removing bolts. Lower valve body assembly out of transmission case, being careful not to cock throttle lever shaft in case hole or lose accumulator spring. Remove accumulator piston from transmission case and inspect piston for scoring.

Installation: Reverse removal procedure being careful to tighten valve body attaching bolts evenly, then tighten bolts to 100 inch pounds.

PARKING LOCK (PLYMOUTH & DODGE, EXC. CUSTOM 880): Removal – Remove extension housing, then remove parking lock cable adapter cover from bottom of extension housing. Carefully remove cable adapter from parking lock lever. *NOTE – Replace spring on adapter if it becomes distorted during removal.* Remove plug from extension housing and slide out shaft to remove parking lock lever and shim. Slide bushing sleeve out of housing to remove parking pawl and spring.

Installation: Position parking pawl and spring in housing and insert bushing sleeve. *NOTE – Make sure square lug on pawl is toward sprag and the spring is positioned so as to lift pawl away from sprag.* Position lock lever and shim in housing and install lever shaft. *NOTE – Lever roller must be on top of pawl so as to push it into engagement with sprag.* Tighten plug to 150 inch pounds. Attach cable adapter to parking lock lever, making sure it is properly positioned. Place a new adapter cover gasket on extension housing, then insert a small punch through cable opening in adapter cover and into end of adapter. Carefully lower cover into position, feeding adapter into cable opening in cover. Install cover retaining bolts and tighten to 150 inch pounds. Install extension housing and complete installation.

TRANSMISSION REMOVAL & INSTALLATION

► *REMOVAL & INSTALLATION NOTE: Transmission and converter must be removed as an assembly. If not, converter drive plate, front pump bushing, and oil seal will be damaged. DO NOT allow weight of transmission to be supported on drive plate at any time.*

REMOVAL: Connect a suitable remote control starter switch to starter solenoid and position switch so engine can be rotated from under car. Disconnect high tension cable from ignition coil, then raise car and support with jack stands. Drain transmission and converter *(see "Draining & Refilling" above).* Mark converter and drive plate for use at reassembly. *NOTE – Crankshaft flang bolt hol s, inner and outer circl of bolt hol s in driv plat , and th four tapped holes in front face f convert r all hav on hole offs t to insur assembly in original location.* Rotate engine to locate two converter–to–drive plate bolts at "5 and 7 o'clock" positions. Remove the two bolts, then rotate engine and remove remaining two bolts. *CAUTION – Do not rotate converter or drive plate by prying with a screwdriver or similar tool as the drive plate may become distorted. Do not engage starter if drive plate is not attached to converter with at least one bolt or if the transmission case–to–engine bolts have been loosened.* Depress "L" (Low) button, then disconnect ground cable from battery and remove starter assembly. Remove pushbutton control cable–to–transmission adjusting wheel lockscrew and insert a screwdriver through neutral starting switch opening. Push lightly on upper projecting portion of cable lock spring and pull outward on cable to remove cable from adapter and transmission case. Disconnect throttle rod from lever on side of transmission case, then disconnect oil cooler lines at transmission and remove oil filler tube. Remove speedometer pinion and sleeve. On Chrysler and Dodge Custom 880, disconnect parking brake cable from parking brake. On other models, loosen transmission parking lock cable clamp bolt where cable enters the cover, then remove housing cover lower plug. Insert screwdriver through hole, then gently exert pressure against projecting portion of lock spring and withdraw lock cable. On all models, disconnect front universal joint and tie propeller shaft out-of-way. *NOTE – On Chrysler Imperial models, remove propeller shaft center bearing housing bolts and slide front propeller shaft rearward to disengage front universal joint from front flange.* Disconnect extension housing from crossmember, then install support fixture, Tool C–3487, and raise engine slightly. Place a transmission jack under transmission to support the assembly, then attach a small "C" clamp to edge of converter housing to hold converter in place during removal of transmission. Remove converter housing retaining bolts and carefully work transmission rearward off engine block dowels and disengage converter hub from end of crankshaft. Lower transmission jack and remove transmission and converter assembly. Remove "C" clamp from edge of converter housing, then slide assembly out of transmission.

INSTALLATION: Reverse removal procedure and note the following: To install converter on transmission, rotate front pump rotors with Tool C–3881 until two small holes in handle of tool are vertical, then carefully slide converter assembly over input shaft and reaction shaft. Make sure converter impeller shaft slots are also vertical and fully engage front pump inner rotor lugs. Inspect for full engagement by placing a straightedge on face of case. Surface of converter should be at least ½" to rear of straightedge when converter is pushed all the way into transmission. Attach a "C" clamp to edge of converter housing to hold converter in place during installation of transmission. Coat converter hub hole in crankshaft with wheel bearing lubricant and rotate converter so mark on converter (made during removal) will align with mark on drive plate. *NOTE – Offset holes in plate are located next to 1/8" hole in inner circle of plate. A stamped "V" mark identifies offset hole in converter front cover.* Tighten converter bolts to 25–30 ft. lbs., drive plate bolts to 270 inch pounds, extension housing insulator bolts to 35 ft. lbs., propeller shaft–to–front flange bolts to 35 ft. lbs., and crossmember attaching bolts to 75 ft. lbs. *NOTE – On Chrysl r Imp rial mod ls, place pr p ll r shaft c nter b aring h using s h i m s under housing, then install retaining bolts and tighten to 35 ft. lbs.* To install control cable in case, engage "R" (Reverse) button and hold it firmly depressed. Insert push button control cable into transmission case and push inward on cable, making sure lock spring engages cable. Adjust control cable *(see "Linkage Adjustment" above).*

TRANSMISSION UNIT REMOVAL

FRONT PUMP OIL SEAL: *NOTE – Fr nt pump oil s al can be replaced without r moving front pump, and reaction shaft support assembly from transmission cas as follows:* With transmission removed from car, screw seal remover, Tool C–3861 into seal and tighten screw of tool to withdraw seal. To install a new seal, place seal in opening of front pump housing with lip side facing inward, then use Tool C–3860 and drive seal into housing until tool bottoms.

VALVE BODY ASSEMBLY & ACCUMULATOR PISTON: *See "Transmission Unit Removal & Installation – Transmission in Car" above.*

DRIVE TRAIN ENDPLAY MEASUREMENT: *NOTE – Before removal of parking brak drum or univ rsal joint flange, check endplay as follows:* Attach a dial indicator to transmission bell housing with plunger seated against end of input shaft, then move input shaft in and out to obtain endplay reading. Endplay should be .030–.070". Record the reading obtained as it will be necessary to change the thrust washer between reaction shaft support and front clutch retainer during assembly if endplay is not within specifications.

EXTENSION HOUSING: *See "Transmission Unit R moval & Installation – Transmission in Car" abov .*

GOVERNOR & PARKING SPRAG (OR SUPPORT): *S "Transmission Unit Removal & Installation – Transmission in Car" above.*

REAR OIL PUMP: Remove oil pump rear cover, then remove inner and outer rotors. *NOTE – Use car in removing inner rotor so as not to los th small ball us d to key rotor to shaft. If pump body is to b r placed, drive it rearward out of cas aft r transmission is completely disassembled (s b low).*

FRONT OIL PUMP AND REACTION SHAFT SUPPORT: Remove pump housing retaining bolts, then tighten front band adjusting screw until band is tight on front clutch retainer (this prevents clutch retainer coming out with front pump which might cause damage to clutches). Attach Tool C–3752 (sliding hammers) to pump housing flange by threading screws of tools into flange holes at "9 and 3 o'clock" positions. Bump evenly outward on the two weights to withdraw pump and reaction shaft support assembly from case.

FRONT BAND & FRONT CLUTCH: Loosen front band adjuster, then remove band strut and slide band out of case. Slide front clutch assembly out of case.

INPUT SHAFT & REAR CLUTCH: Grasp input shaft and slide shaft and rear clutch assembly out of case. *CAUTION – Be careful not to lose thrust wash r located between rear end of input shaft and forward nd of output shaft.*

PLANETARY GEAR ASSEMBLIES, SUN GEAR, DRIVING SHELL: While supporting output shaft and driving shell, carefully slide the assembly forward and out through case. *CAUTION – Be v ry car ful not to damag ground surfac s on output shaft during r moval.*

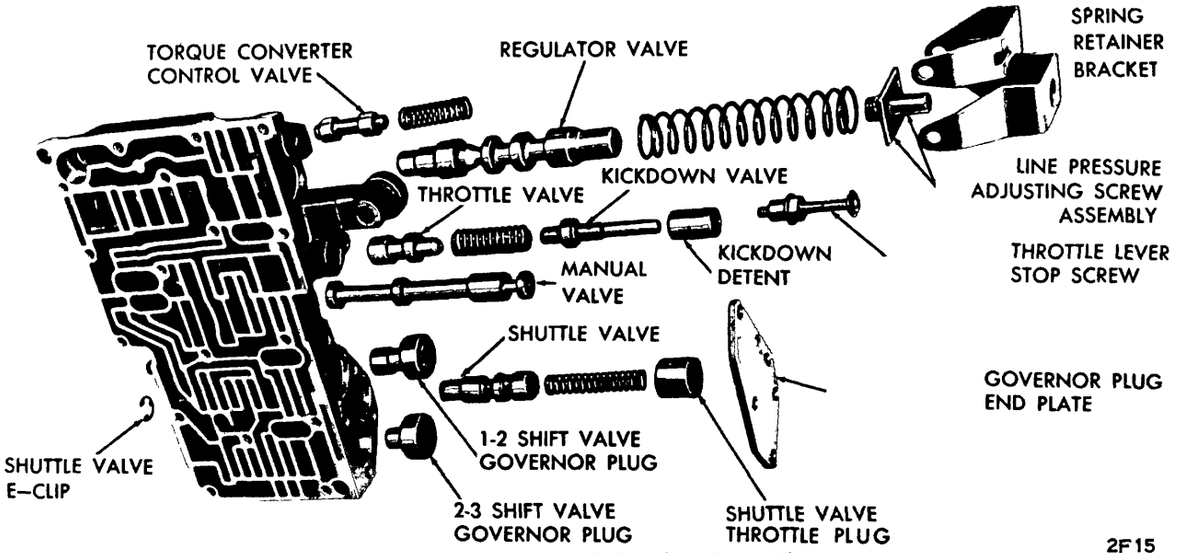
REAR BAND & LOW–REVERSE DRUM: Remove low–reverse drum, then loosen rear band adjuster. Remove band strut and band from case.

CONTINUED ON NEXT PAGE

CHRYSLER CORP.
TORQUEFLITE EIGHT (C nt.)

OVERRUNNING CLUTCH: Note position of overrunning clutch rollers and springs before disassembly, then carefully slide out clutch hub and remove rollers and springs. *NOTE – If v rrunning clutch cam and/or roll r spring r tain r ar found to be damaged or worn, r f r to "Ov rrunning Clutch Cam Replacement" below.*

KICKDOWN SERVO: Compress kickdown servo spring by using Engine Valve Spring Compressor, Tool C–3422, then remove snap ring. Remove rod guide, springs and piston rod from case, being careful not to damage piston rod or guide during removal. Insert Tool C–484 inside piston and withdraw piston from transmission case.



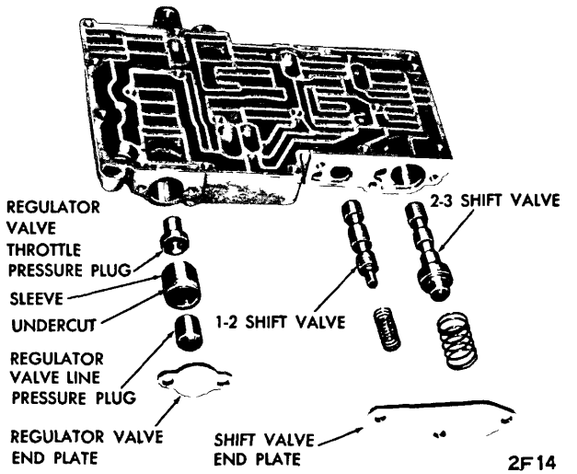
LOW & REVERSE SERVO: Compress low and reverse servo piston spring in same manner as for kickdown servo (above), then remove snap ring. Remove spring retainer, spring, and servo piston and plug assembly from case.

TRANSMISSION UNIT OVERHAUL

►*OVERHAUL NOTE: At r assembly, coat each part with Automatic Transmission Fluid Type "A" (Suffix "A").*

VALVE BODY: Disass mbly – *CAUTION – Never clamp any portion of valv body or transfer plate in a vise. Wh n r moving or installing valves or plugs, use care. Do not forc .* Place valve body assembly on repair stand, Tool C–3749, then remove three screws from oil screen and remove screen. While holding spring retainer bracket firmly against spring pressure, remove bracket retaining screws, spring bracket, torque converter control valve spring, and regulator valve spring with line pressure adjusting screw assembly. *CAUTION – Do not alter s tting of line pressure adjusting screw and nut. Th nut has an interference thread and does not turn easily on screw.* Slide regulator valve and the torque converter control valve out of valve body. Invert transfer plate assembly and remove stiffener plate. Remove retaining screws securing steel plate to transfer plate and carefully lift off steel plate. Remove rear pump check valve and spring. Remove reverse blocker valve cover and lift out spring and valve. Note location of the six steel balls in valve body (one of them is larger than the other five and is in the larger chamber). Remove steel balls, front pump check valve and spring. Invert valve body and lay it on a clean cloth or paper, then remove E–clip from throttle lever shaft. *NOTE – Remov any burrs from shaft.* Then while holding manual lever detent ball and spring in their bore with Tool C–3765 or similar tool, slide manual lever off shaft. Remove detent ball and spring. Remove manual valve by sliding it carefully out of valve body with a twisting motion, then remove throttle lever and shaft. Remove shuttle valve cover plate and remove E–clip from exposed end of shuttle valve. If necessary, remove throttle lever stopscrew assembly, being careful not to disturb the setting any more than is necessary. Remove kickdown detent, kickdown valve, throttle valve spring and throttle valve. Remove governor plug end plate, then tip valve body to allow shuttle valve throttle plug, spring, shuttle valve, and the shift valve governor plugs to slide out into the hand. *NOTE – 1–2 shift valv plug is identified by its longer stem.* Remove shift valve end plate and slide out two springs and valves. Remove regulator valve end plate, then slide regulator valve line pressure plug, sleeve, and regulator valve throttle pressure plug out of valve body.

Inspection: Check all parts for nicks, burrs, scores and scratches. Remove minor blemishes with crocus cloth.



2F15

CONTROL VALVE ASSEMBLY (LEVER SIDE)

using only a light pressure. *NOTE – When using crocus cloth on valves and plugs, use extreme care not to round off sharp edges.* Check all valves and plugs for free operation in valve body bores. When bores, valves and plugs are clean and dry, the valves and plugs should fall freely in bores.

Reassembly: Place rear pump check valve and spring in transfer plate, then position steel plate on transfer plate. Hold rear pump check valve in its bore with a thin steel blade, and install four steel plate–to–transfer plate retaining screws. Make sure bolt holes in steel plate and transfer plate are aligned, then tighten screws evenly to 28 inch pounds. Check rear pump check valve for free movement in transfer plate, then install stiffener plate and tighten retaining screws to 28 inch pounds. Turn transfer plate over and install reverse blocker valve spring and valve, rotating valve until it seats through the steel plate. Hold valve down and install blocker valve cover plate and tighten retaining screws to 28 inch pounds. Place 1–2 and 2–3 shift valve governor plugs in their respective bores. Install shuttle valve, spring and shuttle valve throttle plug. Install governor plug end plate and tighten retaining screws to 28 inch pounds. Install E–clip on end of shuttle valve and install shuttle valve cover plate and tighten retaining screws to 28 inch pounds. Install 1–2 and 2–3 shift valves and springs, then install shift valve end plate and tighten retaining screws to 28 inch pounds. Install regulator valve throttle pressure plug, sleeve (undercut on sleeve toward end plate), and line pressure plug. Install regulator valve end plate and tighten retaining screws to 28 inch pounds. Install throttle valve and spring, then slide kickdown detent on kickdown valve (counterbore side of detent toward valve) and install assembly in valve body. Install throttle lever stopscrew and tighten locknut finger tight, then install manual valve. Install throttle lever and shaft on valve body and insert detent spring and ball in its seat in valve body. Depress ball and spring with Tool C–3765 or similar tool and slide manual valve lever over throttle shaft so that it engages manual valve and detent ball. Install retaining E–clip

2F14

CONTROL VALVE ASSEMBLY (SHIFT VALVE SIDE)

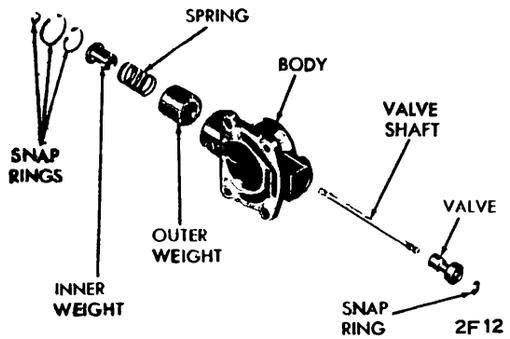
on throttle shaft. Position valve body assembly on holding stand, then place the six steel balls in valve body chambers with large ball in large chamber, then place front pump check valve and spring in valve body. Position transfer plate assembly on valve body, and while holding front pump check valve in its bore with a thin steel blade, install 14 retaining screws. Starting at center and working outward, tighten screws to 28 inch pounds. Install torque converter valve and regulator valve and spring retainer ring. Position torque converter valve spring and regulator valve spring over ends of their respective valves. Place line pressure adjusting screw assembly on end of regulator valve spring with long dimension of nut at right angles to valve body. Install spring retainer bracket, making sure con-

CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

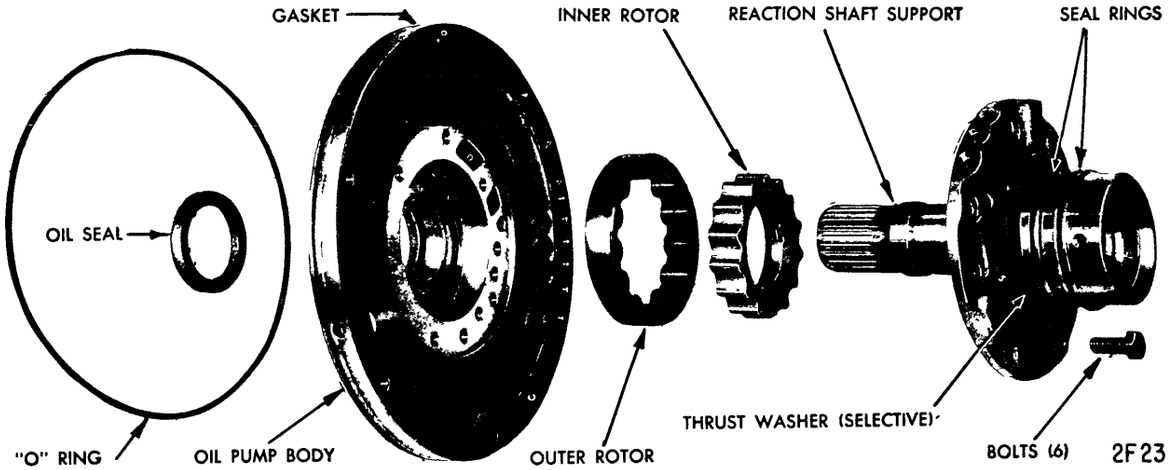
verter valve spring is engaged on tang and positioned squarely in bracket. Tighten bracket retaining screws to 28 inch pounds. Install oil strainer and tighten retaining screws to 28 inch pounds.

ACCUMULATOR PISTON & SPRING: Inspection – Inspect seal rings for wear and make sure they turn freely in piston grooves. *NOTE – It is not necessary to remove rings unless damage is evident.* Inspect piston for nicks, burrs, scores and wear. Check piston bore in case for burrs, scores or other damage and check piston spring for distortion. Replace parts as required.



EXTENSION HOUSING BEARING & OIL SEAL: Replacement – Pry or drive oil seal out of extension housing with a suitable blunt drift punch, being careful not to damage oil seal surface in extension housing. Remove bearing snap ring from housing and drive bearing rearward out of housing with Tool C–3275. Place a new bearing in opening of housing and drive it into position using Tool C–3204, then install snap ring. Install a new seal using Tool C–3837, driving seal in until tool bottoms.

GOVERNOR & SUPPORT OR PARKING SPRAG: Disassembly – Remove large snap ring from weight end of governor housing and remove weight assembly. Remove snap ring from inside governor weight and remove inner weight and spring from outer weight. If necessary, remove bolts and separate support (or parking sprag) from governor housing.

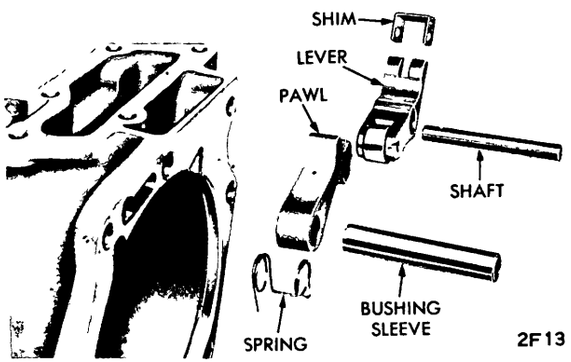


Inspection: Inspect all parts for burrs or wear. Test inner weight for free movement in outer weight, and outer weight for free movement in governor housing. Weights and valve should fall freely in bores when clean and dry. If necessary, remove rough surfaces with crocus cloth.

R assembly: If support (or parking sprag) was separated from governor housing, assemble and tighten bolts finger tight. Make sure oil passages of governor housing align with passage in support (or parking sprag). Assemble governor weights and spring and secure with snap ring inside large governor weight. Place weight assembly in governor housing and install snap ring.

PARKING PAWL & LEVER: Disassembly – Remove parking lock cable adapter cover from bottom of extension housing, remove adapter from lock lever. Remove plug and slide shaft out of extension housing to remove parking lock lever and shim. Slide bushing sleeve out of housing to remove parking pawl and spring.

GOVERNOR ASSEMBLY



FRONT PUMP ASSEMBLY

Inspection: Check bushing sleeve and shaft for scores and free movement in housing, and in pawl and lever. Check roller for nicks, burrs and free turning. Inspect square lug on parking pawl for broken edges or other damage. Replace parts as required.

Reassembly: Position parking pawl and spring in housing and insert bushing sleeve, making sure square lug on pawl is toward sprag, and spring is positioned so as to lift pawl away from sprag. Position lock lever and shim in housing and install lever shaft. Lever shaft roller must be on top of pawl so as to push it into engagement with sprag. Attach cable adapter to parking lock lever. Place a new adapter cover gasket on extension housing, then insert small punch through cable opening in adapter cover and into end of adapter. Carefully lower cover into position, feeding adapter into cable opening in cover. Install cover screws and tighten to 150 inch pounds.

REAR OIL PUMP: Inspection – Inspect pump body and cover surfaces for nicks and burrs. Inspect rotors for scoring or pitting. With rotors cleaned and installed in pump body, place a straightedge across face of rotors and pump body, then use a feeler gauge and measure clearance between straightedge and face of rotors. Clearance limits are .0015–.003".

PARKING PAWL ASSEMBLY
(EXC. CHRYSLER & DODGE CUSTOM 880)

Replacement (Pump Body): Drive pump body rearward out of transmission case with a wood block and hammer. To prevent distortion of pump body during installation, use the following procedure. Screw two pilot studs, Tool C–3288 into case to guide pump body during installation, then chill pump body in ice. After thorough chilling, quickly position body over pilot studs, and drive it firmly into place with a wooden block and hammer. Remove guide studs.

FRONT OIL PUMP & REACTION SHAFT SUPPORT: Inspection – Inspect interlocking seal rings on reaction shaft support for wear or broken locks, and make sure they turn freely in grooves. *NOTE – Do not r mov rings unless replacement is n c ssary.* Inspect bushing in reaction shaft for wear, and machined surfaces on oil pump body and reaction shaft for nicks and burrs. With rotors cleaned and installed in pump body, use a feeler gauge and measure clearance between straightedge and face of rotors. Clearance limits are .0015–.003".

Reassembly: Install pump rotors in housing, then install reaction shaft support. Install retaining bolts and tighten to 150 inch pounds. Place a new seal in opening of pump housing with lip of seal inward, then use Tool C–3860 and drive seal in until tool bottoms.

FRONT CLUTCH: Disassembly – Remove large snap ring securing pressure plate in piston retainer, then remove pressure plate and clutch plates. Install compressor, Tool C–3863, over piston spring retainer and compress spring. Remove snap ring and slowly release tool until spring retainer is free of hub, then remove tool, retainer and spring. Invert clutch retainer assembly and bump on a wood block to remove piston. Remove seals from piston and clutch retainer hub.

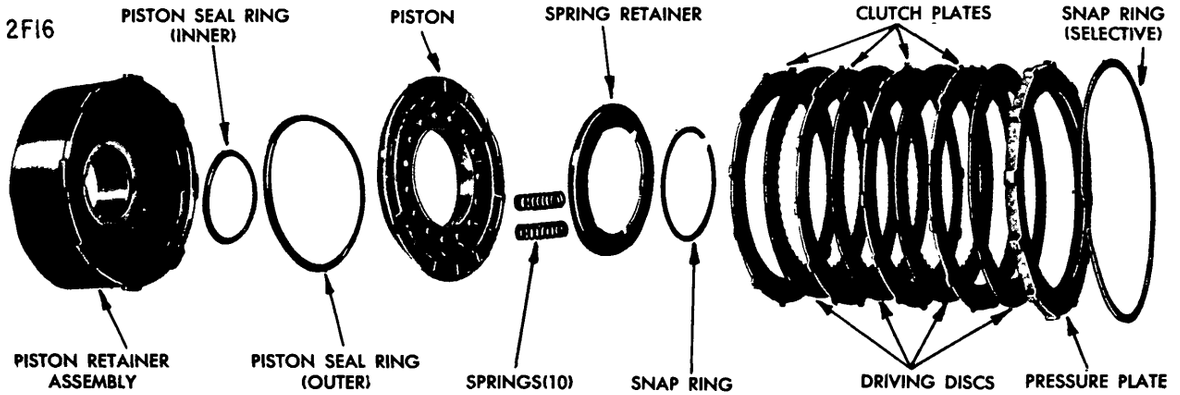
Inspection: Inspect driving discs for burring, glazing and flaking off of facing material. *NOTE – Scratch facings with finger nail, if material c ll cts und r nail, r plac all driving discs.* Inspect disc splines for wear or other damage. Inspect steel plate and pressure plate surfaces for burring, scoring or damaged driving lugs and replace if necessary. Inspect steel plate driving disc grooves in clutch retainer for smooth surfaces. Inspect band contacting surface on clutch retainer for scores. Inspect check ball in clutch retainer and make sure ball moves freely. Inspect all seal surfaces for nicks or deep

CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

scratches, and make sure neoprene seals have not deteriorated, worn, or become hardened. Inspect piston springs, retainer, and snap ring for distortion.

REASSEMBLY: Lubricate and install inner seal on hub of clutch retainer, making sure lip of seal faces down and is properly seated in groove. Install outer seal on clutch piston, with lip of seal toward bottom of clutch retainer. Apply a coat of "Door Ease" or other suitable lubricant to outer edge of seal for easier installation of piston assembly. Place piston assembly in retainer and carefully seat piston in bottom of retainer. Place ten springs on piston hub exactly as indicated in illustration, then position spring retainer and snap ring. Compress springs with Tool C–3863, and seat snap ring in hub groove, then remove compressor tool. Lubricate all clutch plates (see table below for correct number in clutch pack), then install one steel plate followed by a lined plate until all plates are installed. Install pressure plate and snap ring, making sure snap ring is properly seated. With front clutch completely assembled, insert a feeler gauge between pressure plate and snap ring. The clearance should be .024–.123". If not, install a snap ring of proper thickness to obtain specified clearance. *NOTE – Snap rings are same as th se us d in r ar clutch and are available in thickn ss s of .060–.062", .074–.076", .088–.090".*



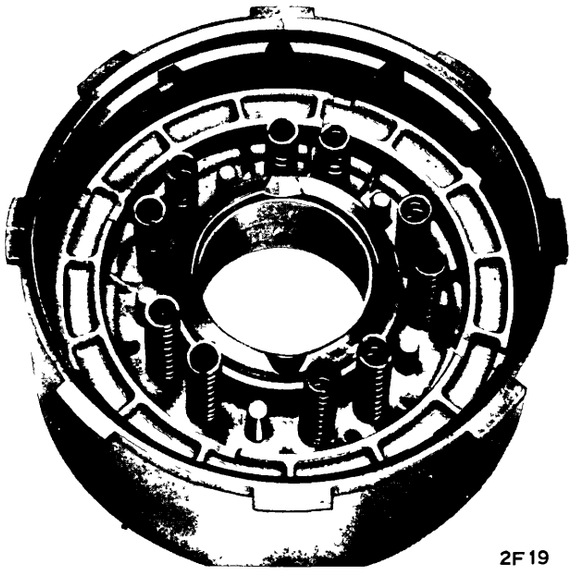
Front & R ar Clutch Packs

L cati n	Engine	Number Required
Front Clutch Plates	All	4
Front Clutch Discs	All	4
Rear Clutch Plates	318"	2
Rear Clutch Discs	318"	3
Rear Clutch Plates	361", 383", 413"	3
Rear Clutch Discs	361", 383", 413"	4

REAR CLUTCH: Disass mbly – Remove large snap ring securing pressure plate in clutch retainer, then remove pressure plate, clutch plates, and inner pressure plate out of retainer. Remove piston spring snap ring and remove spring. Invert clutch piston retainer assembly and bump on a wood block to remove piston, then remove seals from piston. If necessary, remove snap ring and press input shaft from clutch piston retainer.

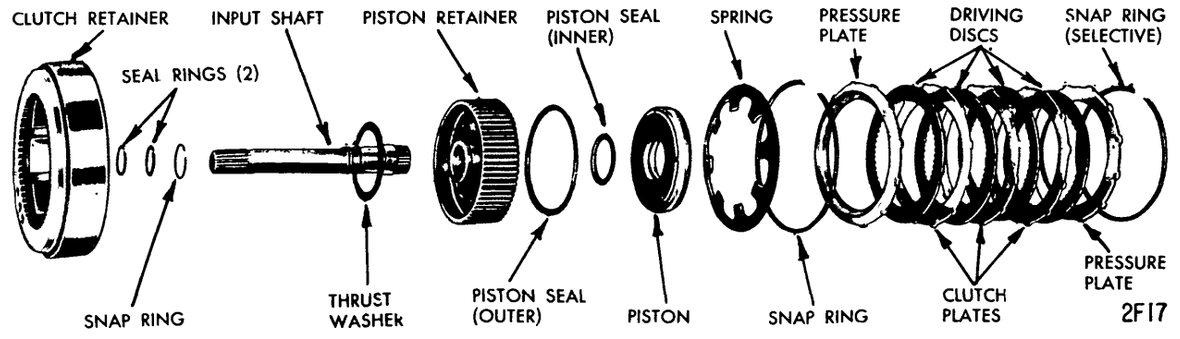
Inspecti n: Inspect in same manner as for front clutch (see above) and note the following: Inspect interlocking seal rings on input shaft for wear or broken locks, and make sure they turn freely in grooves. *NOTE – Do not remov rings unl ss r placement is necessary.* Inspect bushing in input shaft for wear or scores. Inspect rear clutch–to–front clutch thrust washer for wear. Washer thickness should be .061"–.063", replace if necessary.

Reass mbly: If removed, press input shaft into clutch piston retainer and install snap ring. Lubricate and install inner and outer seal rings on clutch piston, making sure lip of seals face toward head of clutch retainer, and seals are properly seated in piston grooves. Place piston assembly in retainer, and using a twisting motion, seat piston in bottom of retainer. Position clutch retainer over piston retainer splines and support the assembly so clutch retainer remains in place. Place spring over piston with outer edge of spring positioned below snap ring grooves. Start one end of snap ring in groove, making sure spring is exactly centered on piston, then progressively tap snap ring into groove. Install inner pressure plate in clutch retainer with raised portion of plate resting on spring. Lubricate all clutch plates (see table above for correct number in clutch pack), then install one lined plate followed by



FRONT CLUTCH ASSEMBLY

a steel plate until all clutch plates are installed. Install outer pressure plate and snap ring. With rear clutch completely assembled, insert feeler gauge between pressure plate and snap ring and measure clearance. On "three disc" clutch, clearance should be .022–.042", and .026–.054" on "four disc" clutch. If not within limits, install a snap ring of proper thickness to obtain specified clearance. *NOTE – Low limit clearances are desired. Snap rings are available in thicknesses of .060–.062", .074–.076", .088–.090".*

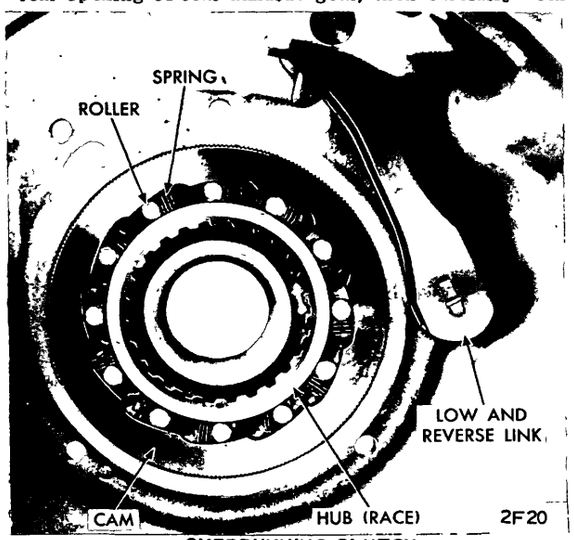


PLANETARY GEAR ASSEMBLIES, SUN GEAR, DRIVING SHELL: *NOTE – Measure endplay of planetary gear assemblies, sun gear and driving shell before removing these parts from output shaft as follows: With assemblies in an upright position, push rear annulus gear support downward onto output shaft, then insert a feeler gauge between rear annulus gear support hub and shoulder on output shaft. Clearance should be .012–.055".*

Disassembly: Remove thrust washer and snap ring from forward end of output shaft, then slide front planetary assembly off shaft. Slide front annulus gear off planetary gear set. Slide sun gear, driving shell and rear planetary assembly, with low and reverse drum, off output shaft. Lift sun gear and driving shell off rear planetary assembly, then remove thrust washer from inside driving shell. Remove snap ring and steel washer from sun gear (rear side of driving shell), and slide

CONTINUED ON NEXT PAGE

FRONT CLUTCH PISTON RETURN SPRING LOCATION



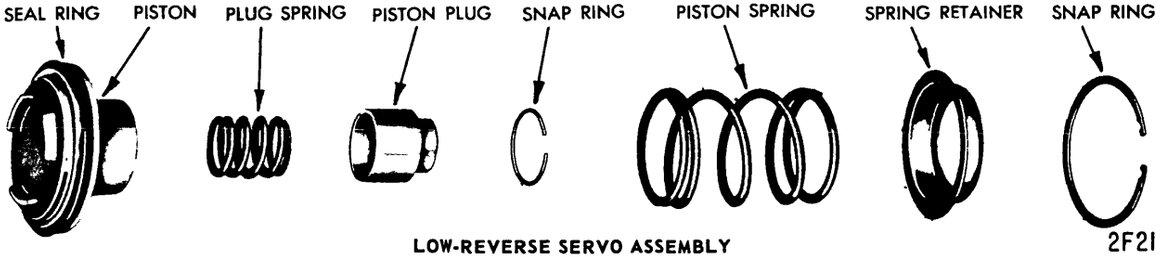
REAR CLUTCH ASSEMBLY

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

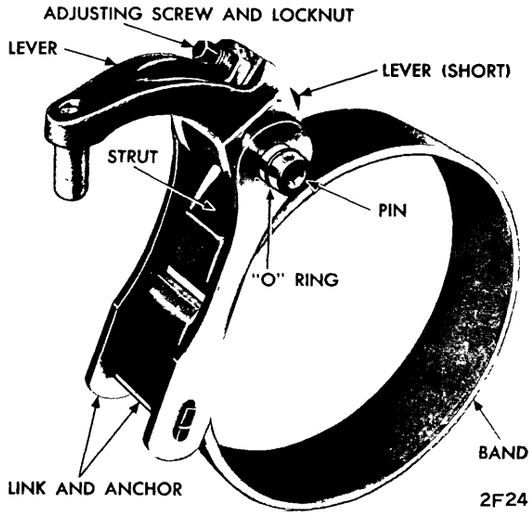
sun gear out of shell. Remove front snap ring from sun gear if necessary. *NOTE – Front end of sun gear is longer than rear.* Remove thrust washer from forward side of rear planetary gear assembly, then remove planetary gear set from annulus gear.

Inspection: Inspect all parts for nicks or damage and make sure all passages in shaft are open and clean. Inspect bushings in sun gear for wear or scores and replace sun gear assembly if bushings are damaged. Inspect all thrust washers for wear and scores, and replace if damaged or worn below specifications. Inspect planetary gear carrier for cracks and pinions for broken or worn gear teeth. Inspect annulus gear and driving gear teeth for damage. Replace distorted lock rings.

Reassembly: Position rear planetary gear assembly in rear annulus gear, then place thrust washer on front side of planetary gear assembly. Insert output shaft in rear opening of rear annulus gear, then carefully work shaft through annulus gear and planetary gear assembly. Make sure splines are fully engaged in splines of annulus gear. Install snap ring in front groove of sun gear (long end of gear), then insert sun gear through front side of driving shell, and install rear steel thrust washer and snap ring. Carefully slide driving shell and sun gear assembly on output shaft, engaging sun gear teeth with rear planetary pinion teeth. Place thrust washer inside front of driving shell. Place thrust washer on rear hub of front planetary gear set, then slide the assembly into front annulus gear. Carefully work front planetary and annulus gear assembly on output shaft, meshing planetary pinions with sun gear teeth. With all components porperly positioned, install retaining snap ring on front end of output shaft.

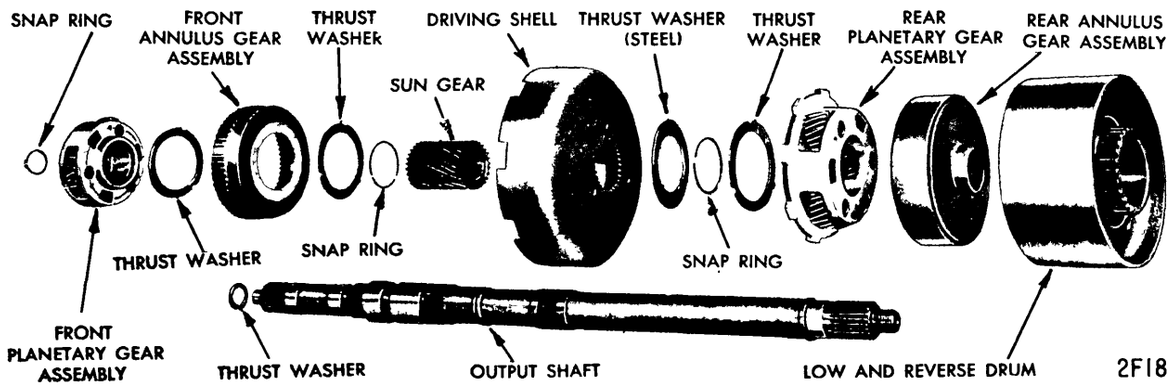


OVERRUNNING CLUTCH



OVERRUNNING CLUTCH: Inspection – Inspect rollers for flat spots or chipped edges and roller contacting surfaces in cam and race for brinelling. Check roller springs for distortion, wear or damage. Inspect cam setscrew for tightness. If loose, tighten and restake the case around screw.

Overrunning Clutch Cam Replacement: – Remove setscrew from case below clutch cam, then insert a punch through pump body bolt holes and drive cam from case. *NOTE – Alternate punch from one bolt to another so cam will be driven evenly from case.* Clean all chips and burrs from cam area in case. Place spring retainer on cam, making sure retainer lugs snap firmly into place in notches on cam. Position cam in case with cam serrations aligned with those in case. Tap cam **evenly** into case as far as possible with a soft mallet. Install Tool C–3863 and tighten nut on tool to seat cam into case. Make sure cam is firmly bottomed, then install cam retaining setscrew. Stake case around screw to prevent it coming loose.



KICKDOWN & LOW–REVERSE SERVOS & BANDS: Inspection – *NOTE – These parts were disassembled when removed from transmission cas . Th only additional disassembly requir d is to r mov snap ring from low–reverse servo piston and r mov piston plug and spring.* Inspect piston and guide seal rings for wear, and make sure they turn freely in grooves. Do not remove seals unless replacement is necessary. Inspect piston for nicks, burrs, scores, and wear. Check piston bore in case for scores or other damage. Check fit of guide on piston rod and piston spring for distortion. Check band lining for wear and bond of lining to band. Check lining for black burn marks, glazing, non-uniform wear pattern and flaking. If lining is worn so grooves are not visible at the ends or any portion of band, replace band. Inspect band for distortion cracked ends. On low-reverse servo piston, lubricate and install piston plug and spring in piston, and secure with snap ring.

LOW-REVERSE SERVO ASSEMBLY

LOW-REVERSE BAND ASSEMBLY

PLANETARY UNIT, LOW-REVERSE DRUM & OUTPUT SHAFT ASSEMBLY

TRANSMISSION UNIT INSTALLATION

► *INSTALLATION NOTE: Lubricat all parts with Automatic Transmission Fluid Typ "A" (Suffix "A") wh n assembled or installed.*

OVERRUNNING CLUTCH: With transmission case in upright position, insert clutch race inside cam, then install overrunning clutch rollers and springs as shown in illustration.

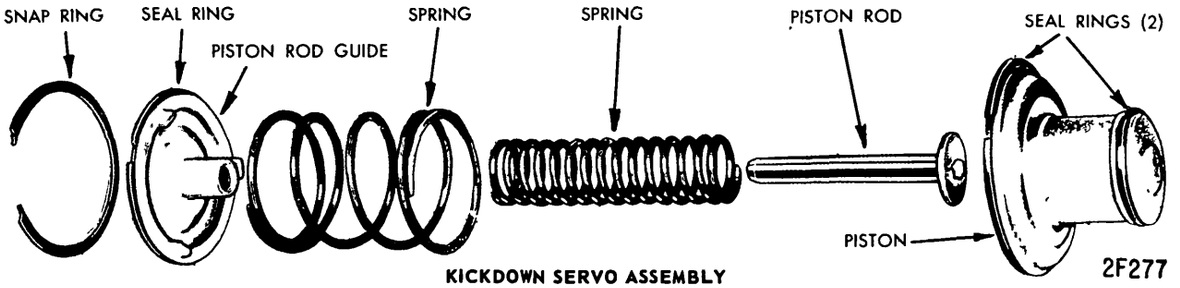
LOW–REVERSE SERVO & BAND: Carefully work servo piston assembly into case with a twisting motion, then place spring, retainer and snap ring over piston. Compress low-reverse servo piston spring by using engine

CONTINUED ON NEXT PAGE

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)

valve spring compressor (Tool C–3422), then install snap ring. Position rear band in case and install short strut, then connect long lever and strut to band (see illustration). Screw in band adjuster just enough to hold struts in place. *CAUTION – Be sure long lever and strut ass mbly is installed correctly.* Install low-reserve drum.

KICKDOWN SERVO: Carefully push servo piston into case bore, then install piston rod, the two springs, and guide. Compress kickdown servo springs using same tool as used for low-reverse servo (above), then install snap ring.



PLANETARY GEAR ASSEMBLIES, SUN GEAR, DRIVING SHELL: While supporting assembly in case, insert output shaft through rear pump housing, then carefully work the assembly rearward engaging rear planetary carrier lugs into low-reverse drum slots. *CAUTION – B v ry car ful n t t damage ground surfaces on output shaft during installati n.* Apply a coat of grease on input–to–output shaft thrust washer, and install washer on front end of output shaft.

INPUT SHAFT & REAR CLUTCH: Invert transmission and support in an upright position with output shaft downward, then align rear clutch plate inner splines and lower input shaft and clutch assembly into position in case. Carefully work clutch assembly in a circular motion to engage clutch splines over splines of front annulus gear. Coat one side of the fibre thrust washer with heavy grease, then position washer in recess on front face of rear clutch piston retainer.

FRONT CLUTCH: Align front clutch inner splines, and lower clutch assembly into position in case. Carefully work clutch assembly in a circular motion to engage clutch splines over splines of rear clutch piston retainer. Make sure front clutch driving lugs are fully engaged in slots in driving shell.

FRONT BAND: Slide band over front clutch assembly, then install band strut, and screw in adjuster just enough to hold strut in place.

FRONT OIL PUMP & REACTION SHAFT SUPPORT: *CAUTION – If driv train endplay was not within specificati ns (.030–.070") when checked at disassembly, r plac thrust wash r on reaction shaft support hub with on of prop r thickness. Thrust washers are availabl in th following thicknesses and are identifi d as indicated: .043–.045" (Natural); .061–.063" (Gr n); .084–.086" (R d).* Screw two pilot studs, Tool C–3288, in front oil pump opening in case, then install a new gasket over studs. Place a new rubber seal ring in groove on outer flange of oil pump housing and make sure seal is not twisted. Insert aligning Tool C–3881 through pump body and engage with inner rotor, then install pump assembly in case and tap lightly into position with a soft mallet. *CAUTION – If difficulty was encounter d in r moving front pump assembly from cas b caus f an xceptionally tight fit, it may be n c ssary to xpand case with heat during pump installati n. If h at is nec ssary, use a suitable heat lamp and h at cas in ar a of front pump for a few minut s prior to installing pump and reaction shaft support assembly.* With pump installed in case, place deflector over vent opening and install four pump body bolts, then remove studs and install remaining bolts. Snug all bolts down evenly, then tighten evenly to 150 inch pounds. Rotate pump rotors with Tool C–3881 until the two small holes in handle of tool are vertical (this will locate inner rotor so converter impeller shaft will engage inner rotor lugs during installation).

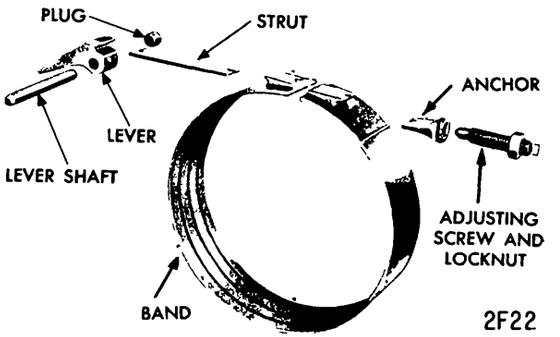
KICKDOWN SERVO ASSEMBLY

REAR OIL PUMP: Place outer rotor in pump body, then turn output shaft so inner rotor driving ball pocket is up. Install ball and slide inner rotor on output shaft in alignment with ball. Install oil pump cover with retaining bolts threaded in a few turns. Slide aligning sleeve, Tool C–3864 all the way in until it bottoms against rotors, then tighten cover bolts evenly to 150 inch pounds.

GOVERNOR & PARKING SPRAG (OR SUPPORT): *See "Transmission Unit Removal & Installation – Transmission in Car" above.*

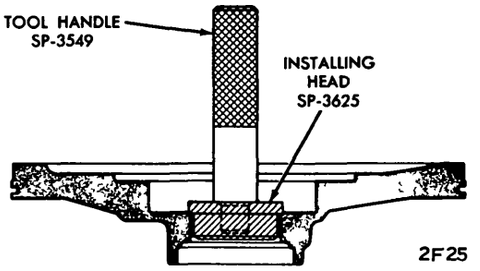
EXTENSION HOUSING: *See "Transmission Unit Removal & Installation – Transmission in Car" above.*

VALVE BODY ASSEMBLY & ACCUMULATOR PISTON: *See "Transmission Unit Removal & Installation – Transmission in Car" above.*



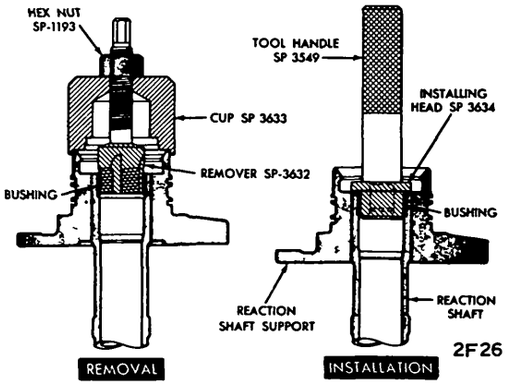
TRANSMISSION BUSHING REPLACEMENT

►*NOTE: The transmission bushings indicated below are available for service replacement. Bushings in the sun gear are not serviced separately.*



FRONT PUMP BUSHING: Position front pump housing on a smooth surface with rotor cavity down, then place removing head, Tool SP–3550, in bushing and install handle, Tool SP–3549, in removing head. Drive bushing straight down and out of bore. *CAUTION – Be careful not to cock tool in bore.* To install bushing, position a new bushing on installer head, Tool SP–3625, then with hub end down on a smooth surface, start bushing and installing head in bushing bore. Install handle, Tool SP–3549, on installing head and drive bushing into housing until tool bottoms in pump cavity (see illustration). Stake bushing in place with a blunt punch at each staking slot in pump housing. Use a narrow knife blade so similar tool and remove high points or burrs around staked area. *CAUTION – Do not use a file or other tool that will remove more metal than is necessary. Clean pump housing before installation.*

REACTION SHAFT BUSHING: For removal of bushing, assemble tools as indicated in illustration. *CAUTION – Do not clamp any part of reaction shaft or support in a vise.* With cup of tool held firmly against reaction shaft, thread remover into bushing as far as it will go by hand, then use a wrench and screw remover into bushing three or four additional turns to firmly engage threads in bushing. Turn hex nut down against cup to pull bushing from reaction shaft, then clean shaft to remove any chips. Slide a new bushing (chamfered end first) on installing head of tool and then into bore of reaction shaft. Support reaction shaft upright on a smooth surface and install handle in installing head. Drive bushing into shaft until tool bottoms. Clean reaction shaft before installation.



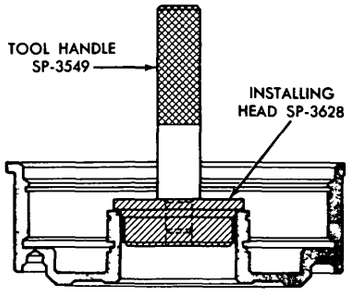
CONTINUED ON NEXT PAGE

FRONT (KICKDOWN) BAND & LINKAGE

FRONT PUMP BUSHING INSTALLATION

REACTION SHAFT BUSHING REPLACEMENT

CHRYSLER CORP. TORQUEFLITE EIGHT (C nt.)



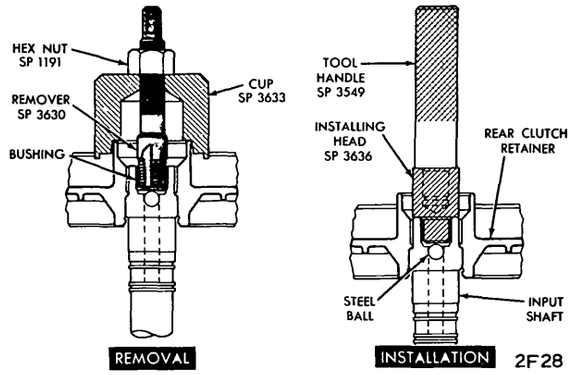
FRONT CLUTCH RETAINER BUSHING: Lay clutch retainer (open end down) on a smooth surface and place removing head, Tool SP–3629, in bushing. Install handle in removing head and drive bushing straight down and out retainer bore, being careful not to cock tool in bore. To install bushing, start bushing into bore using tools indicated in illustration and drive bushing in until tool bottoms. Clean retainer before assembly and installation.

INPUT SHAFT BUSHING: Clamp input shaft in a vise with soft jaws, being careful not to clamp on seal ring lands or journal. Assemble tools as indicated in illustration, then thread remover into bushing as far as possible by hand. Use a wrench and screw remover into bushing an additional three or four turns to firmly engage threads in bushing. Turn hex nut down against cup and pull bushing from shaft. Clean input shaft to remove all chips. *CAUTION – Make sure small lubrication hole next to ball in end of shaft is not plugged with chips, and that chips are not lodged next to steel ball.* Slide a new bushing on installing head and start them into bore of input shaft. Stand input shaft upright on a smooth surface and install tool handle, then drive bushing into shaft until tool bottoms. Clean input shaft and clutch piston retainer before assembly and installation.

STARTER RING GEAR REPLACEMENT

►*REPLACEMENT NOTE: Any of the following methods may be used to heat and expand starter ring gear for installation on converter.*

Oven – Place ring gear in oven (C–794) and set temperature at 200°F. Allow ring gear to remain in oven 15 or 20 minutes.



FRONT CLUTCH RETAINER BUSHING REPLACEMENT

Boiling Water – Place ring gear in a shallow container, add water, and heat for approximately eight minutes after water has come to a boil.

Steam – Place ring gear on flat surface and direct a steam flow around gear for approximately two minutes.

Flame – Place ring gear squarely on a flat surface, then use a medium size tip and direct a slow flame around inner rim of ring gear. *CAUTION – Do not apply heat to gear teeth.* Place a few drops of water on surface of gear at intervals during heating process. When gear is hot enough to just boil the water, installation of gear on torque converter can be made.

RING GEAR: Removal – Cut through weld material at rear side of ring gear with a hack saw or grinding wheel, being very careful not to cut into front cover stamping. Scribe a heavy line on front cover next to front face of ring gear to aid in locating new gear, then support converter with the four lugs faces resting on blocks of wood. *CAUTION – Converter must not rest on front cover hub during this operation.* Use a blunt chisel and hammer, tap downward on ring gear near welded areas to break any remaining weld material, then tap around ring gear until it comes off converter. Smooth off any weld areas on cover with a file.

INPUT SHAFT BUSHING REPLACEMENT

Installation: After ring gear is expanded by heating, place gear in position on converter front cover. Tap gear on cover evenly with a plastic hammer until front face of gear is even with scribed line around full circumference of front cover. Reweld ring gear to front cover, being careful to place weld material in exactly the same location, and in the same amount as used in original weld. Place welds alternately on opposite side of cover to minimize distortion.

►*WELDING NOTE:* Do not gas weld. Use a D.C. welder that is set at straight polarity or an A.C. welder if proper electrode is available. Use a 1/8" diameter welding rod, and a welding current of 80–125 amps. Direct arc at intersection of gear and front cover from an angle of 45° from rear face of gear. Inspect gear teeth and remove all nicks where metal is raised and weld metal splatter in order to insure quiet starter operation.

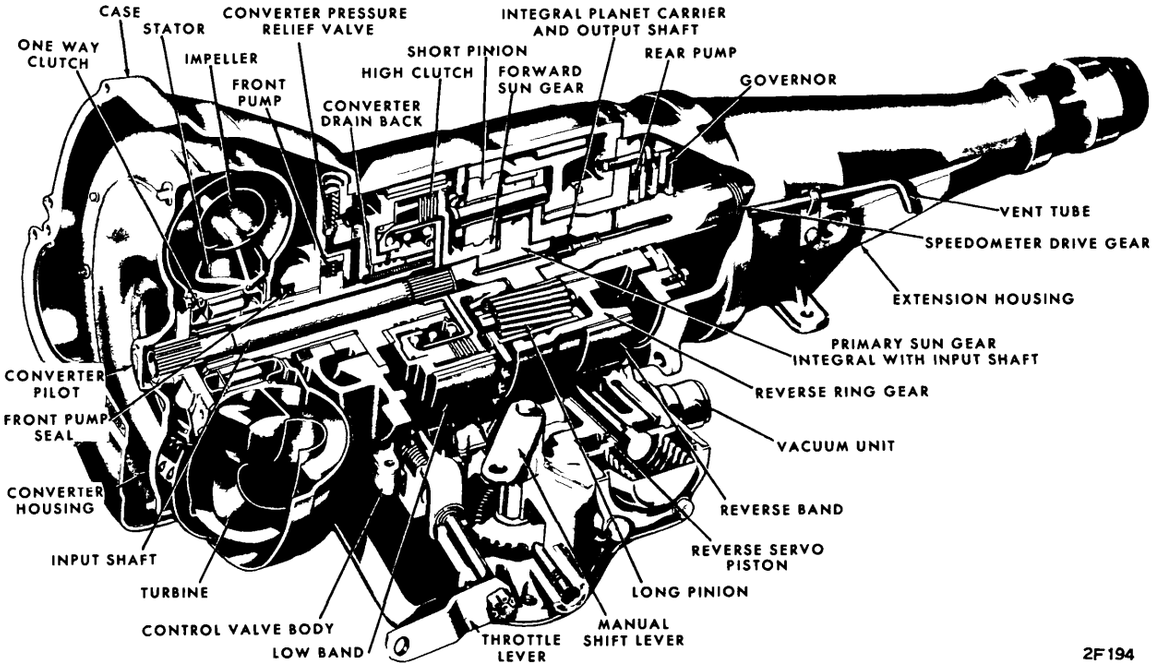
►CHANGES, CAUTIONS, CORRECTIONS

► *1961-62 MERCURY & FORD 292" ENGINE RUNAWAY DURING 1-2 UPSHIFT CORRECTION:* If this condition occurs under light throttle (15—23 MPH), remove vacuum diaphragm assembly, Part No. C1AP-7A377-C, and install Part No. C1AP-7A377-B which is identified by a yellow stripe. If this condition occurs under light and heavy throttle (15 MPH up to and beyond 23 MPH), check for proper front servo return spring, Part No. B9AZ-7A003-C, identified by a yellow stripe. Install proper spring. If condition still exists after correct spring is installed, it will be necessary to disassemble transmission for a complete investigation.

► *1962 LOW SERVO PISTON INSTALLATION NOTE:* After removal and installation of low servo piston during transmission repairs, and before transmission has been road tested, move transmission selector lever from "N" (Neutral) to "D" (Drive) approximately 20 times with car standing still and engine at fast idle speed. This procedure will exhaust any air trapped in low servo piston cylinder and insure proper shift quality.

► *1961-62 TRANSMISSION LOW LINE PRESSURE CORRECTION:* This condition may be caused by wear at end of throttle control valve rod and can be corrected by installing a new rod. Throttle control valve rod should measure 2.084—2.094" in length.

► *TRANSMISSION IDENTIFICATION NOTE:* A number of different transmission models are used on the various engines as indicated in table below. For identification, refer to service identification tag attached to oil pan flange or to rear servo cover mounting bolt. This tag will be stamped with transmission serial number prefix and suffix and will include a figure indicating service identification code number.



Transmissi n Identification

Engin	Serial Prefix
144" 6 Cyl	PCL
170" 6 Cyl	PCM
221" V8	PCN
223" 6 Cyl	PCH
260" V8	PCP
292" V8	PCJ
352" V8	PCK

► *TOWING CAR CAUTIONS: If transmission in working condition, car may be towed for a distance not to exceed 15 miles and at a speed not greater than 30 MPH with transmission selector lever in "N" (Neutral). If transmission inoperable, disconnect and remove propeller shaft or tow car with rear wheels off ground.*

DESCRIPTION

DESCRIPTION: Same design as used on later 1961 models with vacuum controlled throttle and control pressures.

FORD MOTOR 2-SPEED AUTOMATIC TRANSMISSION

LUBRICATION

Check fluid level every 1000 miles (Comet), every 6000 miles (All Others). Periodic draining and refilling is not required except at time of overhaul.

Checking Fluid Level: With transmission at normal operating temperature and engine at normal idle speed, shift transmission through all ranges, then place in "P" (Park) position. Check fluid level on dipstick and add recommended fluid as required to bring level up to "F" mark on dipstick. *CAUTION – Do not overfill.*

Draining & Refilling: Periodic draining and refilling is not required except at time of overhaul. To fill a dry transmission, install 5 qts. of recommended fluid, then start engine and shift transmission through all ranges. Place selector lever in "P" (Park) position and recheck fluid level. *CAUTION – Do not overfill.* When a partial drain and refill is required (due to front band adjustment or minor service) proceed as follows. To drain transmission, remove oil pan bolts and loosen front end of pan, then allow transmission fluid to drain. Install oil pan and new gasket (new filter if so equipped). On Falcon & Comet, add one quart of fluid, then run engine at idle speed for two minutes, and add one more quart of fluid. On other models add fluid to bring level up to "F" mark on dipstick. On all models, run engine at fast idle speed with transmission in "N" (Neutral) until transmission is at normal operating temperature. *CAUTION – Do not race engine.* Shift selector lever through all ranges, then place selector lever in "P" (Park) and check fluid level. If necessary, add fluid to bring level up to "F" mark on dipstick.

Recommended Fluid: Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity (Refill, Dry Transmission): 6½ qts. (Comet & Falcon), 6¼ qts. (Fairlane & Meteor), 9¼ qts. (All Others). *CAUTION – These capacities are approximat . Check fluid level on dipstick and adjust. See "Checking Fluid Level" above.*

ADJUSTMENTS

LINKAGE ADJUSTMENT: Throttle Linkage Adjustment– *See CARBURETOR on car model pages.*

Manual Shift Linkage: Adjustments are different for the various car models as indicated below.

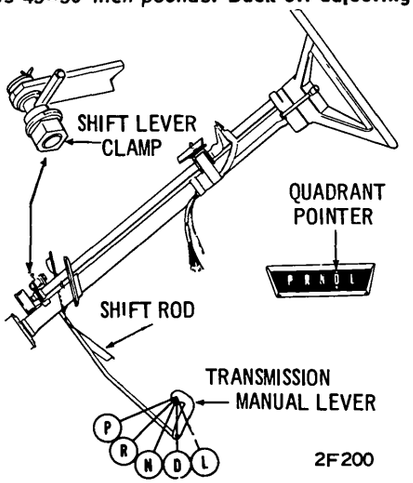
Comet, Falcon, Fairlane & Meteor – With engine stopped, loosen clamp at shift lever so that shift rod is free to slide in clamp at lower end of steering column. Position selector lever so pointer lines up in "D" (Drive) position, then shift manual lever at transmission into "D" detent (second from rear). Tighten clamp on shift rod at lower end of steering column and check pointer for alignment in all selector lever positions.

Galaxie & Monterey – With engine stopped, loosen clamp at shift lever on lower end of steering column so that shift rod is free to slide in clamp, then position selector lever in "D" against stop on steering column. Shift manual lever at transmission into "D" detent (second from rear), then tighten clamp on shift rod and check pointer for alignment.

NEUTRAL SAFETY SWITCH ADJUSTMENT: (F rd Galaxie) – Loosen switch–to–steering column attaching screws, then shift selector lever to "N" (Neutral).

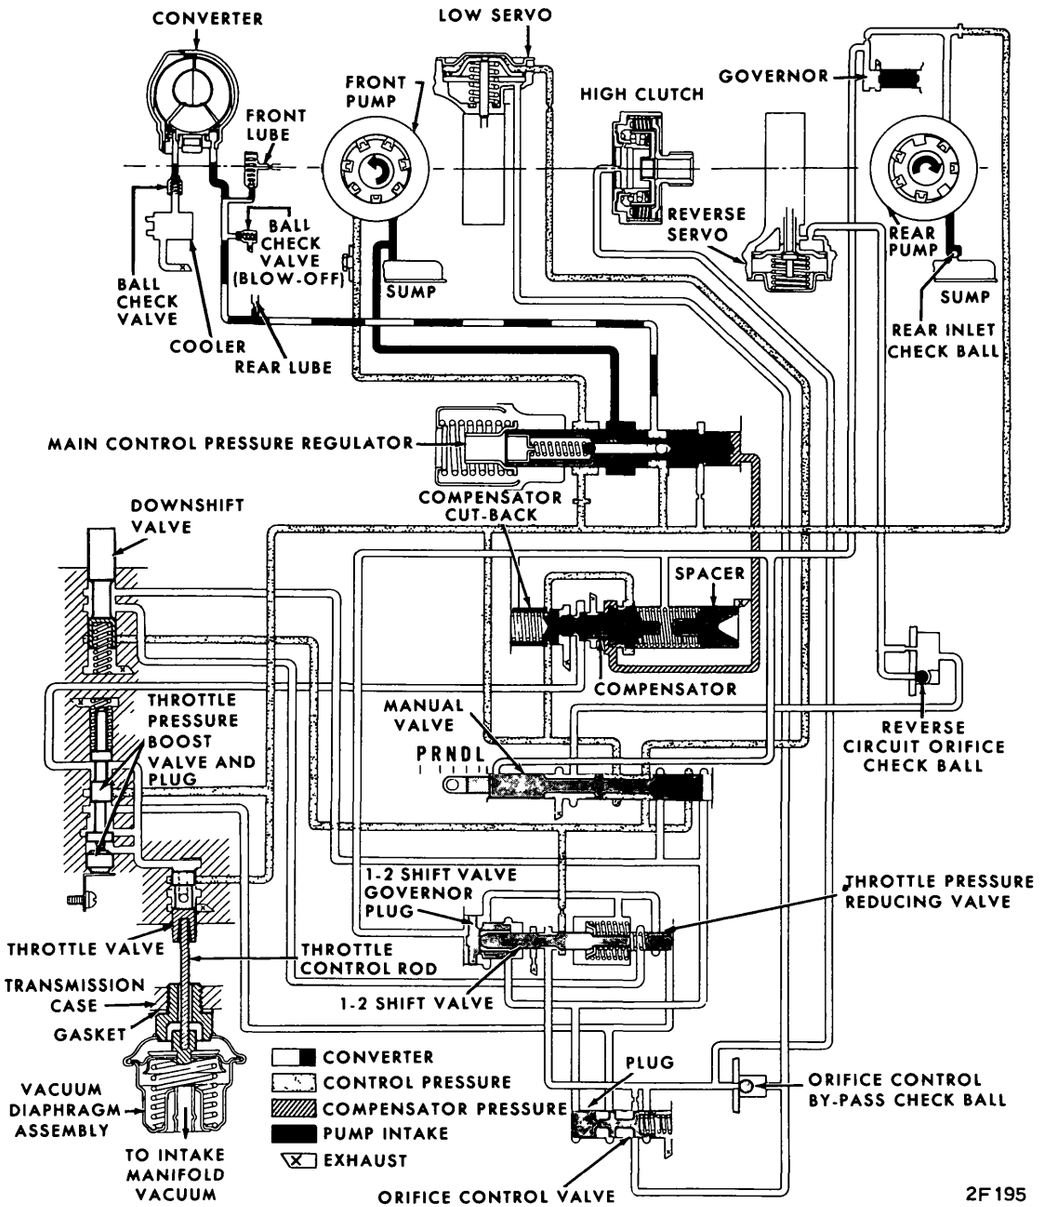
CONTINUED ON NEXT PAGE

FORD MOTOR CO. 2-SPEED AUTOMATIC TRANSMISSION (Cont.)



Rotate switch as far as it will go in either direction, then insert a .060" pin through switch housing and gauge pin hole. Hold pressure against gauge pin and rotate switch in free direction until pin engages hole in plate. With gauge pin through housing and into plate, tighten attaching screws and remove gauge pin. Check starter circuit in all selector lever positions. Starter must operate with selector lever in "N" or "P" only.

Comet, Fairlane, Falcon, Mercury & Meteor: Loosen screws securing switch to steering column, then move switch as necessary to obtain starter operation with transmission selector lever in "N" or "P" only. Tighten switch attaching screws.



BAND ADJUSTMENT: Periodic band adjustment is not required. Check band adjustment each time oil pan is removed and adjust as necessary.

Front Band (Low Range): Loosen locknut on adjusting screw on left front side of transmission case, then tighten adjusting screw with Tool T59P-77370-A or B (Fairlane, Falcon, Galaxie); Tool 7345 (Comet, Mercury, Meteor) until tool handle snaps (breaks) over center. *NOTE – These tools are preset torque wrenches which overrun when torque on screws reaches 10 ft. lbs.* **Back off adjusting screw exactly two full turns.** Hold adjusting screw at this point and tighten locknut to 35–40 ft. lbs.

Rear Band (Reverse Range): Remove oil pan and screen, loosen rear servo piston rod locknut and adjusting nut, and install adjusting tool as follows: If Ford Tool T59P-77409-A is used, place tool on rear servo rod so two forks straddle band apply lever. *NOTE – The inner fork must engage flat on servo piston rod. The outer fork is a ¼" spacer and must be inserted between piston rod seat and adjusting nut.* If Mercury Tool 7355-A is used, insert tool between adjusting nut and piston rod–to–actuating lever seat, with opposite end of tool resting on raised boss on control valve assembly. With wrench T59P-77423-A (Ford), or No. 7355-B (Mercury), tighten adjusting nut until wrench handle snaps (breaks) over center. *NOTE – These tools are pre-set torque wrenches which overrun when torque on nut reaches 45–50 inch pounds.* **Back off adjusting nut exactly two turns.** Hold adjusting nut at this position and tighten locknut to 15–18 ft. lbs. Remove tools from servo piston rod. Install oil pan and screen using a new gasket, then refill transmission with recommended fluid.

MANUAL LINKAGE ADJUSTMENT

HYDRAULIC CIRCUIT DIAGRAM

TESTING

STALL TEST: *NOTE – Make s parat stall t st in "D" (Driv), "L" (Low), and in "R" (R verse).* With parking and service brakes applied and selector lever in "D", "L" or "R", open throttle through detent and note pressure and vacuum gauge readings and engine RPM. Vacuum should drop below 1.5" Hg. and the pressure should reach maximum limits as indicated in "Hydraulic Control Pressure Table" below. Engine speed at stall should be as indicated in "Engine Stall Speed Table." *CAUTION – Do not stall t st for mor than 5 s conds. B tween t sts, run ngin for at l ast 2 minutes at*

CONTINUED ON NEXT PAGE

FORD MOTOR CO. 2-SPEED AUTOMATIC TRANSMISSION (Cont.)

1000 RPM with transmission selector lever in "N" (Neutral) to prevent overheating. If engine runs away on a stall test in "D" or "L", but is held within limits in "R", the low band is slipping. If engine runs away in "R" during a stall test, but is held within limits in "D" or "L", the reverse band is slipping. *NOTE – Transmission "high" clutch cannot be tested since the clutch applies at road speeds above 15 MPH.*

ENGINE STALL SPEEDS

Engine	Low Limit–RPM–Limit	High
144" 6 Cyl	1600	1800
170" 6 Cyl	1750	1950
221" V8	1600	1800
223" 6 Cyl	1300	1500
260" V8	1800	2000
292" V8	1550	1750
352" V8	1550	1750

AIR PRESSURE TESTS (With Transmission in Car): Raise car on hoist, then remove transmission oil pan and control valve assembly. Proceed as follows:

Clutch Apply: Apply pressure to front clutch passage (see illustration). A dull thud indicates that clutch is operating. Retain air pressure in passage for several seconds to check for leakage

Low & Reverse Servos: Apply pressure to "Low Band Apply" and "Reverse Band Apply" holes in case (see illustration). Band operation can be observed.

SHIFT TEST: Shift points and low gear operation should be as indicated in table below. *NOTE - These speeds are approximate.*

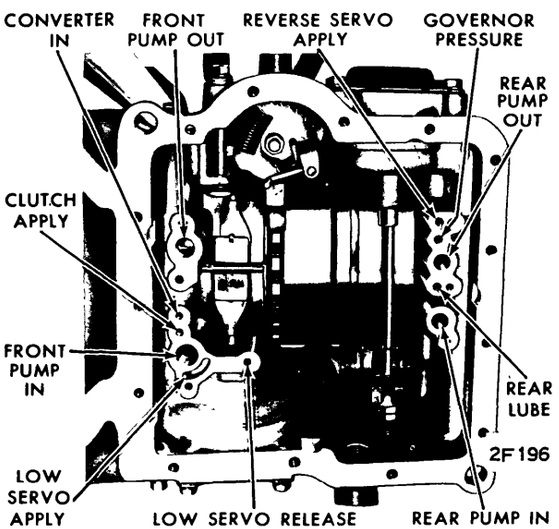
CONTROL PRESSURE RISE TEST: With engine and transmission at normal operating temperature, connect a suitable pressure gauge (300 lbs.) to pressure take-off hole on left side of transmission case above shift levers, then proceed as follows:

1) During operation of engine from idle to wide open throttle (stall test), with selector lever in "D", "L" or "R", control pressure should rise as indicated in "Hydraulic Control Pressure Table."

2) In "D" position, if this rise does not occur, there are three possible causes (throttle and compensator pressures, pump capacity, and excessive leakage). Before control valve body or transmission is removed for inspection, make the following checks.

3) Install a vacuum gauge in vacuum line (preferably at diaphragm). Vacuum reading and pressure should be as indicated in control pressure table. If control pressure is low (below specifications), vacuum diaphragm and connecting lines are probably all right. If control pressure is high (above specifications), disconnect tube from rear of diaphragm unit and alternately plug and free end of tube. Engine should slow down and speed up as this is done. If engine speed does not vary, check line for leakage between diaphragm and intake manifold. Also check for restrictions in line. If vacuum line is all right, remove diaphragm unit and rod, then replace unit without the rod. Control pressure should now remain at idle specifications regardless of manifold vacuum. *CAUTION – Do not run engine under load for more than five seconds with diaphragm rod removed.* Start engine and check control pressure at engine idle speed with selector lever in "D" position. If control pressure is still too high, trouble is in transmission control system. If pressure is now within limits, diaphragm unit is not operating properly and should be replaced.

4) Check control pressure in "D", "L" and "R". If pressure rise is normal in any one position, throttle and compensator pressures, and pump capacity are normal. The probable cause of no pressure rise in other positions is leakage in hydraulic system ahead of manual valve.



HYDRAULIC CONTROL PRESSURE TABLE

Throttle Position	Manifold Vacuum (" Hg.)	Shift Lever Position	CONTROL PRESSURES 144" Eng.	170" Eng.	Others
Closed	Above 15.0"	All	40-48 lbs.	46-63 lbs.	45-63 lbs.

TRANSMISSION CASE OIL PASSAGES

TROUBLE SHOOTING & DIAGNOSIS

HARD SHIFTING: Vacuum supply tube disconnected. Throttle valve sticking. Vacuum diaphragm loose in transmission case. Engine idle speed too high. Engine operation faulty, resulting in loss of vacuum.

ENGINE OVERSPEEDS DURING 1–2 UPSHIFT: Vacuum diaphragm throttle rod bent or missing. Throttle valve sticking. Vacuum diaphragm connected to constant vacuum source (power brake or windshield wiper lines).

HARSH INITIAL ENGAGEMENT IN "D", "L", OR "R": Check engine idle and fluid level.

SLIPS OR CHATTERS IN "D" OR "L": Check fluid level, throttle linkage, control pressure, low band adjustment. Make an air pressure check. Inspect for loose or worn engine or transmission mounts. Check operation of low servo and band. Check for leakage in low servo apply circuit.

SLIPS OR CHATTERS IN "R": Check fluid level, throttle linkage, control pressure, reverse band adjustment. Make an air pressure check. Inspect for worn or loose engine mounts. Check operation of reverse servo. Check for leakage in reverse servo apply circuit.

CREEPS EXCESSIVELY IN "D": Engine idle speed too fast.

ENGINE OVERSPEEDS DURING 1-2 SHIFT: Check fluid level. Check fluid odor for possibly burned clutch plates. Check throttle linkage adjustment, control pressure, low band adjustment. Make an air pressure check. Check control valve body for malfunction. Check for leakage in clutch apply or low servo release circuit. Check planetary gears.

CONTINUED ON NEXT PAGE

FORD MOTOR CO. 2-SPEED AUTOMATIC TRANSMISSION (C nt.)

MOMENTARY LOCKUP DURING 1-2 SHIFT: Check fluid level, throttle linkage, control pressure and low band adjustmeht. Low servo and band not operating properly. Check high clutch for malfunctiori. Check for possible broken low servo return spring.

SEVERE 2-1 SHIFT DURING COAST-DOWN: Check engine idle speed and throttle linkage. Check control valve body for malfunction. Make a control pressure check.

NO 1-2 SHIFT IN "D": Check fluid level. Check fluid odor for possibly burned clutch plates. Check manual linkage adjustment. Check for improperly operating governor. Check for leakage in control pressure main circuit. Check high clutch and low servo and band for improper operation.

DELAYED 1-2 UPSHIFT: Check throttle linkage. Check for improperly operating governor. Check for leakage in control pressure main circuit.

SLIPS CONTINUOUSLY AFTER 1-2 SHIFT: Check fluid odor for possibly burned clutch plates. Check throttle linkage adjustment and fluid level. Make a control pressure check and an air pressure check. Check high clutch for improper operation and for leakage in clutch apply or low servo release circuit.

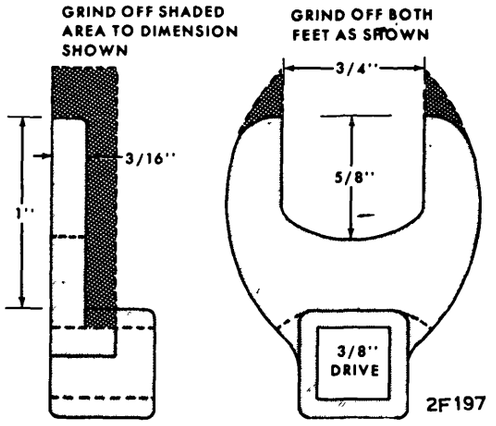
NO 2-1 FORCED DOWNSHIFT (KICKDOWN): Check throttle linkage adjustment. Check control valve body for malfunction. Check for leakage in control pressure main circuit.

NO 2-1 SHIFT DURING COAST-DOWN: Check for malfunction in control valve body or governor.

FLUID FORCED OUT FILLER TUBE OR VENT: Check fluid for contamination by engine coolant. Transmission external vent plugged. Check fluid for aeration.

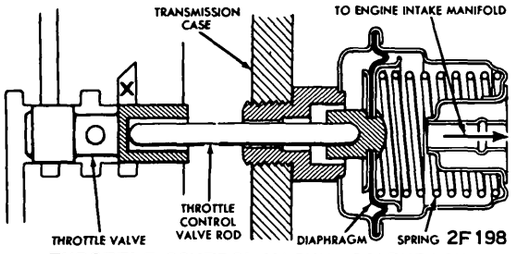
TRANSMISSION OVERHEATS: Check control pressure. Check oil cooler flow.

ACCELERATION NORMAL (MAXIMUM SPEED APPROXIMATELY 45 MPH): Converter one-way clutch not operating properly.



ACCELERATION VERY POOR (OPERATION ABOVE 30 MPH AT STEADY THROTTLE IS NORMAL): Converter one-way clutch not operating properly.

ENGINE DOES NOT START BY PUSHING CAR: Check fluid level and manual linkage adjustment. Check for malfunction in control valve body. Rear pump not operating properly. Check for leakage in control pressure main circuit.



PARKING LOCK DOES NOT HOLD OR BINDS: Check manual linkage adjustment. Check parking linkage.

MINOR REPAIRS (TRANSMISSION IN CAR)

Vacuum Diaphragm: Removal – To remove diaphragm assembly without removing oil pan and throttle valve body, modify a ⅜" "Crow–foot" wrench as illustrated below and use it on "hex" portion of diaphragm to turn diaphragm assembly out of transmission case. The diaphragm assembly can also be removed by removing oil pan, throttle valve assembly, and throttle valve control rod, then insert a 3/16" Allen wrench into end of diaphragm assembly (from inside transmission case) and turn diaphragm assembly out of case. *CAUTION –*

VACUUM DIAPHRAGM WRENCH

THROTTLE CONTROL VACUUM DIAPHRAGM

Do not apply any pressure to diaphragm housing.

Installation – Reverse removal procedure and tighten diaphragm assembly to 15–18 ft. lbs.

Control Valve Body: Removal - Drain fluid from transmission, then remove oil pan and gasket. Remove fluid screen retaining clip and screen. Remove six bolts attaching control valve body to transmission case, then lower control valve body and work the manual shift valve link out of manual valve.

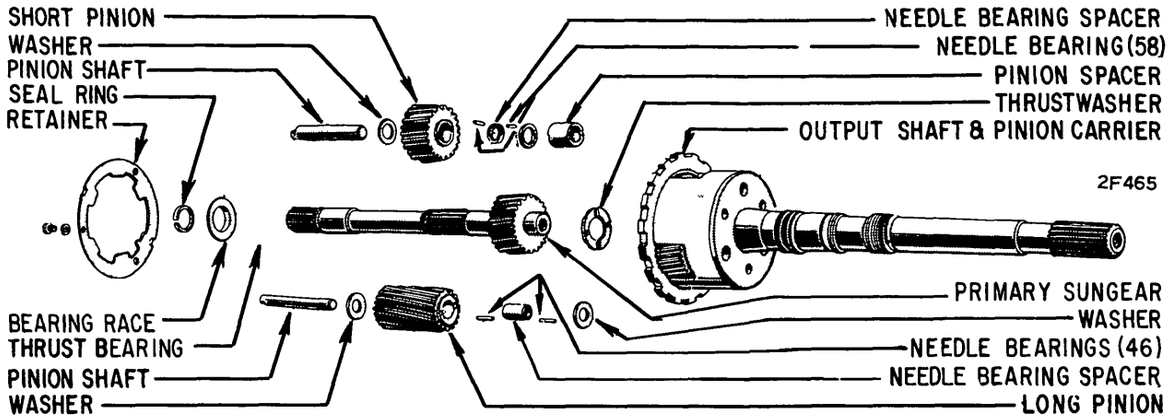
Installation - Position control valve assembly in transmission case, then connect manual valve shift link to manual valve, and position the throttle valve lever between downshift valve and the stop plate on upper valve body. Install control valve attaching screws and tighten to 8-10 ft. lbs. Install fluid screen and oil pan, using a new gasket. Tighten attaching bolts to 10-13 ft. lbs. Install drain plug and tighten to 10-13 ft. lbs. Refill transmission with recommended fluid and adjust throttle linkage and manual linkage.

Front Servo Piston Assembly: Removal - Drain fluid from transmission, then remove oil pan and gasket. Remove fluid screen retaining clip and screen. Remove main control valve assembly (see above), and disconnect fluid filler tube from transmission case. Remove two opposing bolts from front servo cover, then install two longer bolts (5/16" - 18 x 2") and nuts to hold cover in position against servo spring tension while removing remaining servo cover bolts. Remove servo cover by slowly unscrewing nuts on long bolts until all servo spring tension is released from cover. Remove the long bolts, nuts and servo cover. *NOTE - B for r moving s rvo cov r, note position of front band actuation struts. This will aid in reass mbly in cas struts ar dislodged.* Remove servo piston assembly and servo spring from transmission case and remove servo piston seal ring from piston.

Installation - Inspect front servo piston for nicks, burrs and a warped or bent condition. Inspect servo piston bore for burrs, wear, and scoring. Install new seal ring on servo piston and install servo piston spring and piston assembly in servo bore with air bleed hole toward top of case. Clean servo cover and mounting face and position new "O" ring seal on cover, then place servo cover on servo piston. Retain servo cover in place with the two long bolts used at disassembly (5/16" - 18 x 2"), and nuts. Pull servo cover partially into position by turn the nuts on long bolts to compress servo spring. Install regular cover attaching bolts in the open threaded holes. Remove both long bolts and nuts and install remaining two cover attaching bolts. *NOTE - Check position of front band actuating strut while tightening servo cover bolts to assure that s rvo piston rod enters actuating strut prop rly. If struts have been dislodged, loosen front s rvo band adjusting screw and position them correctly.* Tighten servo cover attaching bolts evenly to avoid distorting cover, then when cover is firmly seated, tighten bolts to 12–15 ft. lbs. *CAUTION - Use care when positioning "O" ring seal and servo cover to pr v nt future leakag .* Install main control valve assembly, then connect manual shift valve link to manual valve and position throttle lever between downshift valve and stop plate on upper valve body. Tighten control valve attaching bolts to 8-10 ft. lbs. Adjust front and rear bands (see "Adjustments" above). Install fluid screen and transmission oil pan and refill transmission. Adjust Linkage.

►*FRONT SERVO COVER GASKET REPLACEMENT:* Remove low band adjusting screw locknut and tighten adjusting screw with wrench, Tool T59P-77370-A (Ford), Tool 7345 (Mercury) until wrench overruns. Loosen cover capscrews approximately two turns each, then tighten band adjusting screw until wrench overruns. Repeat this procedure until servo cap is removed (low band strut will be seated against bottom of servo casting and will be held in place). To install cover, use two 5/16" - 18 x 1¼" hex head bolts in place of the regular bolts, then place servo cover over piston and start the two bolts. Tighten bolts snugly to bring cover into contact with piston and to position piston stem in band strut (piston stem will be back in position in cup face of band strut). Loosen band adjusting screw two turns, then tighten servo cover capscrews approximately two turns or until they are snug (band will again be tight against drum). Repeat this procedure until cover is drawn close enough so that regular cover capscrews can be installed in rest of cover holes, then remove the two temporary bolts and replace them with regular bolts. Continue to repeat the above procedure until cover is fully installed. Install low band adjusting screw locknut and adjust the band.

CONTINUED ON NEXT PAGE



FORD MOTOR CO. 2-SPEED AUTOMATIC TRANSMISSION (C nt.)

R ar Serv Pist n Ass mbly: Removal - Disconnect accelerator pedal connecting rod, then raise car and remove transmission oil pan, fluid screen and main control valve. Remove four bolts and remove rear servo cover, "O" ring seal, and servo piston spring. *CAUTION - Servo cover is spring loaded.* Remove locknut, adjusting nut, and half-ball rod seal from rear servo piston rod. Remove rear engine mount from under transmission housing, then lower extension onto frame crossmember. Remove servo piston rod from transmission case. Remove servo piston and seal ring from piston bore. *NOTE - Push outward on piston stem from inside transmission cas or apply air pressure to reverse servo apply passag in transmission case to remove piston.* Remove seal ring from piston.

Installati n - Inspect piston, stem and rod for nicks or burrs. Check rod for wear or for a bent or warped condition. Inspect piston bore, for burrs, wear and scoring. Install new seal on piston, then install piston assembly into bore in case. Push piston to bottom of bore. Install piston rod through piston, then position band operating lever and install the half-ball rod seal, adjusting nut, and locknut loosely. Raise transmission from frame crossmember and install rear engine mount. Install new "O" ring seal on servo cover, then install servo cover, maintaining pressure against cover while tightening the attaching bolts. Tighten bolts slowly and evenly until cover is firmly seated, then tighten bolts to 12-15 ft. lbs. Adjust front and rear bands (see "Adjustments" above). Install main control valve assembly, fluid screen, transmission oil pan, and drain plug. Refill transmission (see "Draining & Refilling" above). Connect accelerator rod and adjust pedal to 3½" above floor. Adjust throttle and manual linkage.

EXTENSION HOUSING & GOVERNOR: Removal - Raise car and drain fluid from transmission, then disconnect driveshaft at rear universal and remove driveshaft. Remove bolts attaching rear engine support to transmission, then use a transmission jack and raise transmission until extension housing clears rear engine support and frame crossmember. Remove extension housing from transmission case. To remove governor, remove snap ring from output shaft and remove governor and governor drive ball. *NOTE - Replace output shaft seal if worn or damaged.*

Installati n - Reverse removal procedure.

PINION CARRIER & PRIMARY SUN GEAR ASSEMBLY

►*EXTENSION HOUSING BUSHING & SEAL REPLACEMENT NOTE: Replaceable with suitable tools. Coat seal with non-hardening compound.*

REMOVAL & INSTALLATION

COMET, FALCON, FAIRLANE & METEOR

REMOVAL: *NOTE - Transmission and converter are removed as an assembly.*

1) Place car on a hoist, then disconnect battery and remove starter motor. On six cylinder engines, remove two "Z" bar bracket retaining bolts from top of converter housing. On all models, raise car and drain transmission *(see "Draining & Refilling" above).*

2) Remove dust shield from bottom of converter housing, then disconnect cooler lines if so equipped. Disconnect drive shaft at rear and remove from transmission. Disconnect manual and throttle linkage, speedometer cable, and vacuum line at transmission. Disconnect parking brake cable from rear support, then disconnect front parking brake cable from equalizer bar.

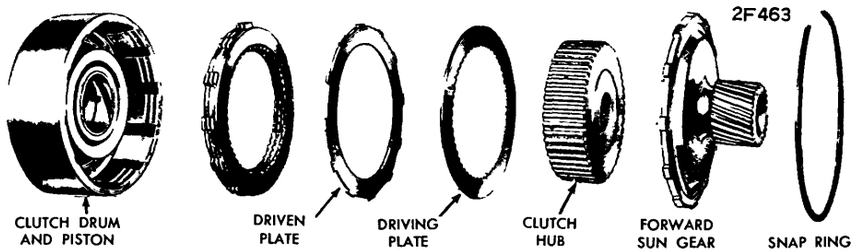
3) If so equipped, remove bolts attaching engine rear support spring to extension housing. On all models, place a transmission jack under transmission and raise it slightly to take weight off engine rear support member. On Comet & Falcon, remove bolts attaching engine rear support to underbody and move support aside. On other models, remove transmission–to–crossmember bolts, then remove crossmember–to–body bolts and remove crossmember.

4) Lower transmission and engine, then support engine with a jack stand. Remove nuts attaching converter to drive plate, and remove converter housing–to–engine block bolts. Work converter housing off engine dowel pins, and work converter pilot out of engine crankshaft. Secure converter to converter housing and lower transmission.

►*V8 ENGINE REMOVAL NOTE: On some models it may be necessary to remove part of engine exhaust system in order to remove transmission assembly.*

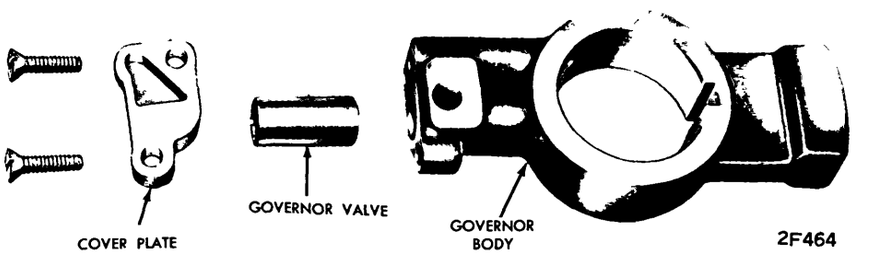
INSTALLATION: Reverse removal procedure and note the following: Tighten converter housing–to–engine block bolts to 25–30 ft. lbs. Tighten converter–to–flywheel bolts to 15–26 ft. lbs. Tighten coolant lines to 10–12 ft. lbs. With transmission completely installed and filled with fluid, run engine at idle speed and shift selector lever from "N" to "D" and from "D" to "N" at least twenty times to bleed air out of low servo release cavity. Adjust manual and throttle linkage.

GALAXIE & MONTEREY



REMOVAL: Transmission and converter are removed as an assembly.

1) Raise car and drain transmission and converter, then disconnect drive shaft at pinion flange and remove shaft Install extension housing seal replacer in extension housing seal *(see "Extension Housing Bushing and/ r Seal Replacement" above for tool number).*



2) Disconnect manual and throttle linkage at transmission, then disconnect speedometer cable from extension housing. Disconnect oil cooler lines at transmission, then remove lines from clamp at engine block Disconnect oil filler tube at transmission case.

3) Remove starter from converter housing and disconnect parking brake cables at the equalizer. Remove two engine rear support bolts from extension housing and remove support clamp.

CONTINUED ON NEXT PAGE

CLUTCH DRUM ASSEMBLY

GOVERNOR ASSEMBLY

FORD MOTOR CO. 2-SPEED AUTOMATIC TRANSMISSION (Cont.)

4) Position a transmission jack under transmission and raise it slightly to take weight off crossmember. Support rear of engine in this position with an engine support bar or stand, then remove crossmember.

5) Remove bolts attaching converter-to-flywheel and remove converter housing-to-engine block bolts. Secure converter to transmission so it will not fall out when transmission is separated from engine, then work transmission off engine block dowel pins and toward rear until converter pilot clears crankshaft. Lower transmission and remove it from car.

INSTALLATION: Reverse removal procedure and note the following: Tighten insulator-to-crossmember bolts to 23-29 ft. lbs. Tighten converter-to-flywheel stud nuts to 23-28 ft. lbs. With transmission completely installed, and filled with fluid, run engine at idle speed and shift selector lever from "N" to "D" and from "D" to "N" at least twenty times to bleed air out of low servo release cavity. Adjust manual and throttle linkage.

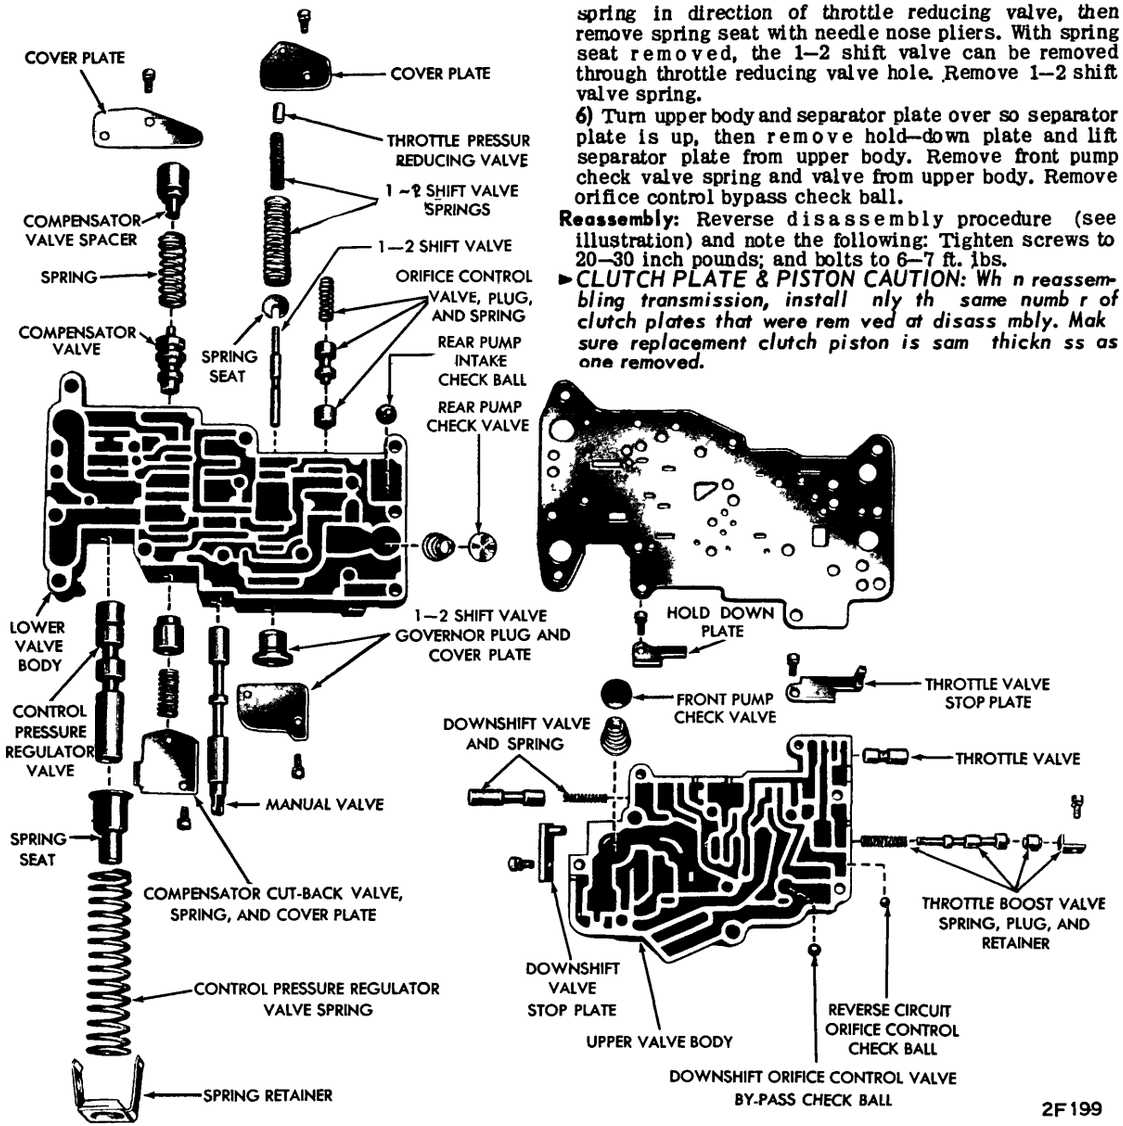
TRANSMISSION OVERHAUL

See 1959 Final Data, Page 452, or later Manual edition and note the following:

CONTROL VALVE: Disassembly – 1) Remove manual valve, then remove control pressure regulator valve spring retainer, spring and spring seat, and valve. Remove hold-down plate near compensator cut-back valve cover, then remove cover. Remove compensator cut-back valve spring and valve from lower body.

2) Remove 1-2 shift valve governor plug cover and governor plug. At opposite side of lower body, remove compensator and control pressure regulator cover plate. *CAUTION – Maintain pressure on this plate (against spring pressure) until all screws are removed.* Remove compensator valve spacer, spring and valve. *NOTE – Temporarily install hold-down plate and screw so that separator plate is held on upper body.*

3) Remove orifice control valve cover plate. Remove throttle reducing valve and spring and orifice control valve spring, valve, and plug. From upper body, remove downshift valve stop plate, then remove downshift valve and spring.



4) Remove throttle valve stop plate and throttle valve from opposite end of upper body. Remove throttle boost valve retainer, plug, throttle boost valve and spring. Remove three screws and five bolts holding upper body, separator plate, and lower body together.

5) Lift upper body and separator plate from lower body, then remove rear pump check valve and spring. Remove rear pump check ball from lower body. To remove 1-2 shift valve from lower body, compress 1-2 shift valve spring in direction of throttle reducing valve, then remove spring seat with needle nose pliers. With spring seat removed, the 1-2 shift valve can be removed through throttle reducing valve hole. Remove 1-2 shift valve spring.

6) Turn upper body and separator plate over so separator plate is up, then remove hold-down plate and lift separator plate from upper body. Remove front pump check valve spring and valve from upper body. Remove orifice control bypass check ball.

Reassembly: Reverse disassembly procedure (see illustration) and note the following: Tighten screws to 20-30 inch pounds; and bolts to 6-7 ft. lbs.

► *CLUTCH PLATE & PISTON CAUTION: When reassembling transmission, install only the same number of clutch plates that were removed at disassembly. Make sure replacement clutch piston is same thickness as one removed.*

MAIN CONTROL VALVE ASSEMBLY

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION

CRUISE-O-MATIC
F rd Galaxie (1962)
Thund rbird (1962)

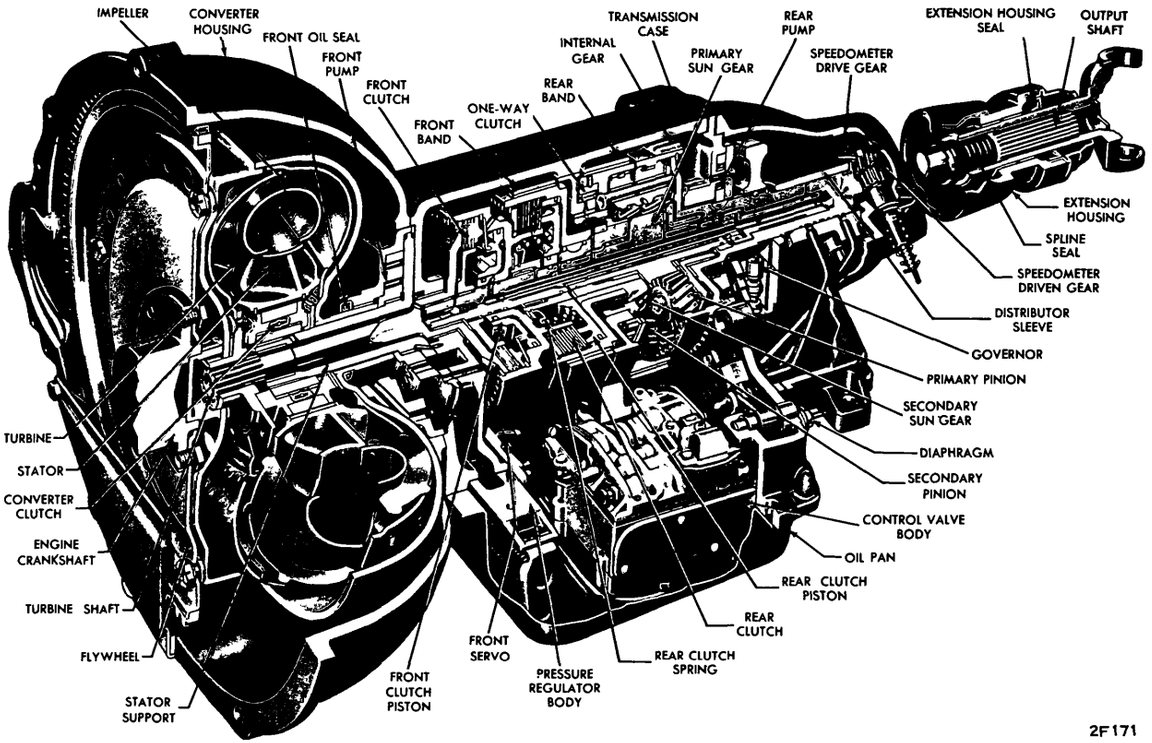
MULTI-DRIVE
M rcury Monterey (1962)

►CHANGES, CAUTIONS, CORRECTIONS



►*1962 NYLON SPEEDOMETER DRIVE GEAR NOTE:* A nylon speedometer drive gear is being installed on some transmissions in production. A steel gear is available for service replacement. If necessary to remove a nylon speedometer gear, and it does not slide off shaft freely, remove output shaft, rear pump, governor oil distributor sleeve and tubes, and the speedometer drive gear from transmission as an assembly. Remove distributor tubes from sleeve, then remove speedometer drive gear snap ring from output shaft. Move oil distributor sleeve and speedometer gear toward rear of output shaft by prying between boss on sleeve and governor counterweight. *CAUTION – Do not pry against gov rnor drive body.* Slide distributor sleeve toward front of transmission, then tap drive gear off output shaft with a brass drift or hammer. To prevent gear cocking, tap gently all the way around gear. To install nylon gear, heat to 180°F. by placing gear on a 100 watt light bulb for five minutes on each side. *NOTE – Coat g ar lib rally with automatic transmission fluid b for h ating.*

►*TRANSMISSION IDENTIFICATION NOTE:* A number of different transmission models are used on these car models as indicated in following table. For identification, refer to identification plate located on side of case, or to additional identification tag fastened on oil pan by one of the oil pan attaching bolts. On the identification plate, the prefix letters to Transmission Serial Number indicate transmission models (Example "PCD-C" followed by serial number). These same letters are used on identification tag to indicate transmission model. An additional figure on identification tag indicates detail changes made to transmission and should be referred to for service and parts replacement.

Transmission Identification

Model	Engine	Serial Prefix
Ford Pass	292"	PCC-C,D
Ford Pass	352"	PCD-C,D,D-1,F
Ford Pass	390"	PCE-G,S
Police Interceptor	390"	PCE-J, K
Thunderbird	390"	PCE-H,T
Ford Truck F-100	223"	PBC-R
Ford Truck F-100	292"	PBW-L
Ford Truck F-250	223"	PBC-M
Ford Truck F-250	292"	PBW-K
Ford Truck F-350	223"	PAU-L
Ford Truck F-350	292"	PBY-G
Ford Truck P-350,400,500	223"	PAU-M
Ford Truck P-350,400,500	292"	PBY-H
Mercury	292"	PCC-C
Mercury	352"	PCC-D
Mercury	390"	PCE-G

►*FAST IDLE OPERATION (FOR SUSTAINED PERIOD) CAUTION:* To prevent transmission overheating, do not operate engine with transmission in Neutral or Park for periods longer than 10 minutes unless fluid lever, manual and throttle linkage, and parking brake adjustments are within specifications. It is suggested the car be raised and properly supported, and operated in gear if long periods of operation at fast idle are required.

FORD & MERCURY 3-SPEED AUTOMATIC TRANSMISSION SECTIONAL VIEW

►*STARTING ENGINE BY TOWING OR PUSHING CAR:* Pushing is recommended. Place selector lever in Neutral "N" position. When car reaches 20 MPH speed, turn on ignition, move selector lever to "LO", depress accelerator pedal to half throttle position until engine begins to run. *NOTE – On ice or snow where traction not good, move selector lever to "DR" position to crank engine.*

►*TOWING CAR CAUTIONS: Do not tow at speed greater than 40 MPH and observe following precautions:*

If Transmission Operating Properly – Place selector lever in Neutral "N" position. Car can be towed normally for distances not to exceed 12 miles. **For greater distances, use same procedure as for inoperative transmission.**

If Transmission Inoperative – Tow car with rear wheels lifted off road, or disconnect and remove propeller shaft and protect rear end of transmission from entry of dirt (U-joint Knuckle, Part No. 1M-4841 can be installed and wired in place for this purpose).

DESCRIPTION

DESCRIPTION: Same design as previous dual-range automatic transmissions having a vacuum controlled throttle valve. The spring loaded vacuum diaphragm unit mounted on rear of transmission case is actuated by engine vacuum against spring pressure. At high engine vacuum, diaphragm moves against spring pressure to move pushrod away from throttle valve, cutting off throttle pressure. As vacuum drops, spring loaded diaphragm moves pushrod to open throttle valve and increase throttle pressure. A transmission oil cooler is provided on all models.

OPERATION

OPERATION: Same as for 1957 models (*see "Ford-O-Matic, Merc-O-Matic & Turbo-Drive Transmissions" in 1957 Final Data, or later Manual editions and note the following*). On dual-range transmissions, with selector lever in "Dr 1" range, the car starts in first gear and upshifts to 2nd, then to 3rd. With selector lever in "Dr 2" range, the car starts in 2nd gear (same as for single range type transmissions) and upshifts to 3rd gear. Power flow through dual-range transmission is same as for single range type transmissions except that with selector lever in "Dr 1" range, the pinion carrier is held against rotation by a one-way sprag clutch instead of rear band. First gear in "Dr 1" range is the only gear that uses the sprag clutch.

LUBRICATION

Checking Fluid Level: Check fluid level every 4000 miles (Ford, Thunderbird, Mercury); 1000 miles (Ford Truck - On highway operation); Daily (Ford Truck - Off highway operation). Apply hand brake, place selector lever in "N" position, then run engine at fast idle

CONTINUED ON NEXT PAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (Cont.)

speed to bring transmission to normal operating temperature. Move selector lever through all positions in turn, then move selector lever to "P" (Park) position. Check fluid level and add recommended transmission fluid as required to bring level to "F" (Full) mark on dipstick.

Recommended Fluid – Automatic Transmission Fluid Type "A" (Suffix "A").

► *TRANSMISSION DRAINING & REFILLING NOTE: Periodic draining and refilling is not recommended, except at time of overhaul.*

Capacity (All Models) – 10 qts. (drain & refill); 11½ qts. (transmission dry).

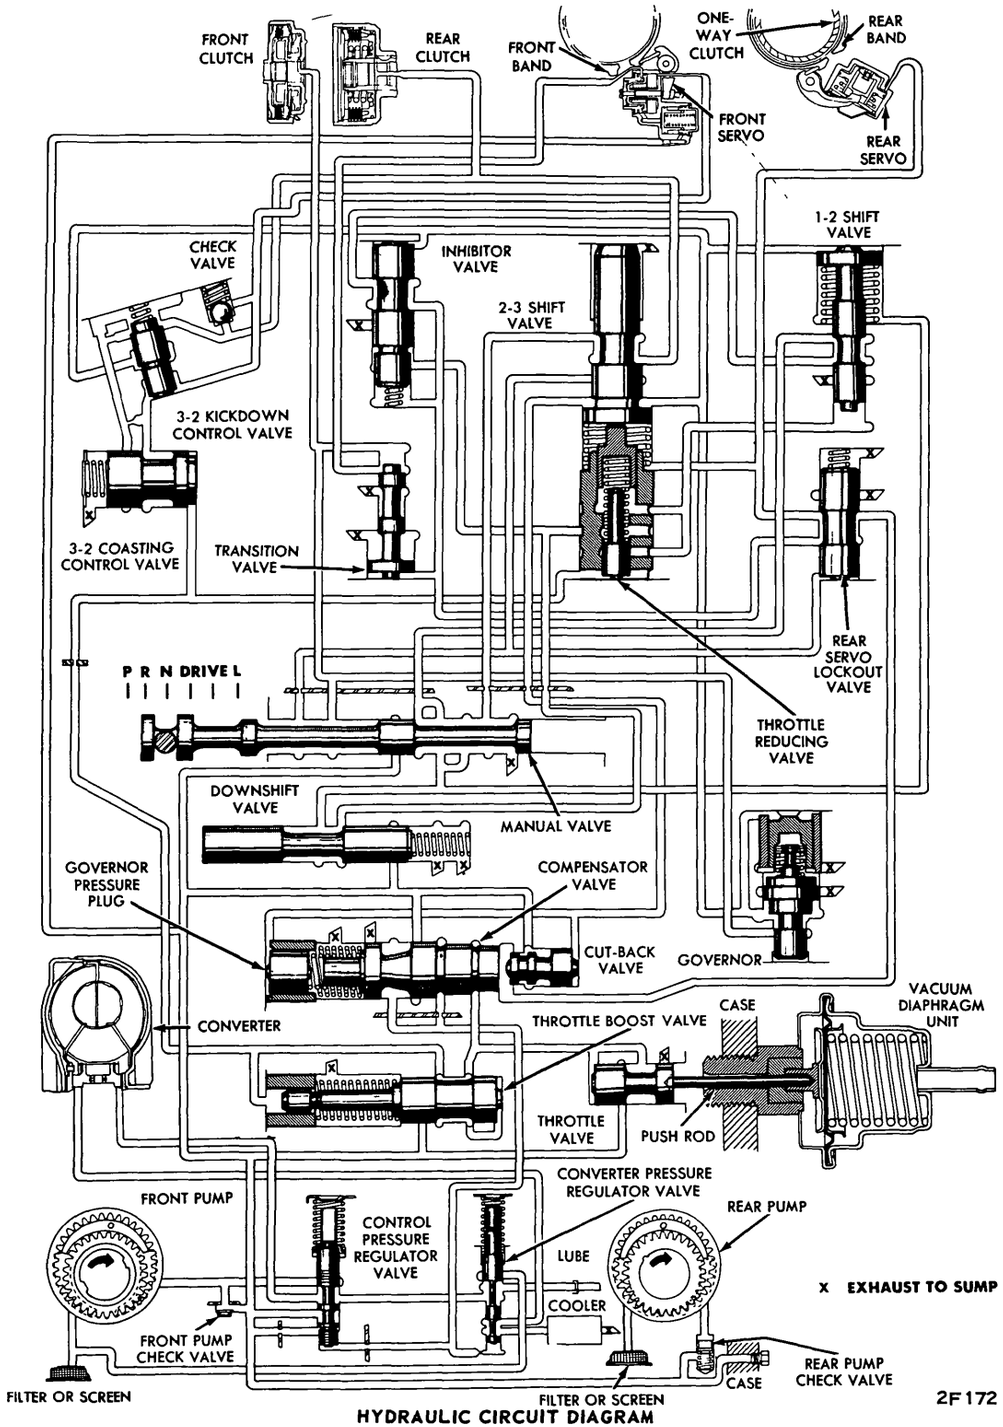
Draining & Refilling: *NOTE – Not recommended except at time of transmission overhaul.* Remove converter housing lower cover and drain converter by removing one drain plug, then rotate engine 180° and remove second drain plug. Disconnect oil filler tube from transmission oil pan to drain fluid from transmission. Tighten converter drain plugs to 15–28 ft. lbs., then install transmission filler tube. Install 5 qts. of recommended fluid, then start engine and allow to run 2-4 minutes at idle speed. Add remaining amount of fluid (see above) and bring engine and transmission to normal operating temperature. Place transmission in "P" (Park) position and check fluid level. Add fluid to bring level up to "F" (Full) mark on dipstick. *CAUTION – Correct fluid level should be determined by dipstick reading rather than actual quantity of fluid installed.*

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment: *See CARBURETOR on car model pages.*

FORD PASS. CARS & MERCURY (EXC. THUNDERBIRD)

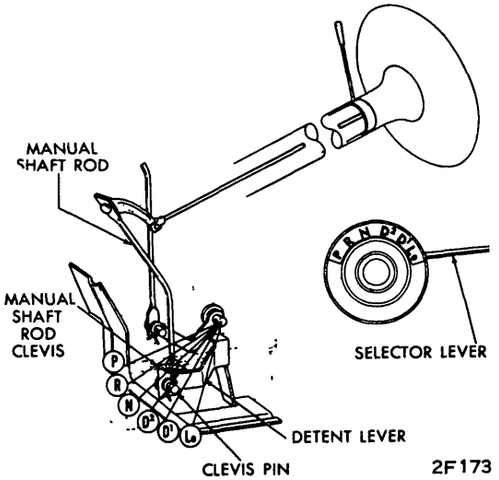
Manual Linkage Adjustment: With engine stopped, loosen clamp at shift lever on lower end of steering column so shift rod is free to slide in clamp. Position selector lever in "D1" position, then shift manual lever on transmission to "D1" position (second from rear). Tighten clamp on shift rod, then check pointer alignment for all selector lever detent positions.



THUNDERBIRD

Manual Linkage Adjustment: With engine stopped, loosen nut at lower end of manual shift rod on transmission shift lever. Position manual selector lever so pointer is against steering column stop in "D1" position (large green dot is "D1" position). Move shift lever on transmission to "D1" detent position (second from bottom), then tighten nut on shift rod and shift lever. Check pointer alignment for all positions of selector lever and reset if necessary.

FORD TRUCK



Manual Linkage Adjustment: With engine stopped, disconnect upper end of manual shift rod from selector lever, then position lever so pointer is down against steering column stop in "Dr" position (Fordomatic); "D1" position (Cruise–O–Matic). Shift manual lever on transmission to second detent position from bottom. Rotate adjusting sleeve on manual shift rod until pin can easily be inserted in lever, then lengthen rod by **turning adjusting sl v tw full turns.** Lock adjusting sleeve in position and connect rod to selector lever. Check pointer alignment for all positions of selector lever.

CONTINUED ON NEXT PAGE

HYDRAULIC CIRCUIT DIAGRAM

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (Cont.)

MANUAL SHIFT LINKAGE

NEUTRAL SAFETY SWITCH ADJUSTMENT

Ford Pass. Cars (Exc. Thunderbird): Loosen switch–to–steering column attaching screws at lower end of steering column, then shift selector lever to "N" (Neutral) position. Move switch in elongated mounting holes until a .090" gauge pin can be inserted through switch housing and into switch plate. With gauge pin in place, tighten attaching screws, then remove gauge pin. Check starter circuit in all selector lever positions. Starter circuit should be open in all positions except "N" or "P".

Thund rbird & Mercury: Switch is located on lower side (Thunderbird); upper side (Mercury) of steering column (inside drivers compartment). To adjust, loosen steering column–to–switch attaching screws and position switch so starter circuit is closed when selector lever is in "N" or "P" positions, then tighten attaching screws. *NOTE – Starter circuit must be open in all positions except "N" or "P"*

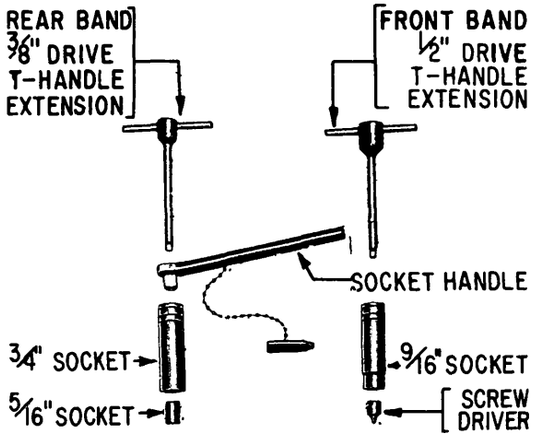
Ford Trucks: Loosen screws attaching switch to bracket on steering column, then position switch so that starter circuit is closed when selector lever is in "N" or "P" positions. *NOTE – Circuit must be open in all other positions.* Tighten attaching screws and check operation in all lever positions.

BAND ADJUSTMENT

► *BAND ADJUSTMENT NOTE: Adjust bands every 12,000 miles under normal operation. For severe operation, adjust bands more frequently as required.*

FRONT BAND ADJUSTMENT (Except Mercury): Drain fluid from oil pan and remove pan and oil screen. Loosen front servo adjusting screw locknut two full turns and check adjusting screw for free rotation in actuating lever. Pull adjusting screw end of actuating lever away from servo body and insert adjusting tool gauge block (part of Tool T58L–7195–A) between servo piston stem and adjusting screw. *NOTE – See illustration for details of Tool T58L–7195–A and other tools required for front band adjustment.* Install special ½" drive socket handle on 9/16" deep socket, then insert special T–handle extension through socket handle and socket, and install screwdriver socket on end of T–handle extension. Place assembled tools on adjusting screw so screwdriver socket engages adjusting screw and 9/16" socket engages adjusting screw locknut. With a torque wrench on T–handle extension, tighten adjusting screw to 10 inch pounds, then **back off screw exactly one full turn.** *CAUTION – Damage will result to transmission if adjusting screw is not backed off exactly one full turn.* Hold adjusting screw stationary and tighten locknut to 20–25 ft. lbs. Remove gauge block, install screen and oil pan and refill transmission with fluid.

Mercury: Drain transmission and remove oil pan and screen, then loosen front servo adjusting screw locknut two full turns. Pull back on actuating rod and insert Gauge Block, Tool 7225–C13–B (part of Tool T–7225–C) between front servo piston stem and adjusting screw. Tighten adjusting screw until wrench overruns, **then back off adjusting screw exactly one complete turn,** hold adjusting screw and tighten locknut to 20–25 ft. lbs. *CAUTION – Damage will result to transmission if adjusting screw is not backed off exactly one full turn.* Install screen and oil pan and refill transmission with fluid.



REAR BAND ADJUSTMENT (Except Mercury): On all models except Thunderbird, fold back floor mat at right side of floor pan and remove access hole cover. On Thunderbird, remove console and right side heater duct floor director, then remove access hole cover. On all models, place socket handle (part of Tool T58L-7195-A) on ¾" deep socket. *NOTE – See illustration for details of Tool T58L–7195–A and other tools required for rear band adjustment.* Insert special 3/8" drive T–handle extension through handle and socket, then install 5/16" 8–point socket on extension. Insert assembled tools ir access hole so that adjusting screw and locknut are engaged. Loosen adjusting screw locknut and tighten adjusting screw to 10 ft.- lbs. Remove torque wrench from T–handle extension and **back off adjusting screw exactly 1½ turns.** *CAUTION – Damage will result to transmission if adjusting screw is not backed off exactly 1½ turns.* Hold adjusting screw stationary and tighten locknut to 35–40 ft. lbs.

Mercury: Fold back floor mat on right side and remove access hole cover. Loosen band adjusting screw locknut with Tool 7195–C, then use T–handle portion of tool to tighten adjusting screw until wrench overruns. *CAUTION – If screw is found to be tighter than wrench capacity (10 ft. lbs.), loosen screw and retighten until wrench overruns.* **Back off adjusting screw 1½ turns,** then tighten locknut to 35–40 ft. lbs. while holding adjusting screw stationary. *CAUTION – Damage will result to transmission if adjusting screw is not backed off exactly 1½ turns.*

TESTING

► *TRANSMISSION STALL TEST NOTE: Stall test procedures are the same for "Single–Range" and "Twin–Range" transmissions. When making the stall test, never hold throttle open longer than 5 seconds.*

STALL TEST: With engine at normal operating temperature and at slow (hot) idle speed, install a tachometer on engine and apply service and parking brakes. Stall test transmission in each driving range at full throttle (do not depress accelerator through detent into kick-down position), and note engine speed (see Stall Speed Table below). *CAUTION – If engine speed exceeds maximum limits in table, release accelerator immediately.* Clutches and bands are applied in each selector lever position as follows: **"D1"** – Front clutch and one–way clutch engaged at all accelerator pedal positions. **"D2"** – Front clutch and front band applied at all accelerator pedal positions. **"L"** – Front clutch and rear band applied. **"R"** – Rear clutch and rear band applied. *NOTE – Engine over-speeding is an indication of clutch or band slippage.*

TOOL T58L-7195-A 2F174

FORD BAND ADJUSTING TOOL

ENGINE STALL SPEEDS

Engine	Engine RPM
Pass. Car 292" Eng	1500–1700
Pass. Car 352" Eng	1600–1800
Pass. Car 390" Eng (Std.)	1800–2000
Pass. Car 390" Eng (Police)	1850–2050
Truck 223" Eng	1400–1600
Truck 292" Eng	1520–1720

SHIFT TESTS (Twin–Range Transmissions With Vacuum Throttle Control):

1–2, 2–3 Upshift (Minimum Throttle): Place selector lever in "D1" range. Starting from a standstill, transmission should start in first gear and shift to second, then at a higher speed, shift to third.

3–2, 2–1 Downshift (Forced): With transmission in third gear, depress accelerator pedal to floor (through detent). Transmission should shift from third to second, or from third to first, depending on car speed.

3–1 Downshift (Minimum Throttle): Coasting down from approximately 30 MPH in third gear, transmission should downshift from third to first. *NOTE – A 3–2–1 downshift may be experienced under the above conditions.*

3–2, 2–1 Downshift (Partial Throttle): With transmission selector lever in "D1" position and car speed at approximately 30 MPH, depress and hold accelerator at half throttle position and at the same time apply service brakes to a point where road speed is slowly decreased. The 3–2 and 2–1 shifts should occur as road speed decreases.

CONTROL PRESSURE TESTS (PASS. CARS): Attach tachometer and vacuum gauge to engine, then attach a pressure gauge to control pressure outlet at rear of

CONTINUED ON NEXT PAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (C nt.)

transmission case. Apply parking brake and adjust idle speed to 450–475 RPM with transmission selector lever in "D1" or "D2" position. *NOTE – If idle speed cannot be brought within limits by adjusting carburetor throttle stopscrew, check throttle and downshift linkage for binding and check for vacuum leakage at transmission diaphragm unit.* With engine at indicated idle speed and engine vacuum at 18.0" Hg., control pressure should be as indicated in table below. If control pressure is within these limits, place selector lever in "D1" or "D2" and apply service brakes. Advance throttle until engine vacuum drops below 16–13.7" Hg. As vacuum gauge reading passes through this range (16–13.7"), transmission control pressure should start to rise and continue to rise with throttle opening until maximum control pressure for stall in "D1" or "D2" is obtained. *NOTE – In "P", "L" or "R", control pressure rise is not dependent on diaphragm unit. When selector lever is shifted into these positions and engine speed is increased, control pressure should rise immediately and reach maximum before engine speed reaches stall RPM.*

CONTROL PRESSURES

Ford Pass. Cars, Thunderbird & Mercury (Except Police Cars)

Engine Speed	Lever Position	Pressure
Idle	N, D1, D2	57–72 lbs.
Idle	P, R, L	57–213 lbs.
Stall	D1, D2	145–170 lbs.
Stall	R, L	201–213 lbs.

Police Cars

Engine Speed	Lever Position	Pressure
Idle	N, D1, D2	70–95 lbs.
Idle	P, R, L	70–228 lbs.
Stall	D1, D2	170–200 lbs.
Stall	R, L	212–228 lbs.

CONTROL PRESSURE TEST (TRUCKS): Install a pressure gauge to pressure take-off tube in engine compartment (located to rear of carburetor), then install a tachometer on engine and bring engine to normal operating temperature. Adjust engine to correct idle speed, then set hand brake and place selector lever in "D1" or "D2". Check idle pressure which should be within specifications (see table below). Increase engine speed and note control pressure indicated on gauge. If pressure is not within limits, adjust throttle control rod to obtain required pressure, then recheck idle pressure. With selector lever in one of the above positions, increase engine speed to stall condition and note pressure and engine RPM which should be within specifications.

Ford Trucks

Engine Speed	Lever Position	Pressure
Idle Speed	All	57–67 lbs.
1000 RPM	D1 or D2	80–85 lbs.
Stall	D1 or D2	153–170 lbs.
Stall	R or Lo	203–214 lbs.

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Raise car on hoist and remove transmission oil pan, and control valve assembly, Proceed as follows:

Fr nt Clutch: Apply pressure to front clutch and governor input passage (see illustration). Listen for dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of system.

Governor Valve: Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

Rear Clutch: Apply air pressure to rear clutch oil passage (see illustration). Listen for a dull thud to indicate clutch is operating. Check for leaks in same manner as for front clutch (above).

Rear Band & Servo: Apply pressure to rear servo oil passage (see illustration), and observe band application.

Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application.

►*TESTING NOTE: If servos, bands, clutches, and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" in OVERHAUL BELOW.*

TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Make corrections in sequence shown, testing operation of transmission after each correction.*

SEVERE ENGAGEMENT ("Lo", "Dr", or "R" Ranges): Check engine idle speed and throttle linkage adjustments. Adjust rear band. Perform a control pressure test. Remove and clean main control valve assembly and pressure regulator valve.

TRANSMISSION CASE OIL PASSAGES

1–2, 2–3 SHIFT POINTS LOW, HIGH, OR ERRATIC: Check fluid level. Adjust throttle and manual linkage. Check governor operation. Perform a pressure control test. Remove and clean main control valve assembly and pressure regulator valve.

SEVERE 2–3 SHIFT: Adjust throttle linkage. Adjust front band. Remove and clean main control valve assembly and pressure regulator valve. Remove and inspect front servo.

ENGINE OVERSPEEDS (2–3 SHIFT): Adjust front band. Remove and clean main control valve assembly.

NO 1–2 OR 2–3 SHIFTS: Remove and inspect governor. Remove and clean valve assembly. Rear clutch slippage. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

NO FORCED DOWNSHIFTS: Adjust throttle linkage. Perform control pressure check. Remove and clean main control valve assembly. Check operation of inner and outer throttle levers.

SEVERE 3–2 OR 3–1 SHIFTS (CLOSED THROTTLE): Check engine idle speed and throttle linkage. Remove and clean main control valve assembly.

SLIPPAGE OR CHATTER IN 2ND SPEED: Check fluid level. Adjust throttle linkage. Adjust front band. Check control pressure. Clean main control valve and pressure regulator assemblies. Front servo not performing properly. Front clutch slipping. Leakage in hydraulic system.

SLIPPAGE OR CHATTER IN 1ST SPEED: Check fluid level. Adjust throttle linkage. Adjust rear band. Clean main control valve and pressure regulator assemblies. Check inner and outer throttle levers. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

SLIPPAGE OR CHATTER IN REVERSE: Check fluid level. Adjust throttle linkage. Adjust rear band. Check control pressure. Clean main control valve and pressure regulator assemblies. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

NO DRIVE IN "DR" OR "D2" RANGE: Adjust front band. Clean main control valve assembly. Make an air pressure check. Front clutch slipping. Leakage in hydraulic system. Fluid distributor in output shaft faulty.

CONTINUED ON NEXT PAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (Cont.)

NO DRIVE IN "D1" RANGE: Adjust manual linkage. Rear pump not operating properly. Planetary one-way clutch not operating properly.

NO DRIVE IN "R" RANGE: Adjust rear band. Rear servo not operating properly. Clean main control valve assembly. Make an air pressure check. Rear clutch not operating. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

NO DRIVE IN "LO" RANGE: Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Clean main control valve assembly. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

NO DRIVE IN ANY RANGE: Check fluid level. Adjust manual linkage. Check control pressure. Clean main control valve and pressure regulator assemblies. Make an air pressure check. Leakage in hydraulic system.

LOCKUP IN "DR" RANGE: Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Front servo not operating properly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

LOCKUP IN "R" RANGE: Adjust front band. Front servo not operating properly. Front clutch slipping. Check parking linkage. Leakage in hydraulic system.

LOCKUP IN "LO" RANGE: Adjust front band. Front servo not operating properly. Clean main control valve assembly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

PARKING LOCK BINDS OR WILL NOT HOLD: Adjust manual linkage. Check parking linkage.

UNABLE TO START ENGINE BY PUSHING: Check fluid level. Adjust manual linkage. Clean main control and pressure regulator valve assemblies. Rear pump not operating. Leakage in hydraulic system.

TRANSMISSION OVERHEATING: Converter cooling air passages blocked. Oil cooler and connections faulty. Clean pressure regulator assembly. Converter one-way clutch slipping or faulty.

ENGINE RUNAWAY ON FORCED DOWNSHIFT: Adjust front band. Clean main control valve and regulator valve assembly. Front servo not operating properly. Leakage in hydraulic system.

MAXIMUM SPEED BELOW NORMAL (POOR ACCELERATION): Converter one-way clutch not operating properly.

NO 2-1 DOWNSHIFT: Adjust throttle linkage. Clean main control valve assembly. Rear servo not operating properly.

NO 3-1 DOWNSHIFT: Adjust engine idle speed and throttle linkage. Remove and clean main control valve assembly.

NOISE IN NEUTRAL: Clean and inspect pressure regulator. Engine rear oil seal faulty. Front clutch not releasing properly. Front pump faulty.

NOISE IN 1ST, 2ND OR REVERSE SPEEDS: Clean and inspect pressure regulator. Fault in planetary assembly. Front or rear clutch faulty. Front pump faulty.

NOISE IN PARK RANGE: Clean and inspect pressure regulator. Front pump faulty.

NOISE WHEN COASTING IN NEUTRAL (20-30 MPH) WITH ENGINE OFF: Rear pump faulty.

MINOR REPAIRS (TRANSMISSION IN CAR)

► *MINOR REPAIR NOTE: The following transmission units can be removed for repair without removing transmission assembly from car. Raise car on a hoist for these operations, then drain fluid from transmission and remove oil pan. For disassembly and overhaul of these units, see OVERHAUL (TRANSMISSION UNITS) below.*

GOVERNOR: Removal – *NOTE – It is not necessary to remove transmission oil pan for this operation.* Remove governor inspection cover from extension housing, then rotate drive shaft until governor is in line with inspection hole. Remove governor valve body from counterweight. *CAUTION – Do not drop attaching bolts or governor parts into extension housing.*

Installation: Lubricate governor valve parts with transmission fluid and make sure valve works freely in body bore. Install governor valve body on counterweight so that valve body cover is facing rearward, then tighten attaching bolts securely. Install inspection cover and a new gasket and tighten screws to 20–30 inch pounds.

CONTROL VALVE BODY: Removal – Drain fluid from oil pan, then disconnect hose from vacuum diaphragm and remove diaphragm from transmission case. *CAUTION-Use a tool such as FCO-24. DO NOT USE pliers or a pipe wrench on diaphragm housing.* Remove oil pan and gasket, then remove screen retaining clip and screen. Remove two tubes which connect to pressure regulator and to control valve body (not necessary to remove regulator lubrication tube). Loosen front servo attaching bolt three turns, then remove three control valve body attaching bolts, and lower valve body while pulling it off the front servo oil tube.

Installation: *NOTE – Before installing control valve body, check for bent manual valve by rolling valve on a flat surface.* Install but do not tighten attaching bolts, then install the two tubes to pressure regulator and control valve body. Move control valve body toward center of case as far as attaching bolts will allow, then tighten attaching bolts to 8–10 ft. lbs. Turn manual valve one full turn in each detent position and check for binding. If valve binds against actuating pin in any detent position, loosen valve body attaching bolts and move body away from center of case only enough to relieve binding. Retighten attaching bolts and check for binding. Position pushrod in bore of vacuum unit, then using diaphragm as a guide, insert pushrod into threaded opening of case. Tighten diaphragm unit to 20–30 ft. lbs. Complete installation by reversing removal procedure.

FRONT SERVO: Removal – Drain fluid from transmission, then remove oil pan and screen. Remove vacuum diaphragm and pressure regulator lubrication tube. Loosen three control valve body attaching bolts, then remove bolts attaching front servo to case. Hold strut with fingers and remove servo.

Installation: Position front band forward in case with ends of band facing downward. Align large end of servo strut with servo actuating lever, and align small end with band end. Rotate band, strut, and servo to align anchor end of band with anchor in case. Push servo body onto control valve body and pressure regulator tubes, then install and tighten attaching bolt to 30–35 ft. lbs. Tighten control valve body attaching bolts to 8–10 ft. lbs. *NOTE – Check clearance between manual valve and actuating pin (see "Control Valve Body" above).* Install pressure regulator lubrication tube, then adjust front band *(see "Adjustments" above).* Install vacuum diaphram unit, fluid screen and oil pan, then fill transmission with fluid. Adjust downshift and manual linkage.

REAR SERVO: Removal – Remove control valve body (see above) and two front servo oil tubes. Remove attaching bolts from rear servo, hold actuating and anchor struts with fingers, and remove servo.

Installation: Position servo anchor strut on servo band, and rotate band to engage strut, then hold strut in position with fingers and position actuating lever strut, and install servo. Install servo attaching bolts (longer bolt in inner bolt hole) and tighten to 40–50 ft. lbs. Complete installation by reversing removal procedure, then adjust rear band *(see "Adjustments" above).*

PRESSURE REGULATOR: Removal – Drain transmission and remove oil pan and screen, then remove pressure regulator lubrication tube. Remove the small compensator pressure tube and the large control pressure tube from control valve body and pressure regulator. Remove pressure regulator spring retainer, springs, and spacer. *CAUTION – Maintain pressure on retainer to prevent springs from flying out.* Remove pressure regulator attaching bolts and washers, and remove regulator. *NOTE – Leave pressure regulator-to-front servo tube in servo body.*

Installation: Reverse removal procedure. *NOTE – Make sure converter pressure and control pressure valves operate freely in bores.*

EXTENSION HOUSING BUSHING & REAR SEAL REPLACEMENT: Remove propeller shaft from transmission output shaft. If rear seal only is to be replaced, remove seal with a tapered chisel. If bushing is being replaced, install Tool T57P-7697-A and remove bushing and seal. Install new bushing with Tool T57P-7697-B. Before installing new seal, inspect sealing surface of universal joint yoke for scores. If scored, replace yoke. Inspect counterbore of housing and polish off any burrs with crocus cloth. Drive a new seal into housing using Tool T61-7657-B, firmly seating it in bore. Coat inner diameter of seal with a suitable lubricant, then coat universal joint spline with lubricant and install propeller shaft.

OIL COOLER FLUSHING: *NOTE – Use the following procedure when clutch or bands fail or other internal trouble has occurred in transmission.* Disconnect fluid return line from rear of transmission, then start engine and drain about two quarts of fluid from cooler. If there is no fluid flow or fluid does not flow freely from return line, shut off engine and disconnect both lines at cooler and at transmission. Use an air hose with not more than 100 lbs. pressure to reverse flush lines and cooler, then connect both lines at cooler, and the pressure line at transmission. Start engine and check fluid flow. If fluid flows freely, connect return line at transmission and fill transmission with new fluid to specified level. If there is no flow or if flow is restricted, replace radiator. *CAUTION – Do not attempt to correct cooler or cooler line leaks by closing off the lines.*

TRANSMISSION & CONVERTER REMOVAL & INSTALLATION FORD PASS. CARS (EXC. THUNDERBIRD)

1) Place car on hoist but do not raise. Pull back floor mat and remove converter access hole covers, then remove two upper bolts attaching converter housing to engine.

2) Raise car, and remove cover from lower front side of converter housing, then drain converter and transmission *(see "Draining & Refilling" above).* Remove vacuum hose from vacuum diaphragm unit.

3) Remove flywheel to converter bolts. *NOTE – On "Dual-Range" type transmissions, install converter hub using front plate to hold converter in place when*

CONTINUED ON NEXT PAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (Cont.)

transmission is removed.

4) Disconnect battery cable at starter, and transmission to body ground cable from transmission, then remove starter.

5) Disconnect oil cooler lines from transmission, then disconnect manual and throttle linkage from transmission levers.

6) Disconnect speedometer cable from extension housing, and remove drive shaft. Remove remaining converter housing–to–engine attaching bolts. Remove two engine rear support–to–transmission bolts, and raise transmission slightly to take weight off crossmember, then remove crossmember.

7) On V8 models with single exhaust, loosen and drop exhaust system to allow converter to clear muffler inlet pipe.

8) If clearance needed to remove transmission and converter assembly from car, tilt rear of assembly upward slightly and to rear of car (enough to allow removal of flywheel–to–crankshaft bolts). Move assembly to rear and remove it. *NOTE – If there is enough clearance, remove flywheel–to–converter attaching bolts, then move assembly toward rear and lower it, leaving flywheel attached to crankshaft.*

9) To install transmission and converter assembly, reverse removal procedures and note the following: Tighten flywheel housing–to–engine block bolts to 40–50 ft. lbs. Tighten converter–to–flywheel bolts to 15–28 ft. lbs.

Torque Converter Removal (From Transmission): *See "Torque Converter Overhaul" below.*

THUNDERBIRD

►*NOTE: Transmission and torque converter must be removed as separate assemblies. See "Transmission Removal (Without Converter)" below.*

FORD TRUCKS

1) Place truck on hoist, but do not raise. Remove converter access hole convers in floor pan and remove two upper converter housing–to–engine bolts. Raise truck on hoist and remove cover from lower front side of converter housing. Drain transmission and converter. (*see "Draining & Refilling" below*).

2) Remove flywheel–to–converter bolts. On V8 models, install converter housing front plate to hold converter in place during transmission removal. On 6 cyl. models, wedge converter in place.

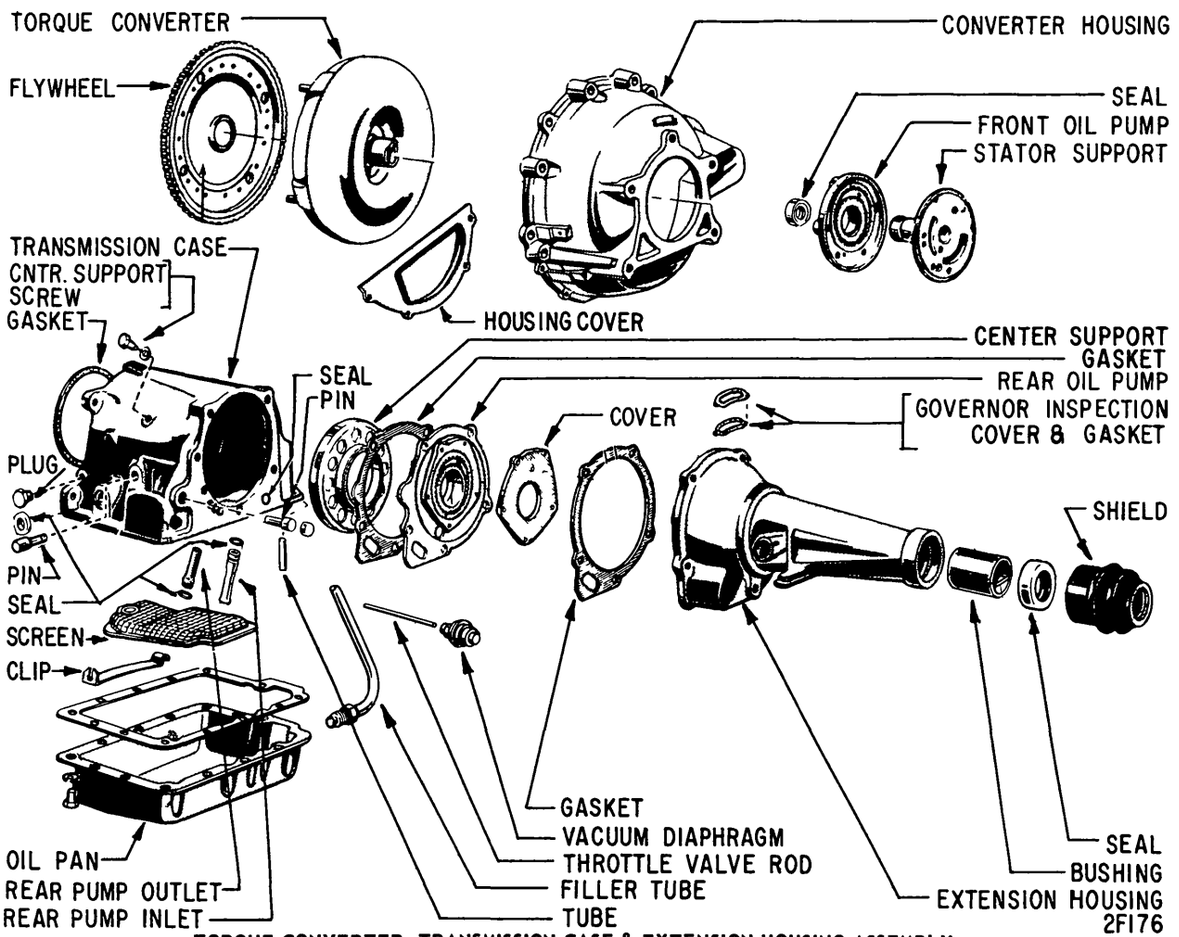
3) Disconnect starter cable at starter, then disconnect body ground cable at transmission. Remove starter. On 6 cyl. models, remove linkage splash shield. On trucks with oil cooler, disconnect water hoses at cooler.

4) Disconnect manual and throttle linkage from transmission levers, then disconnect speedometer cable from extension housing. Remove drive shaft.

5) Remove both engine rear support bolts, then raise engine and transmission high enough to remove engine rear supports. Lower engine against floor stand or engine support bar so converter housing is clear of crossmember when all weight is off transmission jack. Remove remaining converter housing–to–engine attaching bolts.

6) On V8 models with single exhaust system, loosen and drop exhaust system, to allow converter to clear muffler inlet pipe.

7) If clearance is needed to remove assembly, tilt rear of assembly upward slightly and to the rear (enough to allow removal of the six flywheel–to–crankshaft bolts). Move assembly to the rear. *NOTE: If there is enough clearance, remove flywheel–to–converter attaching bolts, then move assembly toward rear and lower it, leaving flywheel attached to crankshaft.*



8) To install transmission and torque converter assembly, reverse removal procedures and note the following: Tighten converter housing–to–engine bolts to 45–50 ft. lbs. Tighten converter–to–flywheel bolts to 15–28 ft. lbs.

Torque Converter Removal (From Transmission): *See "Torque Converter Overhaul" below.*

MERCURY

1) Connect a starter remote control to starter solenoid, then remove three converter housing–to–engine attaching bolts and the starter motor upper bolt at right side of engine.

2) Raise car and remove converter housing lower plate and drain oil from converter assembly. *NOTE – Use starter remote control to rotate converter.* Disconnect selector rod and downshift control rod at transmission, then disconnect speedometer cable and vacuum diaphragm engine vacuum tube.

TORQUE CONVERTER, TRANSMISSION CASE & EXTENSION HOUSING ASSEMBLY

3) Drain transmission and remove filler tube from transmission. Disconnect oil cooler lines at transmission, then disconnect parking brake cables at equalizer. Disconnect drive shaft at rear universal and remove driveshaft.

4) Remove converter–to–flywheel retaining nuts. *NOTE – Use starter remote control to turn flywheel.* Remove starter cable at starter and remove starter. Position a transmission jack under transmission and slightly raise transmission.

5) Remove engine rear support insulator bolts and engine rear support crossmember bolts and remove crossmember. *NOTE – If car is equipped with dual exhaust system, it may be necessary to disconnect exhaust pipes at exhaust manifolds and lower pipes to obtain clearance for removal of crossmember.*

6) Remove converter housing–to–engine lower retaining bolts, then remove transmission and converter assembly from under car.

7) To install converter and transmission assembly, reverse removal procedures and note the following: Tighten rear support insulator bolts and converter housing

CONTINUED ON NEXT PAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (C nt.)

lower bolts to 40-45 ft. lbs. Tighten converter-to-flywheel retaining nuts to 15–28 ft. lbs.

T rqu C nv rt r R m val (From Transmission): *See "T rqu Conv rt r Ov rhaul" below.*

TRANSMISSION REMOVAL & INSTALLATION (WITHOUT CONVERTER) FORD PASS. CARS & FORD TRUCKS

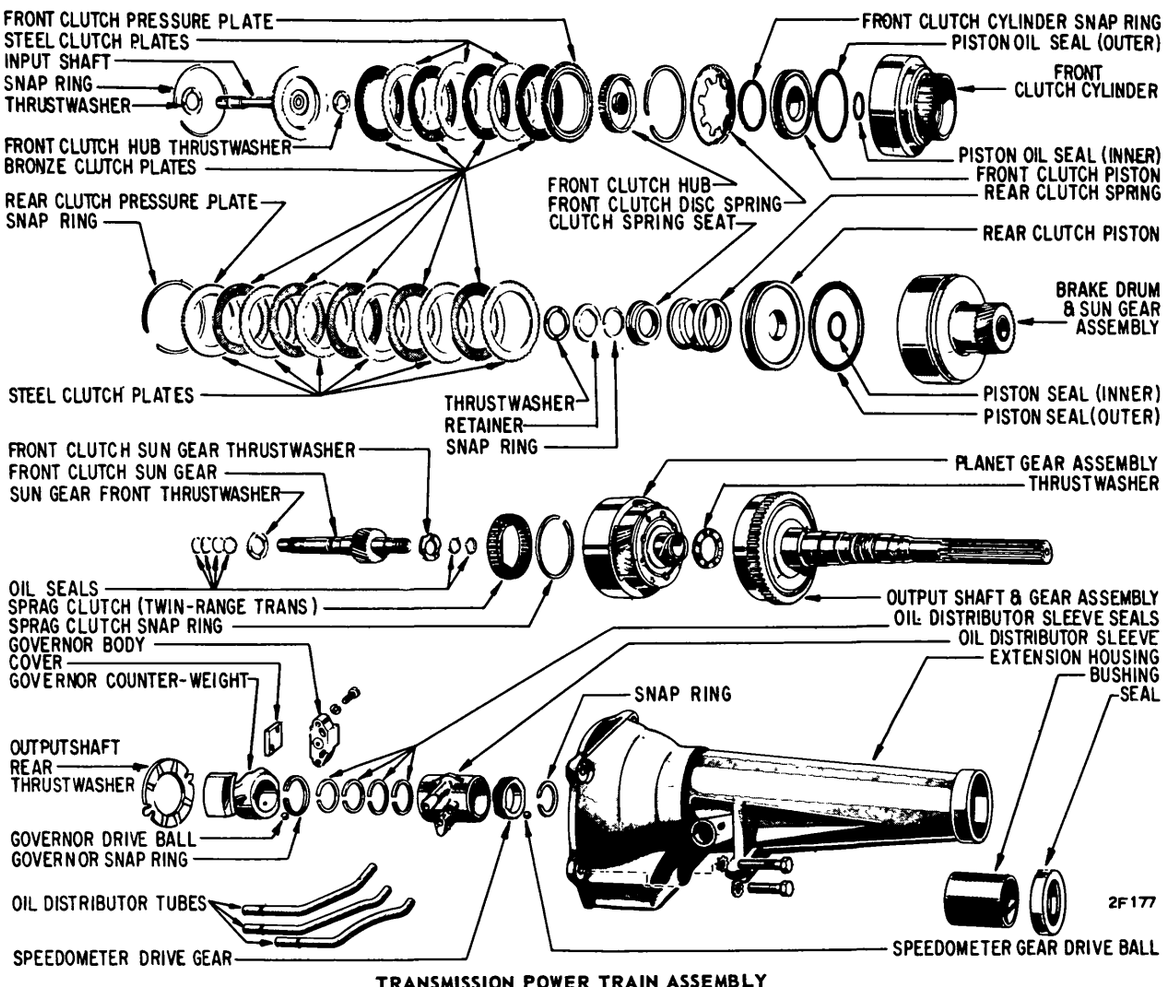
►*NOTE: Transmission and torque converter must be r mov d as an ass mbly on Sunliner models.*

1) Raise car or truck on a hoist and drain transmission and torque converter, then disconnect oil cooler lines. On truck models, disconnect water hoses from oil cooler. On Pass. Cars, disconnect vacuum tube from vacuum diaphragm unit.

2) Remove linkage splash shield, then disconnect manual and throttle linkage from transmission levers. Disconnect speedometer cable from extension housing.

TORQUE CONVERTER REMOVAL & INSTALLATION

►*TORQUE CONVERTER NOTE:* Torque converter assembly on all models is welded construction and cannot be disassembled for service. The only service required is the inspection of one–way clutch and converter endplay (converter thrust washer inspection) as noted below.



ALL MODELS

REMOVAL: Fr m Engin – With transmission assembly removed, remove stud nuts attaching converter, then install converter housing lower cover to prevent converter from falling when housing is removed. Remove starter motor, then remove converter housing-to-engine bolts. Work converter off engine dowel pins and remove housing and converter.

INSTALLATION: On Engin – Place converter in housing and retain it there by installing lower front cover. Raise housing and converter into position and start housing on engine dowel pins. Start converter housing-to-engine bolts. Remove converter housing front cover and position converter on flywheel. Install converter-to-flywheel stud nuts and tighten to 15-28 ft.lbs. Tighten converter housing-to-engine bolts to 40-45 ft.lbs., then install converter front cover and install transmission.

CONVERTER ONE–WAY CLUTCH INSPECTION: Ford Pass. Cars, Thund rbird & Trucks – Install one stator outer race holding tool in one of the four holes provided in stator, then install Tool T58L-7902-A in converter pump drive hub (as tool enters converter, the pins will engage stator clutch inner race spline). Place a torque wrench on tool. Tool (and stator inner race) should turn freely **cl ckwis** (from pump drive hub side of converter). It should lock up and hold a 10 ft. lbs. pull when wrench is turned **c unt rcl ckwis** . Try clutch for lockup and hold in at least five different locations around converter. If clutch fails to lockup and hold a 10 ft. lbs. torque, replace converter unit.

M rcury: Install Tool 7946-A in converter hub, then install torque wrench on tool. Rotate torque wrench in a clockwise direction (viewed from rear). Tool should rotate freely. If tool cannot be rotated, overrunning clutch is binding and converter must be replaced. Swing tool so steel rod is positioned against opposite pump drive lug. Apply a 10 ft. lbs. torque while attempting to rotate converter counterclockwise (viewed from rear). Rotate tool clockwise and attempt to turn converter counterclockwise at least five times. If tool fails to hold on any attempt to turn converter counterclockwise, the one–way clutch is slipping and converter must be replaced. *NOTE – One–way clutch inspection can be performed with converter installed on engine, if transmission has been removed.*

TRANSMISSION POWER TRAIN ASSEMBLY

CONVERTER ENDPLAY CHECK: Ford Pass. Cars, Thunderbird & Ford Truck – Install Tool T58L-7902-A into converter pump drive hub until it bottoms, then install guide over converter pump drive hub. Expand split fibre bushing in turbine spline by tightening adjusting nut until tool is securely locked in spline. Attach a dial indicator to tool and position indicator button on converter pump drive hub lug, then set dial indicator to zero. Lift tool upward as far as it will go and note indicator reading. If total endplay exceeds .060", replace converter unit.

M rcury: Install Thrust Washer Check Tool (endplay checking tool), Tool 7937-A, into converter pump drive hub. Tap lightly on end of tool to drive it forward to eliminate end thrust movement. Install dial indicator on rod so indicator lever rests against outside surface of converter, then pull toward rear of converter and note movement on dial indicator. If movement exceeds .060", replace converter assembly. *NOTE – Convert r endplay can be checked with converter installed on engine, if transmission is removed.*

TRANSMISSION DISASSEMBLY (INTO MAJOR UNITS)

►*TRANSMISSION DISASSEMBLY NOTE: Before removing any sub-assemblies, thoroughly clean outside of transmission case.*

1) Remove converter and converter housing, then place transmission in a suitable holding fixture. Remove oil pan, gasket, and screen clip, and lift screen off forward tube, then lift it off rear tube. Remove spring seat from pressure regulator. *CAUTION – Maintain constant pr ssure n seat to pr v nt dist rtion of*

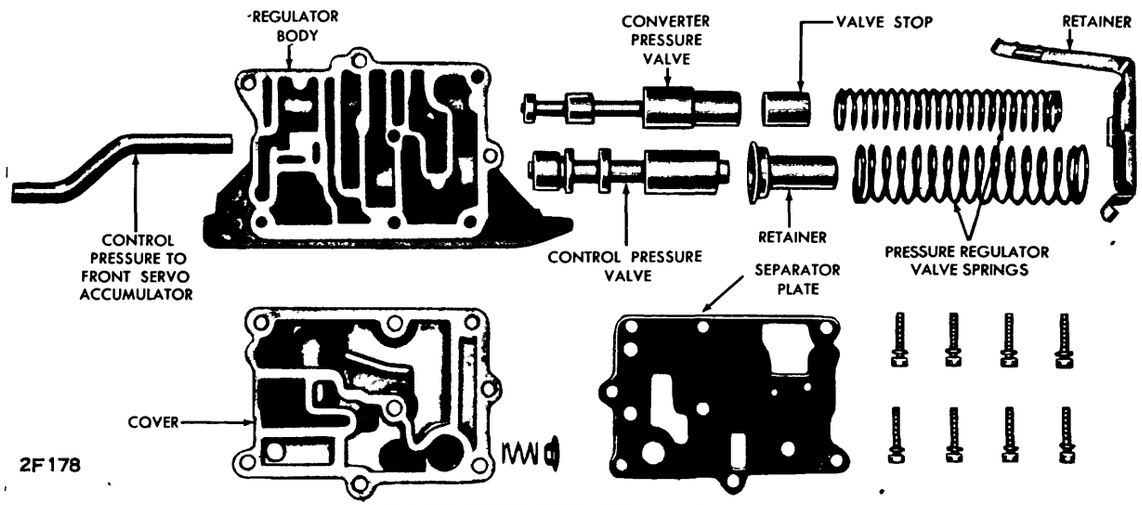
CONTINUED ON NEXT PAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (Cont.)

spring s at and sudden r l as f springs. Remove pressure regulator springs and spacers, but do not remove valves. Loosen, but do not remove, regulator body attaching screws. Remove lubrication tube from pressure regulator and rear pump, being careful not to bend or distort tubes.

2) Lift rear pump intake tube out of hole in transmission case, then remove compensator pressure tube. Remove control pressure tube from pressure regulator and control valve body. If necessary, tap tubes with a soft hammer but do not distort them. Loosen front and rear servo band adjusting screws several turns, then loosen front servo attaching bolts three turns. Remove vacuum diaphragm assembly and control rod. *NOTE – To prevent damage to diaphragm unit, use a hex wrench on hex portion of diaphragm.*

3) Remove main control valve body attaching bolts, then align internal levers to permit removal of main control valve body. Lift valve body to clear transmission case, then pull valve body off servo tubes and remove control valve assembly from transmission case. Remove pressure regulator body from case (retain control pressure valve and converter pressure regulator valve in pressure regulator to avoid damage to valves).



4) Remove front servo apply, accumulator, and release tubes, then remove front servo attaching bolts. Hold front servo strut and remove servo assembly from case. Remove rear servo attaching bolts, then hold actuating and anchor struts and remove servo from case.

5) *NOTE – At this point, check and record transmission endplay as follows:* Remove one front pump attaching bolt and mount a suitable support for a dial indicator in bolt hole. Mount a dial indicator on support so that indicator contact rests on end of turbine shaft. *NOTE– Install extension housing seal replacer on output shaft to support the shaft.* Pry front cylinder toward rear of transmission with a large screwdriver, then set dial indicator to zero. Remove screwdriver and pry units toward front of transmission by inserting a screwdriver between large internal gear and transmission case. Record indicator reading for use during transmission assembly. Endplay should be .010–.029". Remove indicator support, then remove seal replacer from output shaft.

6) Remove front pump attaching bolts and remove front pump from transmission case. Remove extension housing attaching bolts and pull housing off transmission and output shaft, being careful not to damage extension housing oil seal. Remove speedometer gear snap ring, then slide speedometer gear off output shaft. *CAUTION – Do not lose speedometer drive gear drive ball,*

7) Remove distributor sleeve and tubes from output shaft by tapping sleeve with a soft hammer. Remove four seal rings and the spacer washer from output shaft. Remove governor snap ring and slide governor off output shaft. Remove governor drive ball. Remove rear pump discharge tube using Tool 77869A or W (Ford), Tool 77869 (Mercury), from discharge passage in case.

8) Remove rear pump from case and remove extension housing and pump gaskets. Remove rear pump drive key from shaft, then remove bronze thrust washer. Hold rear drum forward and remove output shaft and the selective fit thrust washer. Remove two oil seal rings from primary sun gear shaft, and remove planet carrier. Remove thrust bearing from primary sun gear shaft, then remove thrust bearing race from inside pinion carrier. *CAUTION – Note the rear band position for reference in assembly. The end of the band next to adjusting screw has a depression in center of boss.* Squeeze ends of band together, then tilt band to rear and remove band from case.

PRESSURE REGULATOR VALVE ASSEMBLY

9) Remove two center support outer bolts from each side of transmission case. Exert enough pressure on end of turbine shaft to hold clutch units together, then remove center support and front and rear clutch assemblies as a unit.

OVERHAUL (MAJOR UNITS)

PRESSURE REGULATOR: Disassembly – Remove valves from regulator body. *NOTE – As valves are removed, check to make sure they work freely in valve bores.* Remove pressure regulator valve body cover and separator plate, then remove front pump check valve and spring from regulator cover.

Inspection: Wash all parts in solvent and blow dry with air. Inspect body and cover mating surfaces for burrs or scores. Burrs and scores can be removed with crocus cloth. Check all fluid passages for obstructions. Inspect control pressure and converter pressure valves and bores for burrs and scores. Remove all burrs with crocus cloth. Check for free movement of valves in their bores. Each valve should fall freely into its bore when both valve and bore are dry. Check valve springs to be sure they are the correct springs and inspect springs for distortion.

Reassembly: Position front pump check valve spring and valve on regulator cover, then position separator plate on cover. Position regulator cover and separator plate on regulator body, then install valves in their respective bores. *NOTE – Springs, spacers and spring retainer will not be assembled until pressure regulator is installed in transmission case.*

MAIN CONTROL VALVE BODY: Disassembly–*CAUTION – Do n t separat upper and low r valve bodies and cov r until valv s hav b en removed.* Remove manual valve, then remove throttle body and separator plate. Remove throttle valve. Remove one screw attaching separator plate to lower valve body, then remove upper body front plate. *NOTE – Upp r b dy fr nt plate is spring loaded. Apply pressur t plate whil rem ving attaching screws.* Remove compensator sleeve and plug, and remove compensator valve springs. Remove compensator valve. Remove throttle boost short valve and sleeve, throttle boost valve spring and valve. Remove downshift valve and spring, then remove upper valve body rear plate. Remove compensator cut back valve, then remove lower body side plate. *NOTE – Lower body side plate is spring l aded. Apply pr ssure to plate while removing attaching scr ws.* Remove 1–2 shift valve and spring, and the inhibitor valve and spring. Remove screws attaching separator plate to cover, then remove lower body end plate. *NOTE – Lower body end plate is spring l aded. Apply pr ssure to plate while removing attaching screws.* Remove rear servo lockout valve and spring. Remove 2–3 delay and throttle reducing valve sleeve, throttle reducing valve, spring, and the 2–3 shift delay valve. Remove 2–3 shift valve spring and valve. Remove transition valve. Remove end plate from valve body cover, then remove check ball spring and ball. Remove 3–2 kickdown control valve spring and valve. Remove 3–2 coasting control valve spring retainer from cover, then remove spring and valve. Remove through bolts and separate bodies. *NOTE – Inspect r ar pump ch ck valv f r freedom of movement (this valv s ats in low r body, is staked for a firm fit, and sh uld not be r mov d unless a new one is to be installed).*

Inspection: Clean all parts in clean solvent and blow dry with air. Inspect all mating surfaces for burrs, scratches, and flatness. Check all passages for obstructions. Inspect all valves and valve bores for free movement in bores (valves should slide in bores of their own weight when all parts are dry). Valves can be polished with crocus cloth. *CAUTION – Do not round off sharp edges of valv s and plugs.*

Reassembly: *NOTE – Lubricat all parts with aut matic transmission fluid b for installing in valv body. Wh n installing valv s and plugs in bor s, rotat thes parts to av id sh aring soft body casting.* Position separator plate on upper body (do not tighten screws).

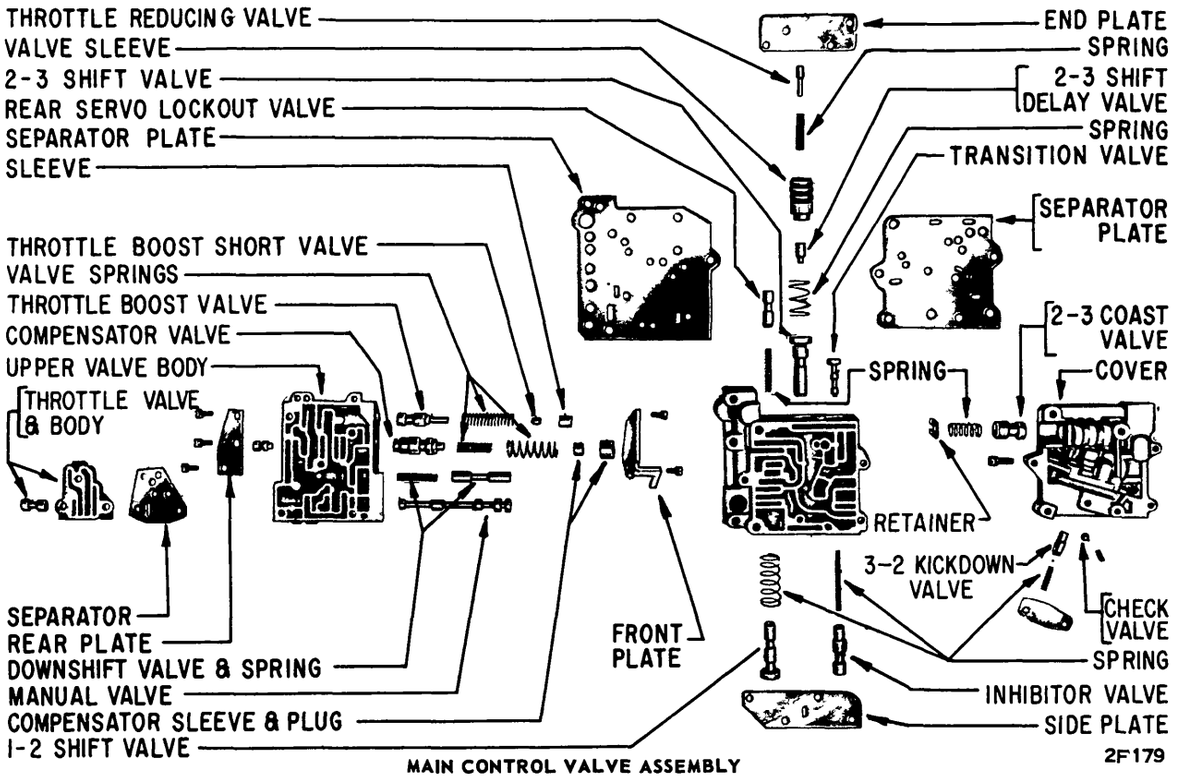
CONTINUED ON NEXT PAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (C nt.)

Make sure rear pump check valve spring, valve, and seat in lower body are correctly installed, then position lower body on upper body, and install but do not tighten attaching screw. Position cover and separator plate on lower valve body and install four bolts (do not tighten bolts). Align separator with upper and lower valve body attaching bolt holes, then install and tighten four bolts to 4–6 ft. lbs. *CAUTION – Overtightening will distort valve bodies and cause valves and plugs to stick.* Install 3–2 kickdown control valve and spring, and check ball and spring in cover. Install plate. Install 3–2 coasting control valve, spring, and spring retainer in cover, then install transition valve in lower body. Install 2–3 shift valve and spring, then install 2–3 shift delay valve and spring and throttle reducing valve in sleeve. Slide sleeve and valve into position in lower body. Install rear servo lockout valve spring and valve, then install lower body end plate. Install inhibitor valve spring and valve in lower body, then install 1–2 shift valve spring and valve and install lower body side plate. Install compensator cut back valve in upper valve body and install upper body rear plate. Install downshift valve spring and valve. Install throttle boost valve and spring, throttle boost short valve and sleeve. Install compensator valve, inner and outer compensator springs, and the compensator sleeve and plug. Position front plate, applying pressure to plate while installing two attaching screws. Install throttle valve in throttle valve body. Position separator on upper body and install throttle valve body and three attaching screws. Install four screws attaching cover to lower body, two screws attaching separator plate to upper body and one screw attaching separator plate to lower body. Tighten all body screws to 20–30 in. lbs. Install manual valve.

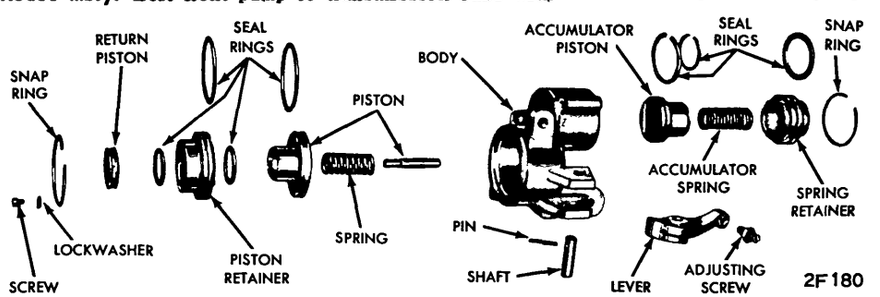
FRONT PUMP: Disassembly – Remove stator support attaching screws and remove stator support. *NOTE – Mark top surface of pump gears for correct reassembly.* Remove drive and driven gears from pump body.

Inspection: Inspect pump body housing, drive gear bushing, gear pockets, and crescents for scores. Inspect mating surfaces of pump body and cover for burrs. Inspect drive and driven gear bearing surfaces for scores, and check gear teeth for burrs. Inspect stator support splines for wear and burrs. Check fluid passages for obstructions. *NOTE – If any parts other than stator support are found to be damaged or defective, replace pump as a unit. Minor burrs or scores may be removed with crocus cloth.*



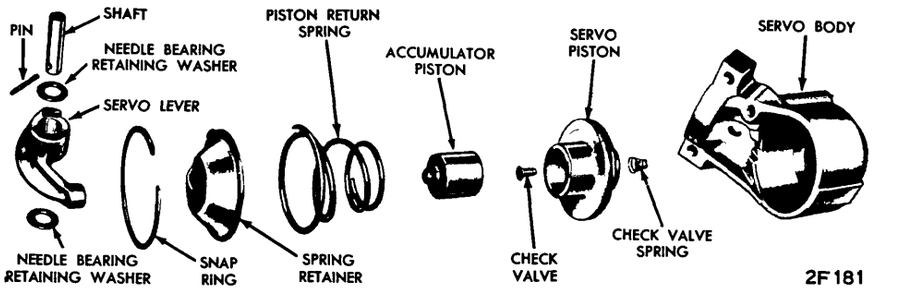
Reassembly: Bolt front pump to transmission case with capscrews, then install oil seal remover, Tool 1175-AE (Mercury) or other suitable tool and remove seal from pump body. Remove pump body from transmission case, then coat outer diameter of new seal with sealing compound and drive seal into pump body with Tool 77837 (Ford & Mercury), until it is seated firmly. Place pump driven gear in pump body with mark on gear (made at disassembly) facing upward, then install driven gear. Install stator support, single attaching screw and lockwasher and tighten securely. Check pump for free movement of pump and driven gears. *NOTE – One screw only is used to attach stator support to pump body.*

REAR PUMP: Disassembly – Remove pump cover and mark top face of pump drive and driven gear with prussian blue for correct installation of gears at assembly. Remove drive and driven gears.



Inspection: Inspect gear pockets and crescent of pump body for scores or pitting. Inspect inner bushing and drive and driven gear bearing surfaces for scores. Check all fluid passages for obstructions and check mating surfaces and gasket surfaces of pump body and cover for burrs. Inspect pump cover bearing surface for scores. *NOTE – Minor burrs or scores can be removed with crocus cloth. If any pump parts other than pump cover are defective, replace pump as a unit.*

Reassembly: Place pump driven gear in pump body with mark (made at disassembly) facing upward, then install drive gear in same manner. Install pump cover and



CONTINUED ON NEXT PAGE

MAIN CONTROL VALVE ASSEMBLY

FRONT SERVO ASSEMBLY

REAR SERVO ASSEMBLY

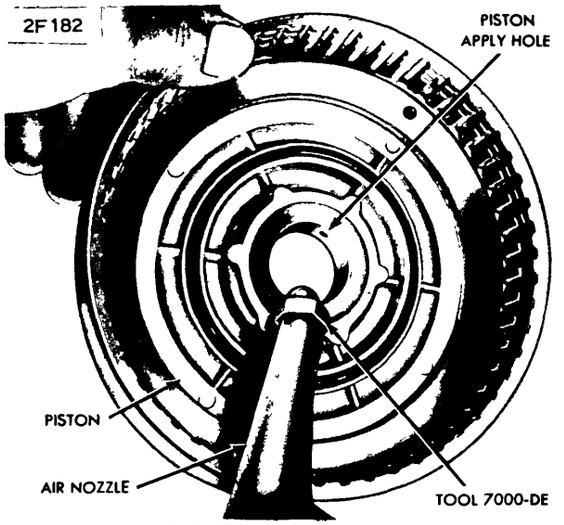
FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (Cont.)

tighten attaching screws to 25–35 inch pounds (small screws); 80–90 inch pounds (larger ¼" screws).

FRONT SERVO: Disassembly – Remove servo piston retainer snap ring. *CAUTION – Servo piston is spring loaded. Apply pressure to piston when removing snap ring.* Remove servo piston retainer, servo piston, and return spring. *NOTE – Tap piston stem lightly with a soft hammer to separate retainer from servo body.* Remove screw and plain washer from end of piston stem, separate piston retainer, return spring and servo piston. Remove all seal rings, and remove spring from servo body. Apply pressure to accumulator piston, then remove snap ring. Remove accumulator piston retainer and piston from servo body, then separate piston and retainer. Remove spring from piston (accumulator piston is the heavier of two springs). Remove seal ring from accumulator retainer and remove piston rings from accumulator piston.

Inspection: Inspect servo body for cracks or scores. Check fluid passages for obstructions. Check all parts for damage and wear. Check actuating lever for free movement. If necessary to replace actuating lever or shaft, remove retaining pin and push shaft out of bracket. *NOTE – If shaft is not retained by a pin, it is retained by serrations on one end of shaft. To remove shaft with serrations, press on end opposite serrations.* Inspect adjusting screw threads and threads in lever. Check servo spring and servo band strut for distortion. Inspect servo band lining for excessive wear and bonding to metal. *NOTE – Band should be replaced if worn to a point where grooves are not clearly evident.* Inspect band ends for cracks and check band for distortion.

R assembly: Reverse disassembly procedure.



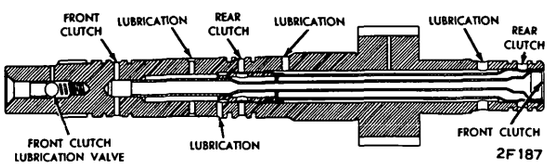
REAR SERVO: Disassembly – Remove servo actuating lever pin with a 1/8" punch, then remove shaft and actuating lever needle bearings and thrust washers. Press down on servo spring retainer and remove snap ring. *CAUTION –Release pressure on retainer slowly to prevent spring flying out.* Remove retainer and servo spring. Force piston out of servo body with air pressure (hold hand over piston to prevent damage). Remove piston seal ring, then remove accumulator piston from servo piston.

Inspection: Inspect in same manner as for front servo (see above). In addition, check orifice in servo piston for dirt. Inspect check valve in servo piston for free movement and proper seating.

Reassembly: Reverse disassembly procedure and note the following: Install servo spring with small coiled end against servo piston, then install retainer. Compress spring with a "C" clamp and install snap ring. *NOTE – Make sure snap ring is fully seated in groove.*

FRONT & REAR CLUTCHES: Disassembly – Lift front clutch from primary sun gear and rear clutch, then remove bronze and steel thrust washers from primary sun gear shaft. Remove front clutch seal rings from primary sun gear shaft. *CAUTION – Use care when removing rings as they are easily broken.* Lift rear clutch assembly from primary sun gear shaft, using care not to lose needle bearings. *NOTE – Do not rock the assembly whil lifting, to pr v nt damag to s al rings.* Remove rear clutch seal rings and thrust washer from primary sun gear shaft.

Fr nt Clutch Disass mbly – Remove front clutch snap ring, then remove turbine shaft from clutch drum. Remove fibre thrust washer from clutch hub, then remove bronze and steel thrust plates and pressure plate. Use an arbor press and Tool 77565 (Ford & Mercury) to compress Belleville spring so that clutch release spring snap ring can be removed. Remove Belleville clutch release spring from clutch cylinder. Install special nozzle, Tool 7000-DD or DE on air hose, place nozzle against clutch apply hole in front clutch housing (see illustration) and force piston from housing. Remove piston inner seal from clutch housing and outer seal from groove in piston.



FRONT CLUTCH PISTON REMOVAL

Front Clutch Inspection – Inspect clutch cylinder thrust surfaces, piston bore and clutch plate serrations for scores or burrs. Remove minor burrs or scores with crocus cloth. Check fluid passages in clutch cylinder for obstructions and clean out all passages. Inspect piston check valve for free movement and proper seating. Check release spring for distortion and cracks and replace if necessary. Inspect bronze composition, and steel clutch plates, for scored bearing surfaces, then check pressure plate. Replace any plates that are deeply scored. Check clutch plates for flatness and fit on clutch hub serrations. If plates do not slide freely on serrations, replace plates. *CAUTION – Front and rear clutch plates are different and are not interchangeable.* Check clutch hub thrust surfaces for scores and clutch hub splines for wear. Inspect turbine shaft bearing surfaces for wear. Inspect bushing in turbine shaft for scores and lubricating hole for obstructions.

Front Clutch Reassembly – Lubricate all parts with automatic transmission fluid, then install new piston inner seal ring in clutch cylinder and a new piston outer seal ring in groove of piston. Install piston in clutch cylinder, making sure steel bearing ring is in place on piston. Position release spring in clutch cylinder with concave side up, then place release spring compressor on spring and compress spring with an arbor press. Install snap ring, making sure it is fully seated in groove. *NOTE – Do not compl t ly ass mbl front clutch at this point.*

R ar Clutch Disass mbly – Remove clutch pressure plate snap ring, and remove pressure plate from drum,

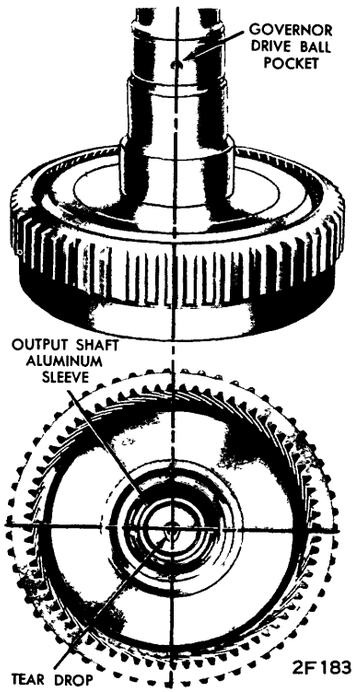
PRIMARY SUN GEAR SHAFT PASSAGES

then remove bronze and steel plates. Compress rear clutch return spring in an arbor press with Tool 77515 (Ford & Mercury), and remove snap ring. *NOTE – Guid spring retainer while releasing arbor pr ss t pr v nt retainer from locking in snap ring gr v .* Position primary sun gear shaft in rear clutch, then place an air hose nozzle in one of the rear clutch apply holes in shaft, and place a finger over other hole. Force clutch piston out of drum with air pressure. Remove clutch piston inner seal ring from clutch drum and clutch piston outer seal ring from groove in piston.

Rear Clutch Inspection – Inspect rear clutch in same manner as for front clutch (see above) and note the following: Inspect drum band surfaces, bushing, and thrust surfaces for scores. Remove minor scores with crocus cloth. Inspect needle bearing rollers for wear. Check air bleed valve in clutch piston for free movement. Position steel plates on a flat surface and check "coning" with a feeler gauge. Plates are "coned" .000–.010". *CAUTION – Front and rear clutch plat s are not interchangeable.*

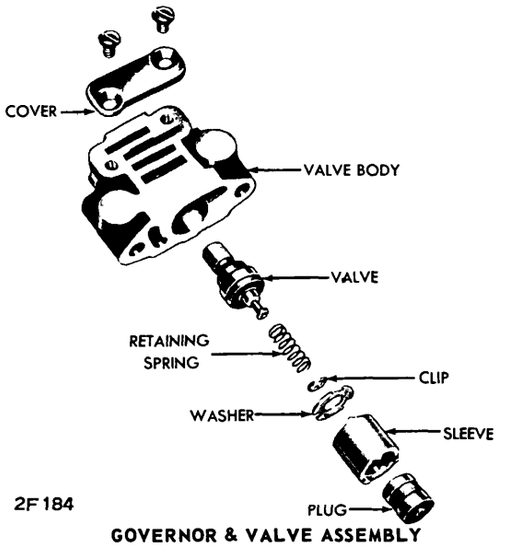
Primary Sun Gear Inspection – Check fit of seal rings in grooves of shaft and make sure they enter grooves freely without binding. Check fit of seal rings in their respective bores, then install seal rings on shaft, and check for free movement in grooves. If front clutch lubrication check valve in front of shaft is not operating properly, install a new repair kit.

Rear Clutch Reassembly – *NOTE – Lubricate all parts with automatic transmission fluid b for installation.* Install a new clutch piston inner seal on groove of clutch drum and a new seal on clutch piston, then install piston in clutch drum. Install clutch release spring and position retainer on spring. Position clutch assembly in an arbor press, and position Tool 77515 on spring retainer, then compress piston and install snap ring. *NOTE – While compr ssing spring, guid retainer into place to avoid int rf r nc of r tain r with snap ring groove.* Alternately install bronze plates and steel plates (same number of each type as removed during disassembly), starting with a steel plate. *CAUTION – Because of "coning", all st l plat s must face the same way with ith r all conv x sid s or all concave sides up.* Install clutch pressure plate with bearing surface down, then install clutch pressure plate snap ring. Make sure snap ring is fully seated.



Reassembly: Install bronze thrust washer on primary sun gear shaft, then place sun gear shaft in a suitable holding fixture. Install rear clutch on primary shaft. *CAUTION – Center the seal rings on primary sun g ar shaft to prevent breakage. If r ar clutch hub is quipp d with a needle bearing that contains loos n dl s, b sure all needles are in plac b for assembling clutch assembly on sun gear shaft.* Install steel and bronze thrust washers on secondary sun gear. *NOTE – If outer dg of ste l wash r is chamf r d on on sid , install it with chamf r d sid down.* Install the two seal rings in groove of primary shaft, making sure that rings have

CONTINUED ON NEXT PAGE



FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (C nt.)

a free movement in grooves and in their respective bores. Install front clutch housing on primary sun gear shaft by rotating clutch units to mesh plates with clutch hub. *CAUTION – Do not break seal rings on sun g ar shaft during installation.* Install front clutch hub in clutch cylinder with deep counterbore down, then install thrust washer on clutch hub. Install pressure plate in clutch cylinder with bearing surface up, then alternately install bronze plates and steel plates (same number of each type as removed during disassembly), starting with a bronze plate. *NOTE – Lubricate plat s b for installation.* Install turbine shaft in clutch cylinder and install snap ring.

OUTPUT SHAFT: Insp cti n – Inspect thrust surfaces and journals of shaft for scores and inspect internal gear for broken or worn teeth. Inspect aluminum sleeve for scores or leakage. Inspect ring grooves for burrs. Inspect keyway and drive ball pocket for wear, and inspect splines for burrs or wear. Inspect output shaft sleeve for alignment with governor drive ball (see illustration). *NOTE – Mak an additional check by inserting a piec of drill rod through g o v e r n o r pressure apply hole into c nt r of output shaft and through the aluminum sl v . If sl ve has turned, drill rod will not nt r c nt r ar a of output shaft.* Inspect external parking pawl gear teeth for damage and the speedometer drive gear teeth for burrs. *NOTE – If necessary to r plac speedom t r drive gear (nylon type), see "Nylon Speedometer Drive Gear Note" above.* If either output shaft or ring gear has been replaced, place the assembled unit, with gear face down, on a bench and push shaft downward. Check clearance between top of snap ring and its groove. If this clearance exceeds .002", replace snap ring with a thicker ring to reduce clearance to less than .002". Check rubber boot seal and stop ring at front of output shaft spline.

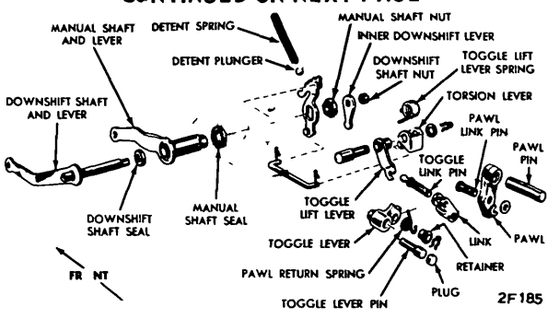
OUTPUT SHAFT & SLEEVE ALIGNMENT

GOVERNOR & VALVE ASSEMBLY

DISTRIBUTOR SLEEVE & TUBES: Inspection – Check sleeve for internal oil ring scores or wear and check oil passages for cross leaks or cracks. Check fit of each oil tube into distributor sleeve and check each tube for damage, distortion or leakage.

GOVERNOR: Disassembly – Remove governor weight retaining screws from counterweight, then remove governor valve assembly. Remove plug, sleeve, washer and valve from valve body.

Inspection: Inspect governor valve and bores for scores, and remove minor scores with crocus cloth. If valve or valve body is deeply scored, replace governor. Check for free m o v e m e n t of valve in bore. Inspect fluid passages in valve body, and counterweight for obstructions. Inspect mating surfaces of valve body and counterweight for burrs or distortion. Mating surfaces must be smooth and flat.



Reassembly: Install governor valve and spring assembly in bore of valve body, then install washer, sleeve and plug. *NOTE – Make sure the three points on end of sleeve seat in slots in washer.* Install body assembly on counterweight, aligning fluid passages in body and counterweight. Tighten attaching screws to 50–60 inch pounds. Position valve body cover on body and tighten screws to 20–40 inch pounds.

CASE & LINKAGE: Disassembly – Remove inner throttle lever shaft nut, then remove inner throttle lever. Slip outer throttle lever and shaft out of transmission case. Remove throttle shaft seal from manual lever and shaft. Remove retaining pin from each end of parking pawl torsion rod, then remove rod. Rotate manual lever until detent lever clears detent ball, then remove detent ball and spring. *NOTE – H ld n hand ov r d t nt ball whil r tating manual l v r to pr v nt l ss of spring and ball.* Remove nut securing detent lever to shaft, then remove inner lever. Slip outer manual lever and shaft out of case. Tap on toggle lever until toggle lever pin plug is removed, then remove toggle lever pin and remove pawl pin and toggle assembly. Remove pawl link pin and remove pawl pin and needle bearings. Remove manual lever shaft seal and remove vent from transmission case.

Inspection: Clean transmission case with solvent and blow out all passages. Inspect case bushing for scores, and inspect torsion lever pin for wear. Inspect case for cracks and stripped threads. Check gasket surfaces and mating surfaces for burrs. Inspect center support bushing for scores and one–way clutch for damage. Inspect torsion lever, toggle lift lever, inner throttle lever, detent lever, manual lever, and throttle lever for wear. Inspect toggle lift lever spring and detent spring for distortion. Inspect toggle link and link pin for wear. Check vent to make sure it is clean and free of obstructions.

Reassembly: Install manual lever seal in case with Tool 77288, then install vent in transmission case. Assemble link to pawl with pawl link pin, washer, and pawl return spring. Assemble toggle lever to link with toggle link pin. Position pawl return spring over toggle link pin, and secure it in place with washer and small retainer clip. Install assembly in transmission case by installing pawl pin and toggle lever pin. Install torsion lever assembly, then position spring on torsion lever with a screwdriver. *NOTE – Make certain that sh rt side of toggle does not extend beyond largest diamet r of ball on toggle lever pin. Tap toggle lever in or out as necessary to center toggle lever on ball.* Install manual lever and shaft in transmission case, then position detent lever on shaft and secure it with a nut. Tighten nut to 35–40 ft. lbs. Rotate manual lever to rear of case and position detent spring in case. Hold detent ball on spring with a 3/16" socket wrench, then depress spring until ball is flush with case. Carefully rotate manual lever to front of case to secure the ball. *NOTE – A piece of thin-walled tubing may be used to depress ball in place of the 3/16" socket.* Position ends of parking pawl torsion lever rod in detent lever and torsion lever, and secure with two small retaining pins. Install a new seal on throttle lever shaft, then install outer throttle lever and shaft in case. Position inner throttle lever on inner end of shaft with the mark "O" facing toward center of case. Install lockwasher and nut, and tighten nut to 35–40 ft. lbs.

CONTINUED ON NEXT PAGE

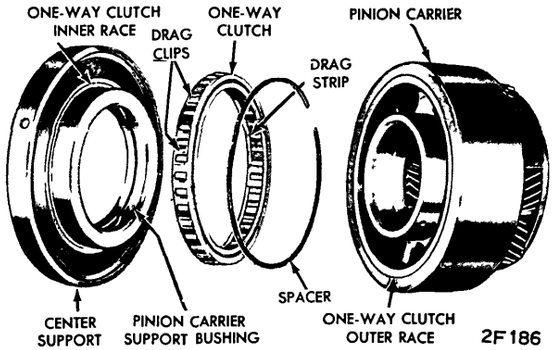
TRANSMISSION MANUAL & KICKDOWN LINKAGE

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION (Cont.)

TRANSMISSION REASSEMBLY

►*REASSEMBLY NOTE: Lubricate all parts with automatic transmission fluid before installation. Use all new gaskets and seals.*

1) Install front band in transmission case so that anchor end is aligned with anchor in case, then install clutch assemblies in case while positioning front servo band on rear clutch drum. *CAUTION – Do not allow clutch assemblies to separate during installation.*



2) On the bench, install one–way clutch on center support with flanged side of cage rings up and the drag spring down. Carefully compress each drag spring as it is started on inner race. After all drag springs are started on race, rotate clutch to tilt sprags, then push clutch all the way down on center support.

3) Install center support and one–way clutch assembly in case, then install right hand, then left hand, center support special bolts and tighten to 28–33 ft. lbs. Install rear band in case with depression in band facing anchor pin side of case. Install needle bearing thrust washers and race on primary sun gear shaft with needle bearings resting against face of sun gear.

4) Place a rubber band around one–way clutch to compress sprags. *NOTE – This may be done before or after rear band is positioned in case.* Install planet carrier through rear of case, through rear band, and onto the one–way clutch. After planet pinions are meshed, pull rubber band off the one–way clutch and push planet carrier forward as far as it will go.

5) Install selective fit thrust washer on pinion carrier. *NOTE – If endplay was not within specifications when checked before disassembly (see "Transmission Disassembly–Into Major Units" above), replace washer with one of proper thickness. Selective fit washers are available in thicknesses of .063–.061", .069–.067", .076–.074", .083–.081".*

6) Install and check oil rings on end of primary sun gear shaft, making sure that all rings are properly positioned and that ends of rings are locked together. Install output shaft, carefully meshing internal gear with pinions. *CAUTION – Do not break oil rings on sun gear shaft as output shaft is assembled.* Position rear pump drive key in keyway on output shaft, then position new front and rear gaskets on rear pump body, retaining gaskets with transmission fluid. Install thrust washer on pump body with bronze side up, aligning thrust washer tangs with bosses on pump body, then install rear pump. *CAUTION – Be sure drive key is aligned with keyway in pump drive gear.* Position governor drive ball in pocket in output shaft, then install governor assembly with governor body plate toward rear of transmission, and with groove aligned with drive ball. Install governor snap ring.

PINION CARRIER, ONE-WAY CLUTCH & CENTER SUPPORT

7) Place the four seal rings in distributor drive sleeve, and check ring gap, then install rings in grooves of output shaft. *NOTE – Check freeness of rings in output shaft by closing and releasing rings.* Install the three tubes in distributor sleeve, then install sleeve on output shaft with chamfer facing forward. Slide sleeve forward over the oil seal rings, and at the same time start tubes into case holes. *CAUTION – Use care not to damage oil seal rings on output shaft.*

8) Position governor drive gear ball in pocket of output shaft, then install speedometer drive gear and snap ring. *NOTE – If drive gear is nylon, see "Nylon Speedometer Drive Gear Note" above.* Install a new seal on rear pump outlet tube and install tube in transmission case and rear pump body. Install extension housing on transmission case and tighten bolts to 28–38 ft. lbs. *NOTE – Rolled edge of lockwashers must be toward transmission case.*

9) Position a new front pump gasket in counterbore of transmission case, then install front pump, aligning pump bolt holes with holes in case. Install three of the front pump attaching bolts and tighten to 17–22 ft.lbs. *NOTE – At this point, check transmission endplay. See "Transmission Disassembly (Into Major Units)" above. If endplay is not within specifications, it will be necessary to change thickness of thrust washer on pinion carrier assembly (see Step 5 above for thrust washer thicknesses).* Remove indicator and holding tool from pump housing and install pump attaching bolt and tighten to 17–22 ft. lbs.

10) Position front band forward in case with band ends up, then position front servo strut with slotted end aligned with servo actuating lever, and with small end aligned with band end. Rotate band, strut, and servo into position engaging anchor end of band with anchor pin in case. Locate servo on transmission case and install attaching bolts, tightening them only two or three threads. Install servo tubes, then position rear servo anchor strut, and rotate rear band to engage strut. Position rear servo actuating strut with a finger, then install servo and tighten bolts to 40–45 ft. lbs.

11) Install pressure regulator body and attaching bolts, then install tube between regulator body and front servo. Tighten pressure regulator attaching bolts to 17–22 ft. lbs. Install control and converter valve spacers and springs, then install spring retainer. Recheck springs and spacers to make sure they are seated and properly aligned. Install a new seal on rear pump intake tube and install tube in case.

12) Install main control valve assembly, carefully aligning servo tubes with control valve. Align inner downshift lever between the stop and downshift valve, then shift manual lever to "L". Align manual valve with actuating pin in manual detent lever, then install but do not tighten control valve body attaching bolts. Install main control pressure tube in valve body and regulator, and compensator pressure tube in valve body and regulator. Move main control valve body toward center of case as far as bolts will permit, then tighten attaching bolts to 8–10 ft. lbs. (tightening center bolts first).

13) *NOTE – Turn manual valv on full turn in ach manual lever detent position. If valv binds against actuating pin in any detent p sition, loosen valve body attaching bolts and move body away from c nt r of case only enough to reliev binding. R –tight n attaching bolts and check manual valv for binding. Install lubrication tube in rear pump and r gulator body.*

14) Tighten front servo attaching bolts to 30–35 ft. lbs., then adjust front and rear bands. *See "Band Adjustment" above.* Install oil screen over rear pump inlet tube and front pump inlet tube, then press screen firmly in place and install retaining clip. Install vacuum diaphragm unit and control rod. As diaphragm unit is assembled, make sure that end of control rod is centered in throttle valve and the opposite end of rod is properly positioned into diaphragm unit. Tighten diaphragm to 20–30 ft. lbs.

CAUTION – Make sure control rod is not bent during assembly of diaphragm unit. Place a new gasket on transmission case and install oil pan. Tighten attaching bolts to 10–13 ft. lbs.

15) Remove transmission from holding fixture and install converter housing. Tighten attaching bolts to 35–45 ft. lbs. Install converter, making sure that converter hub aligns properly with front pump drive gear and that converter drain plug is tightened to 15–20 ft. lbs.

LINCOLN AUTOMATIC TRANSMISSION

Linc ln C ntin ntal (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*TRANSMISSION IDENTIFICATION NOTE: An identification tag fasten d t oil pan attaching bolt is stamped with Transmission M del letters "PCA–D" which may be follow d by an additional figure indicating changes in transmission construction.*

►*STATOR SUPPORT–TO–FRONT PUMP ATTACHING BOLT NOTE:* One of the two stator support–to–front pump attaching bolts has been removed in production. As these bolts are required only for locating purposes prior to assembly, only a single bolt is necessary.

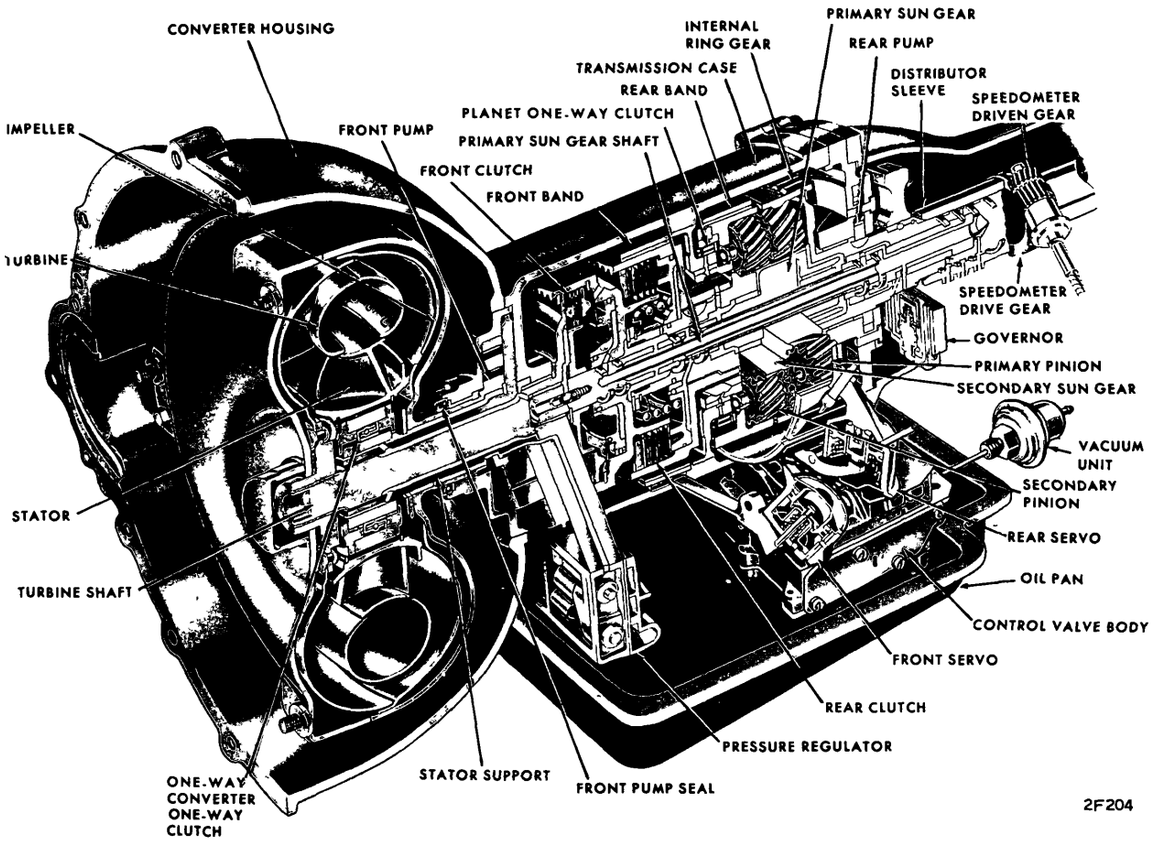
►*TOWING CAR CAUTIONS: Do not tow car at speed greater than 40 MPH and observe following precautions:*
Transmissi n Op rating Properly – Place transmission in "N" (Neutral) position. Car can be towed normally for distances not to exceed 12 miles. ***For great distanc s, use sam proc dure as for inoperative transmissi n.***
Transmissi n In perativ – Tow car with rear wheels lifted off ground or disconnect and remove propeller shaft. *NOTE – Be sur and protect rear end of transmission from entry of dirt.*

DESCRIPTION

DESCRIPTION: Three speed hydraulically controlled planetary transmission and torque converter which provides automatic shifting between low, intermediate and high (selector lever in "D1"), and between intermediate and high (selector lever in "D2"). "Lo", "R", & "P" are controlled manually. Transmission throttle valve is controlled by engine vacuum operating a diaphragm assembly at rear of transmission, eliminating throttle control linkage. A downshift lever actuated by accelerator pedal allows transmission to be downshifted by depressing accelerator pedal past the full throttle detent position. Front and rear servos are machined into transmission and external front and rear band adjusting screws have been provided. Transmission fluid is filtered through an internal filter, and is cooled in an oil cooler located in car radiator.

LUBRICATION

►*TRANSMISSION FLUID LEVEL CAUTION: Transmission fluid l v l must not be allowed to drop more than ONE PINT b low normal FULL level.*



Ch cking Fluid L vel: Check fluid level every 6000 miles. With engine and transmission at normal operating temperature, shift transmission through all ranges, then place selector lever in "P" (Park) position. Check fluid level on dipstick and add sufficient recommended fluid to bring level up to FULL mark on dipstick. *CAUTION – Do not overfill.*

Draining & R filling: Periodic fluid changes not recommended except at time of transmission overhaul.

Capacity: 23 pints (transmission and torque converter dry).

R c mm nd d Fluid: Lincoln Part No. C1AZ–19582 or Automatic Transmission Fluid Type "A" (Suffix "A").

Transmission Fluid Filter: This is a Dacron type filter which does not require periodical change. If necessary to change because of transmission failure and filter contamination, replace filter assembly. *DO NOT ATTEMPT TO CLEAN OLD FILTER.*

LINCOLN AUTOMATIC TRANSMISSION

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment: *See CARBURETOR on car model pages.*

Manual Linkage Adjustment: With engine off and transmission selector lever in "D1" position against stop, raise car and remove splash shield. Disconnect adjustable link from transmission manual shift lever on transmission and make sure shift lever is fully engaged in second detent from bottom. Loosen locknut on adjustable link, then pull downward on link to hold selector lever against stop. Adjust rod length as necessary until hole in link aligns with stud on transmission manual lever, then lengthen link one–half turn additional and connect to transmission shift lever. Check selector lever through all positions. *CAUTION – Do not make compensating adjustments in manual control linkage to overcome misalignment of selector lever indicator or starter neutral switch.*

NEUTRAL SAFETY SWITCH ADJUSTMENT

Lincoln (1962): Remove lower radio speaker and grille, then remove hood release handle from instrument panel. On convertible models, remove top control switch from instrument panel. On all models, remove lower left instrument panel cover and lower section of left vent. Remove wire connector from neutral safety switch, then position transmission selector lever in "D1" or "D2" range and loosen screws attaching neutral switch to steering column. Connect a self–powered test lamp to lower two terminals (back–up lamp) on neutral safety switch. Position selector lever in "R" position and pull switch to its farthest downward position. Slowly move switch upward until test lamp goes on. Tighten one switch mounting screw and move selector lever up and down without moving it out of "R" position. Test lamp should remain on. Attach test lamp lead to upper two terminals on switch and shift selector lever to "P" or "N" position. Test lamp should light. Apply a slight up and down pressure on selector lever while in "P" and "N" positions. Test lamp should not go out. Tighten switch attaching screws and connect wire connector to switch, then install vent extension, lower

CONTINUED ON NEXT PAGE

LINCOLN AUTOMATIC TRANSMISSION (C ntinu d)

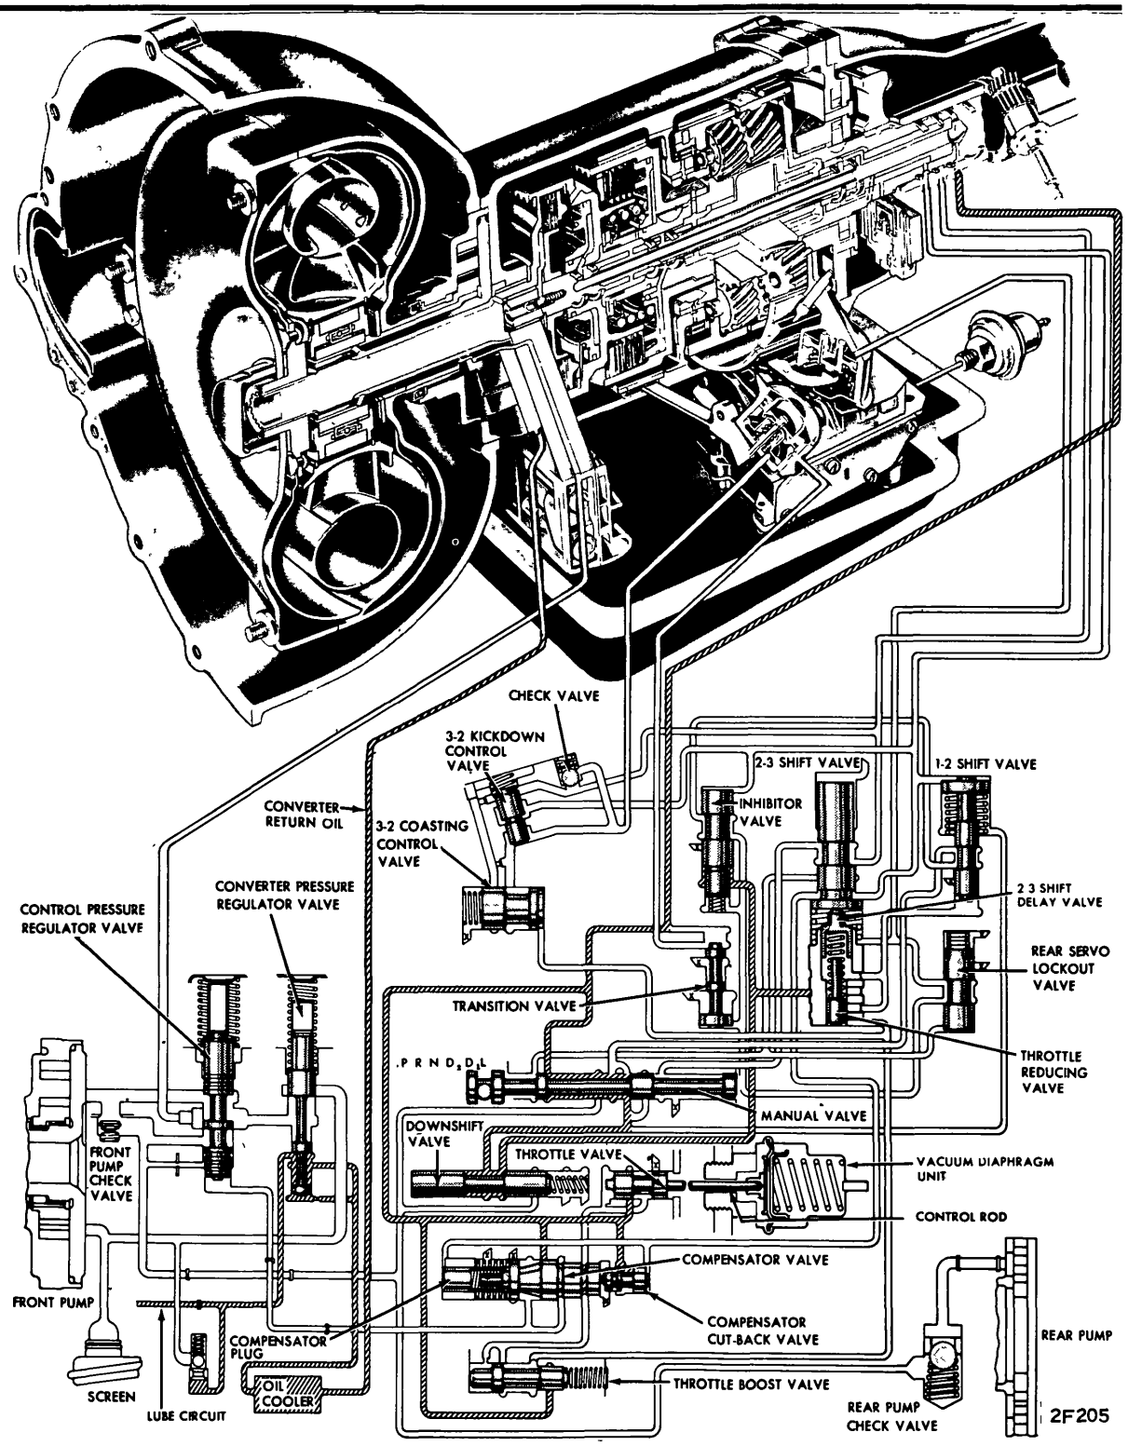
instrument panel cover, hood release handle, and lower radio speaker and grille.

BAND ADJUSTMENT

► *BAND ADJUSTMENT NOTE: Adjust bands every 12,000 miles under normal operation. For severe operation, adjust bands every 6,000 miles.*

FRONT BAND ADJUSTMENT: *NOTE – Front band adjusting screw is located on left side of transmission case (above plug for line pressure check). It is not necessary to remove oil pan for front band adjustment.* Raise car and remove transmission linkage splash shield, then remove all dirt from adjusting screw threads and oil threads. Loosen adjusting screw locknut, then install Tool 7345 and tighten adjusting screw until handle "breaks" over center. *CAUTION – If adjusting screw is tighten than wrench capacity (10 ft. lbs.), loosen adjusting screw and readjust.* **Back off adjusting screw exactly three full turns.** Hold adjust- screw stationary and tighten locknut to 35–40 ft. lbs. *CAUTION – Damage may result to transmission if adjusting screw is not backed off exactly three full turns.*

► *FRONT BAND ADJUSTING TOOL NOTE:* Tool 7345 consists of two parts, adjusting screw locknut wrench (Tool 7345–L) and adjusting screw ratchet wrench (Tool 7345). Adjusting screw wrench is designed to be inserted through locknut wrench.



REAR BAND ADJUSTMENT: *NOTE – Rear band adjusting screw is located on right side of transmission and is accessible through a hole in floor pan.* Fold back floor mat on right side and remove cover from access hole in floor pan. Remove dirt from adjusting screw and oil the threads, then loosen adjusting screw locknut with Tool 7195–C. Use T–handle of tool and tighten adjusting screw until wrench overruns. *CAUTION – If adjusting screw is tighter than wrench capacity (10 ft. lbs.), loosen adjusting screw and readjust.* **Back off adjusting screw exactly 1½ turns** and tighten locknut to 35–40 ft. lbs. *CAUTION – Damage may result to transmission if adjusting screw is not backed off exactly 1½ turns.*

TESTING

► *TRANSMISSION STALL TEST NOTE: When making stall test, never hold throttle open longer than 5 seconds.*

STALL TEST: With engine at normal operating temperature and at slow (hot) idle speed, install a tachometer on engine and apply service and parking brakes. Stall test transmission in each driving range at full throttle (do not depress accelerator through detent into kickdown position), and note engine speed which should be 1600–1800 RPM. *CAUTION – If engine speed exceeds maximum limits, release accelerator immediately.* Clutches and bands are applied in each selector lever position as follows: **"D1"** – Front clutch and one–way clutch engaged at all accelerator pedal positions. **"D2"** – Front clutch and front band applied at all accelerator pedal positions. **"L"** – Front clutch and rear band applied. **"R"** – Rear clutch and rear band applied. *NOTE – Engin v rsp ding is an indication f clutch r band slippag .*

CONTINUED ON NEXT PAGE

LINCOLN AUTOMATIC TRANSMISSION HYDRAULIC CIRCUIT

LINCOLN AUTOMATIC TRANSMISSION (C ntinu d)

SHIFT TESTS: Select a smooth road for tests. Make tests as outlined below and refer to "Shift Speed Table" for correct speed where shift should occur.

1–2, 2–3 Upshift (Minimum Throttle): Place selector lever in "D1" range, and starting from a standstill, transmission should start in first gear and upshift to second, then at a higher speed, upshift to third.

2–3 Upshift (Minimum Thr ttle): Place selector lever in "D2" range, and starting from a standstill, transmission should start in second gear and upshift to third gear.

1–2, 2–3 Upshift (Maximum Throttle, Through Detent): Place selector lever in "D1" range, then depress accelerator through detent and hold there. Transmission should upshift at speeds indicated. *NOTE – 2–3 Upshift with s lector l v r in "D2" range will occur at sam sp ed as for "D1" range.*

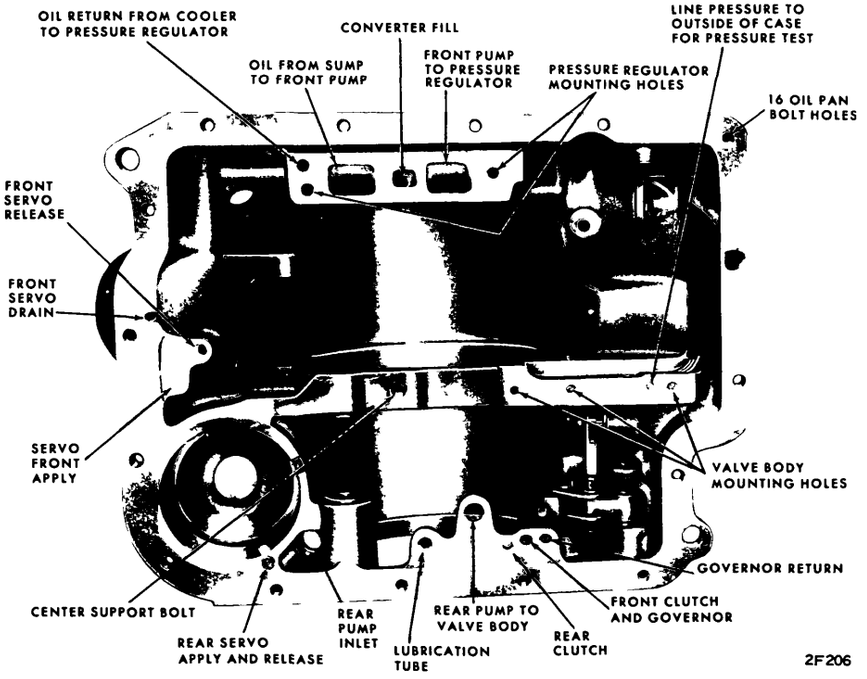
3–2, 2–1 D wnshift (F rc d): With transmission in third gear, depress accelerator pedal to floor (through detent). Transmission should shift from third to second, or from third to first, depending on car speed.

3–1 D wnshift (Minimum Throttle): Coasting down from approximately 30 MPH in third gear, transmission should downshift from third to first. *NOTE – A 3–2–1 d wnshift may b exp rienced under the above conditions.*

"DR" to "LO" (Manual Shift): With car speed approximately at 50 MPH, shift selector lever from "D1" or "D2" to "Lo". Transmission should shift from high to second. When car speed is reduced within range indicated in table, transmission should shift to low gear.

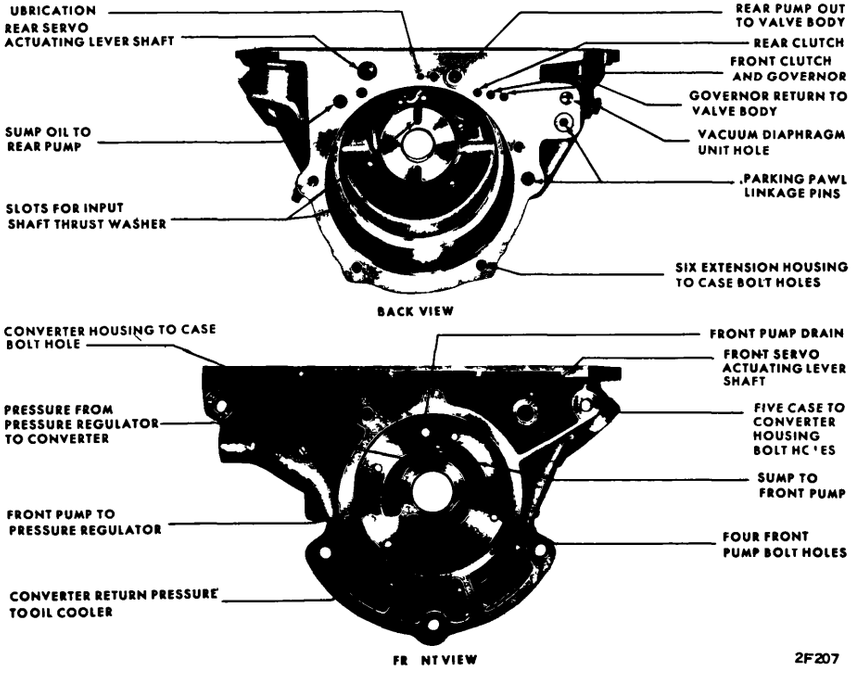
TRANSMISSION SHIFT POINTS

RANGE THROTTLE SHIFT	AXLE RATIO	SHIFT SPEEDS (RPM)								MANUAL SHIFT
		D1	D1	D1 or D2	D1 or D2	D1	D1 or D2	D1	D2	Lo
		Min. 1-2	Max. 1-2	Min. 2-3	Max. 2-3	Min. 3-1	Max. 3-2	Max. 2-1	Min. 3-2	2-1
Continental	2.89-1	8-11	40-50	11-25	65-77	7-9	62-72	21-32	7-11	19-28



CONTROL PRESSURE TESTS: Attach a tachometer and vacuum gauge to engine, then attach a pressure gauge to control pressure outlet on side of transmission (directly below front band adjusting screw on left side of case). Apply parking brake and adjust idle speed to 450–475 RPM with transmission selector lever in "D2" position. With engine at indicated idle speed and engine vacuum above 16" Hg, and with transmission in either "D1", "D2" or "Lo", pressure should be 57-72 lbs. In "P", "N" or "R", pressure should be 57–213 lbs. If control pressures are within limits, apply service brakes and place transmission selector lever in "D1" or "D2", then increase engine speed slowly until line pressure starts to rise. At this point, manifold vacuum should be 16.0" to 13.7" Hg. As vacuum reading passes through this range, transmission control pressure should start to rise and continue to rise with throttle opening, reaching a maximum pressure of 145–170 lbs. At maximum pressure, vacuum reading should be 1.5" Hg. *CAUTION – Do not h ld transmission under stall condition for more than fiv seconds.* If control pressures are not correct, erratic, or fail to rise with increased engine speed, s *"Trouble Shooting & Diagnosis".*

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Raise car on hoist and remove transmission oil pan and control valve assembly, then proceed as follows:



Front Clutch: Apply pressure to front clutch and governor input passage (see illustration). Listen for a dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leakage in this part of system.

Governor Valve: Remove governor inspection cover, then apply air pressure to same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

CONTINUED ON NEXT PAGE

TRANSMISSION CASE PASSAGES (BOTTOM VIEW)

TRANSMISSION CASE PASSAGES (FRONT & REAR VIEWS)

LINCOLN AUTOMATIC TRANSMISSION (C ntinu d)

Rear Clutch: Apply air pressure to rear clutch oil passage (see illustration) and listen for a dull thud to indicate clutch is operating. Check for leakage in same manner as for front clutch (above).

Rear Band & Servo: Apply pressure to rear servo oil passage (see illustration) and check band application.

Front Band & Servo: Apply pressure to front servo apply hole and check band application.

TROUBLE SHOOTING & DIAGNOSIS

CONTROL PRESSURE LOW: If pressure is low at idle speed in all selector lever positions, check for excessive leakage in front oil pump, case, and control valve body. *NOTE – Control pressure in "P", "L", & "R" is regulated entirely by control pressure regulator valve and its spring.*

CONTROL PRESSURE HIGH: If control pressure is high at idle speed with transmission selector lever in "N", "D1" & "D2", trouble may be in diaphragm unit or its connecting tubes or hoses. Check engine manifold vacuum. Check diaphragm pushrod for bends and for corrosion. Install diaphragm unit with pushrod removed and recheck control pressure in "N", "D1" or "D2". If control pressure is still too high, trouble is in transmission control system. If pressure is within limits, diaphragm unit is not operating properly.

CONTROL PRESSURE DOES NOT RISE WITH THROTTLE OPENING: If control pressure does not rise in "D1" or "D2" as engine vacuum falls below 16–13.7" Hg, check transmission pressure rise capacity by shifting to "L" or "R". In these positions, maximum control pressure should be obtained at not more than engine stall RPM. If pressure rise is normal in "R" & "L", remove hose from diaphragm unit and check hose and tube. *NOTE – To check, hold thumb over end of hose and check for vacuum. If engine speeds up when hose is disconnected and slows down as thumb is held against end of hose, vacuum source is satisfactory.* If vacuum reading at end of hose is 18" Hg or greater, change diaphragm unit and recheck pressure rise with throttle opening in "D1" or "D2". If control pressure does not rise now, trouble is in transmission. Check for internal leakage in components that have pressure in them in "D1" and "D2" but do not have pressure in them in "R" or "L".

CONTROL PRESSURE IS EXTREMELY ERRATIC: If control pressure is erratic in "N", "D1" and "D2", check diaphragm unit tubes, hoses and diaphragm pushrod (see "Control Pressure High" above). If vacuum is satisfactory, replace diaphragm unit and retest control pressure. If no improvement noted, clean and inspect control valve body and pressure regulator.

ROUGH INITIAL ENGAGEMENT: Adjust engine idle speed. Check throttle linkage, manifold vacuum and vacuum diaphragm unit. Check control pressure. Adjust front and rear bands.

SHIFT POINTS INCORRECT OR NO SHIFT POINTS: Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm unit. Check for sticking governor valve or plug. Check control pressure. Check position of valves in control valve body (Check control pressure at each detent position during road test).

ROUGH SHIFT POINTS: Check engine idle speed, throttle linkage, manifold vacuum and vacuum diaphragm. Check control pressure. Check for sticking governor valve or plug. Check control valve body. Adjust front band. Check rear servo accumulator.

SLIPPAGE DURING SHIFTS: Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check for sticking governor valve or plug. Check control valve assembly. Adjust front band. Check front servo circuit (air pressure check). Check rear clutch and circuit (air pressure check).

SLIPS (INITIAL ENGAGEMENT "D2", "D1" & "Lo": Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check control pressure. Check front clutch and circuit (air pressure check).

SLIPS (REVERSE ONLY – OR NO REVERSE): Check control pressure. Adjust rear band. Check rear servo circuit (air pressure check). Check control valve body. Check rear clutch and circuit (air pressure check). Check for turned oil distributor sleeve in output shaft.

SLIPS ("D1" LOW GEAR ONLY – OR NO DRIVE IN "D1"): Check operation of planet carrier one–way clutch. Check adjustment of manual and transmission linkage.

LOSS OF INTERMEDIATE GEAR IN "D1" & "D2": Check front band adjustment. Check front servo circuit (air pressure check). Check control valve body.

SLIPS IN REVERSE (OR IN HIGH GEAR IN "D1" & "D2"): Check rear clutch and circuit (air pressure check). Check control valve body. Check control pressure. Check for turned oil distributor sleeve in output shaft.

NO CLOSED THROTTLE DOWNSHIFTS: Check for sticking governor valve or plug. Check control pressure. Check control valve body.

NO FORCED DOWNSHIFT: Check for correct accelerator pedal height. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check control valve body.

ENGINE RUNAWAY ON FORCED DOWNSHIFT: Check control pressure. Check control valve body. Check front servo circuit (air pressure check). Adjust front band. Check operation of planet carrier one–way clutch.

CAR CREEPS EXCESSIVELY (SELECTOR LEVER IN ANY DRIVING RANGE): Excessive engine idle speed.

CAR MOVES FORWARD IN NEUTRAL: Check manual and transmission linkage adjustment. Check front clutch and circuit (air pressure check).

NO DRIVE IN ANY RANGE: Check transmission fluid level. Check manual and transmission linkage adjustment. Check control pressure. Check for broken converter lugs or input shaft.

COMPLETE LOCK–UP IN ANY RANGE: Check for wrong clutch and/or band application. Check control valve body. Check operation of planet carrier one–way clutch. Check for turned oil distributor sleeve in output shaft. Check front clutch and circuit (air pressure check). Check rear clutch and circuit (air pressure check). Check for release of parking linkage.

UNABLE TO START BY PUSHING: Check transmission fluid level. Check rear pump assembly. Check for broken converter lugs or input shaft. Check front clutch and circuit (air pressure check).

PARK LINKAGE WILL NOT HOLD: Check manual and transmission linkage adjustment. Check parking linkage.

TRANSMISSION OVERHEATS: Check transmission fluid level. Check control pressure. Check for restricted or leaking oil cooler and lines. Check converter one–way clutch operation. Check front band adjustment. Check rear band adjustment.

POOR ACCELERATION (MAXIMUM SPEED TOO LOW): Check transmission fluid level. Check operation of converter one–way clutch. Check engine performance.

TRANSMISSION NOISY ON COASTING 40–20 MPH: Check rear pump assembly.

MINOR REPAIRS (TRANSMISSION IN CAR)

PARKING PAWL REPLACEMENT: Loosen locknut on rear band adjusting screw and tighten adjusting screw with Tool 7195–C until wrench overruns. *NOTE – This holds planet carrier, front and r ar clutch ass mblies in place during parking pawl replacement.* Raise car on a hoist and support front of transmission with a jack stand and wooden block, then drain transmission oil pan. Mark drive shaft and rear companion flange (for reassembly at same location), then remove drive shaft. Remove oil pan and screen. Remove three short tubes from main control valve that directs rear clutch, front clutch and governor return pressure to case. Remove cross member at extension housing and remove extension housing. Remove distributor sleeve snap ring and move distributor back until rear clutch, front clutch and governor return tubes are removed from case. Remove output shaft and rear pump, then remove toggle return spring from lever pin, and remove .328" diameter washer and pin. Remove parking pawl support pin with a magnet and remove parking pawl parts. To reassemble, reverse disassembly procedure using new gaskets. Adjust rear band and fill transmission case with fluid.

GOVERNOR REPLACEMENT: Raise car and remove inspection cover from extension housing. Rotate drive shaft until governor is in line with inspection hole in housing, then remove two governor valve body retaining bolts and governor from counterweight. *CAUTION– Do not drop any parts into xtensi n h using.* Make sure all parts are thoroughly cleaned and that governor valve moves freely in valve body before valve body assembly is assembled to counterweight. Install governor valve assembly to counterweight so that valve body cover is faced toward rear of car, then tighten attaching bolts to 50–60 inch pounds. Install a new gasket on inspection cover and install cover.

TRANSMISSION & CONVERTER REMOVAL & INSTALLATION

REMOVAL: *NOTE – Transmission and c nv rt r must*

CONTINUED ON NEXT FAGE

LINCOLN AUTOMATIC TRANSMISSION (C ntinu d)

b remov d as an ass mbly. One additional converter h using–to–transmission case bolt is located behind conv rter ass mbly where it is not accessible until after convert r is removed.

1) Remove upper converter housing–to–engine bolts (from under hood), then install starter remote control so engine can be rotated from under car. Place transmission selector lever in "N" (Neutral), then raise car and drain transmission oil pan.
2) Remove converter access cover from front of converter housing and remove transmission linkage splash shield. Mark drive shaft and rear companion flange for installation in same position and remove drive shaft.
3) Remove parking brake equalizer bar retracting spring and disconnect parking brake cables and equalizer assembly. Disconnect transmission downshift rod and manual linkage parts at transmission levers, then disconnect vacuum line hose at vacuum diaphragm and speedometer cable at transmission.
4) Remove engine stabilizer bar from converter housing and converter–to–flywheel retaining nuts. *NOTE– As c nv rt r is r tated, r mov conv rt r drain plugs and drain c nv rt r.* Turn front wheels fully to right and remove starter motor, then disconnect oil cooler lines at transmission and at radiator and remove lines. Remove transmission filler tube and underbody reinforcing plate.
5) Position transmission jack, with Adapter Kit 7000–EG and Bracket Kit 7000–LC, under transmission and raise transmission slightly. Remove rear support crossmember and brackets from extension housing and car underbody.
6) Detach vacuum line at converter housing, then remove manual linkage equalizer assembly mounted between transmission and underbody. Remove remaining converter housing–to–engine retaining bolts and move transmission and converter toward rear and from under car.

INSTALLATION: Reverse removal procedure and note the following: Tighten crossmember–to–underbody bolts to 13–18 ft. lbs. and body bracket–to–body bolts to 20–30 lt. lbs. Tighten rear universal joint bolts to 15–20 ft. lbs. Tighten converter housing retaining bolts and underbody reinforcement plate bolts to 40–50 ft. lbs. Tighten converter housing–to–flywheel retain- bolts to 20–25 ft. lbs.

CONVERTER & HOUSING: R m val – With transmission removed from car, hold converter assembly with both hands and pull converter directly forward. *CAUTION – To prevent damage to front pump seal, do not rock converter assembly from side to side.* Remove one bolt from inside converter housing (holding converter housing to transmission case). Remove remaining five bolts holding converter housing to transmission case and remove housing.

Installation: Position converter housing on case and install five bolts and washers from outside converter housing and one self–locking bolt from inside housing. Install converter so drive lugs on converter are between lugs on front pump drive gear. *CAUTION – Do not move converter from side to side or up and down when it is being assembled.*

OVERHAUL

► *TORQUE CONVERTER NOTE: This is a welded unit and cannot be disassembled.*

TRANSMISSION OVERHAUL: *See 1961 Final Data, Page 462.*

DUAL-COUPLING (4-SPEED) HYDRA-MATIC

Cadillac (1962)
Pontiac (1962)

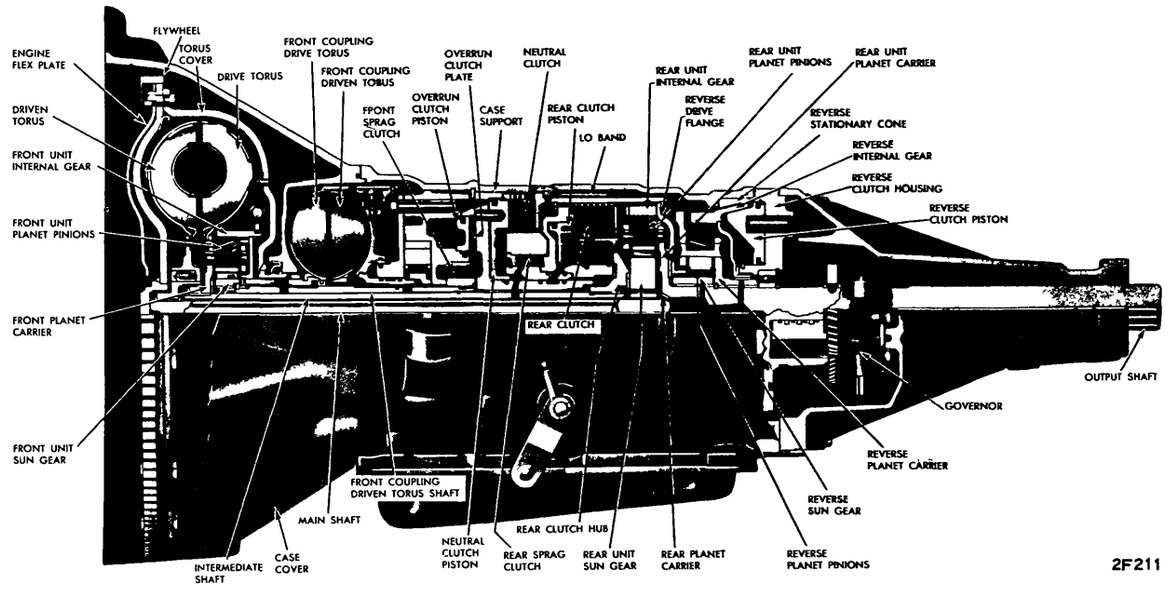
►*TRANSMISSION IDENTIFICATION NOTE: A serial number prefix stamped on serial number plate located at lower left hand corner on rear face of transmission case identifies the various transmissions as indicated in table below.*

Car Model	Serial Number Prefix
Cadillac Series 60 & 72	C
Cadillac Series 75	CA
Pontiac, 2–Bbl. Carb.①	PS–62
Pontiac, 2–Bbl. Carb.②	PES–62
Pontiac, 4–Bbl. Carb	PBS–62
Pontiac, Triple Carbs	PAS–62

① – 10.25–1 compression ratio.
② – 8.6–1 compression ratio.

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR NOTE: Due to the elimination of the rear pump in this transmission, it is not possible to start the engine by pushing, towing, or coasting the car.*



►*TOWING HYDRA-MATIC DRIVE CARS: Car may be towed at speeds up to 30 MPH for distances up to 50 miles if there is nothing wrong with the transmission. When towing at speeds above 30 MPH or if transmission known to be out of order, disconnect propeller shaft from transmission. CAUTION - After towing, check fluid level and if necessary, bring to proper level.*

►*1961–EARLY 1962 HYDRA-MATIC GEAR WHINE CORRECTION:* The whine, which is heard when decelerating from approximately 15 MPH to stop, may be caused by governor drive gear being held too tightly by its front wave type snap ring. To correct, install a new type snap ring, Part No. 8622243 (Cadillac), identified by a daub of green paint; Part No. 8618752 (Pontiac), identified by a daub of white paint.

►*1962 HYDRA-MATIC REAR BEARING NOISE CORRECTION:* This low frequency noise is most pronounced at 20–30 MPH with transmission operating in high speed with normal load and may be mistaken for speedometer cable or transmission governor noise. Check by operating transmission on a hoist while listening in area of reverse clutch housing. To correct, install a new rear bearing, Part No. 906883.

►*1962 PONTIAC HYDRA-MATIC TRANSMISSION LEAKAGE NOTE:* If leakage is occurring around dust plug of universal joint slip yoke, replace slip yoke assembly.

►*1962 PONTIAC HYDRA-MATIC CONSOLE TYPE SHIFT LEVER BUTTON BREAKAGE CORRECTION (EARLY CARS):* Remove console assembly, then remove shift lever, bracket, and switch assembly. Remove shift lever from bracket, then remove shift guide retaining nut. Disengage shift guide from lever assembly and remove guide, spring and rod from lever assembly. Install "O" ring, Part No. 3732225 over upper end of rod and seat against pawl. Grind .040" of stock off lower edge of "Park" and "Reverse" lockouts on bracket. Reassemble unit and install a new plastic release button, Part No. 543234, in shift knob.

DUAL COUPLING (4-SPEED) HYDRA-MATIC

DESCRIPTION: Four-speed hydraulically controlled planetary type transmission of same design used on previous models.

LUBRICATION

LUBRICATION: Check fluid level each time engine oil is changed (Cadillac); at every 2000 mile chassis lubrication (Pontiac). Drain and refill every 16,000 miles (Cadillac), every 25,000 miles (Pontiac). *CADILLAC NOTE: Original factory fill should be changed at 30,000 miles or one year, whichever occurs first.*

►*FLUID LEVEL CAUTION: Due to the smaller size of this transmission, it is extremely important that the proper fluid level be maintained. DO NOT check or change the fluid level when transmission is extremely hot or cold because of fluid expansion and contraction.*

Recommended Lubricant: Use Automatic Transmission Fluid Type "A" (Suffix "A"). *NOTE - On Pontiac, Automatic Transmission Type "A" may be used.*

CHECKING FLUID LEVEL: With transmission selector lever in "N" or "P" position and transmission at normal operating temperature (engine at idle speed), check fluid level on dipstick. Add oil with engine running to bring level up to "Full" mark on dipstick. *NOTE - It requires approximately 1 pint of fluid to bring level from "Low" to "Full". DO NOT OVERFILL TRANSMISSION.*

DRAINING & REFILLING: Remove transmission oil pan drain plugs or disconnect filler tube from side of transmission oil pan, then remove plugs from flywheel or torus cover (remove flywheel cover or inspection plate). Allow fluid to drain completely and then reinstall plugs and filler tube. Pour 7 qts. (Cadillac), 8 qts. (Pontiac) of recommended fluid into transmission through filler tube (tube is located under hood and also houses dipstick). Run engine at 800 RPM (Cadillac), fast idle speed (Pontiac) for 1½ minutes with transmission selector lever in "P" (Park) position. Add fluid as required to bring level up to FULL mark on dipstick (on Cadillac, reduce engine speed to normal idle before adding fluid). *NOTE - After transmission has been warmed to normal operating temperature, check fluid level to make sure it is at FULL mark.*

Capacity: Refill - 9 qts. (Cadillac & Pontiac).
After Overhaul - 10 qts. (Cadillac), 10½ qts. (Pontiac).
CAUTION - The transmission fluid capacities indicated above are approximate, follow procedure outlined above (see "Checking Fluid Level").

►*CADILLAC TRANSMISSION OIL FILTER: A paper element type oil strainer on oil intake pipe (in oil pan) should be replaced every 30,000 miles or when any major transmission failure has occurred.*

LINKAGE ADJUSTMENT

►*THROTTLE VALVE LINKAGE ADJUSTMENT NOTE: See "Carburetor" on individual Car Mod I pages for throttle valve linkage adjustm nt.*

CADILLAC

MANUAL LEVER LINKAGE ADJUSTMENT: Remove slush deflector, then remove clevis from manual lever on transmission. Loosen adjusting nuts on transmission manual rod and place manual lever in DR-4 position. Place selector lever on steering column in DR-4 position, then adjust length of manual rod until hole in manual lever lines up with hole in clevis. Increase length of rod **one turn.** Install clevis and tighten adjusting nuts. Check operation of selector lever. It should be free to enter "P" (Park) position and DR-4 stop in steering column should correspond to DR-4

CONTINUED ON NEXT PAGE

DUAL-COUPLING (4-SPEED) HYDRA-MATIC (C ntinu d)

detent position in transmission. Readjust if necessary.

N utral Saf ty Switch Adjustment (Combination Neutral Saf ty Switch, Back-up Light Switch): Located on steering column forward of instrument panel. Loosen attaching screw on switch and position it on jacket so starter is not operative in any position except "N" (Neutral) or "P" (Park).

PONTIAC

MANUAL LEVER LINKAGE ADJUSTMENT: Place selector lever and transmission manual lever in "P" (Park) position; and with outer transmission shift lever trunnion nuts backed off clear of trunnion, pull shift rod down toward transmission as far as possible. While holding in this position, run the upper trunnion nut down to just contact trunnion, then run lower nut up to contact trunnion and lock nuts securely.

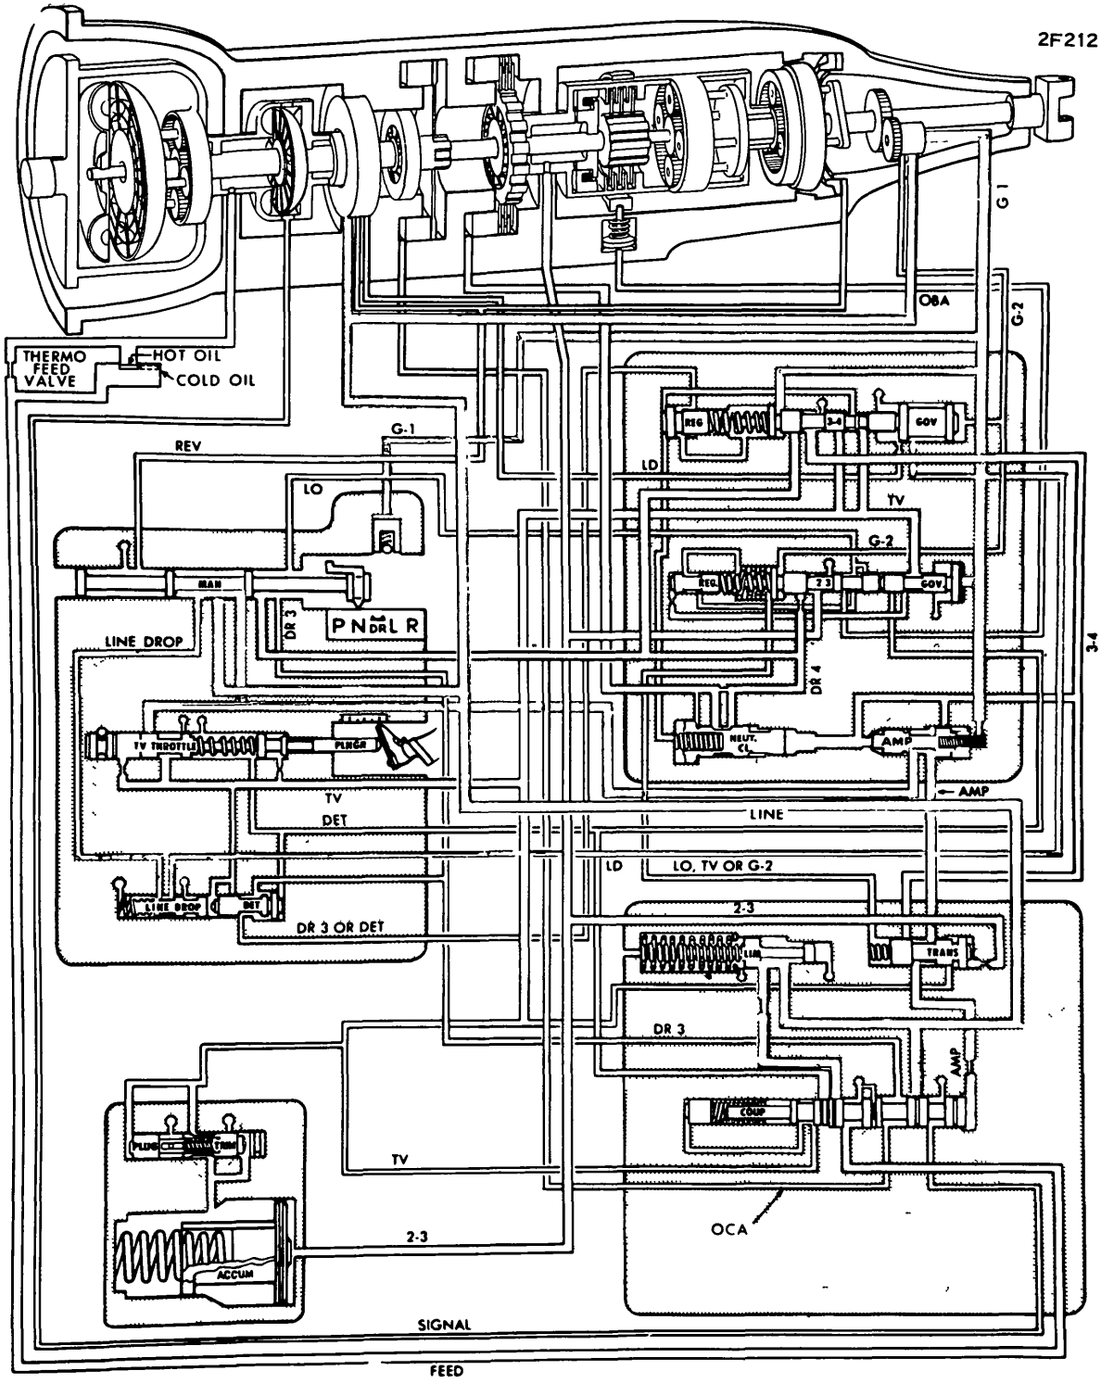
N utral Saf ty Switch Adjustment: Located at lower end of steering column in engine compartment. Place selector lever in "N" (Neutral) position, then loosen switch mounting screws. Adjust switch to index with selector lever. *NOTE - Starter must not operate when ignition key is turned to start position with selector lever in "D" (Driv) position.* Test to see that engine starts when selector lever is in "P" (Park) or "N" (Neutral) position. Tighten switch mounting screws securely.

TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. *See "Dual-Coupling Hydra-Matic" Shift Point Table for correct shift speeds.*

OIL PRESSURE TEST: Connect oil pressure gauge, Tool J-2540-A (Cadillac), J-5907 (Pontiac) to take-off hole at bottom of reverse clutch housing using a hose and fitting. Drive car until normal operating temperis reached, then test as follows:

Z r Throttl Pr ssure (Pontiac): Check pressure in all ranges. Pressure should be 50 lbs. minimum in all ranges with a maximum variation of 10 lbs. (may be higher in reverse).



Driv "Right" Pr ssur (Pontiac): With transmission selector lever in Drive "Right" position and car speed at approximately 25 MPH, pressure should be 90-100 lbs. *NOTE - Pressure at any speed is constant regardless of throttle pressure as throttle valve pressure is not used to modulate line pressure.*

Driv "Left" Pr ssur (Pontiac): While driving at 25 MPH, move selector lever to Drive "Left" position so that transmission will shift into 4th Speed. Oil pressure should drop to 60-70 lbs. in 4th.

Zer Thr ttl Pr ssur T st (Cadillac): Above 20 MPH in fourth speed with zero throttle, oil line pressure should be 60—70 lbs.

Full Thr ttl Pr ssur T st (Cadillac): In any drive range, pressure should be at least 30 lbs. higher than zero throttle pressure test reading (see above).

CONTINUED ON NEXT PAGE

HYDRAULIC CIRCUIT DIAGRAM

DUAL-COUPLING (4-SPEED) HYDRA-MATIC (C ntinued)

Reverse Pressure Test (Cadillac): With selector lever in "R", apply foot brake and increase engine speed to half throttle. Pressure range under these conditions should be 175—200 lbs.

Ⓒ - When this shift occurs, transmission will freewheel and it is not possible to observe shift with throttle closed. To check for shift, decelerate, with throttle closed, to specified speed, then accelerate to determine which speed transmission is in.
② - Forced.

TROUBLE SHOOTING & DIAGNOSIS

NO UPSHIFTS OR ERRATIC: Governor valves stuck. Broken governor rings. Sticking valves or dirt in valve body. G-2 bushing turned. Front unit internal gear bushing seized on shaft.

MISSES 2ND SPEED: Governor boost valve stuck. Transition valve stuck away from plate. Sticking valves or dirt in valve body. Governor sticking.

MISSES 3RD, OR 2-4-3: Transition valve sticking. Sticking valves or dirt in valve body. Throttle valve adjustment too long. Rear clutch or transition valve spring faulty.

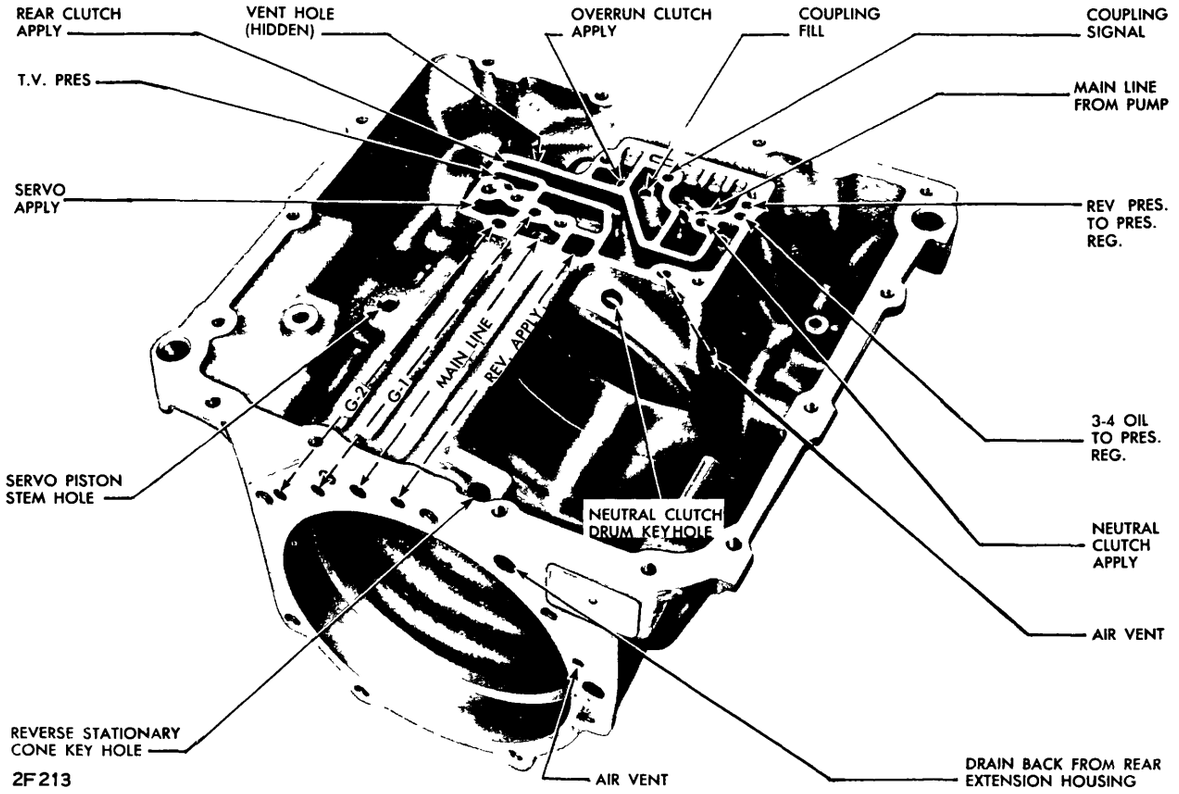
LOCKS UP IN 2ND AND 4TH: Front sprag clutch broken. Overrun clutch applied or sticking.

LOCKS UP IN 3RD OR 4TH: Rear sprag clutch broken. Low band not releasing.

ROUGH 2-3 SHIFT: Accumulator valve stuck or accumulator piston stuck. Accumulator gasket broken or leaking. Restricted or leaking oil passages. Broken accumulator spring. Broken or leaking piston oil seal rings. Control valve faulty or throttle valve adjusted improperly. Rear clutch pack faulty. Case passages restricted or leaking.

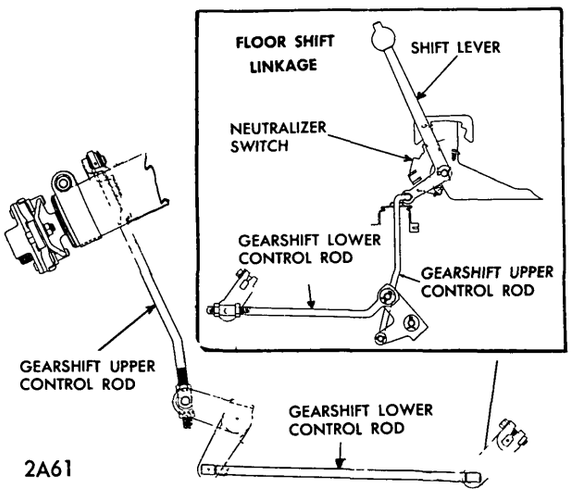
UPSHIFTS ROUGH: Throttle linkage adjusted short. Governor valves sticking. Broken governor rings. Sticking valves or dirt in valve body. Leaking or restricted main line feed to governor.

UPSHIFTS LOW: Throttle linkage adjusted long. Governor valves sticking. Broken governor rings. Sticking valves or dirt in valve body. Leaking throttle valve oil.



NO REVERSE, SLIPS OR LOCKS UP: Manual linkage incorrectly adjusted. Manual valve not engaged with drive pin. Reverse piston apply restricted or leaking. Low oil pressure. Overrun clutch apply leaking. Pressure regulator faulty. Neutral clutch not released. Flash restricting neutral clutch exhaust port or manual body.

SELECTOR LEVER WILL NOT GO INTO REVERSE: Governor valves sticking or broken governor rings. Reverse blocker piston stuck. Manual linkage interference.



REVERSE DRIVE IN NEUTRAL: Reverse stationary cone sticking.

DELAYED 1-2 SHIFT: Coupling valve sticking. Governor boost valve sticking. G-1 valve sticking. Wrong

CONTINUED ON NEXT PAGE

TRANSMISSION CASE OIL PASSAGES

PONTIAC MANUAL SHIFT LINKAGE

DUAL-COUPLING (4-SPEED) HYDRA-MATIC (C ntinu d)

spring on coupler valve.

SLIPS IN 1ST AND 3RD: Front sprag clutch slipping. Front sprag clutch broken.

SLIPS IN OR MISSES 2ND AND 4TH: Front unit torus cover seals leaking. Front unit torus cover exhaust valves sticking or missing. Front unit torus cover feed restriction or leak. Front unit torus cover signal restriction or leak. Low oil pressure. Coupling valve sticking. Sticking valves or dirt in valve body. Coupling snap ring improperly installed, or missing. Limit valve faulty. Coupling passage restricted or leaking. Front unit torus vanes damaged.

SLIPS IN ALL DR RANGES: Manual linkage improperly adjusted. Neutral clutch clipping or burned. Neutral clutch apply restricted or leaking (case support or valve body). Incorrect number of neutral clutch plates. Low oil pressure. Control valve faulty. Torus members (check valve) faulty. Intake pipe "O" ring damaged or missing. Pressure regulator valve stuck in pump. Pump slide stuck.

SLIPS IN 1ST OR 3RD (DR RANGE): Rear sprag clutch slipping or improperly assembled. Rear sprag clutch broken. Neutral clutch burned, restricted or the piston is sticking.

SLIPS IN 3RD OR 4TH: Rear unit clutch slipping or burned. Rear unit clutch apply restricted or leaking. Incorrect number of clutch plates (rear). Accumulator faulty. Center support leakage at 2-3 passage. Low oil pressure. Accumulator valve stuck (3rd only).

SLIPS IN 3RD IN DR RIGHT ON COAST: Overrun clutch slipping or burned. Overrun clutch apply restricted or leaking. Sticking valves or dirt in valve body. Overrun clutch passages restricted or leaking.

SLIPS IN 1ST AND 2ND LO RANGE ON COAST: Low servo apply restricted or leaking. Low band not anchored to case or broken. Low servo piston and rod binding in case or servo and accumulator body. Band facing worn or loose. Anchor dowel pin loose or missing in case.

NO DRIVE IN DR RANGE: Manual linkage incorrectly adjusted or manual valve not engaged with drive pin. Low oil pressure (pressure regulator stuck). Front pump intake pipe improperly installed. Front sprag broken (front pump bushing or front unit drive torus shaft). Front and/or rear sprag not properly installed. Rear sprag broken. Front sprag inner race broken. Rear sprag outer race broken. Neutral clutch plates burned. Neutral clutch piston, control valve or front pump not operating properly.

DRIVE IN LO RANGE ONLY: Rear sprag broken. Neutral clutch not applying.

NO FORCED DOWNSHIFTS (4-3 OR 3-2): Control valve faulty or linkage not properly adjusted.

2-3 RUNAWAY OR 2-1-3 SHIFT: 2-3 passage in center bearing support restricted or leaking. Plug out of accumulator. Rear clutch burned. Valve body faulty (transition valve or case passages in the 2-3 circuit).

WILL NOT GO INTO PARK: Parking links broken. Mechanical interference. Manual linkage or parking pawl faulty.

STARTS IN 2ND SPEED: Valves sticking. Governor sticking or governor boost valve stuck.

DRIVES FORWARD IN REVERSE AND NEUTRAL: Neutral clutch piston stuck in applied position.

LUNGES FORWARD BEFORE BACK-UP WHEN PLACING SELECTOR IN REVERSE: G-2 plunger stuck in outward position. Restricted neutral clutch release oil supply.

TRANSMISSION REMOVAL & INSTALLATION

CADILLAC

REMOVAL: 1) Place car on a hoist or on jack stands and disconnect battery. Remove starter motor and slush deflector and lower flywheel cover front cover.

2) Drain transmission at oil pan and flywheel, then remove transmission filler pipe bracket bolt from right cylinder head. Clean dirt from pipe flange and slide filler pipe out of sleeve in transmission case.

3) Disconnect brake cables from parking brake relay lever, then remove retracting spring and remove relay from frame. Remove propeller shaft assembly and remove intermediate frame crossmember below flywheel housing. Disconnect speedometer cable from extension housing. Remove throttle valve and manual levers from shafts.

4) Remove four nuts from flywheel-to-drive plate screws, then place a jack under rear of engine oil pan (use a wood block to prevent damage to plan). Place transmission jack under transmission and raise it just enough to take strain off rear engine support. Disconnect engine rear support at transmission extension housing and remove crossmember that carries support.

5) Disconnect oil cooler pipes from adapter on transmission case and cap the lines to prevent leakage.

6) Remove six screws holding flywheel housing to engine then remove transmission and flywheel housing as a unit by moving assembly toward rear of car, disengaging flywheel housing from locating dowels on engine, and then tilting front unit downward to lower it from car. Remove washer from pilot hole in crankshaft.

INSTALLATION: 1) Install spacer in pilot hole in crankshaft, then raise transmission into position carefully with transmission jack and align drive plate with torus cover screws and drive dowel holes in flywheel housing with dowels on engine. Install flywheel housing-to-crankcase screws, making sure that flywheel is as far forward as possible. Connect oil cooler lines and tighten securely.

2) Lift engine and transmission to about one inch above its normal height and install engine rear support bracket on frame. Tighten three bracket bolts on one side only. Install three bracket bolts on other side loosely. Lower transmission carefully and install two support screws. Remove block from engine pan and remove transmission jack.

3) Install four nuts attaching drive plate to flywheel and tighten to 15-20 ft. lbs. *CAUTION - Mak sur drain plugs in flywh l and il pan ar tight.* Install flywheel housing front cover making sure to attach the two exhaust braces. Install starter motor.

4) Install filler tube in transmission with support bracket properly positioned on cylinder head. Install manual and throttle valve levers on transmission shaft, making sure that serrations on levers are lined up with serrations on their respective shafts and tighten securely. Install speedometer cable, and install slush deflector.

5) Wedge screwdriver in between frame and end of rear support bracket which was left loose, to spring frame slightly. Install frame crossmember below flywheel housing with six bolts. Remove screwdriver and tighten bolts. Tighten three remaining bolts on engine rear support bracket.

6) Install propeller shaft assembly, then install parking brake relay lever and retracting spring in position on frame. Connect brake cables to lever and adjust cable. Lower car to floor and connect battery.

7) Install filler pipe bracket to cylinder head screw, then fill transmission with fluid *(see "Draining & Refilling" above)*. Adjust manual and throttle valve linkage. *See "Linkage Adjustments" above.*

PONTIAC

REMOVAL: 1) Remove one battery cable and release the parking brake, then raise car and drain transmission (see "Draining & Refilling" above). Disconnect oil cooler lines by either removing clamps and pulling hoses or by cutting the hoses. Disconnect drive line from transmission output shaft, then remove complete drive line assembly.

2) Disconnect speedometer cable from drive gear and remove gearshift lower control rod. Remove cross shaft bracket, cross shaft lever and bushing from transmission. Remove lower end of throttle valve upper control rod (engine-to-transmission idler lever), then remove throttle valve lever control rod and throttle idler lever.

3) Remove both starter cables and remove starter and splash shield. Remove flywheel bottom cover and remove flywheel-to-flex plate attaching bolts. Position automatic transmission jack under transmission and and remove two rear support-to-frame crossmember bolts. Disconnect crossmember at each frame side rail and raise transmission so rear mount supports are clear of cross member, then rotate crossmember slightly in frame and remove parking brake return spring and cable guide rod from crossmember.

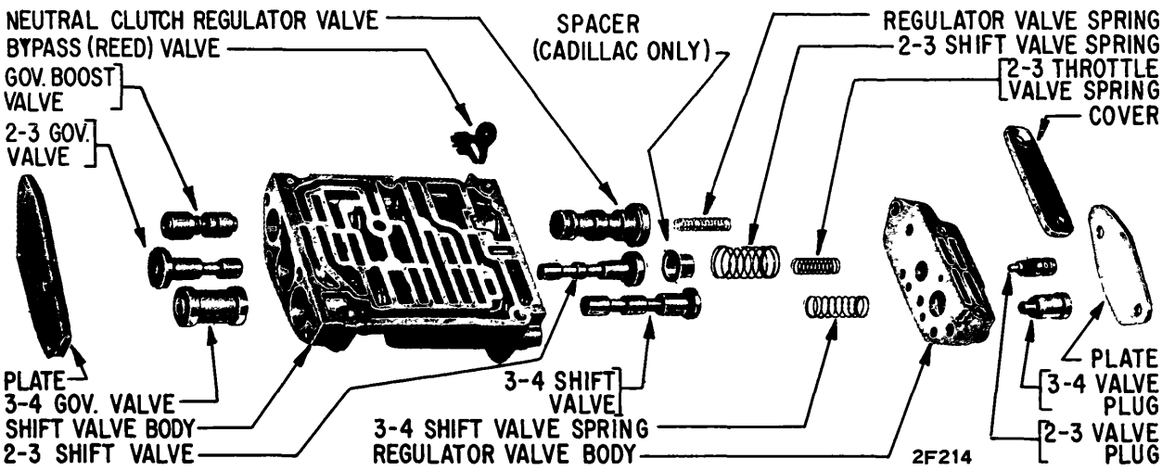
4) Remove crossmember, then lower transmission enough to remove flywheel housing-to-engine bolts. Work transmission rearward to disengage dowels from front flywheel housing and remove transmission.

INSTALLATION: Reverse removal procedure and note the following: With transmission in position engaging dowels into engine and torus cover bolts into flex plate, install and tighten two flywheel housing attaching screws. *NOTE - If pilot on flywheel has entered end of crankshaft properly, flywheel and torus cover should move back and forth slightly.* Rotate flywheel to bring one flex plate mounting pad down to lowest position, then push flywheel forward slightly to seat it against crankshaft. Measure clearance between pad on flex plate and flywheel with a feeler gauge. Minimum clearance should be .015". If less, move trans-

CONTINUED ON NEXT PAGE

DUAL-COUPLING (4-SPEED) HYDRA-MATIC (Continued)

mission away from engine and install special spacer over flywheel pilot. Move transmission back into position and install two flywheel housing-to-engine bolts. When installing flex plate-to-flywheel attaching nuts, tighten nuts to 15 ft. lbs. using a torque wrench with extension, Tool No. J-6498.



TRANSMISSION OVERHAUL

►*1962 CADILLAC 2–3 SHIFT VALVE ASSEMBLY*

NOTE: An additional spacer is used between end of 2–3 Shift Valve and 2–3 Shift Valve Spring (see "Shift Valve Body Assembly" illustration). When installing the spacer, it should fit on end of 2–3 Shift Valve with rim of spacer against large land on valve.

OVERHAUL: *See 1960 Final Data, Page 467, or later Manual edition and note the following:*

Rear Clutch Hub-to-Rear Clutch Unit Thrust Washer: Position bronze thrust washer next to rear clutch hub, then position steel backing washer between bronze thrust washer and rear unit clutch cover with flange on backing washer toward clutch cover.

SHIFT VALVE BODY ASSEMBLY

3-SPEED (4-STAGE) HYDRA-MATIC TRANSMISSION

Oldsmobile, 88, Super 88 & 98 (1962)
Pontiac (1962)

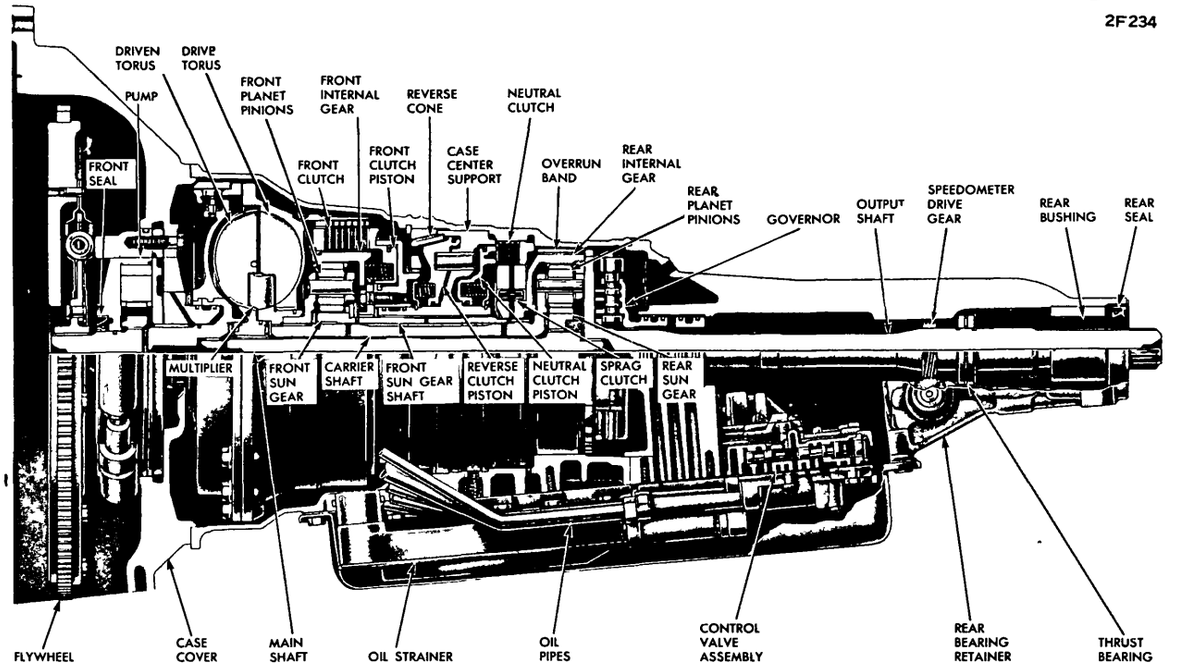
►CHANGES, CAUTIONS, CORRECTIONS

►*TRANSMISSION IDENTIFICATION NOTE: A serial number prefix stamped on the serial number plate located on left side of transmission case identifies the various transmissions as indicated in table below.*

Car Model	Serial Number Prefix
Oldsmobile Series 88 ① ②	062
Oldsmobile Series 88 ① ③	OC62
Oldsmobile All Series ④	OA62
Oldsmobile Starfire	OB62
Pontiac ① ③	P–62
Pontiac ① ⑤	PES–62
Pontiac ③ ④	PB–62
Pontiac ⑥	PA–62
Pontiac ⑤ ⑦	PEH–62

① – 2-Bbl. Carb. ② – 8.75-1 Comp. Ratio.
③ – 10.25-1 Comp. Ratio. ④ – 4-Bbl. Carb.
⑤ – 8.6-1 Comp. Ratio.
⑥ – 425A Eng. 10.75-1 Comp. Ratio
⑦ – 8.6-1 Comp. Ratio. 2–Bbl. Carb. Heavy Duty.

►*TOWING HYDRA-MATIC DRIVE CARS:* Car may be towed at speeds up to 30 MPH for distances up to 50 miles if there is nothing wrong with transmission. When towing at speeds above 30 MPH or if transmission is known to be out of order, disconnect propeller shaft from transmission. *CAUTION – After towing, check fluid level and if necessary, bring to proper level.*



►*STARTING ENGINE BY PUSHING CAR NOTE: It is not possible to start engine in this manner.*

►*1962 PONTIAC HYDRA-MATIC CONSOLE TYPE SHIFT LEVER BUTTON BREAKAGE CORRECTION (EARLY CARS):* Remove console assembly, then remove shift lever, bracket, and switch assembly. Remove shift lever from bracket, then remove shift guide retaining nut. Disengage shift guide from lever assembly and remove guide, spring and rod from lever assembly. Install "O" ring, Part No. 3732225, over upper end of rod and seat against pawl. Grind .040" of stock off lower edge of "Park" and "Reverse" lockouts on bracket. Reassembly units and install a new plastic release button, Part No. 543234.

►*1962 PONTIAC HYDRA-MATIC TRANSMISSION LEAKAGE NOTE:* If leakage is occurring around dust plug on universal joint slip yoke, replace slip yoke assembly.

►*1962 PONTIAC REAR BEARING RETAINER PRODUCTION CHANGE & MANUAL SHAFT "O" RING SEAL REPLACEMENT:* Later rear bearing retainers have been changed to provide a new method for retaining manual shaft. The parking brake bracket and parking brake shaft have also been changed. The manual shaft retaining key has been replaced by a retaining pin. To replace a manual shaft "O" ring seal on later transmissions, it will be necessary to remove or move back the rear bearing retainer to allow retaining pin to be removed. Move manual shaft and detent lever toward outside of case for access to "O" ring seal.

►*1962 HYDRA-MATIC REAR UNIT GEAR TRAIN PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* Later type units which include sun gear, internal gear, pinions and carrier assembly are "counter–phased" and are not interchangeable with early type units. When replacing any of these parts, make sure the new parts have the same number of teeth and the carrier assembly has the same spacing for pinion pins.

3-SPD. (4-STAGE) HYDRA-MATIC SECTIONAL VIEW

DESCRIPTION

DESCRIPTION: Three speed (Four Stage) "split torque" type hydraulically controlled automatic transmission consisting of a torque converter assembly and planetary type gear train. Design is similar to 1961 transmission used on corresponding models, with the following exceptions:

Coupling Cover–to–Case Cover Thrust Bearing: This new needle thrust bearing has 32 rollers.

Pump–to–Case Cover Seal Ring: New design has a square cut for improved sealing.

Reverse Stationary Cone: Cone and retaining key are integral.

One–Way Clutch: Sprag and race assembly (same as 1961 models) or a new design roller type clutch are used in mixed production.

Front Sun Gear Shaft–to–Rear Internal Gear Snap Ring: This snap ring is not used in 1962 transmissions.

Front Pump Assembly: 1962 units incorporate an additional ball check which has been added as part of the line drop system on 2–3 shift.

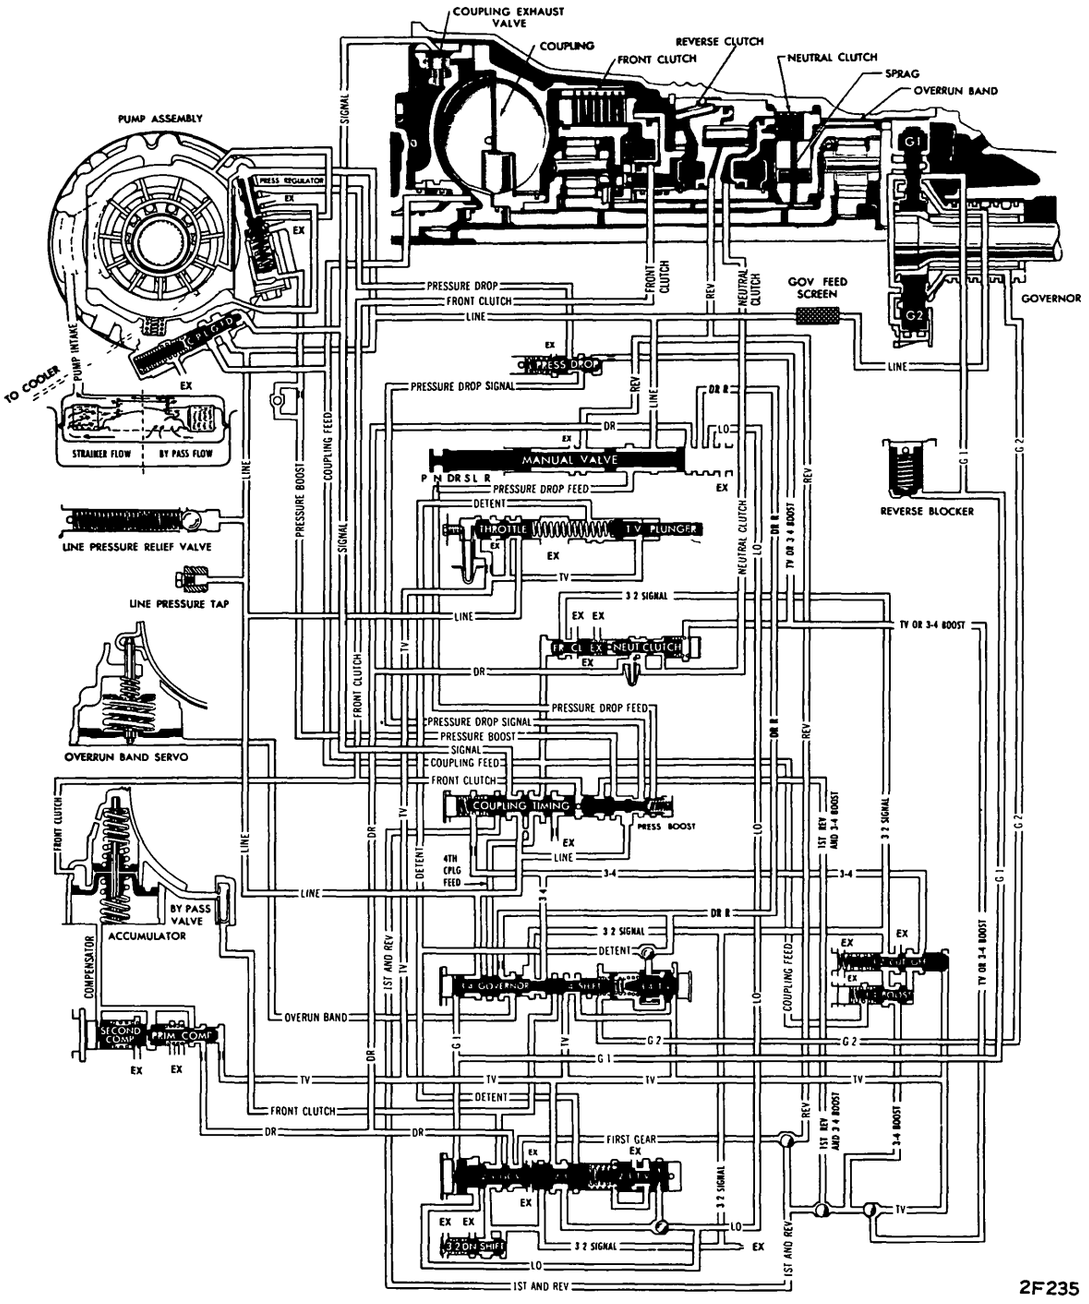
Transmission Case Cover Assembly: Case cover provides a feed hole for the line drop ball check, located in oil pump.

OPERATION

OPERATION: Neutral – Engine torque is transmitted through torus cover to drive torus member causing it to rotate driven torus and turn main shaft and rear sun gear unit in direction of engine rotation. The neutral clutch being disengaged, prevents one–way clutch (sprag or roller type) assembly from holding rear unit internal gear against turning opposite to engine rotation. Therefore, as rear unit sun gear turns in direction of engine rotation, rear unit pinions turn opposite to engine rotation, driving rear internal gear opposite to engine rotation. The front unit sun gear being mechanically connected to rear internal gear, causes front unit pinions to rotate in direction of engine rotation, driving front internal gear in same direction. With both rear unit internal gear and front unit internal gear spinning freely, there is no transmission of torque from front or rear units to carrier or output shaft.

First & Second Stages: Engine torque is transmitted through torus cover to torus drive member, then through oil to torus driven member which directs it through the stator (multiplier) and back to the driven member. This action multiplies engine torque and applies it to mainshaft and rear sun gear. As car speed increases, the difference in speed between drive torus, multiplier, and driven torus decreases so multiplier ceases to be needed. As this happens, the torus assembly begins to function as a simple fluid coupling and the effective ratio of transmission changes from approximately 3.50–1 to approximately 2.93–1 (second stage). Neutral clutch is applied, locking one–way clutch (Sprag or Roller Type) outer race to case, and the rear unit internal gear is held stationary. The rear unit sun gear, turning in direction of engine rotation attempts to drive pinions and internal gear opposite to engine rotation; however, because one–way clutch assembly holds internal gear stationary, the output shaft, through the

CONTINUED ON NEXT PAGE



3-SPEED (4-STAGE) HYDRA-MATIC TRANSMISSION (Continu d)

pinions, is compelled to rotate in direction of engine rotation within the internal gear at reduced speed and with increased torque. As the rear carrier and output shaft rotate in this manner, the front carrier, which is mechanically connected to rear unit, also rotates in same direction at a reduced speed. Because the one—way clutch assembly is holding front unit sun gear from turning opposite to engine rotation, carriers and pinions rotate the front unit internal gear in direction of engine rotation at approximately one—half engine speed. Because the front clutch is released, the reduction in first speed is due to the rear unit reduction, times the coupling torque multiplication, plus the .3 engine torque acting on output shaft through the torque multiplier.

Third Stage: Engine torque is transmitted through torus cover to torus drive member. The front clutch is applied and coupling is empty so engine torque is mechanically applied to front unit internal gear. Front unit sun gear assembly is splined to one—way clutch inner race and is prevented from turning opposite to engine rotation by sprags or rollers when neutral clutch is applied. Engine torque at front internal gear is applied to pinions, and because sun gears cannot rotate opposite to engine rotation, the planet pinions and carrier are forced to rotate in direction of engine rotation around sun gear in reduction. Front carrier is splined to rear unit carrier and shaft assembly which in turn is bolted directly to output shaft.

Fourth Stage: Engine torque is transmitted through torus cover and is applied through front clutch in front unit internal gear. Front unit internal gear, through pinions, tends to turn front sun gear against the one—way clutch causing front unit to run in direction of engine rotation, in reduction. With rear carrier rotating in same direction, and rear internal gear tending to be stationary against the one—way clutch, rear unit pinions attempt to rotate opposite to engine rotation on their pins, thus driving rear unit sun gear and driven torus in direction of engine rotation faster than engine speed. However, because coupling is filled, coupling driven member and rear unit sun gear cannot revolve faster than torus which turns at engine speed. Therefore, rear sun gear is slowed down to approximately engine speed. As a result, rear unit pinions are also slowed down. The carrier and pinions change direction of load against internal gear causing it to overrun the one—way clutch and revolve with carrier and sun gear at same speed. With output shaft and carriers connected to converter stator (multiplier), the stator is also turning at same speed as drive and driven members so that it has no effect in multiplying torque in the torque converter. As a result, the entire drive train must revolve as one common unit in direct drive.

Reverse: Engine torque is applied to mainshaft in same manner as in "First & Second Stage" above. Rear unit sun gear then drives rear unit pinions as idlers which in turn drive rear unit internal gear in direction opposite engine rotation (neutral clutch is released making one—way clutch ineffective for holding internal gear). With rear unit internal gear turning opposite to engine rotation, front unit sun gear is turning in same direction. The reverse cone, which is applied, holds front unit internal gear stationary so that front unit pinions and carrier are forced to walk around front internal gear in a direction opposite to engine rotation, and in reduction. The output shaft being connected to front and rear unit carrier is also turning in a direction opposite to engine rotation, and in reduction.

HYDRAULIC CIRCUIT DIAGRAM

CONTINUED ON NEXT PAGE

3-SPEED (4-STAGE) HYDRA-MATIC TRANSMISSION (C ntinu d)

LUBRICATION

LUBRICATION: Check fluid level every 2000 miles (Oldsmobile); every 4000 miles (Pontiac). Drain and refill every 24,000 miles (Oldsmobile); every 25,000 miles (Pontiac).

R c mm nd d Fluid: Use only Automatic Transmission Fluid Type "A" (Suffix "A").

CHECKING FLUID LEVEL: With car on a level floor, transmission at operating temperature, engine idling, and selector lever in "P" (Park) position, check fluid level on dipstick located at right rear of engine. Add recommended fluid as necessary to bring level to FULL mark on dipstick. *NOTE – 1 pint of fluid is required to bring l v l fr m ADD mark to FULL mark. With transmission cold, il l vel sh uld be at ADD mark. DO NOT OVERFILL.*

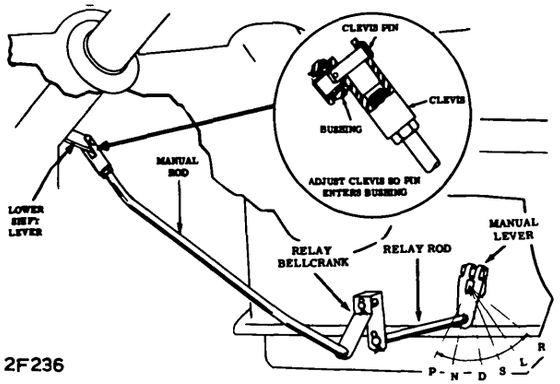
DRAINING & REFILLING: Oldsmobile – With transmission at normal operating temperature, remove oil filler pipe from transmission and drain fluid. Replace filler pipe and add 5 qts. of recommended fluid to transmission. Place selector lever in "P" (Park) position and start engine. Add fluid to bring level to FULL mark on dipstick. *NOTE – Recheck fluid level after transmission is warm.*

P ntiac: *NOTE – Drain fluid immediately after operation bef r it has an opp rtunity to cool.* Disconnect fluid filler pipe from right side of transmission oil pan and allow transmission to drain. Remove oil pan and strainer and thoroughly clean, then install strainer using a new "O" ring on pump intake pipe. Install oil pan and a new gasket and tighten bolts to 12–15 ft. lbs., then connect filler pipe to oil pan and tighten securely. Pour 4 qts. of recommended fluid into transmission. *NOTE – If valv body r moved, pour in 5 qts. If transmissi n v rhaul d, p ur in 8 qts. for initial fill before starting ngin .* Start engine and run at slow idle with selector lever in "P" (Park). With transmission warm and engine idling, recheck fluid level and adjust as required. *D n t verfill.* Replace dipstick and turn handle 1/8 turn to lock it in filler tube.

Capacity: Oldsm bile – 5½ qts. (after drain); 6½ qts. (after pan removed); 9 qts. (after overhaul).
P ntiac – 4½ qts. (after drain); 8½ qts. (after overhaul).

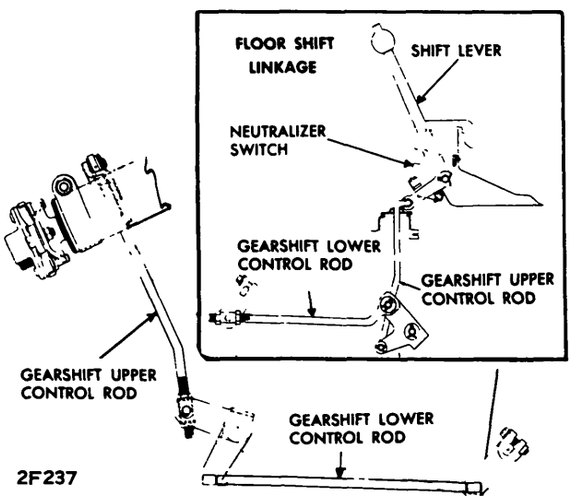
LINKAGE ADJUSTMENT

LINKAGE ADJUSTMENT: Throttle Linkage – *See CARBURETOR on car model pages.*



Manual Shift Linkag : Steering Column Shift – Place transmission selector lever on steering column in "P" (Park) position, then back off locknuts on upper control rod trunnion (at equalizer) so they are free of trunnion. Place manual lever on transmission in "P" (Park) detent, then pull upper control rod down toward transmission as far as possible. While holding rod in this position, run trunnion upper locknut down to just contact trunnion. Run lower locknut up to contact trunnion and lock nuts securely. After making adjustments, check parking lock with car on an incline for positive locking.

Fl r Shift (P ntiac Grand Prix) – Place selector lever in "P" (Park) position, then loosen both trunnion nuts on gearshift lower control rod and back them away from trunnion. While holding lower control rod toward rear of car (to remove slack from linkage) run rear nut up to contact trunnion. Run forward nut down to contact trunnion and lock securely in position.



Floor Shift (Pontiac B nnevill) – Place shift lever in "P" (Park) position and disconnect gearshift lower control rod at forward end. While holding gearshift lower control rod toward rear of car, turn adjusting nut on control rod so that it fits on upper shift lever stud while lever is in its detent position, then lock adjusting nut.

NEUTRAL SAFETY SWITCH: Oldsmobile – Place selector lever in "N" (Neutral) position, then loosen switch mounting screw on steering column jacket below instrument panel. Adjust switch to index with selector lever. Starter must operate when transmission selector lever is in "P" (Park) or "N" (Neutral) positions and must not operate in any other position. Tighten switch mounting screw securely.

Pontiac – *NOTE – There is no adjustment for neutral safety switch on cars with steering column mounted selector lever. Neutral switch should allow engine to be started only in "P" (Park) or "N" (Neutral).* On cars with floor shift, remove console compartment box and then console center bracket–to–floor screws. Remove four remaining screws attaching console, then remove compartment light switch, indicator bulb, courtesy light connections and shift lever knob. Lift console over shift lever and remove toward rear seat. Loosen two neutral safety switch attaching screws and adjust switch so engine starts only with shift lever in "N" (Neutral) or "P" (Park). Install assembly by reversing removal procedure.

OLDSMOBILE MANUAL SELECTOR LINKAGE

PONTIAC MANUAL SELECTOR LINKAGE

TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. *NOTE - Make sure engine is operating at peak performance.* See "Shift Speed Tables" below for correct shift speeds under different operating conditions.

►*CAUTION: Do not stall test transmission under any conditions.*

OIL PRESSURE TEST: With oil pressure gauge connected to the upper of the two test holes on left-hand side of rear bearing retainer, check the oil pressure while on road test with selector lever in Drive Right position and with transmission in second speed at approximately 25 MPH. Minimum pressure should be 98.6 lbs. Maximum pressure should be 111.4 lbs. If not within specifications, check the following:

Low Oil Pressure: Oil level is low. Booster plug is the wrong one or is stuck. Pressure regulator valve is not operating properly. Strainer and "O" ring are leaking. Manual valve is misaligned with quadrant. Fluid is foaming or cavitation is occurring. Internal leakage. Stuck valve in control valve assembly. Front pump slide is stuck causing low output.

High Oil Pressure: Pressure regulator valve is stuck. Booster plug is the wrong one or is stuck. Manual valve is misaligned with quadrant. Stuck valve in control valve assembly. Front pump stuck causing high output.

SHIFT SPEED TABLES

UPSHIFTS		2–3	3–4
"Dr. Left"	(Min. Throttle)	14-18	18-23
	(Full Throttle)	33-40	76-89
"Dr. Right"	(Min. Throttle)	14-18	...
	(Full Throttle)	33-40	76-89
"Lo"	(Min. Throttle)	...	...
	(Full Throttle)	...	76-89

DOWNSHIFTS		4–3	3–2
"Dr. Left"	(Closed Throttle)	20-15	16-13
	(Full Throttle)	84-68	29-25
"Dr. Right"	(Closed Throttle)	84-72	16-13
	(Full Throttle)	84-72	29-25
"Lo"	(Closed Throttle)	84-72	52-46
	(Forced)	84-72	52-46

►*NOTE:* Minimum throttle denotes a fixed throttle opening only sufficient to provide acceleration enough to accomplish each of the shifts.

TROUBLE SHOOTING & DIAGNOSIS

NO UPSHIFT: "G-1" valve in governor is sticking closed or the 1-2 shift valve train in control valve assembly is sticking. *(NOTE* - To determine if "G-1" valve is sticking, drive car between speed of 15-20 MPH, then very carefully attempt to momentarily engage the reverse position to see if reverse blocker piston is working. If selector lever can be moved beyond "LO"

CONTINUED ON NEXT PAGE

3-SPEED (4-STAGE) HYDRA-MATIC TRANSMISSION (Continu d)

range position, reverse blocker is not operating properly, due in most cases to a stuck "G-1" valve. If a thorough rinsing of governor in clean solvent does not free "G-1" valve, replace governor assembly). *CAUTION - When making test, DO NOT fully engage selector lever in Reverse position or leave lever in partial Reverse position.*

NO DRIVE IN DRIVE RANGE: Check Neutral Clutch, Sprag assembly (or Race), Fluid Coupling, Oil Level & Pressure, Manual Linkage, Control Valve Assembly, Sticking Reverse Cone, and for Restricted Passages.

DRIVE IN NEUTRAL: Check operation of Neutral Clutch for Manual Linkage Adjustment.

NO REVERSE: Check Manual Linkage Adjustment, Low Pressure, Restricted Passages, and check operation of Reverse Cone Clutch and Neutral Clutch.

DRIVE IN "RIGHT DRIVE" OR LOW RANGE ONLY: Check operation of Sprag Assembly and Neutral Clutch.

FORWARD DRIVE IN REVERSE: Check Manual Linkage and operation of Neutral Clutch.

REVERSE DRIVE IN NEUTRAL: Check operation of Reverse Cone Clutch.

DRIVE IN THIRD & FOURTH ONLY: Check operation of Reverse Cone Clutch.

DRIVE IN FIRST, SECOND & FOURTH ONLY: *NOTE - This condition may be reported as a 2-3 Slippage.* Check for malfunction in Control Valve Assembly or Fluid Coupling.

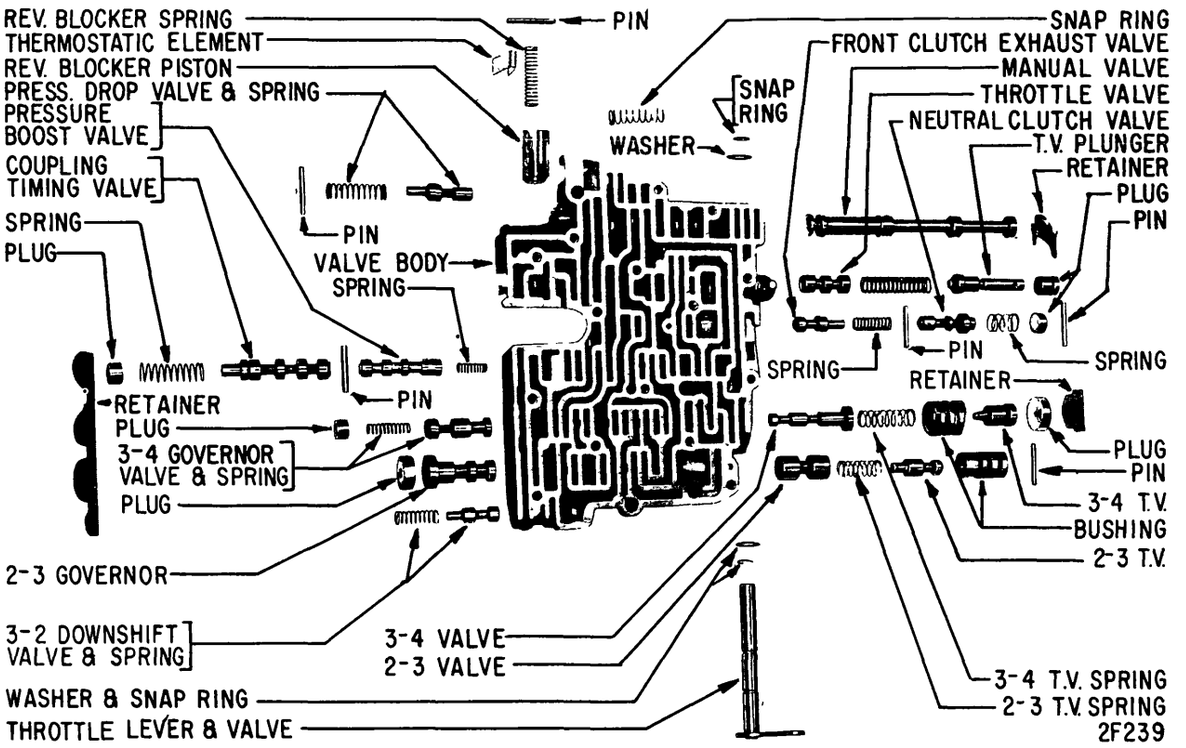
DRIVE IN FIRST, SECOND & THIRD ONLY: Check operation of Governor and for malfunction in Control Valve Assembly.

SLIPPING 2-3 SHIFT: *NOTE - This condition may be reported as "Drive in 2 or 4 Only."* Check operation of front clutch or Accumulator, malfunction in Control Valve Assembly, and for Accumulator Body Assembly not operating properly. Check Throttle Valve Linkage Adjustment and check for Low Oil Pressure. Check for restricted 2-3 oil passages.

SLIPPING 3-4 SHIFT: Check malfunction in Fluid Coupling and in Control Valve Assembly. Front Clutch not operating properly.

SLIPPING IN ALL RANGES: Low Oil Pressure.

ROUGH 2-3 SHIFT: Accumulator, Compensator Body Assembly, or Front Clutch not operating properly. Malfunction in Control Valve Assembly or in Fluid Coupling. Throttle Valve Linkage not adjusted properly. Front Clutch Passage restricted.



ERRATIC SHIFTS: Governor Assembly or Control Valve Assembly not functioning correctly.

HIGH OR LOW UPSHIFTS: Throttle Valve Linkage not properly adjusted (if too short, upshifts will be high, if too long, upshifts will be low). Control Valve Assembly or Governor malfunctioning. Throttle Valve Lever bent. Governor Oil Passage restricted. Throttle Valve or Line Pressure not correct.

NO ENGINE BRAKING (INTERMEDIATE OR LOW RANGE): Overrun Band or Servo not operating.

NO PART THROTTLE OR DETENT DOWNSHIFT: Check Throttle Valve Linkage Adjustment and Accelerator Travel. Malfunction in Control Valve Assembly or Governor.

SELECTOR LEVER WILL NOT GO INTO REVERSE: Check Manual Linkage Adjustment, operation of Governor, and Reverse Blocker Valve.

CONTROL VALVE ASSEMBLY

SELECTOR LEVER WILL NOT GO INTO PARK: Check Parking Linkage and Adjustment of Manual Linkage.

TRANSMISSION REMOVAL & INSTALLATION

►*TRANSMISSION REMOVAL & INSTALLATION PROCEDURE NOTE: See Page 475 in 1961 Final Data.*

TRANSMISSION OVERHAUL

OVERHAUL: *See 1961 Final Data, Page 475 and note the following:*

CONTROL VALVE BODY: Disassembly - 1) Remove channel body from valve body assembly (two screws on valve body side and thirteen screws on channel plate side), then remove neutral clutch bypass valve from cored side of channel plate. Remove front clutch bypass valve.

2) If necessary to remove pressure relief valve and spring, proceed as follows: Turn channel plate over to casting side and remove retaining pin. *CAUTION - Pin is under extreme pressure.* Remove pressure relief valve spring and ball. After cleaning and inspection, reassemble channel plate by installing pressure relief ball, spring and retainer, neutral clutch bypass and front clutch bypass valve, then set channel plate aside and continue with valve body disassembly.

3) Remove channel plate-to-valve body spacer and place on channel plate and check alignment of bypass valves. Remove two check balls and throttle valve thermostatic element. Remove throttle valve plunger guide retainer located in cored passage near throttle valve adjusting screw. Position control valve assembly with cored side up and throttle valve lever positioned on top right hand side.

►*DISASSEMBLY NOTE: Refer to valve body illustration and note the following:*

4) Remove multiple valve plug retainer (plugs are under spring tension), then remove 2-3 downshift valve and spring. Remove valve bore plug from adjacent bore by inserting snap ring pliers in hole in plug.

►*VALVE PLUG REMOVAL NOTE: Valve plugs are non-operating plugs used in valve bores. Remove and install with snap ring pliers.*

5) Remove 2-3 governor valve, then remove 3-4 governor valve plug and 3-4 governor valve. Remove plug from coupling timing valve bore and remove spring and coupling timing valve. Remove pressure boost valve retaining pin from center of cored side of valve body (in coupling timing valve bore) and remove pressure boost valve.

6) From the opposite side of the valve body, remove the pin retaining 2-3 throttle valve bushing and the 2-3 throttle valve. From same bore remove 2-3 shift valve and springs. From the next bore, remove valve bore plug retainer and plug (plug is under spring tension), then remove 3-4 throttle valve, spring and bushing, and 3-4 shift valve and spring.

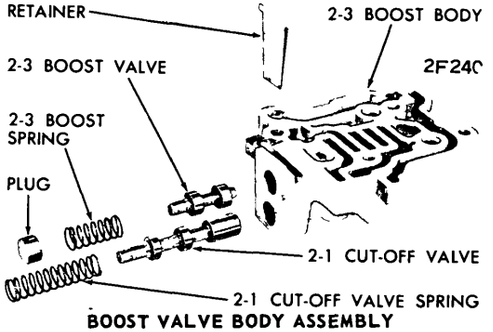
7) Remove retaining pin from neutral clutch valve bore, then remove plug, neutral clutch valve and spring. From the same bore, remove front clutch exhaust valve retaining pin on cored side of valve body (use a small

CONTINUED ON NEXT PAGE

3-SPEED (4-STAGE) HYDRA-MATIC TRANSMISSION (C ntinu d)

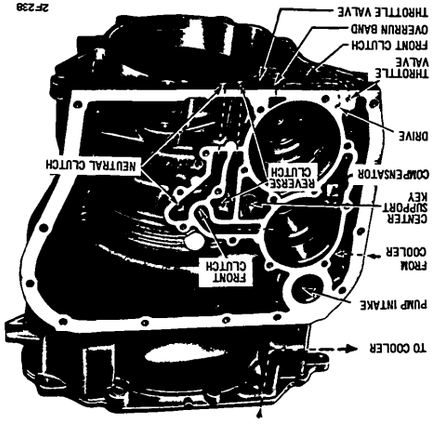
screwdriver to relieve tension on pin for removal), then remove clutch exhaust valve spring and valve.

8) Mark throttle valve adjustment screw and **loosen xactly five turns.** Turn valve body over and remove throttle lever by removing outside "C" ring and washer, positioning shaft so that lever will clear throttle valve adjusting screw, then remove washer. Remove throttle valve plunger, guide, spring and valve.



9) If necessary, remove reverse blocker piston retaining pin, spring, and reverse blocker piston. Remove detent spring. *NOTE – Do not remove detent lever unless n c ssary to r plac . If necessary to replace, drive pin out with a small punch. A new lever will be requir d at r ass mbly.* Remove pressure drop retaining pin, spring and valve.

R ass mbly: *NOTE: All attaching screws must be tighten d to 2.5–3.5 ft. lbs., and all attaching bolts to 6–8 ft. lbs.*



1) Install manual detent lever and pin, then install detent spring. Install reverse blocker piston, spring and pin. Install pressure drop valve (stem end of valve last), spring and retaining pin in top bore adjacent to detent spring.

2) Install throttle valve (round end first), spring, plunger and sleeve in throttle valve bore adjacent to manual valve bore. Place washer against "C" ring on throttle valve lever shaft, then install shaft through hole in valve body so throttle valve lever will index between plunger and throttle adjusting screw. Install washer and "C" ring securing lever assembly to valve body. Turn throttle valve adjusting screw back to original position **(xactly fiv turns).** Install throttle valve plunger guide retainer through cored side of valve body into annular groove in throttle valve plunger.

3) Install front clutch exhaust valve (land end first) and front clutch exhaust valve spring in bore adjacent to throttle valve bore. Install short retaining pin through

BOOST VALVE BODY ASSEMBLY

TRANSMISSION CASE OIL PASSAGES

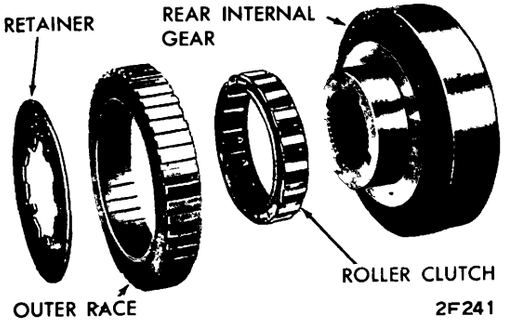
cored side of valve body while compressing exhaust valve spring, then install neutral clutch valve and spring in same bore. Compress valve spring and install valve bore plug (threaded end out) and long copper retaining pin.

4) Install 3–4 valve and spring as a combination, then install 3–4 throttle valve spring into pocket of 3–4 valve. Install 3–4 throttle valve into 3–4 regulator bushing so that valve will completely enter bore of bushing. Install 3–4 throttle valve and bushing into 3–4 bore in valve body (small end of throttle valve first), then install 3–4 valve bore plug (threaded end out), and retainer.

5) Install 2–3 valve in bore adjacent to 3–4 valve trains and install 2–3 throttle valve and shift valve springs in same bore. Install 2–3 throttle valve into bushing with stem end out, then install 2–3 throttle valve and bushing into 2–3 bore (valve end first). Depress bushing and install short retaining pin from cored side of valve body.

6) In the bore adjacent to "U" shaped cutout, install pressure boost valve, using a brass rod to guide valve into bore (long land first). Install retaining pin through same bore from core face of body. Install coupling timing valve (land end first) into same bore, then install coupling timing valve spring over stem end of coupling timing valve. Install valve bore plug in valve body, compressing and partially installing multiple plug retainer. Install retainer in such a manner that only one corner of the plug is retained (this will permit installation of remaining valves).

7) Install 3–4 governor valve and spring into valve bore (flat end first), then install 3–4 valve bore plug against 3–4 governor valve, compressing plug against spring tension into bore and position retainer again so that edge of plug is secured and the adjacent bore hole is unobstructed by retainer.



8) Install 2–3 governor valve into 2–3 shift valve bore, then install bore plug in 2–3 bore, compressing the valve against spring pressure and position multiple retainer, making sure remaining bore is unobstructed. Install 3–2 downshift valve (land end first) into remaining bore, then place 3–2 downshift spring over 3–2 downshift valve. Compress spring and secure with multiple retainer.

►*SPRAG CLUTCH OR ROLLER CLUTCH NOTE: Eith r type is used in production. For "Sprag Clutch" s 1961 Final, Page 483.*

REAR INTERNAL GEAR & ROLLER CLUTCH: Disassembly – Remove roller clutch and outer race from rear internal gear, then carefully remove roller clutch assembly from outer race. Remove rollers and energizing springs from cage.

Inspection: Inspect rollers for pitting, scratches, pickup, galling or flat spots. Inspect springs for distortion, cracks, permanent set or loss of tension. Inspect outer race for pitting, scratches, cracks, galling or broken ramp corners. Inspect cage for bent or broken struts, broken or distorted corners or teeth.

Reassembly: Install release springs on cage struts with upper tab on springs pointing in same direction as teeth or stops on race. *NOTE – Be sure center spring tab snaps securely over strut to retain the spring.* Install rollers into cage between springs in such a way that the upper tab on the spring fits over rollers. Carefully install roller clutch assembly into outer race so that rollers do not pop out. *NOTE – Teeth or stops on cage should align with ramps in outer race.* Place outer race and roller clutch assembly on bench with word "front" on roller clutch cage facing bench, then twist internal gear counterclockwise into roller clutch assembly.

ROLLER TYPE ONE-WAY CLUTCH

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC

Oldsmobile F–85 (1962)

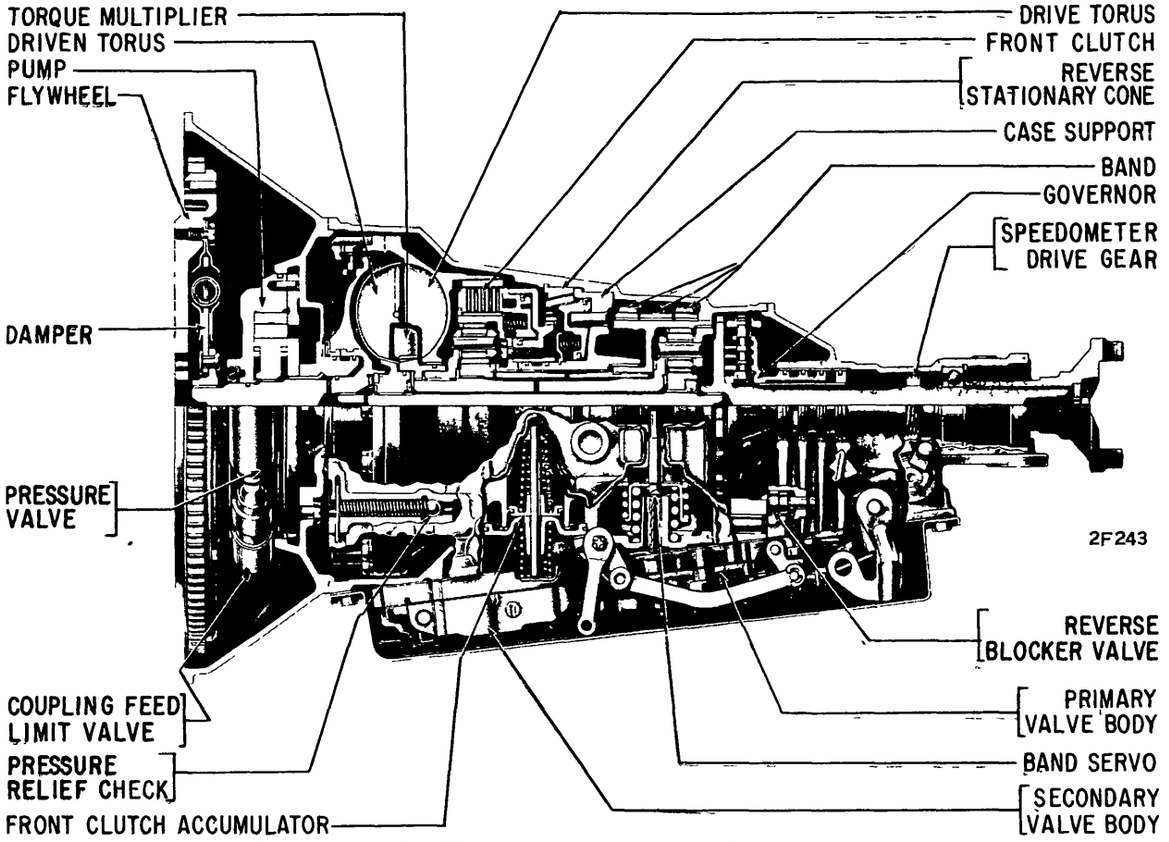
►CHANGES, CAUTIONS, CORRECTIONS

►*TRANSMISSION IDENTIFICATION NOTE: A serial number prefix stamped on serial number plate located n left side of transmission case identifies the various transmissions as indicated in table below.*

Car Model	Serial Number Prefix
F–85 (2–Bbl. Carb.)	O–562
F–85 (4–Bbl. Carb.)	OD–562
F–85 (4–Bbl. Carb. with console)	OE–562

►*TOWING HYDRA–MATIC DRIVE CARS:* Car may be towed at speeds up to 30 MPH if there is nothing wrong with transmission. When towing at speeds above 30 MPH or if transmission is known to be out of order, disconnect propeller shaft from transmission.

►*PUSHING CAR TO START ENGINE NOTE: It is not possible to start engine in this manner.*



DESCRIPTION: "Split Torque" type 3–speed (4–stage) hydraulically controlled automatic planetary transmission and torque converter (fluid coupling and torque multiplier) of same design as used on previous models.

OPERATION: Neutral Range - Engine torque is transmitted through torus cover to drive torus member causing it to rotate driven torus and turn mainshaft and rear unit sun gear in direction of engine rotation. In neutral, the band is released and allows rear unit internal gear to turn. As rear unit sun gear turns in direction of engine rotation, rear unit pinions turn in opposite direction, driving rear internal gear opposite engine rotation. The front unit sun gear being mechanically connected to rear internal gear is also turning opposite engine rotation causing front unit pinions to turn in direction of engine rotation, driving front internal gear in same direction. With both rear unit internal gear and front unit internal gear spinning freely, there is no transfer of torque from front or rear units to carriers or output shaft.

First Stage: Engine torque is transmitted through torus cover to torus drive member then through oil to torus driven member which redirects it through the stator (torque multiplier) and back to driven member. This action multiplies the engine torque and applies to mainshaft and rear unit sun gear. The band is applied locking rear unit internal gear stationary causing output shaft to rotate in direction of engine rotation within the internal gear at a reduced speed and with increased torque. As rear carrier and output shaft rotate clockwise at reduced speed the front carrier, which is mechanically connected to rear carrier, also rotates in direction of engine rotation at a reduced speed. As the band is holding front unit sun gear stationary, the carrier and pinions rotate front unit internal gear in direction of engine rotation at approximately one-half engine speed.

Second Stage: As car speed increases, power from engine is transmitted to output shaft in same manner as for "First Stage" (above), except that oil in torque converter is not redirected by torque multiplier, causing torque converter to function as a fluid coupling.

Third Stag : Engine torque is transmitted through torus cover to torus drive member. The front clutch is applied and coupling is empty so engine torque is mechanically applied to front unit internal gear. Front unit sun gear is splined to rear unit internal gear and is prevented from turning opposite engine rotation when band is applied. Engine torque at front internal gear is then applied to pinions, and because sun gear cannot rotate opposite engine rotation then planet pinions and carrier are compelled to revolve in direction of engine rotation around the sun gear in reduction. Front carrier is splined to rear unit carrier and shaft assembly which in turn is bolted directly to output shaft.

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION SECTIONAL VIEW

Fourth Stage: Engine torque is transmitted through torus cover and is applied through front clutch to front unit internal gear. Front unit internal gear, through pinions, tends to turn front sun gear opposite engine rotation. This would cause front carrier to run in direction of engine rotation, in reduction. The rear carrier, then must also attempt to rotate in direction of engine rotation, in reduction. With rear carrier rotating opposite engine rotation in reduction, and rear unit internal gear tending to turn in opposite direction, the rear unit pinions attempt to rotate in direction of engine rotation on their pins, thus driving rear unit sun gear and driven torus in direction of engine rotation faster than engine speed. As the fluid coupling is filled, coupling driven member and rear unit sun gear cannot revolve faster than drive torus which turns at engine speed. Therefore rear unit sun gear is slowed down to approximately engine speed. In so doing, rear unit pinions are slowed down in their rotation on pinion pins. Carriers and pinions then change direction of load against internal gear causing it to revolve in direction of engine rotation with carrier and sun gear at the same speed. Because output shaft and carriers are connected to the stator (torque multiplier) in the coupling, the torque multiplier is also turning at same speed as drive and driven members so that it has no effect in multiplying torque in coupling, causing the entire train to rotate as one common unit.

Reverse: Engine torque is applied to mainshaft in same manner as in "First Speed" above. Rear unit sun gear then drives rear unit pinions as idlers which in turn drive rear unit internal gear in a direction opposite to engine rotation. With rear unit internal gear turning opposite engine rotation, front unit sun gear is turning in same direction. The reverse cone which is applied holds front unit internal gear stationary so that front unit pinions and carriers are compelled to walk around front internal gear in a direction opposite to engine rotation, and in reduction. The output shaft being connected to

CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC (Continued)

front and rear unit carrier is also turning in a direction opposite engine rotation, and in reduction.

LUBRICATION

LUBRICATION INTERVALS: Check fluid every 2000 miles. Drain and refill every 24,000 miles.

Recommend d Lubricant: Use only Automatic Transmission Fluid Type "A" (Suffix "A").

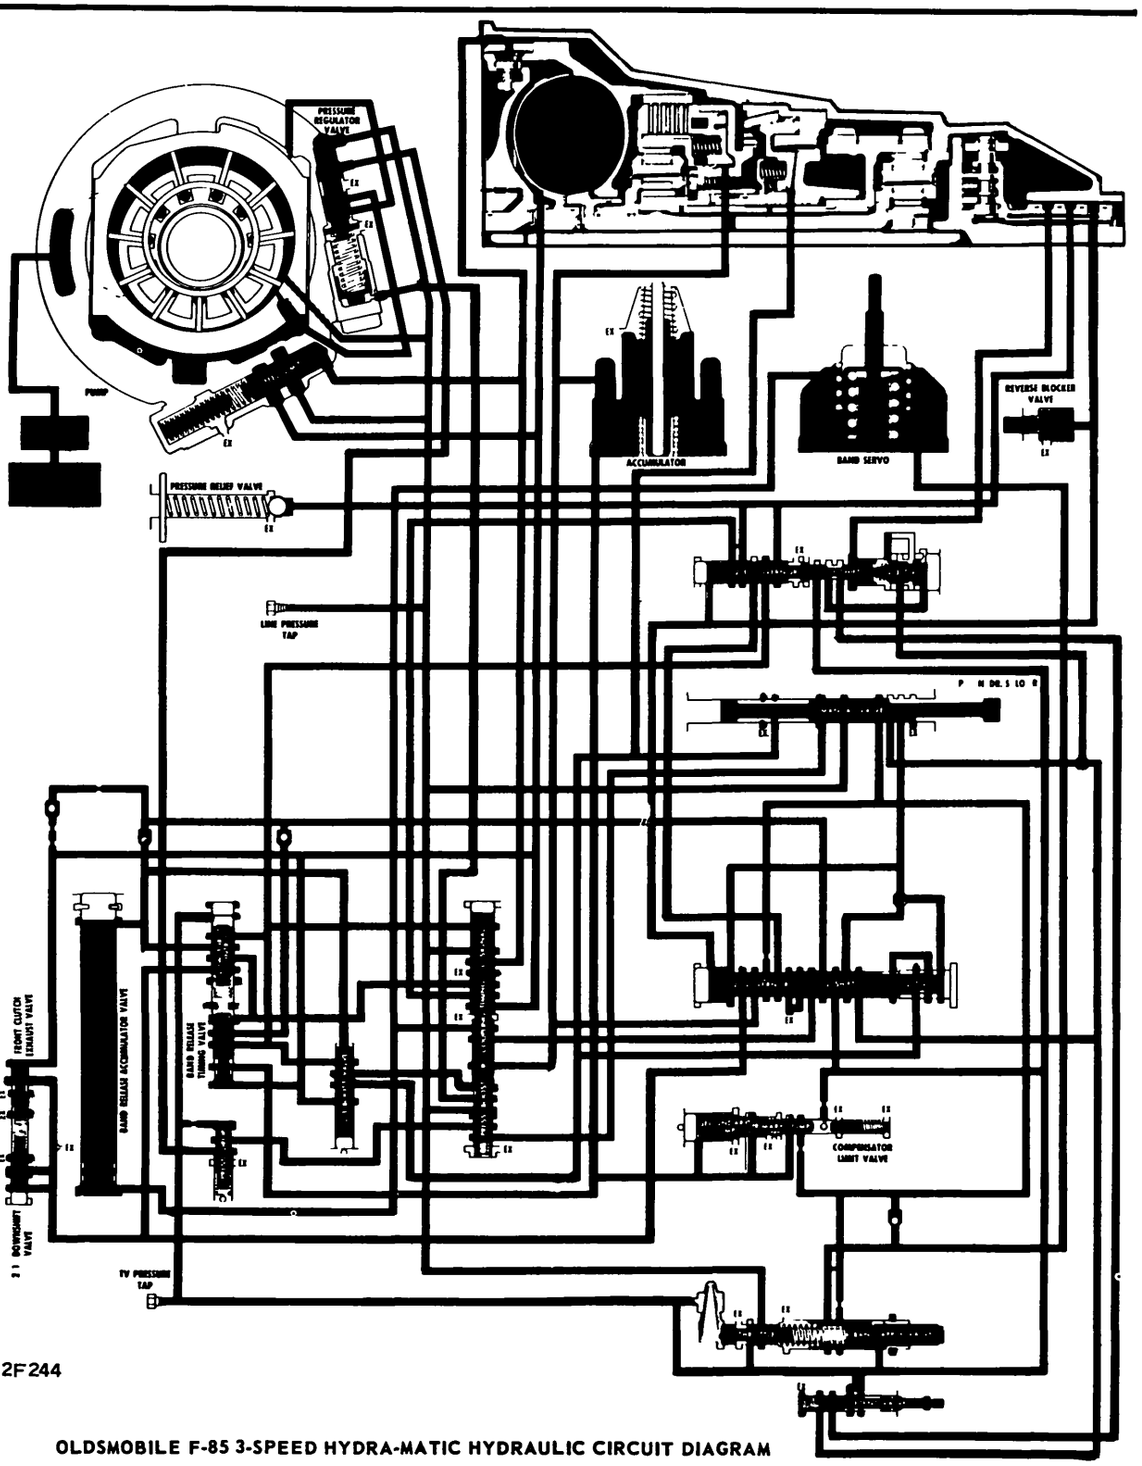
CHECKING FLUID LEVEL: With car on a level floor, transmission at normal operating temperature and selector lever in "P" (Park) position, check fluid level on dipstick. Add recommended fluid as necessary to bring level to FULL mark on dipstick. *NOTE - 1 pint of fluid is required to bring level from ADD mark to FULL mark. DO NOT OVERFILL.*

DRAINING & REFILLING: Remove drain plug from transmission oil pan and drain fluid, then replace plug. Remove dipstick and add 3½ qts. of recommended fluid, then with selector lever in "P" (Park) position and car on a level floor, start engine. With engine running, add sufficient fluid to bring level to FULL mark on dipstick. *CAUTION - Do not overfill.*

Capacity: Approximately 4 qts. (after drain); 5 qts. (after removal of pan); 7 qts. (after overhaul).

LINKAGE ADJUSTMENT

THROTTLE LINKAGE ADJUSTMENT: *See "Carburetor" on car mod l pag .*



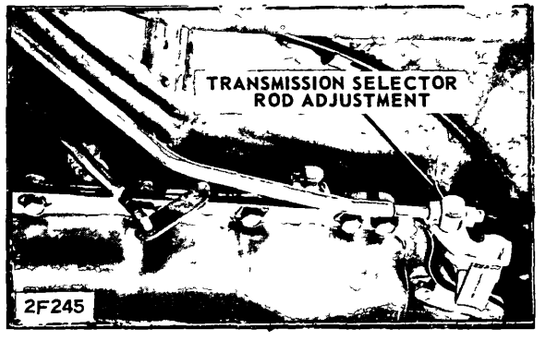
THROTTLE VALVE LEVER (ON TRANSMISSION) ADJUSTMENT: Remove lower throttle valve rod from throttle valve lever and place pin of Throttle Valve Lever Gauge, BT-33-2 in threaded hole in case (located in boss on left side of transmission case at forward end). If hole in lever does not align WITHIN the hole in gauge, bend throttle valve lever as necessary with Bending Tool, BT-33-7 to align center of hole WITHIN gauge hole.

MANUAL LINKAGE ADJUSTMENT (Steering Column & Floor Mounted Selector Levers): Place selector lever in "N" (Neutral) position, then loosen front and rear locknuts at manual lever on transmission. Hold manual rod so that shift lever is positioned against the stop. Tighten rear locknut until it just contacts swivel, then tighten two more turns. Tighten front locknut.

BAND ADJUSTMENT: Adjust every 26,000 miles. Remove oil pan and cleaner and loosen adjusting screw locknut. Use an inch pound torque wrench and Tool J-8591 and tighten adjusting screw to 20 inch pounds. Loosen screw two complete turns and hold while tightening locknut. Tighten locknut to 18-20 ft. lbs.

THROTTLE STOPSCREW ADJUSTMENT: *NOTE - This adjustment is required whenever channel body and throttle body have been separated or either has been replaced.* Disconnect throttle valve rod from outer throttle valve lever on transmission, then insert Tool BT-33-6 between throttle valve plunger and throttle valve lever by pushing plunger into its bore and holding the lever rearward. Adjust stopscrew against lever

CONTINUED ON NEXT PAGE



OLDSMOBILE F-85 3-SPEED HYDRA-MATIC HYDRAULIC CIRCUIT DIAGRAM

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC (C ntinued)

until throttle valve plunger bottoms in its bore, **then back stopscrew out only enough to permit removal of gauge.**

NEUTRAL SAFETY SWITCH ADJUSTMENT (Steering Column Mounted Selector Lever): Loosen switch attaching screws on mast jacket, then with selector lever in "N" (Neutral), position switch so that a .090" pin can be inserted through hole in switch arm and into hole in face of switch. Tighten switch attaching screws and remove pin. Check to make sure starter is not operative in any selector lever position except "N" (Neutral) and "P" (Park).

Floor Mounted (Console) Selector Lever: Remove console, then loosen switch attaching screws. With selector lever in "N" (Neutral), position switch so that a .090" gauge pin can be inserted through hole in switch arm and hole in face of switch. Tighten switch attaching screws and remove pin. Check to make sure starter is not operative in any selector lever position except "N" (Neutral) or "P" (Park).

MANUAL SELECTOR LINKAGE

TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. See "Shift Speed Tables" below for correct shift speeds under different operating conditions.

►*CAUTION: Do not stall test transmission under any conditions.*

OIL PRESSURE TEST: Main Line Pressure - Connect a 300 lbs. pressure gauge to main line passage in case (remove plug in side of case just forward of outer throttle valve lever). With engine at normal operating temperature, engine idling at 500 RPM and parking brake applied, pressure should be 60-125 lbs. in all transmission ranges. Pressure should not vary more than 10 lbs. between ranges. With pressure gauge connected, operate car on road. Pressures should be as indicated in table below.

Operating Pressure Test

Selector Lever Position	Shift	℄ Pressure
Dr., S., L., Rev.	1st	118-175 lbs.
S (30 MPH)	2nd	98-111 lbs.
Dr. (Zero Throttle, 30 MPH)	3rd	68-78 lbs.

℄ - A drop in pressure of approximately 10 lbs. as each shift is made is normal, but gauge reading should stabilize after each shift is made.

SHIFT SPEED TABLES

℄ - Not possible.

TROUBLE SHOOTING & DIAGNOSIS

NO DRIVE IN DRIVE RANGE: Check for low oil level or low pressure. Manual linkage out of adjustment. Sticking valve in control valve assembly. Band not applying. Check for internal leakage. Check for restricted passage with air pressure. Coupling not filling.

MISSING ALL SHIFTS: Sticking governor valve. Sticking valve in control valve assembly. Clutch not applying.

DRIVE IN THIRD & FOURTH ONLY: Sticking valve in control valve assembly. Clutch is locked (too many plates).

DRIVE IN THIRD & FOURTH ONLY (This may be reported as a 2–3 Slip): Sticking valve in control valve assembly. Coupling not emptying.

DRIVE IN SECOND & FOURTH ONLY: Governor "G–2" valve sticking. Sticking valve in control valve assembly.

DRIVE IN FOURTH ONLY: Sticking valve in control valve assembly. Band not applying. Sticking governor valve.

DRIVE IN NEUTRAL (REVERSE OR FORWARD): Internal manual linkage engaging. Neutral clutch mispositioned. Reverse cone clutch not applying.

NO REVERSE: Internal manual linkage mispositioned. Low oil pressure. Reverse cone clutch not engaging. Restricted passage. Band not releasing.

ROUGH 2–3 UPSHIFT: Throttle valve linkage not adjusted properly. Sticking valves in control valve assembly. Sticking parts in accumulator. Coupling not emptying fast enough. Front clutch slipping. 2–3 oil passage restricted.

ROUGH 3–4 UPSHIFT: Band not releasing fast enough. Sticking parts in servo.

SLIPPING IN ALL STAGES: Low oil pressure.

SLIPPING 2–3 UPSHIFT: Throttle valve linkage too long. Low oil pressure. Check for restricted or sticking parts in accumulator. Sticking valves in control valve assembly. Band slipping. Check number of plates in front clutch. 2–3 oil passage restricted.

SLIPPING 3–4 UPSHIFT: Sticking valves in control valve assembly. Coupling not filling fast enough.

NO ENGINE BRAKING IN INTERMEDIATE OR LOW RANGE: Sticking valves in control valve assembly. Band slipping or servo not applying.

NO PART THROTTLE OR DETENT DOWNSHIFT: Throttle valve linkage too long. Sticking valves in control valve assembly. Accelerator travel too short. Governor valves sticking.

SELECTOR LEVER WILL NOT GO INTO REVERSE: Internal manual linkage mispositioned. Reverse blocker valve stuck open. Governor "G-2" valve stuck open.

SELECTOR LEVER WILL NOT GO INTO PARK: Parking linkage broken, improperly assembled or distorted. Manual linkage not properly adjusted.

FORWARD DRIVE IN REVERSE: Internal manual linkage improperly assembled or distorted.

HIGH UPSHIFTS: Throttle valve linkage too short. Sticking valve in control valve assembly or in governor. Throttle valve lever bent. Throttle valve pressure too high. Line pressure too high. Governor oil passage restricted.

LOW UPSHIFTS: Throttle valve linkage too long. Control valve assembly or governor valves sticking. Throttle lever bent. Throttle valve or line pressure too low. Governor passages restricted.

HANGING IN THIRD OR ENGINE STALL UPON STOP: Control valve assembly or governor valves sticking. Throttle valve linkage too short. Clutch not releasing.

TRANSMISSION REMOVAL & INSTALLATION

REMOVAL: Install Engine Support Tool J-8974, then remove oil filler tube and breather tube. Disconnect propeller shaft, shift and throttle linkage, cooler lines and speedometer cable. Remove exhaust pipe and transmission rear support bar, then place transmission lift in position and remove transmission to engine bolts.

Installation: Reverse removal procedures and note the following: Lubricate threads of transmission-to-engine block bolts with Lubricant, Part No. 980131 and tighten to 30-35 ft. lbs.

TRANSMISSION OVERHAUL

OVERHAUL: *See 1961 Final, Page 488, and not th following:*

Control Valve: Disassembly (Compl te C ntr l Valv): Place control valve assembly on a clean surface with channel plate–to–case spacer down, and the rear throttle valve lever located on lower left hand corner. Remove the one retaining screw from each valve body, then turn control valve assembly over so rear throttle valve lever is located in upper left hand corner. Remove three screws retaining channel plate–to–case spacer plate and remove spacer plate. Remove two large and two small ball checks from channel plate, and three channel plate–to–valve body attaching screws. Remove manual valve from primary valve body, then remove channel plate and rear throttle valve lever from valve bodies. Remove the three ball checks, then remove channel plate–to–valve body spacer. Remove sleeve, detent valve and spring from primary valve body. *NOTE – To remov throttl valv l ver fr m channel plate, remove the "E" ring.*

Primary Valve B dy Disass mbly – 1) Remove band apply valve bushing retainer, then remove band apply valve and bushing from throttle valve bore. Remove

CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC (C ntinu d)

band apply valve spring, throttle valve spring and valve. Remove retaining pin from 2–3 valve bore while holding 2–3 throttle valve bushing, then remove 2–3 throttle valve bushing, 2–3 throttle valve and spring, and the 2–3 shift valve.

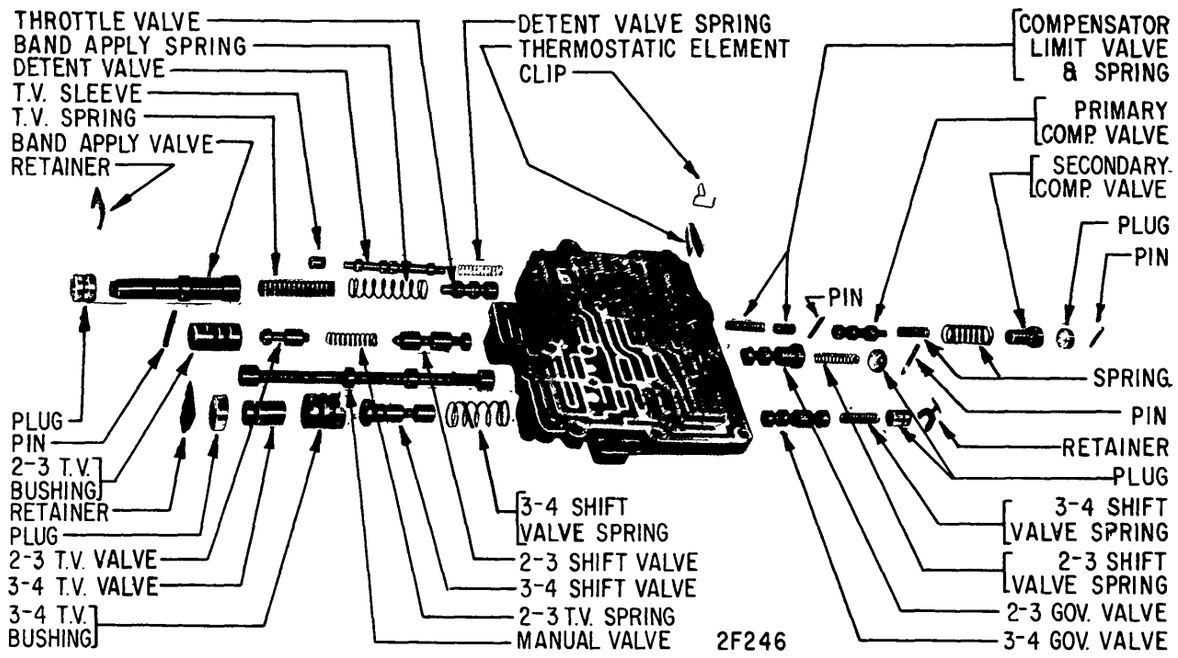
2) Remove 3–4 bore plug retainer and bore plug, then remove 3–4 throttle valve bushing and 3–4 throttle valve. Remove 3–4 throttle valve from bushing. Remove 3–4 shift valve and spring.

3) Remove bore plug retainer and bore plug from other end of 3–4 shift valve bore, then remove 3–4 shift valve spring and governor valve. Remove bore plug retaining pin and bore plug from 2–3 valve bore and remove 2–3 shift valve spring. Remove 2–3 governor valve.

4) Remove bore plug retaining pin from compensator bore while holding the bore plug, then remove compensator bore plug and secondary compensator valve and spring. Remove primary compensator valve and spring. Remove compensator limit valve retainer pin by compressing limit valve spring with a brass rod, then remove compensator limit valve and spring. *CAUTION – D n t disturb th rmostatic throttle valve element adjusting scr w.* Remove throttle valve element clip and element.

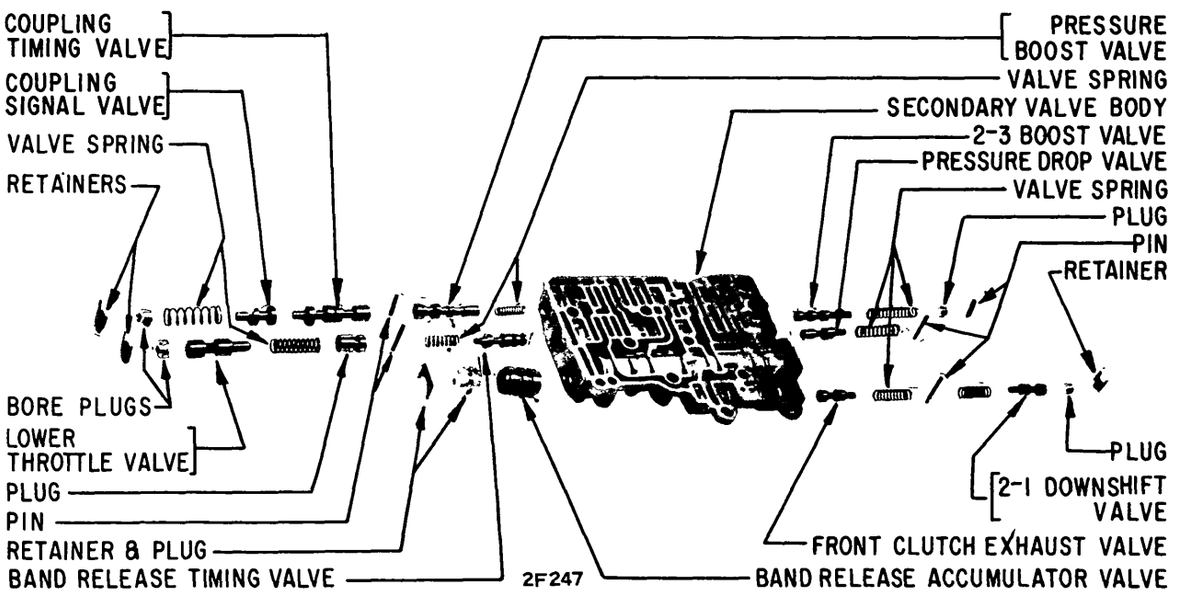
Primary Valv B dy R ass mbly – 1) Install compensator limit valve spring and valve, then install retaining pin by compressing limit valve spring with a brass rod.

2) Install primary compensator valve (land end first) and spring, then install secondary compensator spring and valve (small end first). Install compensator bore plug and retaining pin.



3) Install 3–4 governor valve, shift valve spring and bore plug, then install retaining pin. Install 3–4 rear shift valve spring and shift valve into other end of 3–4 shift valve bore. Install 3–4 throttle valve in the 3–4 throttle valve bushing so that it completely enters bushing, then install valve and bushing, bore plug, and retainer.

4) Install 2–3 shift valve (small end first) in 2–3 bore. Install 2–3 throttle valve spring, then install 2–3 throttle valve into 2–3 throttle valve bushing (land end first), and install 2–3 throttle valve and bushing. Install retaining pin while holding springs compressed.



5) Install throttle valve (stem end out) in throttle valve bore. Install band apply valve spring and throttle valve spring, then install band apply valve (spring pocket first). Install band apply valve bushing on band apply valve, then install band apply valve retainer while holding valve and bushing compressed. Install throttle valve element and clip. *NOTE – Do not install manual valve and det nt valve train at this time.*

Secondary Valv B dy Disassembly & Reassembly – Same as for previous models except that 2–3 Boost Valve parts are now referred to as 3–4 Boost Valve parts; and the 2–1 Downshift Valve and Spring is now referred to as the 3–2 Downshift Valve and Spring. See *"S c ndary Valve B dy Assembly" illustration.*

Contr l Valv : Reass mbly (Complete Control Valve): Reverse disassembly procedure and note the following: Manual valve must be installed so that land with hole is outward. To align primary valve body to channel plate, insert a ¼" drill through one of the attaching holes, then tighten countersunk flathead screw.

PRIMARY VALVE BODY ASSEMBLY

SECONDARY VALVE BODY ASSEMBLY

PONTIAC TEMPEST TRANSAXLE

Pontiac Tempest (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*PUSHING CAR TO START ENGINE (AUTOMATIC TRANSMISSION):* Place transmission selector lever in "N" (Neutral) until car reaches 25 MPH, then move selector lever to "L" (Low) until engine starts.

►*TOWING AUTOMATIC TRANSMISSION CARS:* With transmission selector lever in "N" (Neutral) car may be towed at speeds not to exceed 30 MPH. If transmission is not operating properly, raise rear wheels off ground to tow car.

DESCRIPTION

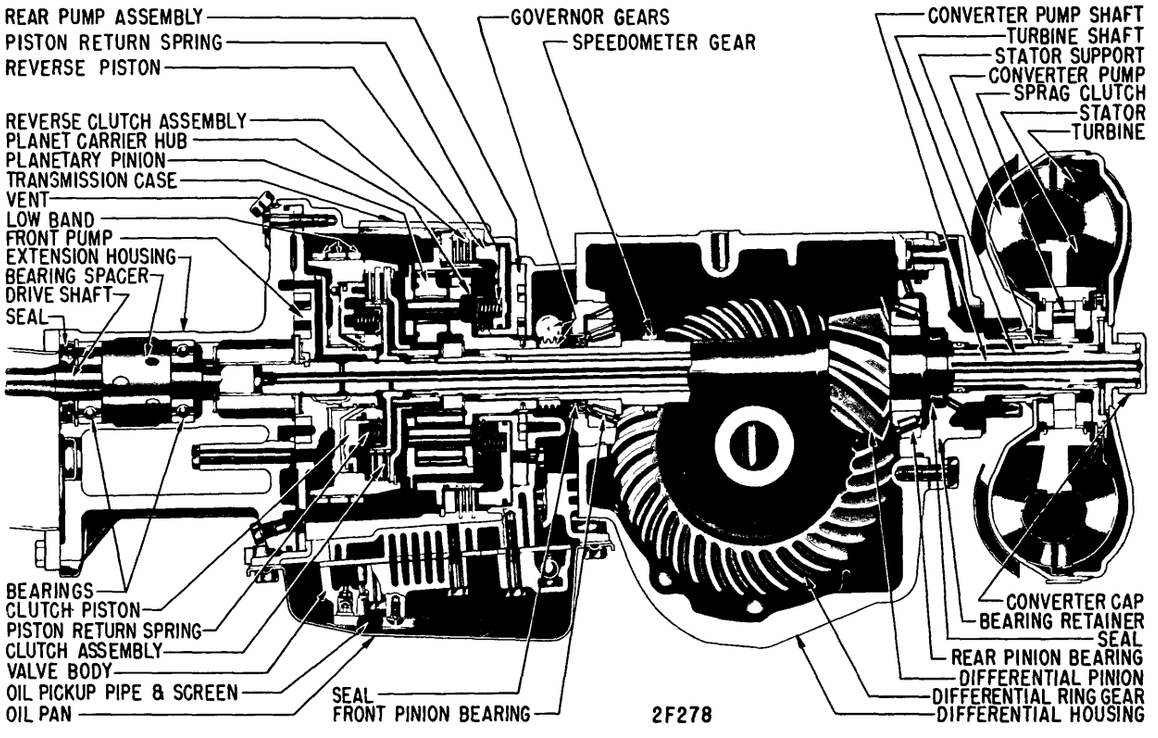
DESCRIPTION: The Transaxle assembly consists of either an integral differential (rear axle) unit and synchro-mesh transmission; or a differential (rear axle) unit and an automatic type transmission as follows:

Differential (Rear Axle) Assembly: Straddle mounted hypoid gear design which is contained in a separate housing attached directly to transmission case. On cars with automatic transmission, the torque converter is located to rear of differential housing with transmission input and output shafts running axially through differential pinion shaft. Each axle shaft is independently suspended and is free to move in a vertical plane in an arc. Axle shafts are attached to universal joints which are splined into differential side gears.

Axle Ratios - *NOTE - Axle ratio stamped on right side of carrier housing on flat surface next to side cover.* 3.08-1 (37-12), 3.31-1 (43-13), 3.55-1 (39-11), 3.73-1 (41-11), 3.90-1 (39-10).

Synchro-mesh Transmission: 3-Speed & 4-Speed synchro-mesh types integral with rear axle differential carrier. **Transmission Ratios (3-Speed)** - 2.94-1 (1st Speed), 1.68-1 (2nd Speed), 1.00-1 (3rd Speed), 3.32-1 (Reverse). **Transmission Ratios (4-Speed)** - 3.65-1 (1st Speed), 2.35-1 (2nd Speed), 1.44-1 (3rd Speed), 1.00-1 (4th Speed), 3.66-1 (Reverse).

Automatic Transmission: Three element torque converter and a hydraulically operated two-speed type automatic shift transmission which is integral with rear axle differential carrier. Engine torque is transmitted through converter pump shaft (located within hollow turbine shaft) to torque converter turbine, then back to transmission through the hollow turbine shaft (located within hollow differential driven pinion shaft). Transmission output shaft is splined directly to differential drive pinion shaft.



LUBRICATION

Check fluid level in all units every 4,000 miles.

►*AUTOMATIC TRANSMISSION NOTE: Draining and refilling of automatic transmission is not recommended except at time of overhaul.*

Recommended Oil (Rear Axle & Synchro-mesh Trans.) - SAE 80 or SAE 90 "Multi-Purpose" gear lubricant. *CAUTION - Do not use straight mineral oil gear lubricants or lubricants containing active sulphur soap.* Differential carrier and synchro-mesh transmission are connected by internal passages.

Automatic Transmission - Automatic Transmission Fluid Type "A" (Suffix "A"). *NOTE - Automatic Transmission is sealed off from differential carrier.*

PONTIAC TEMPEST TRANSAXLE (WITH AUTOMATIC TRANSMISSION)

Checking Fluid Level: Rear Axle & Synchro-mesh Transmission - With unit at normal operating temperature, check fluid in differential carrier first (plug is adjacent to rear axle universal joint on left side of transmission case). If level is low in differential case, also check level in transmission housing. *NOTE - With unit at operating temperature, fluid should be level with bottom of filler plug hole.*

Automatic Transmission - With transmission at normal operating temperature and transmission selector lever in "N" (Neutral) position, engine idling, check fluid level on dipstick in filler tube located under a plate in right-front of luggage compartment. Add recommended fluid as necessary to bring level to "Full" mark on dipstick. Approximately one pint of oil is required to raise level from "Add" to "Full".

Draining & Refilling: Rear Axle & Synchro-mesh Transmission - *NOTE - Not recommended except at time of overhaul or repair.*

Capacity - 2.8 pints (3-Speed Transmission), 3.75 pints (4-Speed Transmission), 3 pints (Differential).

Automatic Transmission - *NOTE - Not recommended except at time of transmission overhaul.* Drain oil by loosening filler tube attaching nut in oil pan. To refill, tighten filler tube nut and add 4 pints of recommended fluid using fillet tube and funnel. Start engine and allow to idle 3-5 minutes in "N", then add sufficient fluid to bring level to "Full" mark.

Capacity - 6 pts. (after draining). 12 pts. (after overhaul).

ADJUSTMENT

Transmission Throttle Linkage (Automatic Trans.): *See CARBURETOR on Car Mod l pag .*

Manual Linkage (Automatic Trans.): Drain transmission oil and remove oil pan. Place selector lever in "D" (Drive) range, then insert Tool J-8365 into manual valve bore (end opposite linkage) with tab of gauge upward so it engages forward port of valve body. With tool in place, push forward on manual valve levers. If valve is properly adjusted, tool will be held in place horizontally without being supported. If adjustment is necessary, loosen lockscrew in manual valve linkage (inside transmission) and push manual valve levers forward so Tool J-8365 is held in a horizontal position. Recheck adjustment. Install oil pan and fill transmission with fluid.

Neutral Starter Switch Adjustment (Aut matic Trans.): Loosen two switch mounting screws and place transmission selector lever in "N" (Neutral) position. Turn ignition switch to start position, then move neutral switch fore and aft until engine cranking begins. Secure switch in that position. Recheck to make sure engine will not start with transmission selector lever in any position other than "N" (Neutral). *NOTE - N utral switch is located n rear of gearshift c ntrol and indicat r ass mbly.*

Low Band: *NOTE - Periodic adjustm nt is not rec m-*

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (C ntinued)

m nd d, h w ver, if n c ssary, proceed as follows: Lower transmission for access to adjusting screw, then loosen locknut and tighten screw to 40±5 inch lbs. torque, **then back off f ur full turns exactly.** Hold adjusting screw stationary and tighten locknut.

TROUBLE SHOOTING
(AUTOMATIC TRANSMISSION)

NO DRIVE IN ANY SELECTOR LEVER POSITION (CANNOT LOAD ENGINE): Low oil level. Clogged oil suction pipe screen. Broken or disconnected manual cable. Defective pressure regulator valve. Defective line pressure limit valve. Defective front pump. Rear pump check valve and rear pump priming ball not seating (both must occur for possible malfunction). Front pump shaft disengaged at either converter or pump gear. Front pump priming ball not seating.

ENGINE SPEED FLARES ON STANDSTILL STARTS BUT ACCELERATION LAGS: Low band only partially applied caused by one or more of the following conditions: Low oil pressure. Clogged pickup pipe screen. Improper band adjustment. Servo piston apply passage blocked. Servo piston ring broken or leaking. Band facing worn. Low band apply linkage disengaged or broken. Converter stator not holding.

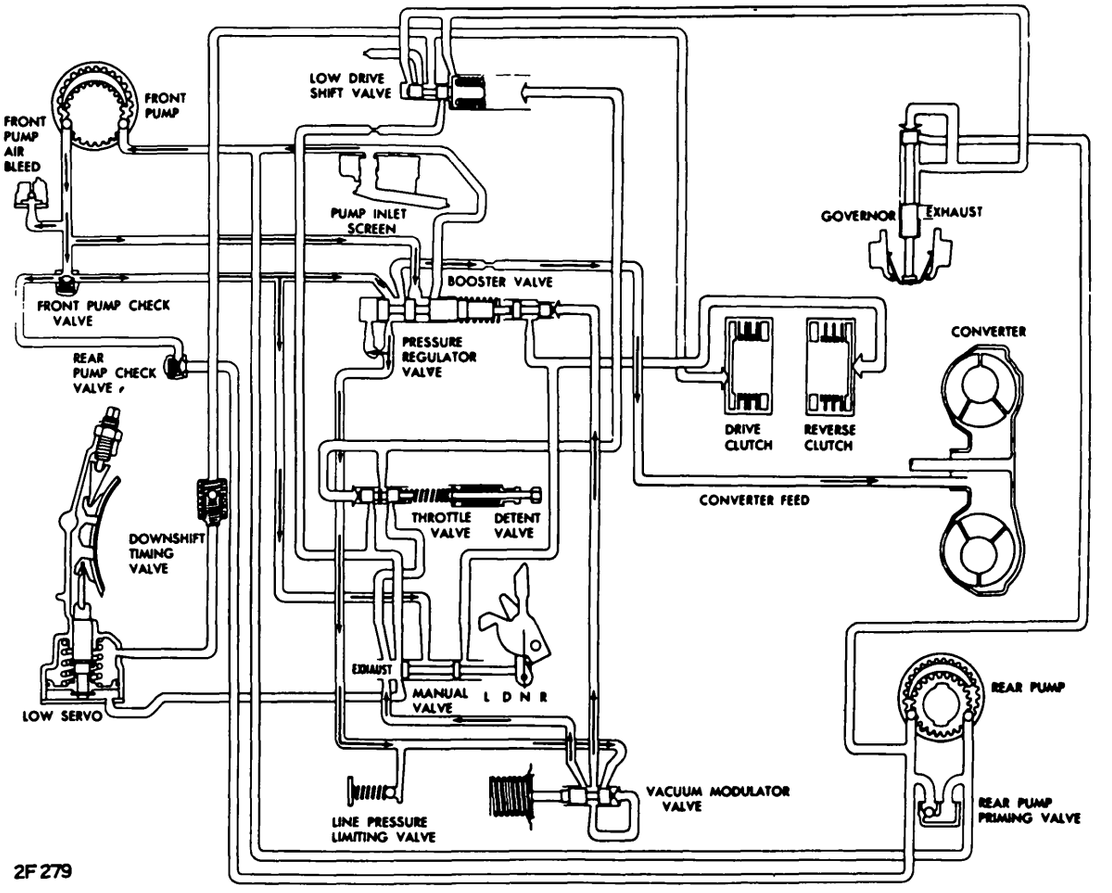
ENGINE SPEED FLARES ON UPSHIFT: Low oil level. Clogged oil suction screen or pipe. High clutch partially applied (blocked feed orifice). Clutch plates worn. Clutch seals leaking. Clutch piston hung up. Clutch drum relief ball not seating. Vacuum modulator hose collapsed.

TRANSMISSION WILL NOT UPSHIFT: Low band not releasing due to one of the following conditions: Stuck low-drive valve. Defective governor. No rear pump output (stuck priming ball, drive pins not engaged, or defective pump). Throttle valve stuck or improperly adjusted. Improperly adjusted manual valve lever.

HARSH UPSHIFT: Incorrect carburetor-to-transmission throttle valve rod adjustment. Improper low band adjustment. Vacuum modulator hose broken or disconnected. Vacuum modulator diaphragm leaks. Vacuum modulator valve stuck. Hydraulic modulator valve stuck.

CLOSED THROTTLE HARSH DOWNSHIFT: Improper low band adjustment. Vacuum modulator hose disconnected or broken. Vacuum modulator diaphragm ruptured. Vacuum modulator valve stuck. Engine idle speed too high. Sticking pressure regulator or hydraulic modulator valves in valve body.

CAR CREEPS EXCESSIVELY IN DRIVE: Idle speed too high.



CAR CREEPS IN NEUTRAL: Incorrect manual valve lever adjustment. High clutch or low band not released.

NO DRIVE IN REVERSE: Manual valve lever adjustment not correct. Cable linkage adjustment not correct. Reverse clutch piston stuck. Reverse clutch plates worn out. Reverse clutch leaking excessively. Blocked reverse clutch apply orifice.

IMPROPER SHIFT POINTS (s "Shift Sp d" tabl bel w): Incorrect accelerator control linkage adjustment. Throttle valve incorrectly adjusted. Governor defective. Rear pump priming ball stuck.

OIL FORCED OUT OF FILLER TUBE: Oil level too high. Oil pickup pipe split or not sealed causing air entrainment.

UNABLE TO PUSH START: Rear pump drive gear not engaged with drive pins on planet carrier hub. Rear pump defective. Rear pump priming ball not seating.

PONTIAC TEMPEST AUTOMATIC TRANSMISSION HYDRAULIC CIRCUIT

TESTING
(AUTOMATIC TRANSMISSION)

►*TESTING NOTE: Transmission must be at normal operating temperature, fluid level at "F" mark on dipstick, and manual and throttle linkage adjustments must be correct.*

ROAD TEST: Road test car to determine transmission shift points as indicated in table below.

Transmission Shift Speeds

UPSHIFTS	℄MPH 4 Cyl.	V8
Minimum Throttle	12-15	17-21
Full Throttle	43-50	49-55
Part Throttle (Detent Touch)	35-45	40-49

DOWNSHIFTS	℄MPH 4 Cyl.	V8
Closed Throttle	9-15	14-18
Full Throttle	39-46	45-51
Part Throttle (Detent Touch)	21-33	28-37

℄ - With 3.55-1 ratio rear axle. *NOTE - To convert for other axle ratios, multiply MPH x 3.55 and divide result by desired ratio.*

PRESSURE TESTS: *NOTE - Pressure tests can be made by raising rear wheels 3-5" off floor on jack stands.*

Front Pump: Remove pipe plug located at 6 o'clock position in front face of transmission extension housing and connect pressure gauge. With engine at idle speed (approximately 16" of vacuum), pressures should be as indicated in table below. Disconnect vacuum hose at modulator, then with engine at idle speed, check pressures again (see table below). If there is no pressure in front pump, check for stuck pressure regulator, broken or disengaged front pump shaft or missing plug from front end of converter pump shaft. Moderately low front pump pressure in all ranges indicate a restricted

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (C ntinu d)

front pump inlet. Failure of pressure to rise when vacuum hose disconnected (or high pressure with vacuum hose connected) indicates a stuck vacuum modulator valve, defective vacuum modulator, or a collapsed hose.

Rear Pump: With gauge connected as for "Front Pump" (rear wheels raised), place selector lever in "D" (Drive) and accelerate engine. Front pump pressure should drop to approximately 0-5 lbs. at 20 MPH. If pressure does not drop, rear pump is disengaged or clogged or rear pump check ball is not seating.

Front Pump Pressures (At Indicated Engine Speed)

	Idle Speed ℂ		1000 RPM ℂ	
Shift Lever Position	**4 Cyl.**	**V8**	**4 Cyl.**	**V8**
Reverse	106-130	110-139	198-222	202-231
Neutral	55-67	59-73	101-114	105-120
Drive	55-67	59-73	101-114	105-120
Low	124-137	130-151	124-137	130-151

ℂ - At 16" Hg. Vacuum.
℃ - With vacuum hose disconnected.

Throttle Valve: Remove plug located at 8 o'clock position in front face of transmission extension housing and connect pressure gauge. Disconnect throttle valve at carburetor and vacuum hose at vacuum modulator, then with engine at idle speed, depress accelerator to wide open position. *NOTE - By disconnecting throttle valve rod at carburetor, engine remains at idle speed throughout test.* Pressure should be as follows with selector lever in indicated range. **Reverse** - 0 lbs. **Neutral** - 0 lbs. **Drive** - 50-52 lbs. (4 Cyl.); 48-50 lbs. (V8). **Low** - 119-132 lbs. (4 Cyl.); 125-146 lbs. (V8). If pressures not as specified, they can be corrected by adjusting position of jam nut located on end of detent valve assembly (inside transmission case). Insert an Allen wrench in end of adjusting screw and hold screw from turning, then turn jam nut (one full turn is equal to 3 psi.). Tightening the nut lowers pressure.

REMOVAL & INSTALLATION

►*AXLE FLANGE RUNOUT NOTE: Flange runout should not exceed .010" when checked just outside wheel bolts.*

AXLE SHAFT: Removal - Remove wheel and brake drum, then remove axle bearing retainer-to-brake backing plate attaching nuts (accessible through hole in axle shaft flange) and pull backing plate out slightly. Push backing plate back on control arm studs to break plate away from bearing retainer. Remove universal joint-to-rear axle flange U-bolts and pull axle shaft to separate flange from U-bolts. Remove axle shaft with Tool J-8614 and pull axle shaft from lower control arm.

Installation: Insert axle shaft through lower control arm and install flange on axle splines. *NOTE - It may be necessary to lightly tap flange onto splines.* Install and securely tighten axle shaft-to-flange bolt. Attach universal joint to flange on axle shaft with U-bolts and tighten nuts to 14-20 ft. lbs. With bearing retainer and brake backing plate holes aligned with control arm studs, insert universal joint splined yoke through seal at side bearing and index with splines of side gears. *NOTE - Coat lip of seal and splines with hypoid lubricant to prevent damage to seal.* Install nuts securing bearing retainer to backing plate (through access hole in axle flange) and tighten to 30-45 ft. lbs. Install wheel and drums and tighten mounting nuts to 70-85 ft. lbs.

TRANSAXLE (TRANSMISSION & DIFFERENTIAL CARRIER): Removal - Raise car and support transaxle assembly and rear of engine, then drain lubricant from transmission and differential carrier housing *(see "Draining & Refilling").* Remove axle bearing retainer-to-brake backing plate attaching nuts and pull axle shafts out far enough to remove universal joints from differential assembly (cover universal joint splines). Remove propeller shaft damper bearing retainer bolts at both bearings, then remove speedometer driven gear from differential assembly. Disconnect transmission control rods and cables from transmission and remove cables and lines from torque tube. On synchro-mesh cars, remove gearshift lever housing. On cars with V8 engine, remove exhaust crossover pipe. On all cars, remove flywheel cover and torque tube access hole cover, then disconnect propeller shaft from flywheel or clutch drive extension. *CAUTION - Place a rag between shaft and torque tube to protect propeller shaft coating.* Disconnect torque tube from flywheel housing, then disconnect transaxle from rear crossmember (remove two bolts through access hole in trunk or from under car). Remove transaxle, propeller shaft, and torque tube as an assembly.

Installation: With torque tube and propeller shaft installed on transaxle, position the assembly in car and install two bolts securing transaxle assembly to rear crossmember (through access holes in trunk) and tighten to 65-85 ft. lbs. Install propeller shaft on flywheel and secure front flange to flywheel, tightening bolts finger tight. Remove protecting rag or cloth from propeller shaft and secure torque tube to flywheel housing, tightening bolts finger tight. Tighten propeller shaft flange-to-flywheel or clutch drive shaft to 30-35 ft. lbs., then tighten torque tube-to-flywheel housing bolts to 30-45 ft. lbs. Install axle shaft universal joint splines in differential carrier assembly. *NOTE - Coat lip of seal and splines with hypoid lubricant to prevent damage to seal.* Install rear axle bearing retainer in position on brake backing plate and tighten attaching nuts to 30-45 ft. lbs. Tighten universal joint U-bolts 14-20 ft. lbs. *CAUTION - Make sure universal joint snap rings are properly installed.* Install wheel and brake drum assemblies, flywheel cover and torque tube access cover plate. On V8 models, install exhaust crossover pipe. Remove support from transaxle and engine, then install transmission control rods and cables. Install parking brake cable on torque tube and adjust. Install speedometer cable in differential carrier assembly and fill transmission and differential housing with proper lubricant *(see "Lubrication" above).* Idle engine approximately one minute, then tighten propeller shaft bearing bolts to 8-12 ft. lbs.

SYNCHRO-MESH TRANSMISSION: Removal - With transaxle assembly removed from car (see above), remove bolts attaching torque tube to transmission, then remove propeller shaft and torque tube as a unit by pulling on propeller shaft flange. Remove transmission-to-differential carrier attaching bolts and separate transmission from differential carrier.

Installation: Install transmission on differential carrier and tighten attaching bolts. Install propeller shaft and torque tube being careful to engage spline of propeller shaft into transmission and journal diameter into transmission extension bearings so journal surfaces are not damaged.

CAUTION - Check alignment of propeller shaft into transmission extension and, if absolutely necessary tap front flange of propeller shaft lightly with a soft rubber hammer. Be sure splines are completely ngag d in transmission. To complete installation in car, see "Transaxle" above.

AUTOMATIC TRANSMISSION: Rem val - With transaxle removed from car, remove converter cover cap using Tool J-9183 or other suitable "strap wrench" to hold converter. Remove converter retaining ring and converter. *NOTE - Reinstall cap on converter after removal and place cap side down to r tain oil.* Remove bolts attaching torque tube to transmission, then remove propeller shaft and torque tube as a unit by pulling on propeller shaft flange. Remove speedometer driven gear, governor assembly and "0" ring, then pull turbine drive shaft out of transmission. Remove screws retaining transmission to differential carrier and separate transmission from differential carrier.

Installation: *CAUTION - Before conn cting Automatic Transmission and differential carrier, determine thickness of thrust washers required at front face of governor gear. See "Rear Selective Thrust Washer" below.* After determining proper thickness thrust washer, install a new gasket to either carrier or rear face of transmission. Align carrier and transmission on a flat surface and carefully guide pump shaft through differential carrier so as not to damage bushing in differential pinion, then engage splines of pinion shaft with planet internal splines in transmission. Install governor and "0" ring seal and secure transmission to carrier with four screws. *NOTE - Drive two screws from carrier side first to minimize chance of cocking mating surface of transmission and carrier.* Tighten screws to 30-35 ft. lbs. Install turbine shaft into converter, then install converter and turbine shaft into transmission, being careful not to damage turbine shaft bushings when sliding over converter pump shaft. *CAUTION - Do not use forc wh n ngaging splines in converter and at end of turbine shaft. Engagement will occur easily if splines are correctly align d* Retain converter with retaining ring, then install converter cap and seal assembly. Tighten to 60-70 ft. lbs. *NOTE - If not previously installed, install modulator valve and vacuum modulator assembly.*

Rear Selective Thrust Washer: Any time repairs are made that require separation of automatic transmission and differential carrier, the proper thickness of thrust washer to be used at front face of governor gear must be determined as follows: Install dial indicator on Support J-8364 and install a 3" indicator extension. Without gasket, place support J-8364 on rear pump cavity surface of transmission case (transmission front end down) so that dial indicator extension tip rests on planet carrier hub. Adjust indicator as required to permit maximum indicator travel, then set dial to zero. *NOTE - Transmission must fac downward when indicator is z roed.* Slowly lift indicator and support off rear pump cavity and note its range of needle deflection from zero Position. *NOTE - If indicator is properly positioned on support, indicator*

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (C ntinu d)

should not deflect more than .050" (one-half turn) when removed; otherwise raise or lower dial indicator on support as required and again "zero" indicator. Place support and dial indicator on governor gear on differential carrier pinion shaft (Support J-8364 will fit over pinion shaft), then slowly lower support (indicator tip of dial indicator against machined face of differential carrier housing) so that revolutions of dial indicator needle can be counted. *NOTE - Measurement starts once the needle reaches "zero".* Finally depress support on governor gear and note indicator reading, then refer to following table for thickness of spacers to be installed on governor gear.

►*NOTE: After selected spacers are installed on governor gear, recheck measurement. If spacer stack is correct, indicator r ading will now be between .025-.038". If not, add or remove spacers until reading is within this range.*

T arust Spacer Chart

Indicator R ading	No. R qd.	© Spacer Thickness

DIFFERENTIAL CARRIER: Removal & Installation - *See instructions above for "Synchro-mesh" or "Automatic" Transmissions.*

OVERHAUL

OVERHAUL: *Se 1961 Final, Page 497 and note the following:*

4-SPEED SYNCHRO-MESH TRANSMISSION

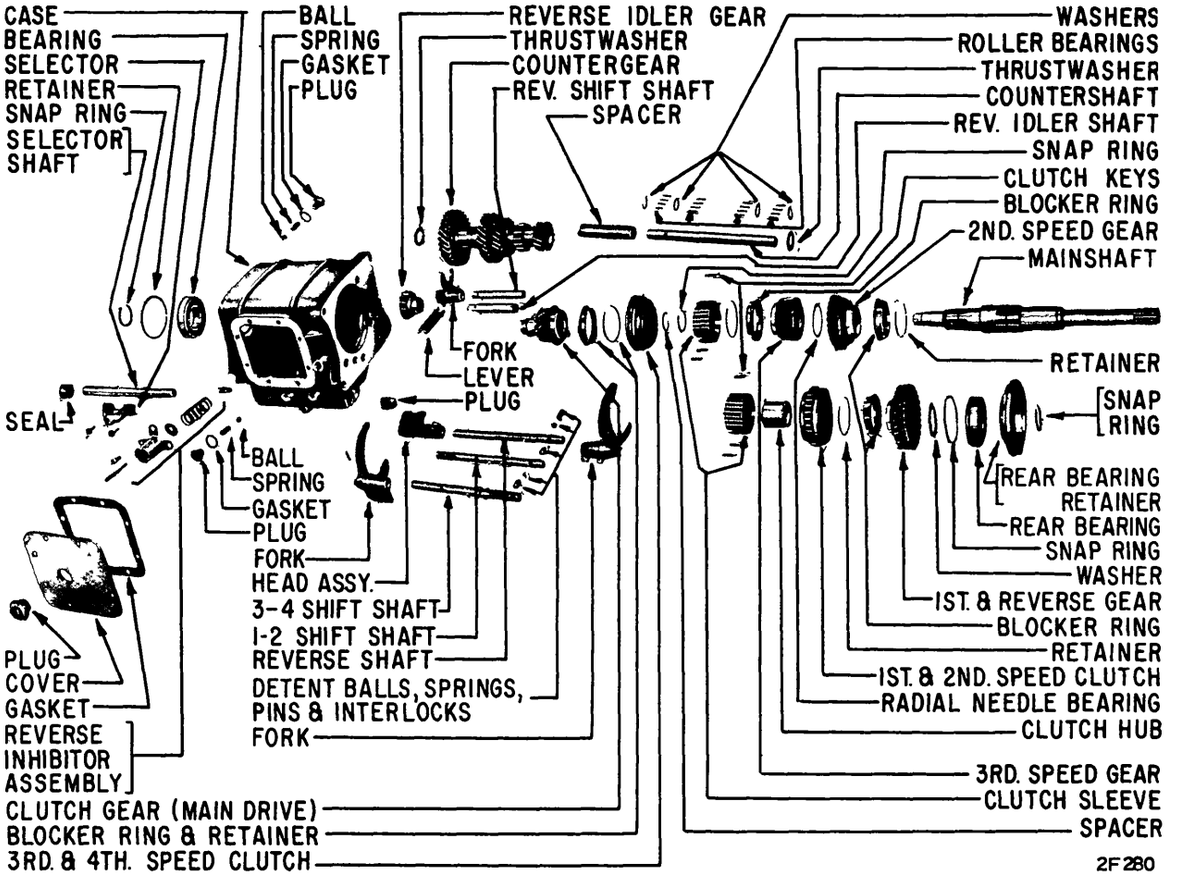
DISASSEMBLY: Transmission Case - 1) Remove front bearing retainer and side cover, then remove plug, detent spring and ball from 3-4 detent channel at left rear of case. Place 3-4 shift fork into fourth gear (fully forward), then drive roll pin from shift fork with a pin punch. Remove 3-4 shift shaft with a drift and remove fork. *NOTE - Shaft can be driven out of case in ith r direction.*

2) Remove plug, spring and detent ball from 1-2 detent channel at front of case, then place shift fork in second gear (fully forward). Remove pin, fork and shaft in same manner as for 3-4 shift fork assembly.

3) Remove snap rings located in clutch gear bore (between clutch gear and bearing, and between clutch gear bearing and case). Install clutch bearing puller J-8880 as follows: Assemble puller plates J-8880-1 onto clutch gear bearing by inserting plates into bearing groove, then secure puller plates together with two screws. Insert adapter plug J-8880-2 into bore of clutch gear, then attach body J-8111-3 to puller plates with two ½"-13 x 2½" screws and two flat washers. Remove clutch gear bearing.

4) Remove two snap rings securing rear mainshaft bearing retainer in place, then remove mainshaft with assembled gears and rear bearing retainer through rear of case. *NOTE - It may be necessary to jiggle output shaft, making sure that clutch gear does not separate from mainshaft.* After removal of mainshaft assembly from transmission, shift synchronizer sleeves to neutral.

5) Drive roll pin from reverse shifter head with a pin punch, then remove shifter head and shaft from case by tapping shaft out in either direction. Drive out reverse idler gear and reverse shifter fork shafts from case by driving rearward with a drift (do not lose woodruff key used in reverse idler gear shaft). Remove idler gear and reverse shifter fork from case. Lift reverse shifter lever off its pin in case.



6) To remove countergear, improvise a dummy shaft by cutting a piece of 5/8" diameter roll stock 7" long. then drive countershaft rearward, using the dummy shaft, until countershaft is removed and dummy shaft is within countergear. Remove countergear and dummy shaft from case being careful not to allow dummy shaft to slip out of gear. Remove countergear thrust washers from case.

7) Remove two interlocks, ball and spring from 3-4 detent channel (use a magnet or tip case). Remove shift finger from selector shaft by first flattening lock tabs securing retainer screws, then remove shifter shaft plug in rear of case. Tap shaft rearward out through case. Remove screws securing reverse inhibitor to case and remove inhibitor.

Mainshaft: Place clutch gear downward against bench top, then lift mainshaft out of clutch gear to prevent disturbing clutch gear roller bearings. Remove special snap ring from front of mainshaft, then slide 3-4 synchronizer unit with blocker rings, third speed gear, radial needle bearing and second speed gear from mainshaft. Remove rear bearing selective snap ring and remove rear bearing and retainer as an assembly. Remove first speed gear thrust washer, first speed gear, and 1-2 blocker rings. Press mainshaft out of 1-2 synchronizer unit and first speed gear sleeve. *CAUTION - Clutch hubs and sliding synchronizer sleeves are a matched assembly and must be kept together.*

INSPECTION: Wash all parts in solvent and blow dry with air. Inspect transmission case for cracks and check for burrs on rear face of case. If necessary dress off any burrs on machined surfaces with a flat file. Check condition of shifter shaft oil seal and re-

CONTINUED ON NEXT PAGE

4-SPEED SYNCHRO-MESH TRANSMISSION

PONTIAC TEMPEST TRANSAXLE (Continued)

place if necessary. Make sure all bearings are clean, then lubricate with light engine oil and check for roughness. Replace all worn clutch gear and countergear bearings and spacers. Replace any gears or thrust washers that are worn or damaged.

►*SYNCHRONIZER CLUTCH SLEEVE & HUB KEY & SPRING REPLACEMENT:* If necessary to replace keys and springs, push hub from sliding sleeves and remove springs. To install, place two springs in position (one on each side of hub), so a tanged end of each spring falls into same keyway in hub. Hold keys in position and align etched marks in sleeve and hub, then slide hub into sleeve (be sure etched marks are aligned after assembly).

►*REAR BEARING RACE REPLACEMENT:* If necessary to replace rear bearing, place bearing and retainer in a press, then expand retainer ring and press out bearing. Reverse procedure to install bearing.

REASSEMBLY: Mainshaft - Install 1-2 synchronizer hub onto mainshaft with shift fork groove of hub downward, then place first gear sleeve on mainshaft. Press both first gear sleeve and synchronizer hub onto mainshaft until they bottom, using Tool J-5590 or other suitable tool. Install blocker ring in rear of 1-2 synchronizer, being sure that notches in blocker ring engage keys in synchronizer unit. *NOTE - Blocker rings used in 1-2 synchronizer have slightly longer hubs than those used in 3-4 synchronizer.* Slide first speed gear and its thrust washer onto mainshaft, then install rear bearing retainer assembly onto mainshaft and secure with selective fit snap ring. *CAUTION* - With proper snap ring installed (available in three sizes), maximum play between rear face of rear bearing and snap ring will be .005". Invert mainshaft, then install second blocker ring (long hub) in front side of 1-2 synchronizer, being sure that blocker ring notches are engaged with keys in synchronizer unit. Install second gear speed gear with clutch teeth toward 1-2 synchronizer, and place radial needle bearing on second speed gear. Install third speed gear, clutch teeth upward, onto mainshaft and seat it against radial needle bearing. Place 3-4 blocker ring on cone surface of third speed gear, then slide 3-4 synchronizer unit onto blocker ring, being sure that notches in blocker ring engage clutch keys in synchronizer unit. Install second blocker ring onto 3-4 synchronizer unit. *NOTE - If clutch gear roller bearings have been displaced, load 33 bearings into innermost diameter and 37 needle bearings into outermost diameter, using a generous amount of petroleum jelly to prevent rollers dropping out.* Carefully slide clutch gear onto mainshaft, then set the assembly aside for later installation.

Transmission: 1) Position reverse inhibitor body in transmission case on its dowel pin and secure with screws and lockwashers. *NOTE - Be sure to install plunger in inhibitor body.* Coat selector shaft with grease, then insert through seal from inside case. *CAUTION - Do not install shaft from front of case as notches in shaft will damage seal.* Attach shift finger to selector shaft with bolts and lock tabs. Bend tabs onto bolt heads after tightening bolts, then install plug at rear of shaft. Install countergear thrust washers in case and retain in place with petroleum jelly, making sure that thrust washer tabs engage grooves in case.

2) Insert countergear with its roller bearings and dummy shaft into case through rear bearing hole, then lift countergear into alignment with countershaft holes and tap countershaft into gear from rear of case. *CAUTION - Be careful to keep dummy shaft tightly against countershaft during installation to prevent roller bearing dropping out of place.* Tap countershaft in until it is flush with rear face of case. *NOTE - Countershaft is a slight press fit at front of case.*

3) Place reverse shifter lever on pin in case with tapered end away from reverse inhibitor. Place reverse idler gear shift fork in case with its pin toward the front and engage fork pin with reverse shift lever, then insert shift fork shaft.

4) With reverse idler gear shift fork fully rearward, engage reverse idler gear to shift fork, then align woodruff key groove in idler gear shaft with keyway in rear face of case and slide shaft almost fully into case. Install woodruff key in shaft and fully bottom shaft in case. Tap both reverse idler and shift fork shaft to insure full seating, then stake each shaft bore in two places below rear face of case adjacent to shaft chamfer. *CAUTION - Be sure stakes do not protrude above rear face as this will disrupt mating surface for axle.*

5) Insert a detent spring and ball in 3-4 detent channel, checking to make sure spring goes fully to bottom of channel and that detent ball does not roll out the reverse shifter head shaft hole in detent channel.

►*SHIFTER SHAFT IDENTIFICATION NOTE:* With interlock notches aligned (lay shafts out in this manner) shafts can be identified as follows:

Reverse Shifter Head Shaft - 8 3/32" overall length, and roll pin hole is approximately centered on shaft.

1-2 Shift Fork Shaft - 7 19/32" overall length, with two interlock notches in shaft and these notches are connected by a drilled hole which houses interlock pin.

3-4 Shift Fork Shaft - 7 19/32" overall length, and roll pin hole is closest to end of shaft opposite detent notched end.

6) Depress detent ball and spring in 3-4 detent channel slightly with a small drift and insert reverse shifter head shaft partially into case to compress detent, then engage pin of reverse shifter head with yoke of reverse shift lever. Check that shaft pin hole is aligned with pin hole in shifter head and push shaft through until pin holes in head and shaft align. Secure shifter head to shaft with a roll pin.

7) To install assembled mainshaft in case, shift synchronizers into second and fourth simultaneously (both fully forward) to provide clearance to pass the countergear. Insert mainshaft through rear bearing bore into case. Align rear bearing retainer snap ring cutouts into rear face of case, then tap rear bearing retainer into case until flush with rear face. *CAUTION - Make sure clutch gear stays securely in place.* With large snap ring installed in outer diameter of front bearing, tap bearing into case from front and over clutch hub until large snap ring seats against front face of case. Install proper snap ring to retain clutch gear in bearing so that maximum clearance between snap ring and bearing is .005". Install two rear bearing retainer snap rings.

8) Before installation of 1-2 shift fork shaft, shift the 1-2 synchronizer and the 3-4 synchronizer to neutral, then install one interlock in 3-4 detent channel. With interlock pin in hole in interlock notch end, push 1-2 shift fork shaft partially into case. *NOTE - The interlock end (two opposite notches) of the shaft goes to rear of case.* Engage 1-2 shift fork (identified by through gate at shift location) with 1-2 synchronizer. Align pin holes in shaft and fork, then tap shaft rearward until it engages interlock, and secure fork to shaft with a roll pin. Install detent ball, spring, gasket and cap in 1-2 detent channel. *NOTE - Cap used at this location has the longer shank.*

9) Drop remaining interlock into 3-4 detent channel, then push 3-4 shift fork shaft partially through hole in front of case. Engage 3-4 shift fork in 3-4 synchronizer, align pin hole in shift fork and shaft, then push shaft fully into rear of case until it engages interlock. Secure shift fork shaft with a roll pin. Install remaining detent ball, spring, nylon washer, and cap in 3-4 detent channel at left rear of case.

10) Before installing front cover, test operation of shift forks by actuating shift selector lever with a small pin punch inserted in hole in shifter shaft. If transmission shifts satisfactorily, install side cover with a new gasket and tighten bolts to 3-4 ft. lbs.

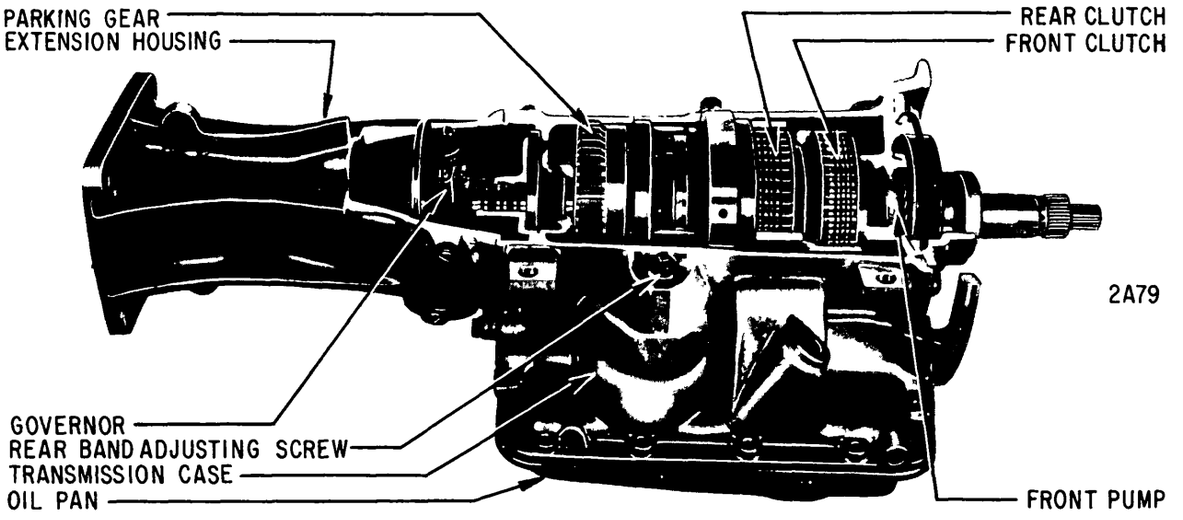
RAMBLER SIX AUTOMATIC TRANSMISSION

Rambl r Am rican (1962)
Rambl r Classic Six (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 ONE-WAY SPRAG CLUTCH INSTALLATION NOTE:* When installing sprag clutch in planet carrier assembly, the three copper tension springs must be located in the downward position in outer race of planet carrier assembly. When installing center support in one-way sprag clutch and planet carrier assembly, center support must freewheel in a counterclockwise direction and lock-up in a clockwise direction.

DESCRIPTION



DESCRIPTION: Three speed hydraulically controlled automatic planetary transmission of new design. With pushbutton or transmission selector lever in "D1" or "D2", transmission upshifts and downshifts are automatic. Additional "L" (Low), "R" (Reverse), and "P" (Park) ranges are controlled manually. A cable connected to carburetor throttle linkage controls the transmission throttle valve in main control valve assembly and varies the throttle pressure as necessary. On Rambler American, a transmission range selector lever, located on steering column and connected to transmission manual lever by linkage, positions manual valve in transmission. A neutral safety switch, mounted on steering jacket tube beneath instrument panel, permits starting engine when selector lever is in either "P" (Park) or "N" (Neutral) position. On the Rambler Classic, a pushbutton transmission range selector control located at left of instrument panel consists of five buttons operating a cable connected to manual lever on transmission. A "Park" lever mounted directly below pushbuttons operates a mechanical parking pawl which engages external teeth on rear internal gear. When "Park" lever is pushed in, all buttons except "N" (Neutral) are locked and cannot be operated. With either of the forward or reverse buttons pushed in, "Park" lever is locked and cannot be engaged.

LUBRICATION

►*LUBRICATION CAUTION:* Check fluid level every 4,000 miles. Drain and refill every 25,000 miles.

Ch cking Fluid L v l: With engine and transmission at normal operating temperature, place transmission selector lever or pushbutton in each range momentarily, finally ending with selector lever or pushbutton in "N" (Neutral). Check fluid level on dipstick. Add recommended fluid to bring level up to full "F" mark on dipstick. *NOTE - Approximately 1½ pints of fluid required to rais l v l from "L" mark to "F" mark on dipstick. Do not verfill.*

Draining & R filling: Raise car and remove converter drain plug, then remove drain plug from right side of transmission oil pan and allow to drain. After complete draining, install converter drain plug and tighten to 7-10 ft. lbs. Tighten oil pan drain plug to 10-14 ft. lbs. Pour 5 qts. of recommended fluid into transmission, then start engine and run at idle speed with transmission in "N" (Neutral). Add 4 qts. and check fluid level on dipstick. Add sufficient fluid to bring level up to "F" mark on dipstick. Do not overfill.

RAMBLER SIX FLASH-O-MATIC TRANSMISSION SECTIONAL VIEW

Recommended Fluid: Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity: Approximately 9 qts.

ADJUSTMENTS

Throttle Linkage: *See CARBURETOR on car model page.*

Manual Linkage (Rambler American): Place selector lever in "L" (Low) range, then disconnect gearshift rod trunnion from transmission lever. Make sure transmission lever is in extreme rear position and adjust trunnion on gearshift rod to enter freely into hole in bushing of transmission lever, then replace washer and cotter pin. Check gear selector lever in all positions.

Pushbutton Control Cable (Rambler Classic): Disconnect cable at manual lever on transmission, then push in "L" (Low) button and move manual lever on transmission all the way to rear. Adjust cable linkage clevis, aligning holes in clevis and lever. Install clevis pin and washer and tighten clevis securely. Check adjustment in all positions.

Neutral Safety Switch Adjustment (Rambler American): *NOTE - Switch is located on steering jacket tube beneath instrument panel.* To adjust, loosen two capscrews securing switch to steering column jacket tube, then place transmission selector lever in "N" (Neutral). Use a 3/32" pin for alignment and insert pin in hole on face of switch, rotating switch until pan freely enters hole in switch toggle. Tighten the two attaching screws and remove alignment pin. *NOTE - Tang of switch must enter channel on operating shaft before securing switch to jacket tube. Check to make sure engine will start in "N" or "P" only.*

Rambler Classic - Neutral safety switch is incorporated into pushbutton control assembly and adjustment is not required. Adjustment will be correct when switch is properly installed.

Parking L v r Adjustm nt (Rambl r Classic): Disconnect cable at transmission lever, then pull park lever handle out. Transmission lever will then lay free against inner parking pawl. Adjust clevis to align with hole in parking lever on transmission. Install clevis pin and washer and tighten clevis securely.

Front Band: With oil pan removed, loosen locknut or adjusting screw and insert .250" gauge block (Part of Tool J-5880-01) between end of adjusting screw and servo rod. Use adapter J-9639 and an inch pound torque wrench and tighten adjusting screw to 9 inch pounds. Tighten locknut securely and remove gauge block.

Rear Band: Loosen locknut on right side of transmission case and install Tool J-7847 on adjusting screw. Tighten adjusting screw with a torque wrench to 7 ft. lbs., then mark adjusting screw for reference point and back off screw 3/4 turn and tighten locknut securely.

TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Before making any corrections to transmission, check and adjust fluid level, manual linkage and throttle linkage, th n recheck operation of transmission to determine if trouble has been improved or corrected.*

HARSH DRIVE ENGAGEMENT: Control valve assembly not tightened properly. Throttle valve sticking. Primary or secondary regulator valve sticking. Front clutch frozen or warped.

DELAYED DRIVE ENGAGEMENT: Improper idle speed. Oil tubes missing or not installed properly. Seal rings missing or broken. Control valve assembly not tightened properly. Primary regulator valve sticking. Front clutch ball check missing or sticking. Failure in front or rear clutch. Converter slipping.

NO "D-2" RANGE: Front band not adjusted properly. Oil tubes missing or not properly installed. Sealing rings missing or broken. Control valve not properly tightened. Primary regulator valve sticking. Front clutch ball check sticking or missing. Front clutch failure. Front band failure or faulty servo. Input shaft broken. Front pump drive tangs broken or converter broken. Worn front pump or converter failure.

CONTINUED ON NEXT PAGE

RAMBLER SIX AUTOMATIC TRANSMISSION (Continu d)

NO "D-1" or "L" RANGE: Oil tubes missing or improperly installed. Sealing rings missing or broken. Control valve not properly tightened. Secondary regulator valve sticking. Failure in front clutch or front clutch check ball missing or sticking. Sprag clutch slipping or improperly installed. Input shaft broken. Front pump or converter failure.

NO "R" RANGE: Oil tubes missing or improperly installed. Sealing rings missing or broken. Control valve not properly tightened. Primary regulator valve sticking. Governor valve sticking or improperly installed. Reverse inhibitor valve sticking. 1-2 shift valve sticking. 2-3 shift valve sticking. Front clutch frozen or warped. Rear clutch failure, faulty piston, broken return spring or worn plates. Rear band failure of faulty servo. Input shaft broken or converter broken. Front pump failure.

LOCK-UP FORWARD OR REVERSE: Front or rear clutch frozen or warped. Sprag clutch frozen.

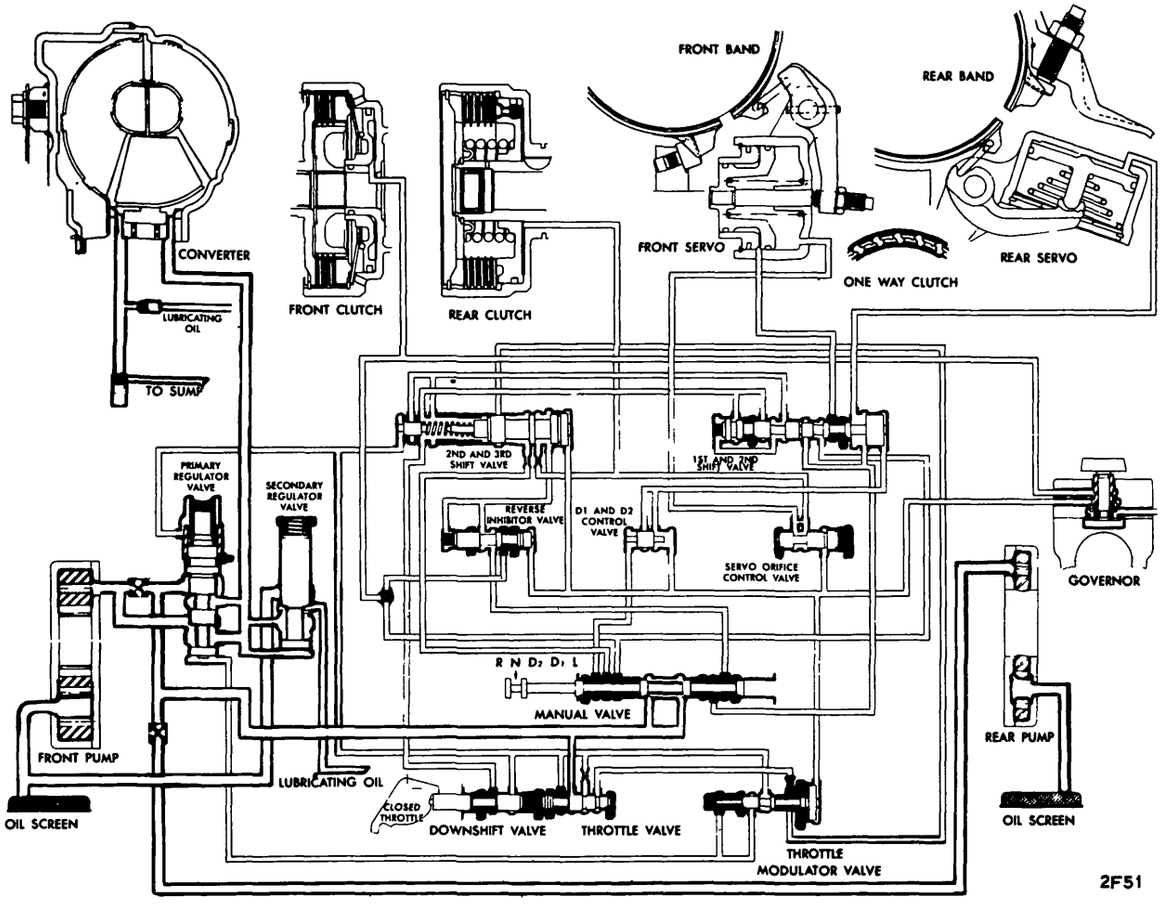
NO NEUTRAL: Front clutch frozen or warped.

NO 1-2 UPSHIFT: Bands not adjusted properly. Governor valve, modulator valve or throttle valve sticking. Oil tubes missing or not properly installed. Control valve not properly tightened. 1-2 shift valve sticking. Front band slipping or servo faulty.

NO 2-3 UPSHIFT: Oil tubes missing or not properly installed. Sealing rings missing or broken. Control valve not properly tightened. Throttle valve sticking. Governor valve sticking or not properly installed. 2-3 shift valve sticking or plug missing. Failure in rear clutch. Annular piston not seating.

LOW 1-2 & 2-3 UPSHIFT: Oil tubes missing or not properly installed. Seal rings missing or broken. Control valve not tightened properly. Throttle valve sticking or not properly installed. Governor valve sticking. 2-3 shift valve plug sticking.

HIGH 1-2 & 2-3 UPSHIFT: In addition to corrections for "Low 1-2 & 2-3 Upshift" (above), check for sticking modulator valve. 1-2 or 2-3 shift valves sticking, or 2-3 shift valve plug sticking.



SLIPPING 1-2 & 2-3 SHIFT: Front band not properly adjusted. Oil tubes missing or improperly installed, Sealing rings missing or broken. Control valve assembly not tightened properly. Primary regulator valve or throttle valve sticking. Governor valve sticking or improperly installed. If 1-2 shift is slipping, check for front clutch ball check sticking or missing, or faulty front servo. If 2-3 shift is slipping, check for worn or slipping rear clutch plates.

HARSH 1-2 & 2-3 SHIFT: Front band not properly adjusted. Control valve assembly not properly tightened. Primary regulator, throttle valve, or modulator valve sticking. Governor valve sticking or not properly installed. If 1-2 shift is harsh, check for front clutch slippage or for frozen sprag clutch. If 2-3 shift is harsh, check for warped or frozen rear clutch.

FAULTY 1-2 SHIFT: Improper rear band adjustment. Rear clutch frozen. Sprag clutch frozen.

FAULTY 2-3 SHIFT: Improper front band adjustment. Oil tubes missing or not properly installed. Control valve assembly bolts missing or not properly tightened.

NO 2-1 DOWNSHIFT: Control valve assembly not properly tightened. Throttle valve sticking. Governor valve sticking, leaking or not properly installed. D-1 & D-2 control valve sticking. 1-2 shift valve sticking.

RAMBLER SIX AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

NO 3-2 DOWNSHIFT: Control valve assembly not properly tightened. Throttle valve or governor valve sticking. 2-3 shift valve or plug sticking.

LOW 2-1 & 3-2 DOWNSHIFT: Seal rings missing or broken. Control valve assembly not tightened properly. Throttle valve or governor valve sticking. 1-2 shift valve sticking. 2-3 shift valve or plug sticking.

HIGH 2-1 & 3-2 DOWNSHIFT: Sealing rings missing or broken. Control valve assembly not properly tightened. Throttle valve, modulator valve or governor valve sticking. 2-3 shift valve or plug sticking.

SLIPPING 2-1 DOWNSHIFT: Sprag clutch slipping or not properly installed.

SLIPPING 3-2 DOWNSHIFT: Improper front band adjustment. Oil delivery tubes missing or not properly installed. Seal rings missing. Control valve assembly not tightened properly. Primary regulator valve, throttle valve, or governor valve sticking. Rear clutch failure. Front band slipping or faulty servo.

HARSH 3-2 DOWNSHIFT: Front band not properly adjusted. Control valve assembly not tightened properly. Throttle valve sticking. Rear clutch frozen or warped.

TESTING

STALL TEST: With engine at normal operating temperature, place transmission in "D1" position. Apply parking brake and foot brake and accelerate engine with wide open throttle to 1400 RPM. *CAUTION - Do not hold throttle open for mor than 15 s conds.* If engine speed will not reach 1400 RPM, poor engine performance is indicated. An engine speed over 1400 RPM indicates transmission or converter slippage.

ROAD TEST: Shift Speeds - Drive car and check for upshifts and downshifts as indicated in following table.

SHIFT SPEEDS

Upshift	Light Throttle	Full Thr ttl	Kickd wn
1-2	6-10 MPH	26-30 MPH	38-42 MPH
2-3	12-16 MPH	45-49 MPH	66-70 MPH
Downshift	**Closed Throttl**	**Part Thr ttl**	**Kickdown**
3-1	4-8 MPH	23-28 MPH	22-26 MPH
3-2			57-61 MPH

AIR PRESSURE CHECKS: Fr nt S rv - Remove front servo apply tube and apply pressure where tube enters servo body.

CONTINUED ON NEXT PAGE

RAMBLER SIX AUTOMATIC TRANSMISSION (C ntinu d)

R ar S rv : Remove rear servo apply tube and apply pressure where tube enters servo body.

R ar Clutch: Remove rear clutch tube and apply pressure where tube enters hole in case. A dull thud should be heard.

Gov rn r: To check governor, remove valve body and apply pressure to Governor oil passage in case. See illustration.

Fr nt Clutch: To check front clutch, remove valve body and apply pressure to front clutch and governor feed oil passage in case. See illustration. A dull thud should be heard.

OIL PRESSURE TEST: CAUTION - Make this test only if transmission is not shifting properly after checking throttle linkage for proper adjustment. Connect a suitable pressure gauge to control pressure test point on rear of transmission case (above oil pan flange toward left side of case). With transmission fluid at 190°F, pressure should be 108±10 lbs. (OHV Eng.); 120±10 lbs. ("L" head Eng.) at 1000 RPM engine speed. At idle speed of 475 RPM, pressure should be 50-60 lbs.

TRANSMISSION REMOVAL & INSTALLATION

RAMBLER (EXCEPT RAMBLER AMERICAN CONVERTIBLE)

REMOVAL: Disconnect battery, then raise car and drain transmission. Disconnect speedometer cable at transmission and rear brake hose bracket from floor pan. Disconnect shift rods at transmission levers, then disconnect throttle cable at throttle shaft on carburetor and at cable bracket. Disconnect shock absorbers at rear axle. On Rambler American, disconnect front brackets of rear springs from floorpan, then slide rear axle rearward to disengage front universal joint from transmission shaft. On Rambler Classic, disconnect torque tube, propeller shaft, and parking brake cable, then lower rear axle and move rearward to separate torque tube and propeller shaft from transmission. On all models, place a suitable transmission jack under transmission, then remove transmission-to-converter housing screws. With transmission jack positioned so transmission is in alignment with converter housing, pull transmission and jack assembly to rear to disengage transmission from housing and converter.

►*TRANSMISSION, BELL HOUSING & CONVERTER ASSEMBLY REMOVAL NOTE:* These parts may be removed as a complete assembly as follows: In addition to transmission removal procedure (see above), remove starter attaching bolts and remove starter, then support transmission and remove crossmember to side sill bolts. Lower engine and bell housing assembly. *NOTE - When lowering this assembly, the oil pan will rest on side sill crossmember supporting the engine.* Remove bell housing-to-engine bolts and bell housing lower mud pan. Remove capscrews retaining torque converter to drive plate, then with transmission jack positioned so transmission and converter assembly are in alignment, pull complete assembly to rear, disengaging housing and converter from engine.

INSTALLATION: Reverse removal procedure and note the following: If transmission removed separately, position front pump drive tangs on converter in a horizontal position, and position front pump external tooth gear drive lugs in a vertical position. Tighten transmission-to-bell housing attaching bolts to 17-22 ft. lbs. If converter has been removed, converter-to-drive plate attaching capscrews must be tightened to 23-28 ft. lbs.

RAMBLER AMERICAN CONVERTIBLE

►*TRANSMISSION REMOVAL NOTE: Transmission and torque converter cannot be removed as a complete assembly. Transmission must be removed separately, then converter and bell housing can be removed. Procedure for removing converter assembly is the same as for other models.*

REMOVAL: *See "Rambler (Except Rambler American Convertible)" above and note the following:* Disconnect parking brake cable from adjusting rod and parking brake bellcrank from cross frame. Disconnect and remove rear axle "U" bolt brackets, then raise rear axle to clear center bolts and slide rear axle on rear springs to remove universal joint from transmission shaft.

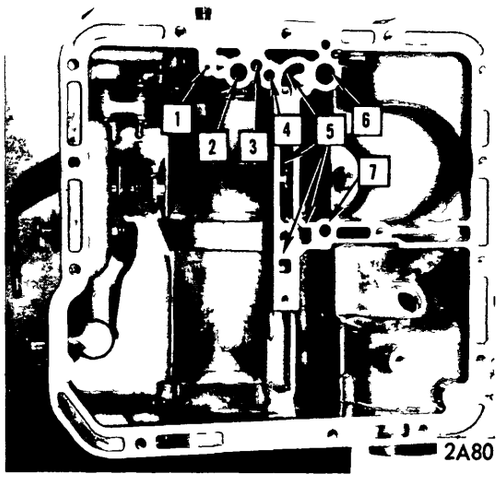
INSTALLATION: Reverse removal procedure and note the following: Position front pump drive tangs on converter in a horizontal position, and position front pump external tooth gear drive lugs in a vertical position. Tighten transmission-to-bell housing attaching bolts to 17-22 ft. lbs. If converter has been removed, converter-to-drive plate attaching capscrews must be tightened to 23-28 ft. lbs.

TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

OIL PAN & SCREEN: Removal - Raise car and drain transmission, then remove transmission oil pan. Remove Alnico magnet from head of rear servo attaching bolt. To remove inlet screen, remove filister head screws from rear screen and the two valve body retaining screws.

Installation: Replace screen and tighten the two valve body retaining screws to 55-66 inch pounds. Install a new oil pan gasket on transmission oil pan flange and hold it in place with Lubriplate. Install pan and tighten capscrews to 100-120 inch pounds, then refill transmission with fluid.

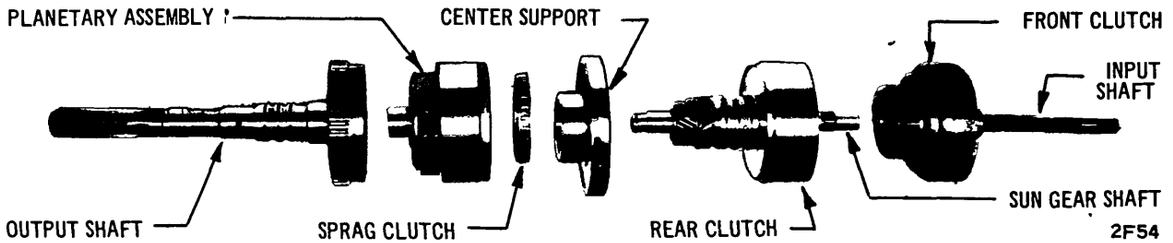
CONTROL VALVE BODY & PRESSURE REGULATOR: Removal - Remove oil pan, then remove throttle lever cable attaching rod. Remove retaining clip from shift lever rod. Remove Alnico magnet, rear servo apply tube, rear clutch tube, and front servo apply and release tubes. Remove three valve body assembly retaining screws and remove valve body. Remove front pump suction tube, front pump pressure tube, and converter in-and-out tubes.



Installation: Reverse removal procedure and tighten valve body attaching screws to 55-66 inch pounds. Tighten oil pan capscrews to 100-120 inch pounds.

FRONT SERVO: Removal - Remove oil pan and gasket, front servo apply and release tubes, and rear clutch tube. Remove two capscrews retaining front servo to transmission case, then lower front servo and actuating rod from case.

Installation: Rotate band to engage anchor end of band with transmission case, then apply Lubriplate to end of actuating lever and insert actuating strut. Holding servo in one hand with tension on the adjusting screw, engage actuating strut with band strut. Install retaining capscrews and lockwashers and tighten to 100-120 inch pounds. Install front servo apply and release tubes, rear clutch tube, oil pan and gasket. Adjust front band *(see "Adjustment" above).*



REAR SERVO: Removal - Remove oil pan and gasket, Alnico magnet, front servo apply tube, then remove two rear servo capscrews retaining rear servo to transmission case. Remove rear servo and actuating strut.

1. Control Pressure
2. Rear Pump Pressure
3. Front Clutch and Governor Feed
4. Governor
5. Lubrication
6. Rear Pump Suction
7. Rear Clutch Apply

TRANSMISSION CASE OIL PASSAGES

PLANETARY GEAR TRAIN

RAMBLER SIX AUTOMATIC TRANSMISSION (C ntinu d)

Installation: Rotate band against anchor in case, then apply Lubriplate to rear servo actuating lever and insert strut in arm. Holding servo in one hand, place servo on case engaging face end of strut with rear band actuating strut. Install capscrews and lockwashers and tighten to 120-154 inch pounds. Adjust rear band *(see "Adjustment" above).*

CONTROL SHAFT INNER LEVERS OR MANUAL CONTROL SHAFT SEALS: Removal - Remove oil pan and throttle control cable from case, then remove control valve assembly. Remove trunnion and rod from outer manual control lever, then remove hex nut and inside lever from end of shaft. Remove tapered pin from case with Tool J-9644; and remove manual valve control lever shaft.

Installation: Install "O" ring seal on manual control lever shaft, then start shaft into case, aligning shaft groove with tapered pin. Tap tapered pin into place and install inside lever and hex nut on inner end of shaft and tighten securely. *NOTE - If manual control shaft is past the tapered pin groove, "O" ring seal will be cut and damaged.* Replace control valve assembly, throttle control cable, oil pan and gasket. Place outer manual control lever toward rear of transmission, then place shift lever in "L" (Low) position and install trunnion and rod in rubber grommet of outer manual control lever so that trunnion fits freely in control lever. Install washer and retain trunnion with cotter pin.

PARKING BRAKE CONTROL TOGGLE HUB SHAFT (RAMBLER AMERICAN): Removal - Remove oil pan and throttle control cable from transmission case, then remove control valve assembly. Remove park lever assembly by removing retaining spring and washer on inner end of toggle hub and remove toggle lift assembly from shaft. Remove tapered pin from case with Tool J-9644 and remove parking brake control toggle hub shaft from case.

Installation: Install "O" ring seal on parking brake toggle hub shaft, then install shaft in case and tap tapered pin into place. Install parking pawl lift assembly on shaft, aligning teeth with shift control inner lever, and install washer and retaining pin. Install control valve assembly, oil pan and gasket.

PARKING BRAKE CONTROL SHAFT (CLASSIC SIX): Removal - Remove oil pan and throttle control cable from transmission case, then remove control valve assembly. Remove trunnion from outer parking brake lever. Remove hex nut and parking pawl spring assembly, then remove tapered pin from case with Tool J-9644 and remove parking brake control shaft from case.

Installation: Install "O" ring seal on parking control lever shaft, then install shaft in case and tap tapered pin into place. Install parking pawl spring assembly on shaft and tighten nut securely. Pull parking lever out at push button control, then position outer parking lever in its lower position and adjust cable trunnion so trunnion screw fits freely and tighten trunnion nut securely. Install control valve and oil pan.

PARKING PAWL (ALL MODELS): Removal - Remove oil pan and control valve, then remove parking brake toggle roll pin and remove toggle pin. Remove bolts from rear extension housing and transmission case. *NOTE - On Classic Six, als r m v bolts from xtension h using and torqu tub adapter.* Rotate extension housing counterclockwise and remove parking brake anchor pin using a magnet. Remove parking brake toggle link and pawl assembly.

Installation: Reverse removal procedure.

GOVERNOR BODY: Removal - Remove inspection hole cover from extension housing, then rotate shaft until governor is in alignment with inspection hole and remove the two retaining screws and lockwashers. Remove governor body.

Installation: Reverse removal procedure.

EXTENSION HOUSING REAR OIL SEAL: Removal - Raise car and remove torque tube (if so equipped) and propeller shaft from transmission output shaft. Remove extension housing oil seal with Tool J-2619 and J-4830-02.

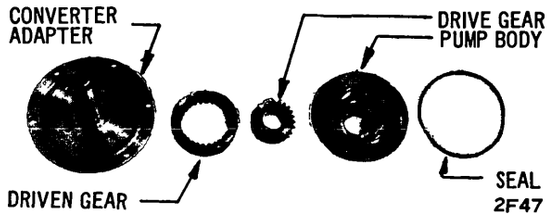
Installation: Position seal in housing with felt part of seal toward rear of housing, then install seal with Tool J-9617. Install propeller shaft, and torque tube (if so equipped), on transmission, then check fluid level in transmission and fill as necessary.

TRANSMISSION UNIT REMOVAL (TRANSMISSION OUT OF CAR)

1) With outside of transmission case cleaned, install tranemission in a holding fixture and remove oil pan, Alnico magnet, rear servo apply tube, rear clutch tube, front servo apply and release tubes, then remove throttle control rod retaining clip and remove throttle rod. Remove shift rod retaining clip and release rod from inside detent lever.

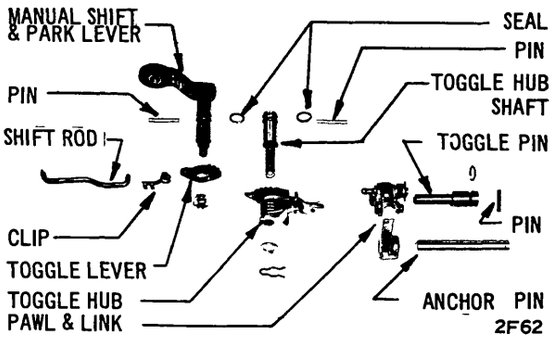
2) Remove valve body-to-case capscrews and remove valve body assembly. Remove front oil pump pressure tube, suction tube, and converter in and out tubes from front pump. Remove two front servo capscrews and remove servo and servo strut, then remove rear servo and strut.

3) At this point of disassembly, check transmission endplay for reference at reassembly. Remove one of the front pump attaching capscrews and mount a dial indicator so that contact button of indicator rests on end of input shaft. Pry front clutch cylinder to rear of transmission with a large screwdriver, then remove screwdriver and set dial indicator to zero. Pry transmission units to front of case by inserting a screwdriver between large internal gear and case. Record indicator reading for use at reassembly. Endplay should be .009 -.0322".



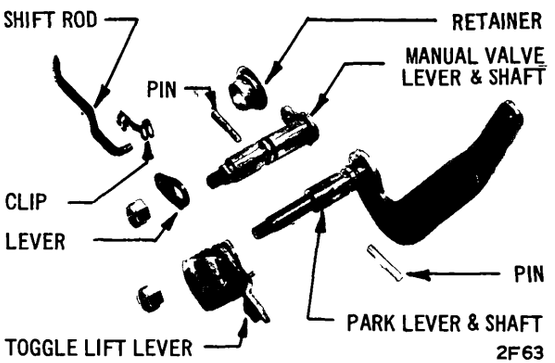
4) Remove front pump attaching capscrews and remove front pump assembly, gasket, and selective thrust washer. Remove front and rear clutch assemblies and forward sun gear assembly, starting units out of case by inserting a large screwdriver between rear clutch drum and center support. *CAUTION - Keep these units together for disassembly at a later time.* Remove front band through front of case.

5) Remove two capscrews from sides of case, then remove center support and planet carrier assemblies. *NOTE - Sprag clutch is located between center support and planet carrier assembly.* Remove rear band through front of case. *NOTE - Front and r ar bands ar th same and are int rchangeabl .*



6) Before removing rear extension housing, remove rear oil seal (if it is necessary to replace) with Tool J-2619 and J-4830-02. Remove capscrews and carefully remove extension housing and gasket from output shaft assembly. Remove outer snap ring from output shaft and remove speedometer drive gear, ball bearing and inner snap ring. Remove snap ring, governor assembly and ball bearing from output shaft.

7) Remove six large and one small fillister head screws from rear pump body and remove rear pump body and driven gear. Remove three oil seal rings from output shaft, then remove rear pump drive gear carefully from output shaft. Remove rear pump drive gear key from output shaft, then remove rear pump body plate. Remove output shaft and rear thrust washer through front of case.



8) Remove tapered pin retaining manual valve linkage shaft using Tool J-9644, then remove manual valve shaft assembly by removing hex nut on inner end of shaft, and remove shaft from case. Remove tapered pin retain-

FRONT PUMP ASSEMBLY

MANUAL & PARK LINKAGE (RAMBLER AMERICAN)

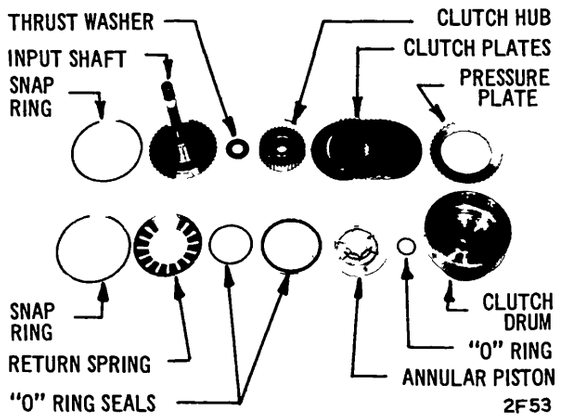
MANUAL & PARK LINKAGE (CLASSIC SIX)

CONTINUED ON NEXT PAGE

RAMBLER SIX AUTOMATIC TRANSMISSION (C ntinu d)

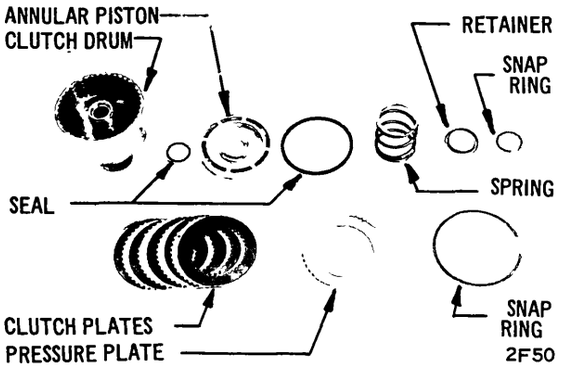
ing park lever toggle nuts, using Tool J-9644. On Rambler American, remove park lever assembly by removing retainer spring and washer on inner end of toggle hub shaft and remove toggle lift lever assembly from shaft. Remove shaft from case. On Classic Six, remove park lever assembly by removing hex nut on inner end of shaft and remove toggle lift lever assembly from shaft. Remove shaft from case.

9) On all models, remove parking brake toggle roll pin by tapping out of case, then remove toggle pin from case (starting removal with long nose pliers). Remove parking brake anchor pin from case (use a magnet to draw pin out of bore in case). Remove parking brake toggle link and pawl assembly.



TRANSMISSION UNIT OVERHAUL

FRONT CLUTCH: Disassembly - Place front clutch, rear clutch, and forward sun gear assembly into planet carrier assembly (using planet carrier assembly as a holding fixture), then lift front clutch and input shaft assembly off rear clutch and remove input shaft snap ring and input shaft. Remove clutch hub and fibre thrust washer, drive and driven plates and pressure plate from front clutch cylinder. Remove front clutch return spring snap ring and remove return spring. Insert nozzle of air hose in inside diameter of hub at oil apply hole and blow out annular piston from clutch cylinder.

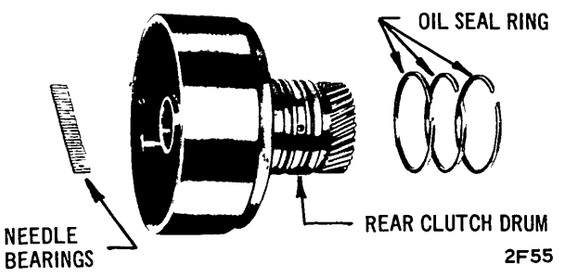


Inspecti n: Inspect all parts for nicks, wear, scratches and other damage. *NOTE - Always use new "O" ring s als wh n r ass mbling.*

R assembly: Install small "O" ring on front clutch cylinder hub and large "O" ring on annular piston. Place annular piston in Tool J-9620-1 and tap piston down into bore of tool. Place Tool J-9620-2 into front clutch cylinder, centering annular piston on hub of cylinder, then using Tool J-5886-2, install annular piston into front clutch cylinder. Install return spring in front clutch cylinder and install snap ring.

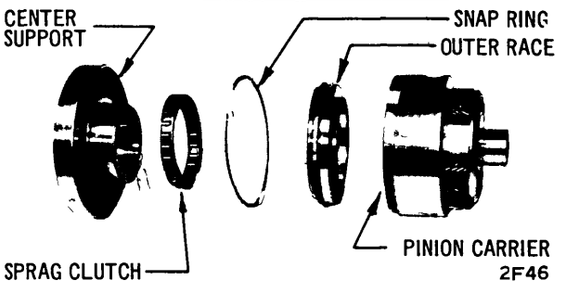
REAR CLUTCH: Disass mbly - Remove bronze and steel thrust washers from rear clutch drum, then remove two oil seal rings from forward sun gear shaft. Remove

FRONT CLUTCH COMPONENTS



REAR CLUTCH COMPONENTS

rear clutch drum assembly from forward sun gear shaft, then remove forward sun gear shaft from planet carrier (which was used as a holding fixture). *NOTE - Forward sun gear shaft has a locking oil ring at rear end and Torrington bearings on each side of sun gear.* Remove snap ring from rear clutch drum and remove pressure plate, drive, and driven plates. Install rear clutch spring compressor, Tool J-5886 with adapter Tool J-5886-5, and compress return spring to remove snap ring, then with air pressure, blow annular piston out of rear clutch drum. *NOTE - Rear clutch drum assembly consists of reverse sun gear, locking oil seal rings, and needle bearings. Use care when removing assembly from forward sun gear shaft as the thirty needle bearings will fall out.*



Reassembly: Install "O" ring seal on annular piston and place in Tool J-9621, then tap annular piston down into bore of tool with Tool J-2995. Place tool assembly in rear clutch drum and drive annular piston into rear clutch drum. Install return spring, retainer and snap ring, then compress spring with Tool J-5886 and adapter J-5886-5 and install snap ring. Install drive and driven plates and pressure plate. *NOTE - Steel plates are concave and must be installed with concave side up toward pressure plate.* Place forward sun gear in planet carrier (using planet carrier as a holding fixture) with one Torrington bearing on top side of gear and install rear clutch assembly on shaft. Install two oil seal rings on forward sun gear shaft, then install steel and bronze thrust washers, keeping them in place with Lubriplate. Install front clutch cylinder on shaft, aligning cylinder with plates in rear drum. Install front clutch hub and fibre thrust washer, then install front clutch pressure plate with smooth side up. Install drive and driven plates starting with a lined plate, then alternating with a steel plate, to complete clutch pack. Install input shaft and snap ring.

CENTER SUPPORT: Serviced only as a complete assembly. Inspect support for burrs or distortion. Inspect bearing for nicks and scratches.

PINION CARRIER ASSEMBLY: Serviced only as a complete assembly. Inspect band surface and inner and outer bushings for scores. Rotate pinions on their shafts to check for freedom of movement and for worn or broken teeth. Use a feeler gauge and check endplay which should be .010-.020". Inspect pinion shaft for

REAR CLUTCH DRUM

CENTER SUPPORT, SPRAG CLUTCH & PINION CARRIER ASSEMBLY

tightness to pinion carrier. *NOTE - Sprag clutch is incorporated in pinion carrier assembly and contains 24 sprags. Outer race is fitted in carrier assembly and is held in place with a snap ring.*

FRONT PUMP: Disassembly - With front pump assembly removed from transmission case, remove capscrews and fillister head screws and remove front pump from adapter and converter support. Remove drive and driven gears and remove rubber "O" ring seal from pump body, then remove suction "O" ring seal.

Inspection: Inspect pump body and adapter for nicks, scratches, burrs or scores and check bushings for wear. Clean all parts and lubricate before assembly.

Reassembly: Install new oil pump body-to-adapter "O" ring seal, then lubricate seal and assemble pump body into adapter and tighten the capscrews to 17-22 ft. lbs. Tighten fillister head screw to 25-35 inch pounds. Install pressure apply tube "O" ring seal in pump body. *NOTE - Front pump seal can be removed and replac d without removing oil pump assembly as follows: With transmission removed, pry out oil seal, then install a new seal using Tool J-9615.*

FRONT SERVO: Disassembly - Remove front servo piston guide and piston, then remove piston from servo guide. Remove spring and remove "O" ring seals from guide and piston. To remove actuating lever, remove remove roll pin from body with a 1/8" drift punch.

Inspection: Inspect body for cracks, burrs or obstructions in fluid passages. Inspect piston bore and stem for scores. Inspect actuating lever and shaft for wear and freeness.

R ass mbly: Install new "O" ring seals, lubricating all parts with transmission fluid before assembly. Assemble servo piston and guide together, then install

CONTINUED ON NEXT PAGE

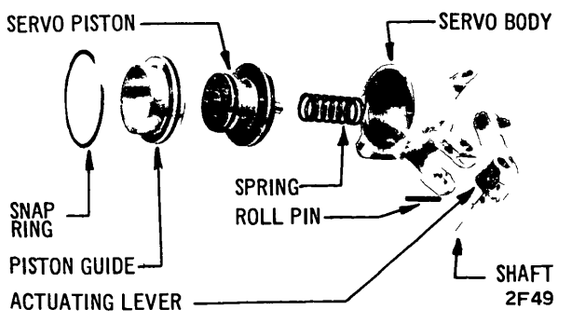
RAMBLER SIX AUTOMATIC TRANSMISSION (C ntinu d)

spring in body and install piston and guide. Press guide into body and install snap ring. Install actuating lever, shaft and roll pin, then check servo piston for freeness by pressing down on piston or by using air pressure.

REAR SERVO: Disassembly - Remove rear servo snap ring, then remove retainer, release spring, and piston. If necessary to replace actuating lever or shaft, remove roll pin by prying it out with side cutters.

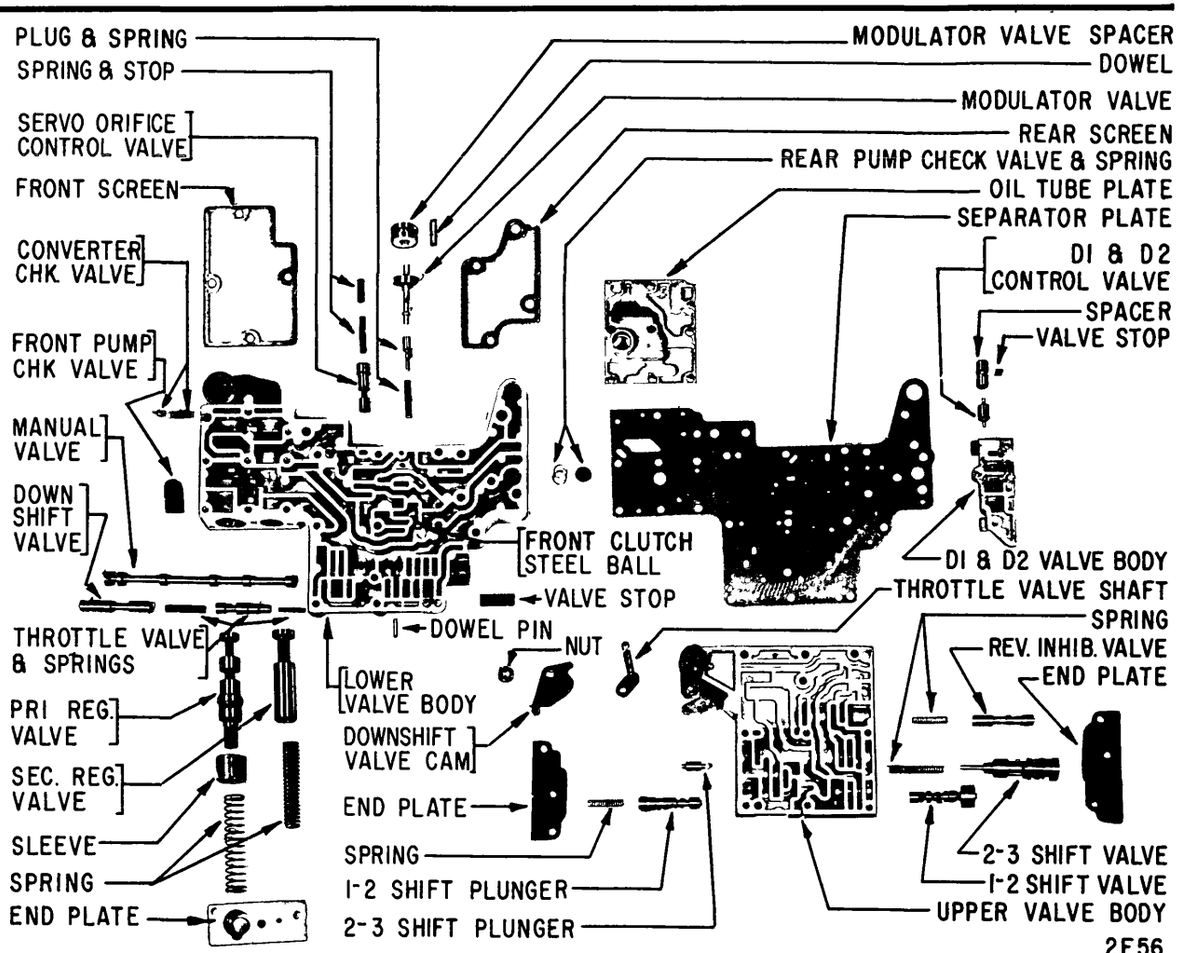
Inspection: Inspect body for cracks, burrs or obstructions in fluid passages. Inspect piston and bore for scores.

R assembly: Install new "O" ring seal in piston, then install piston in servo body and install return spring (small end on piston stem). Install retainer and snap ring. If actuating lever removed, replace lever and shaft, then tap roll pin into place



CONTROL VALVE: Disassembly - 1) Remove both oil screens, then remove 8 fillister head screws from lower valve body (2 screws are 1 1/8" long; 1 screw is 1 3/8" long; and 5 screws are 1" long). Turn valve body over and remove 4 fillister head screws, then lift upper body off two dowels in lower valve body.

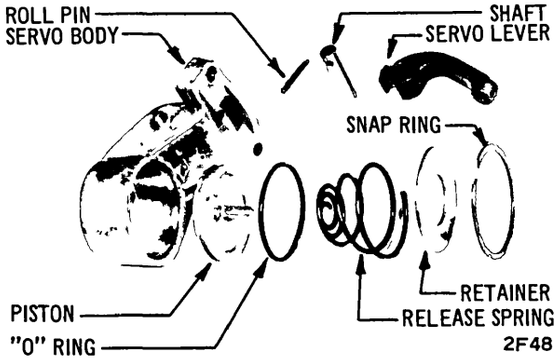
2) Remove rear cover plate from upper valve body, holding pressure on plate, as it is under spring tension. Remove reverse inhibitor valve and spring, 2-3 shift valve and spring, servo orifice control valve, and the 2-3 shift valve plug.



3) Remove separator plate from lower valve body being careful not to lose front and rear pump check valves. *CAUTION - Note the location of these two valves (one is a ball type and the other a reed type) so they may be replaced in their proper locations.* Use the Alnico magnet to remove reed type front pump check valve and ball and spring type rear pump check valve.

4) Remove manual valve and the downshift valve and spring, then remove throttle valve spring with Alnico magnet. Remove throttle valve, throttle valve spring, and stop plate. Remove throttle valve plug pin with Alnico magnet by relieving pressure on plug. Remove modulator valve spacer, throttle modulator valve, plug and spring.

5) Remove three fillister head screws from pressure regulator end plate on lower body. *CAUTION - Apply pressure to plate as it is under heavy spring tension.* Remove plate, primary regulator valve spring, sleeve and valve. Remove secondary regulator valve spring and valve.



FRONT SERVO ASSEMBLY

TRANSMISSION CONTROL VALVE ASSEMBLY

6) Remove D-1 and D-2 control valve spacer stop, spacer plug and D-1 and D-2 control valve "range control valve" from D-1 and D-2 control valve body.

REAR SERVO ASSEMBLY

Inspection: Clean all parts in solvent and blow dry with air. Inspect all valve and plug bores for scores. Check fluid passages for obstructions. Inspect check valves for free movement. Inspect all mating surfaces for burrs and distortion and all valves and plugs for burrs and scores. *NOTE - Crocus cl th may b used to p lish valves and plugs providing car is tak n t av id rounding sharp edges of valv s and plugs.* Inspect all springs for distortion, then check valves and plugs for free movement in their respective bores. *NOTE - Valves and plugs, when dry, must fall f th ir wn w ight in their respective bores.*

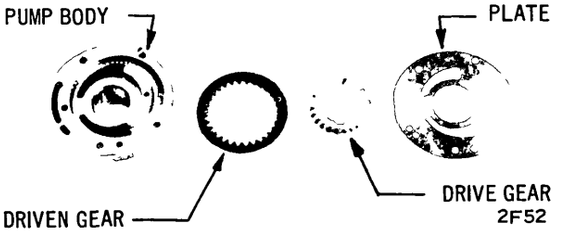
Reassembly: 1) Install D-1 and D-2 control valve in control valve body, then install spacer plug and spacer stop. Install 1-2 shift valve, 2-3 shift valve spring, and 2-3 shift valve, reverse inhibitor valve spring and valve in upper valve body, then install rear end plate with three fillister head screws and lockwashers. 2) Install 1-2 shift plunger, 1-2 shift valve spring, and 2-3 shift plunger in upper valve body, then install front

CONTINUED ON NEXT PAGE

RAMBLER SIX AUTOMATIC TRANSMISSION (C ntinu d)

end plate with three fillister head screws and lockwashers. Install secondary valve and spring, primary valve, sleeve, and spring in lower valve body, then install lower valve body end plate with three fillister head screws and lockwashers.

3) Install orifice control valve and spring in lower valve body, then compress spring with a small screwdriver and insert orifice control valve stop. Install modulator valve spring, plug, valve spacer, and insert dowel pin to retain spacer.



4) Install throttle valve stop, throttle valve return spring, throttle valve, throttle valve spring, and the downshift valve, then insert dowel pin. Install manual valve. Install converter out check spring and ball, then install steel ball (front clutch), rear pump check valve, and front pump check valve spring and check valve. Install spacer plate and check for freeness of pump check valve before installing upper valve body.

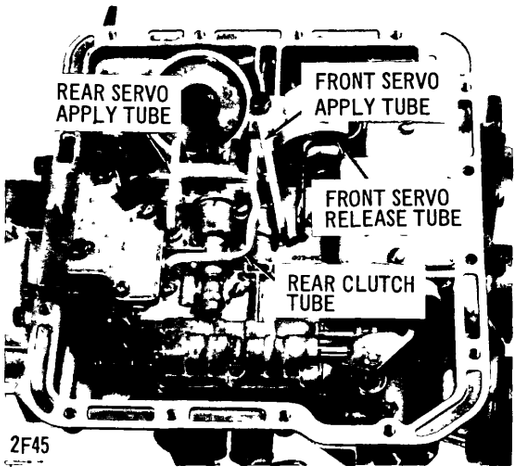
5) Install upper valve body on lower valve body in alignment with the two dowel pins on lower valve body, making sure manual valve is aligned with detent lever. Install four fillister head screws, then turn valve body over and install the two 1 1/8" screws that retain D-1 and D-2 valve body. Install five 1" screws and the 1 3/8" screw through lower valve body. Tighten all fillister head screws to 20-30 inch pounds.

6) Install oil tube cover and the eight fillister head screws and. tighten to 20-30 inch pounds. Install rear screen with the two fillister head screws and the front oil screen with the four flat head screws.

TRANSMISSION UNIT INSTALLATION (TRANSMISSION OUT OF CAR)

1) Install output shaft and rear thrust washer through front end of case, then install rear pump plate, rear pump drive pin, and drive gear on output shaft. Install the three oil seal rings on output shaft and lubricate them with transmission fluid, then install rear pump

REAR PUMP ASSEMBLY



body and driven gear. Tighten large fillister head screws to 55-66 inch pounds and small fillister head screw to 20-30 inch pounds.

2) Install governor drive ball bearing in output shaft, then install governor assembly and retain in place with snap ring. *NOTE - When installing governor, plate on governor assembly is positioned to rear.* Install front snap ring, speedometer gear drive ball, speedometer gear and rear snap ring, then install extension housing and gasket and tighten attaching capscrews to 100-120 inch pounds.

3) Install rear band in transmission case with anchor strut toward rear band adjusting screw. Install planet carrier assembly, sprag clutch, and center support together. Line up center support oil holes with holes in case and install the two center support screws in case. Tighten screws to 120-154 inch pounds.

4) Install front and rear clutches and forward gear shaft assembly, making sure that the one small and three large oil seal locking rings are properly locked in the oil grooves. Install front pump assembly and selective thrust washer, then tighten front pump body attaching screws to 100-120 inch pounds. After installation of front pump, recheck transmission endplay *(see "Transmission Unit Removal - Transmission Out of Car" above)*. Transmission endplay should be .009-.0322". If not within limits, remove front pump assembly and install a selective thrust washer of proper thickness to obtain correct endplay.

5) Install oil pressure tube, converter in and out tubes and oil suction tube in front pump. Install valve body on

OIL TUBE IDENTIFICATION

transmission case and tighten the three capscrews to 55-66 inch pounds. Install shift rod and throttle rod to linkage on valve body.

6) Install rear servo in case using Lubriplate to hold actuating strut in actuating arm, then insert actuating strut in band strut and tighten capscrews to 120-154 inch pounds. Install front servo in case using Lubriplate to hold actuating strut in actuating arm. Hold pressure on adjusting screw while inserting actuating strut in band strut, then tighten capscrews to 100-120 inch pounds.

7) Install rear servo apply tube, rear clutch tube, front servo apply and release tubes. *CAUTION - Do not distort tubes during installation. Short bend of front servo apply tube and long bend of release tube is installed in servo body.* Adjust front and rear servos *(see "Adjustments" above)*. Install throttle cable to inside throttle rod and install throttle cable bracket. Install oil pan gasket on oil pan and hold in place with Lubriplate, then install pan and tighten screws to 100-120 inch pounds.

RAMBLER EIGHT & CHECKER AUTOMATIC TRANSMISSION

DRIV-ER-MATIC & DUAL RANGE
Checker (1962)
FLASH-O-MATIC
Rambler Ambassador, Series 6280 (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING THE ENGINE BY PUSHING CAR: NOTE* - Pushing rather than towing is recommended (to avoid possibility of car ramming towing vehicle). Place selector lever in Neutral "N" position. When speed of 15-20 MPH is reached, turn ignition "on" and move selector lever to "D-1" or "D-2" position.

►*TOWING THE CAR:* If transmission inoperative, always tow car with rear wheels raised or with propeller shaft disconnected. If transmission operating properly car can be towed for **short distance** with selector lever in Neutral "N". Prolonged towing may cause damage to transmission.

DESCRIPTION: Same design as used on corresponding previous models.

LUBRICATION

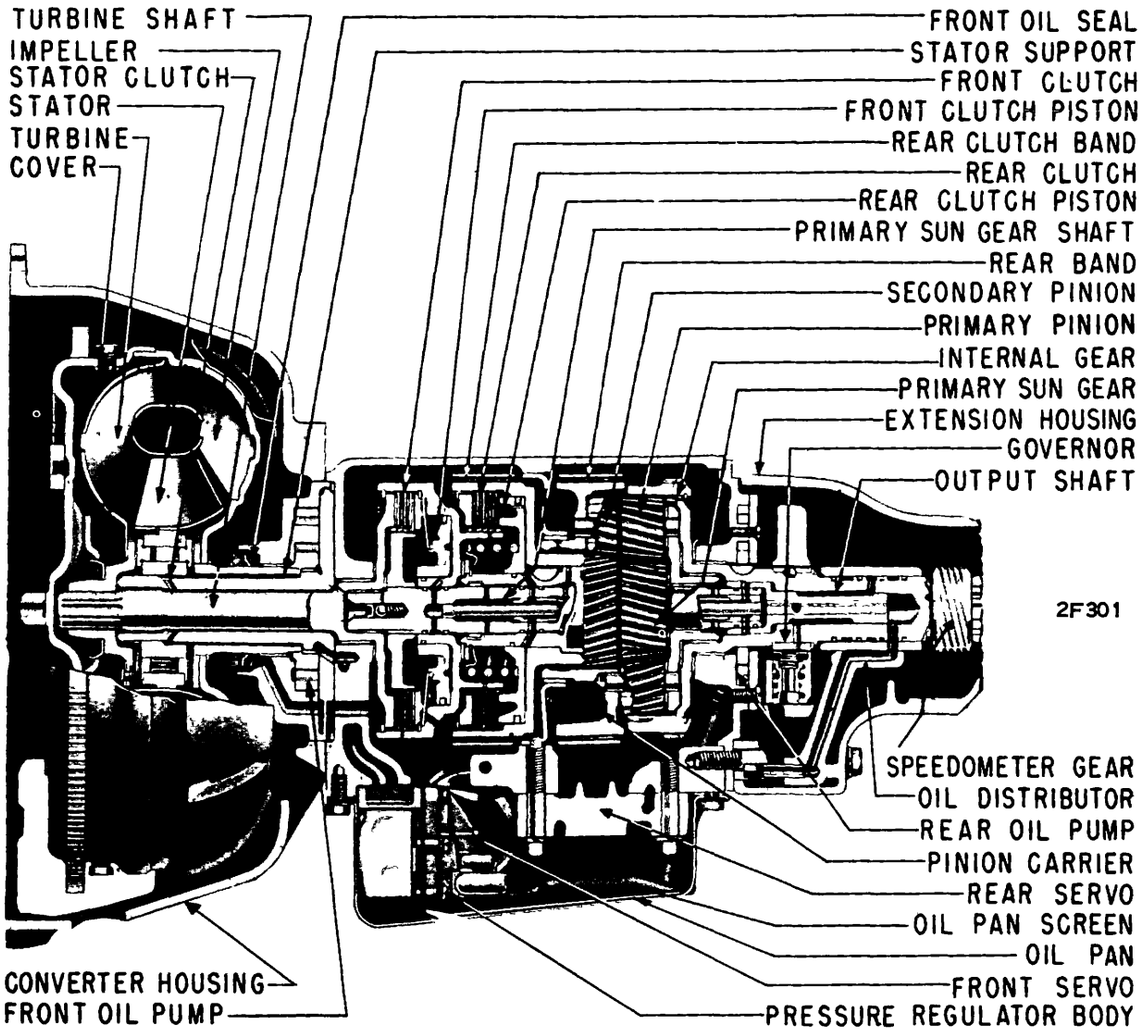
►*LUBRICATION NOTE: Check fluid level every 1000 miles (Checker); 4000 miles (Rambler). Drain and refill every 15,000 miles (Checker); 25,000 miles (Rambler).*

Capacity (Drain & Refill) - Approximately 9½ qts. (Rambler); 10 qts. (Checker).

After Overhaul - Approximately 11 qts. (Rambler).

Checking Fluid Level - With engine and transmission at normal operating temperature and running at idle speed, operate transmission through all ranges. Place transmission in "N" (Neutral) on Rambler American, and in "D-2" range (other models), then check fluid level on dipstick and add fluid as required to bring level to "F" mark. *NOTE - Approximately 1½ pts. of fluid are required to raise fluid level from "L" to "F" mark.*

Draining & Refilling - With transmission at normal operating temperature, rotate converter until one of the drain plugs is visible through opening in converter bell housing. Remove plug and turn converter 180° and remove second drain plug. Disconnect oil filler tube at oil pan and drain transmission. After draining, replace plugs and tighten converter plugs to 7-10 ft. lbs. Install 6 qts. (Rambler); 5 qts. (Checker) of recommended fluid, then set hand brake and run engine with transmission in "N" (Neutral) position. Add 3½ qts. (Rambler); 4 qts. (Checker) of fluid and move selector lever through all ranges. Check oil level, and if necessary, add fluid to bring level to "F" mark on dipstick. *RAMBLER NOTE - 1½ pints approximately, is required to raise fluid level from "L" mark to "F" mark. DO NOT OVERFILL.*



Recommended Fluid - Automatic Transmission Fluid Type "A" (Suffix "A").

CHECKER

Manual Linkag Adjustm nt: Disconnect manual shift rod from selector lever on steering column and from lever on transmission. Position transmission selector lever so indicator is down against stop in "D" (Drive) position. Place transmission manual lever in the "D" (Drive) detent (second from top of transmission), then adjust length of manual shift rod so it fits into ball joint on steering column and into shift lever on transmission without changing position of selector lever or transmission shift lever. Tighten ball joint nut at steering column and install washer and cotter pin at transmission lever. Move selector lever through all positions and check operation.

Neutral Safety Switch Adjustment: Starter circuit must be open in all positions except "N" (Neutral). To adjust, loosen neutral switch-to-steering column screws and position switch so starter circuit is closed when selector lever is at "N" (Neutral).

Kickd wn Switch Adjustm nt: Loosen the two nuts on kickdown switch (one above and the other below toeboard) and rotate the upper nut to obtain a clearance of ¼" between switch and accelerator pedal when carburetor throttle valves are in a wide open position.

RAMBLER EIGHT FLASH-O-MATIC TRANSMISSION SECTIONAL VIEW

PUSH BUTTON CONTROL

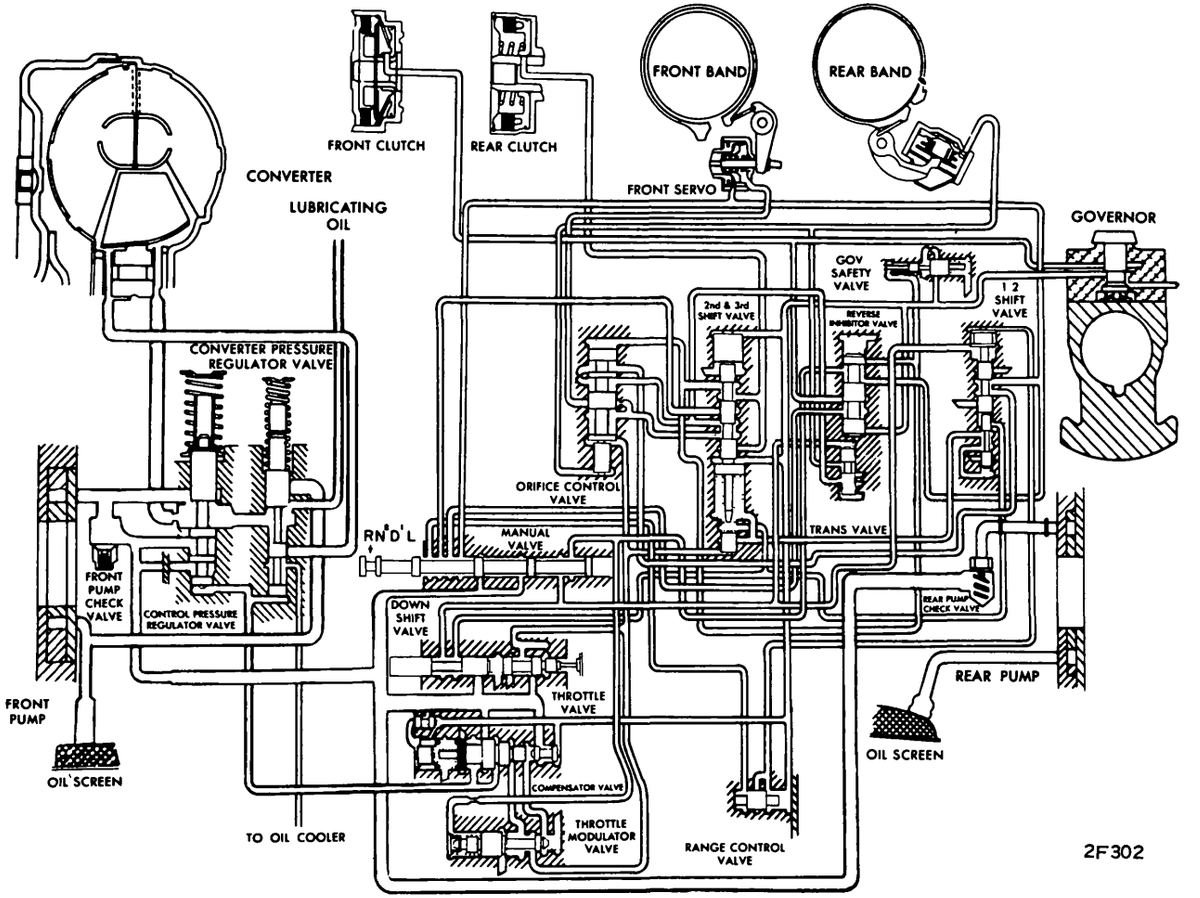
RAMBLER

Gear Selector Pushbutton C ntrol Adjustment: Disconnect cable at transmission lever, then push "L" (Low) button in and move selector lever on transmission all the way to rear. Adjust cable linkage at clevis to align holes in clevis and lever. Install clevis pin and washer and tighten clevis securely. Check adjustment in all five positions.

CONTINUED ON NEXT PAGE

RAMBLER EIGHT & CHECKER AUTOMATIC TRANSMISSION (C nt.)

Parking L v r Adjustment: Pull "Park" lever handle out and disconnect cable at transmission (transmission outer lever will be in its off position and inner lever will lay against toggle lever pin). Adjust clevis on cable to index perfectly with hole in lever. Install clevis, pin and washer and tighten.



Gear S lector Assembly R moval: Disconnect battery, then disconnect back-up light wire at connector and from junction block at firewall. Disconnect control light bulb from connector under instrument panel, then disconnect neutral safety switch wire from junction block and relay at left wheelhouse panel and pull wires through wall. Remove gear selector escutcheon from instrument panel, then remove the three screws retaining gear selector control and move the unit forward to clear pushbuttons from instrument panel. Lower unit and move it toward rear and remove retainer nuts from both cable attaching pins. Pry cable outer looms from brackets of control unit. *NOTE - If safety switch or back-up light switch r quire replacing, bend prongs of switch up with a screwdriver. When installing switch, bend prongs d wn car fully.* To install the assembly, reverse removal procedures.

CONTROL UNIT ADJUSTMENT
RAMBLER

Adjustm nt: *NOTE - Th following instructions supers d all previous testing procedures.* Remove pressure test plug at left front side of transmission and install the 1/8" pipe plug extension provided with Tool J-8773 (Vacuum & Solenoid Control Adjusting Kit), then connect an oil pressure gauge to the extension. Disconnect vacuum line at vacuum and solenoid unit and attach vacuum gauge to "T" fitting on test line. Start engine and bring to normal operating temperature with transmission in neutral. At engine idle speed of 475 RPM, transmission in neutral, turn needle valve on test line to lower vacuum reading on gauge to obtain a vacuum reading of 13.8" Hg. With correct vacuum reading, oil pressure reading should be 85 lbs. plus or minus 3 lbs. If oil pressure reading is not correct, loosen vacuum and solenoid unit locknut and turn unit in toward case if pressure is too low; away from case if pressure is too high. After correcting adjustment, cover bleed holes provided in needle valve to stop atmospheric pressure entering test line. This will increase vacuum reading on the test gauge to highest engine vacuum and oil pressure gauge should then read 55-65 lbs. With rear wheels raised off floor, place transmission in "D-2" position, then cover bleed hole in needle valve. Accelerate engine until transmission shifts into direct drive. Pressure gauge should read 25-35 lbs.

CHECKER

Adjustment: *NOTE - Aft r unit is installed on transmissi n cas , it sh uld be initially adjusted by screwing it in r out so th distance between front edge of unit and transmissi n cas is 3/8".* Remove 1/8" pipe plug from lower left corner of transmission case and install a 300 lb. pressure gauge. Remove fitting at rear of vacuum solenoid unit and install a vacuum gauge using a "T" fitting. Install vacuum line so unit will operate and vacuum gauge will register. Connect a tachometer to engine, then start engine and run several minutes to bring to normal operating temperature.

HYDRAULIC CIRCUIT DIAGRAM (RAMBLER V8)

Place selector lever in "D1" ("D" on Superba A1OL) and apply parking and service brakes. Accelerate engine until a reading of 10.5" HG is obtained on vacuum gauge. Reading on pressure gauge should be 90-105 lbs. If pressure is below specifications, turn vacuum and solenoid unit inward to increase pressure; outward to decrease pressure. When correct pressure has been obtained, tighten locknut. *NOTE - It is recommended that vacuum and solenoid unit not be turned more than 1/2 turn either way from initial setting of 3/8".*

►*CAUTION: When making the above tests, do not operate engine for more than 10 seconds at any one interval.*

BAND ADJUSTMENT

►*TORQUE WRENCH DIAL READING NOTE:* To obtain correct dial reading on wrench, compensate for the additional length of adapter Tool J-7847 as follows: Multiply "9" (torque required on adjusting nut) by lever length of wrench (middle of handle to center of wrench socket drive). Record the product of this multiplication. Add length of torque wrench to length of adapter, Tool J-7847 (6"). Record sum of this addition. Divide product of the multiplication by the sum of the addition. The quotient of this division will be the reading on torque wrench dial which will be required to obtain 9 ft. lbs. on rear band adjusting nut.

Front Band: Remove transmission oil pan, gasket, and screen. Use Tool J-5880 (Rambler), Tool No. 7195 (Checker Superba) and loosen adjusting screw, then insert gauge block (part of tool) between end of adjusting screw and servo piston rod. Turn screw in until it overruns and remove gauge block. *NOTE* - It may be necessary to back adjusting screw off slightly to remove gauge block. If so be sure to tighten screw the same amount after block is removed. Tighten locknut to 20-25 ft. lbs. and install screen, gasket, and transmission oil pan. Refill transmission.

Rear Band: Rambler - Loosen locknut on adjusting screw located on left side of transmission case and install Tool J-7847 on adjusting screw. Tighten screw with torque wrench to 9ft. lbs. *(see "Torque Wrench Dial Reading Not " above).* Mark adjusting screw with a reference point and **back off adjusting scr w 1½ turns.** Tighten locknut securely.

CONTINUED ON NEXT PAGE

RAMBLER EIGHT & CHECKER AUTOMATIC TRANSMISSION (C nt.)

Ch ck r Sup rba - Remove cover plate from floor pan and position Tool No 7225 on adjusting screw and loosen locknut Using "T" handle of tool, tighten adjusting screw until wrench overruns (10 ft lbs), then **back off adjusting screw 1½ turns.** Hold adjusting screw stationary and tighten locknut to 35-40 ft lbs

TESTING

STALL TEST: Connect tachometer to engine and place it where it can be easily read from driver's seat Set hand brake and start engine Place selector lever in "D1" position, apply service brakes and operate engine at full throttle. Note tachometer reading. *(CAUTION - Do not operate engine at high speed while selector lever is in one of the driving ranges, with rear wheels held stationary, for more than 10 seconds at a time to prevent overheating transmission)* Normal stall speeds are as indicated in table below If stall speed is greater than normal, slippage in transmission is indicated If stall speed is below normal, poor engine performance is indicated

Stall Speeds

Model	Engine RPM
Series 80	1600

SHIFT SPEEDS
(Rambler Ambassador)
(Series 80)

Upshift	Light Throttle	Full Throttle	Kickdown
1-2	10-14 MPH	26-30 MPH	37-41MPH
2-3	21-25 MPH	46-50 MPH	64-68 MPH
Downshift	**Closed Throttle**	**Full Throttle**	**Kickdown**
3-2	16-20 MPH	28-32 MPH	58-62 MPH
2-1	6-10 MPH		25-29 MPH

(Checker Superba)

Upshift	Light Throttle	Full Throttle	Kickdown
1-2	5-8 MPH	22-30 MPH	
2-3	10-13 MPH	41-50 MPH	
Downshift	**Closed Throttle**	**Full Throttle**	**Kickdown**
3-2	7-11 MPH		35-49 MPH
2-1	3-7 MPH		

AIR PRESSURE TEST (Transmission in Car)· Raise car on hoist and remove transmission oil pan and control valve assembly The front servo tubes should remain in front servo and the servo attaching screw must be tight *NOTE - When making air pressure tests, hold a clean towel over transmission opening to prevent excessive oil spray.*

Front Clutch· Apply air pressure to front clutch passage (on transmission case rear flange). Listen for a dull thud indicating clutch is operating. Retain air pressure in this passage for several seconds to check for leaks in this circuit

G vernor Valve· Remove governor inspection hole cover and apply air pressure to front clutch passage (see above) Listen for a click and watch valve snap inward Replace inspection hole cover

R ar Clutch: Apply air pressure to rear clutch passage (on transmission case rear flange). Listen for a dull thud indicating clutch is operating. Retain air pressure in this passage for several seconds to check for leaks in this circuit

Front Band & Servo: Apply air pressure to front servo apply tube (rear tube) and observe band application.

Rear Band & Servo: Apply pressure to rear clutch oil passage (transmission case rear flange), and observe band application.

► *TESTING NOTE· If servos, bands, clutches, and governor operate with air pressure, then the no-drive problems, erratic shift, or no-upshift conditions indicate that the control valve assembly and pressure regulator valve assembly is the cause of the trouble. See "Control Valve" and "Pressure Regulator Valve" below.*

TROUBLE SHOOTING & DIAGNOSIS

INITIAL ENGAGEMENT TOO ROUGH: Idle speed may be too high Control pressure may be too high caused by improper adjustment of throttle control vacuum unit. Regulator control valve may be dirty

INITIAL ENGAGEMENT DELAYED: Check fluid level On Rambler American, adjust the rear band as it may be too loose. The control pressure may be too low at idle speed Clean control valve assembly and pressure regulator assembly Check front pump for wear Check fluid circuits for leaks and correct as necessary

INOPERATIVE IN ALL RANGES: Check fluid level Manual linkage may be disconnected No control pressure, which may be caused by trouble at front pump Check rear band adjustment Check rear servo action with air pressure Inspect and clean control valve assembly Check engine stall speed, as converter may not be operating properly

NO DRIVE IN "D" OR "L" POSITION: Check fluid level Manual linkage not properly adjusted Control pressure may be low Adjust vacuum control unit Clean control valve and pressure regulator valve assemblies Check front clutch action with air pressure. On Rambler American, check the rear servo and the band with air pressure. Check the transition valve in the control valve assembly as it may be stuck

NO DRIVE IN "R" POSITION: Check fluid level. Check and adjust manual linkage. Control pressure may be too low. Adjust vacuum control unit. Clean control valve and pressure regulator valve assemblies. Check rear clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly

LOCKS UP IN "D" POSITION· Rear clutch or front band may be applied Clean control valve and governor valve assemblies. Check rear clutch and front band and servo for mechanical failure.

LOCKS UP IN "D" POSITION (2ND GEAR): Check rear band and servo or "one-way" clutch for mechanical failure Check rear clutch Clean control valve assembly assembly

LOCKS UP IN "D" POSITION (3RD GEAR): Front or rear band, or "one-way" clutch may be applied Clean control valve assembly

LOCKS UP IN "R" POSITION: Check front clutch and band and front servo for mechanical failure. Clean control valve assembly.

SLIPS IN "D" OR "L" POSITION: Check fluid level. Control pressure may be low. Adjust vacuum control unit. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited, check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.

1-2 UPSHIFT ROUGH: Control pressure may be too high. Check and correct vacuum and solenoid adjustment. Check and adjust bands. Clean governor valve assembly.

1-2 UPSHIFT SLIPPAGE (LIGHT THROTTLE): This condition may be caused by an unbalanced vacuum condition due to clogged vacuum ports or vacuum leakage at carburetor. Check adjustment of Vacuum & Solenoid Control Unit on transmission *(See "Control Unit Adjustment" above).*

1-2 UPSHIFT SLIPS: Adjust vacuum and solenoid unit. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.

NO 1-2 UPSHIFT: Check for stuck governor valve or 1-2 shift valve.

1-2 UPSHIFT TOO EARLY: Check for stuck governor valve.

1-2 UPSHIFT TOO LATE: Check for stuck governor valve or leak in governor circuit. Adjust vacuum solenoid unit.

2-3 UPSHIFT ROUGH: Control pressure may be too high, adjust vacuum solenoid unit. Clean control valve assembly and adjust front band. Check for stuck governor valve.

2-3 UPSHIFT "PILE-UP" (LIGHT THROTTLE): Se *"1-2 Upshift Slippage (Light Throttl)" above*

2-3 UPSHIFT SLIPS: Control pressure may be too low, adjust vacuum solenoid unit. Clean control valve assembly and adjust front band. Check for internal leaks and stuck governor valve.

NO 2-3 UPSHIFT: Governor valve or 2-3 shift valve may be stuck.

2-3 UPSHIFT EARLY: Check for stuck governor valve.

2-3 UPSHIFT LATE: Check for stuck governor valve or leak in governor circuit Adjust vacuum solenoid unit.

3-2 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust vacuum solenoid unit. Orifice control valve may be stuck.

3-2 KICKDOWN (EARLY): Check for stuck governor valve.

2-1 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust vacuum solenoid unit. Rear servo check valve may be stuck

WILL NOT START BY PUSHING: Rear pump not opera-

CONTINUED ON NEXT PAGE

RAMBLER EIGHT & CHECKER AUTOMATIC TRANSMISSION (C nt.)

ting. Pressure regulator valve may be stuck.

NO PARK POSITION: Adjust vacuum solenoid unit. Check for damaged internal linkage or pawl.

TRANSMISSION REMOVAL & INSTALLATION

RAMBLER

►*TRANSMISSION REMOVAL NOTE (CARS WITH SINGLE EXHAUST): Disc nnect cross-over (right) exhaust pip at manifold flange and "U" clamp conne ctions at l ft exhaust pip .*

REMOVAL: Disconnect battery cable, then raise car on a hoist and place jack stands under rear of car at body sills. Disconnect oil filler tube at oil pan and drain transmission, then disconnect oil cooler lines at transmission. Disconnect vacuum line and wire terminal at vacuum unit located at rear of transmission. Disconnect speedometer cable at transmission and rear brake hose bracket from floor panel. Disconnect shift cable from lever at transmission, then disconnect rear shock absorbers from rear axle. Disconnect torque tube, propeller shaft, and parking brake cable, then lower rear axle and move rearward, separating torque tube and propeller shaft from transmission. Place a hydraulic hoist with a suitable cradle in position under transmission oil pan, then remove transmission-to-converter housing upper capscrews and remove shift cable bracket. Install two guide pins, Tool J-1434 into capscrew holes, then remove lower capscrews and washers. With hydraulic hoist and cradle adjusted so transmission is in alignment with converter housing, pull transmission to rear to disengage it from housing and converter assembly. Lower assembly and remove from car.

►*TRANSMISSION, BELL HOUSING & CONVERTER ASSEMBLY REMOVAL NOTE:* These parts may be removed as an assembly as follows: In addition to transmission removal procedure (see above), remove the starter attaching bolts and remove starter. Support transmission and remove crossmember at side sill bolts. Lower engine and block engine on both sides from the top ledges of oil pan to side sill crossmember (these blocks should be 5" long and 2" square). Remove bell housing-to-engine bolts and bell housing lower mud pan. Remove six capscrews attaching torque converter to drive plate. Complete removal as outlined above.

INSTALLATION: Reverse the removal procedure and note the following: If transmission removed separately, position front pump drive tangs on converter in a horizontal position and position the front pump external tooth gear drive lugs in a vertical position. Tighten transmission-to-bell housing attaching bolts to 40-45 ft. lbs. If converter has been removed, converter-to-drive plate attaching capscrews must be tightened to 23-28 ft. lbs.

CHECKER

REMOVAL: Raise car and drain transmission fluid, then loosen tube clip capscrew at extension on starter motor and rotate filler tube out of the way. Disconnect vacuum line at vacuum unit (rear of transmission), then disconnect hand brake cable at drive shaft if chassis is so equipped. Disconnect manual shift linkage at shift lever on transmission, then disconnect the two oil cooler lines on right side of transmission (if so equipped). Disconnect propeller shaft at transmission companion flange and wire propeller shaft out of the way. Place a hydraulic hoist with a suitable transmission lift cable in position under transmission oil pan and adjust hoist to align cradle with oil pan flange, then hoist enough to support transmission. Remove transmission case to converter housing upper capscrews and lockwashers and install two pilot studs into screw holes. Remove lower transmission case to converter housing capscrews. Pull transmission straight toward rear of car to disengage it from converter housing and converter assembly.

INSTALLATION: Reverse removal procedure, being careful to align turbine shaft splines with turbine hub splines and the converter impeller lugs with slots in front pump drive gear.

TRANSMISSION OVERHAUL

►*CONVERTER OVERHAUL NOTE:* Torque converter is a sealed assembly (case is welded together during manufacture) and cannot be disassembled for service.

TRANSMISSION OVERHAUL: *See "Warner Automatic Transmission" in 1960 Final Data, page 506, or lat r Manual edition.*

STUDEBAKER FLIGHTOMATIC TRANSMISSION

Studebaker Lark & Hawk (1962)

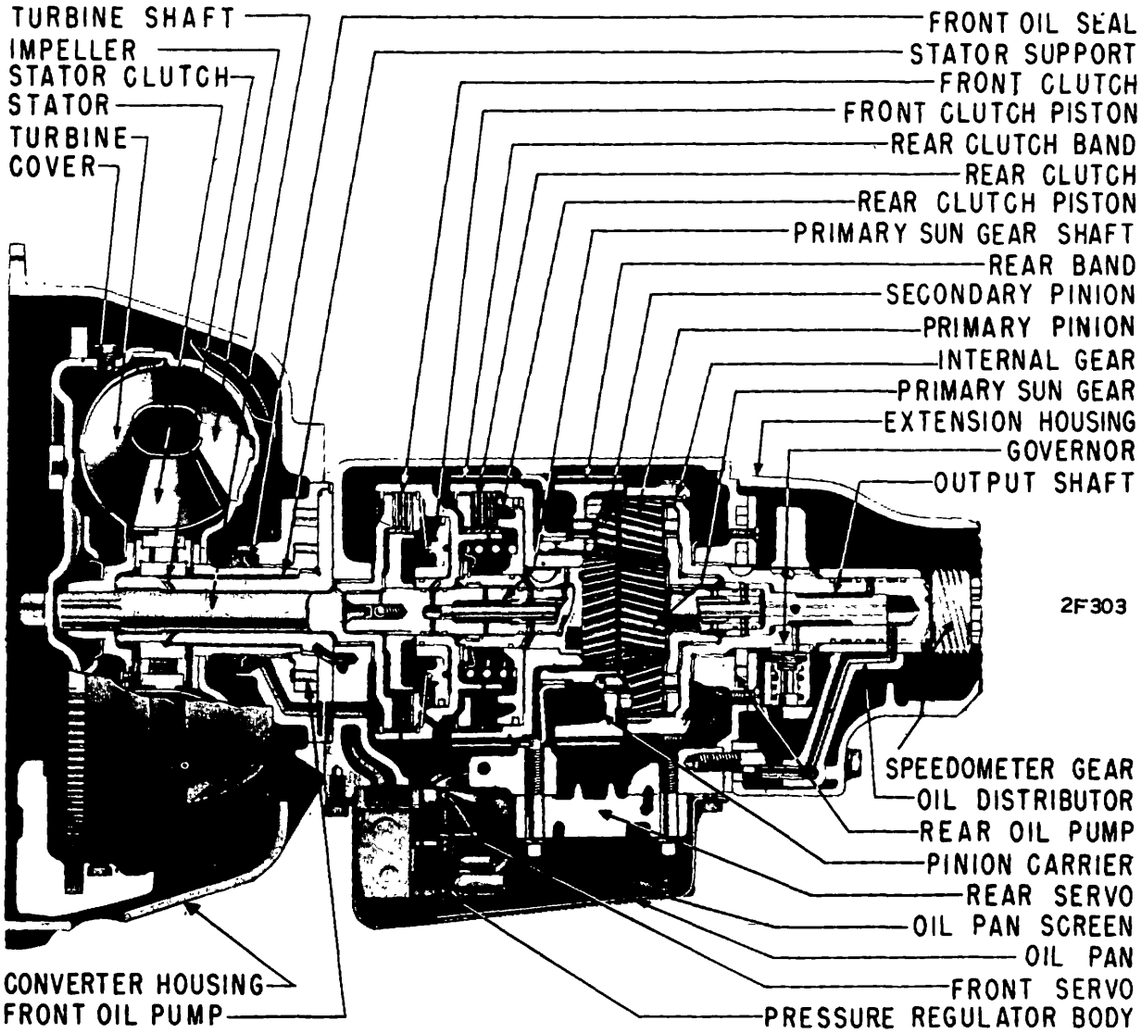
►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR:* Move selector lever to "N" (Neutral) position. When car speed reaches 20 MPH, turn the ignition switch on and move transmission selector lever to the "L" (Low) position. It is recommended that the car be pushed to start it rather than be towed.

►*TOWING CAR CAUTION:* Car can be towed for very short distances with the transmission selector lever in the "N" position. Prolonged towing will result in damage to the transmission unless the drive shaft is disconnected or the rear wheels are off the ground.

DESCRIPTION

DESCRIPTION: Transmissions used on all models are similar to transmissions used on corresponding previous (1961) models. Heavy duty and Taxicab transmissions are water cooled by circulating transmission fluid through an oil cooler located in car radiator. The transmission used on 170" Over-Head-Valve engines is similar to the other transmissions except that a one-way (sprag) clutch is used in the planetary gear train to eliminate application of rear band when transmission is operating in "D" (Drive) range. *NOTE - Rear band is applied only when selector lever is in "L" (Low) or "R" (Reverse).* In conjunction with the addition of a sprag clutch, the control valve assembly was also changed to eliminate the rear servo check valve and spring.



LUBRICATION

►*CAUTION: Check fluid level at 1000 mile intervals. Drain and refill at 15,000 mile intervals, using Automatic Transmission Fluid Type "A" (Suffix "A").*

Capacity - 9 qts. (Exc. Taxicab & Heavy Duty Trans.). 9½ qts. (Taxicab & Heavy Duty Trans.).

Checking Fluid Level–Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission have reached normal operating temperature. Roll up the floor mat from right side until oil level inspection hole cover in floor pan is accessible, and remove cover. Clean all dirt and foreign material from around transmission fluid dipstick. Apply the parking brake and foot brake and move selector lever slowly from "P" position to "R" position and then back to "D" position. Remove dipstick and wipe clean, then install it in transmission and **turn clockwise to the lock position.** Remove dipstick and check fluid level. Add fluid through dipstick hole to raise level to the "F" mark on dipstick. *NOTE*–The amount of fluid required to raise the level from "L" mark on dipstick to "F" mark is approximately 1½ pints.

Draining & Refilling–Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission are at normal operating temperature. Stop engine and raise car on hoist. Remove transmission dipstick (*see "Checking Fluid Level" above*). Remove transmission drain plug. Rotate the converter until one of the drain plugs is visible through hole in converter housing, remove drain plug and quickly rotate converter 180°, and remove the other converter drain plug. After fluid has drained from transmission and converter, install transmission drain plug using a new gasket, and the two converter drain plugs. Lower the car to floor and install three quarts of Automatic Transmission Fluid Type "A" (Suffix "A") through dipstick hole. Apply parking brake and foot brake, then start engine and operate it with selector lever in "N" (Neutral) position. Slowly pour four quarts of fluid into transmission. Move selector lever through all ranges. Check oil level on dipstick (see "Checking Fluid Level" above). Add sufficient oil to bring level up to "F" mark on dipstick.

STUDEBAKER FLIGHTOMATIC TRANSMISSION SECTIONAL VIEW

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment: *See CARBURETOR on Car Model Pages.*

Manual Linkage Adjustment: Disconnect shift lever-to-transmission manual valve lever rod at transmission manual valve lever by removing the ball joint assembly. Place selector lever in "D" (Drive) position and place the manual lever on transmission in the "D"

CONTINUED ON NEXT PAGE

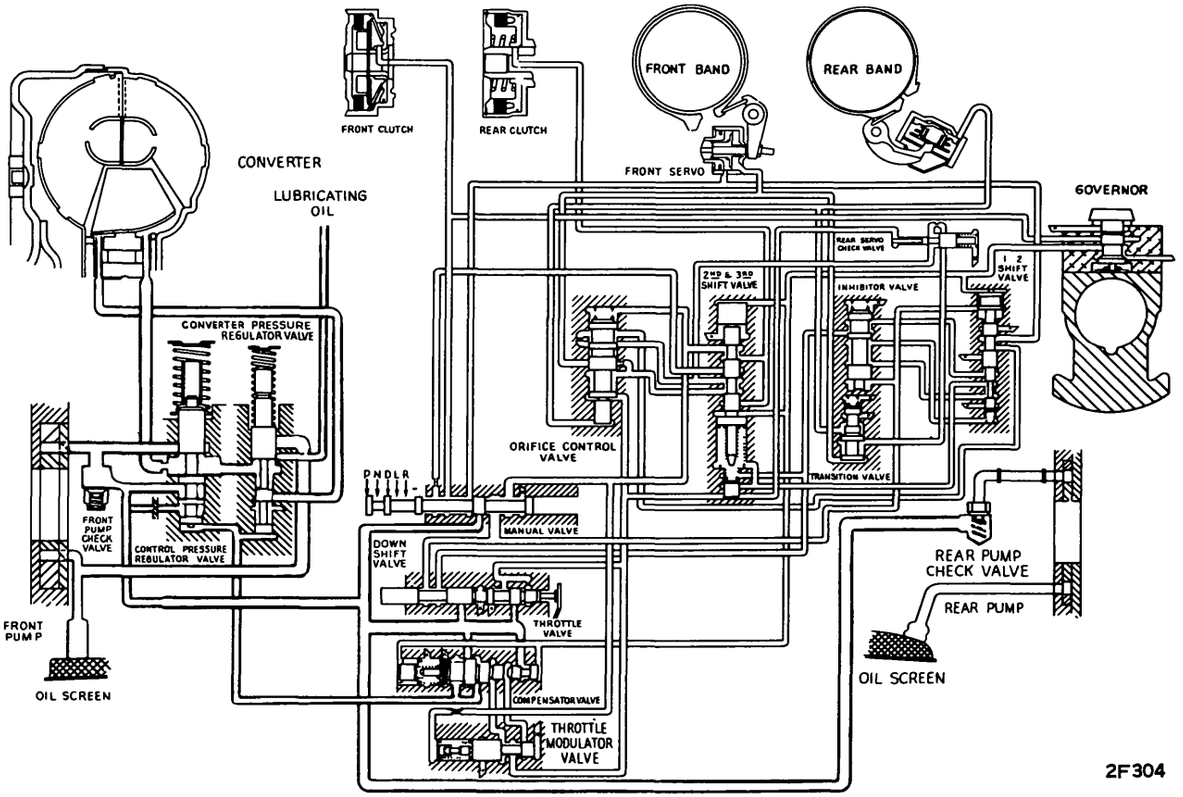
STUDEBAKER FLIGHTOMATIC TRANSMISSION (C ntinu d)

(Drive) position (this is center of manual valve lever travel). Adjust the shift lever-to-manual valve lever rod until the ball joint stud will slip freely through the hole in the manual valve lever. Install ball joint stud locknut and lock to rod.

N utral Saf ty Switch Adjustment: Place transmission selector lever in "N" (Neutral), then loosen switch bracket on steering column jacket. Align pin hole in switch lever with corresponding hole in switch body and install pin to maintain alignment. Tighten bracket attaching screws. Test operation of switch. Engine should start only with selector lever in "P" (Park) or "N" (Neutral) position.

BAND ADJUSTMENT

Fr nt Band: Remove transmission oil pan, gasket and screen. Loosen the front servo adjusting screw locknut two full turns with a 9/16" wrench. Check the adjusting nut for free rotation in the actuating lever and free the adjusting screw if necessary. Install the gauge block of the adjusting tool (J-5880) between the servo piston rod and the adjusting screw. Place the Front Band Adjusting Tool J-5880, on the adjusting screw and tighten until the tool overruns. **Back off the adjusting scr w n full turn,** and tighten locknut to 20-25 ft. lbs. Place the screen over the rear pump inlet first then over the front pump inlet, and install the screen retaining clip. Position a new oil pan gasket on transmission oil pan flange and hold it in place with petroleum jelly. Align oil pan on transmission flange and install capscrews and lockwashers. Tighten to 10-13 ft. lbs. Install drain plug and fill transmission *(s "Lubrication" above).*



Rear Band: Remove inspection cover in center of front compartment floor and clean all dirt and foreign material from around rear band adjusting screw and locknut. Oil adjusting screw threads, then using Tool J-5883, tighten screw until tool overruns. **Back off adjusting screw 1½ turns** and tighten locknut to approximately 35-40 ft. lbs. *CAUTION - It is very important that the adjusting screw be backed off 1½ turns to avoid damage to band and s rvo.*

THROTTLE VALVE STOP ADJUSTMENT

Thr ttl Valv St p: Remove oil pan and screen, then remove compensator tube and bellcrank-to-throttle valve lever rod from throttle valve lever. Hold throttle valve lever against throttle valve stop and measure distance from center of hole in throttle valve lever to machined surface on rear of transmission case. This distance should be a minimum of 4 7/32" and not to exceed 4 5/8". If not within specifications, bend throttle valve stop as necessary. To bend the stop, remove compensating pressure tube from pressure regulator valve assembly and control valve assembly and bend stop with Tool J-5887.

TESTING

STALL TEST: Connect tachometer to the engine and place it where it can be easily read from the drivers

HYDRAULIC CIRCUIT DIAGRAM (6 CYL. MODELS)

seat. Set the hand brake and start the engine. Place selector lever in "D" (Drive) position, apply service brakes and operate the engine at full throttle. Note tachometer reading. Repeat this procedure with selector lever in "L" and "R" positions. *(CAUTION–Do not operate the engine at high speed while the selector lever is in one of the driving ranges, with the rear wheels held stationary, for more than 10 seconds at a time or for a total time greater than one minute in any half hour period).* Normal stall speeds are 1450-1550 RPM (6 Cyl.), 1550-1650 (259" V8 Eng.), 1750-1850 (289" V8 Eng.), If stall speed is greater than normal, slippage in transmission is indicated. If stall speed is between 900-1000 RPM (if engine is normal), slippage is indicated in torque converter free-wheel unit.

ROAD TEST: A thorough test must be made to determine the shift speed and transmission performance. The initial application of the various bands and clutches should be checked in all driving ranges by stopping the car and moving the selector lever to "D", "Lo", & "R" ranges. A driving test should be made in the "D" range to check the shift speeds. *See "Shift Speeds" below.*

FLUID PRESSURE TESTS: Fluid pressure tests should be made to ascertain whether or not the pressure regulator system is functioning correctly and to determine if there is fluid leakage in the clutch circuits. Remove the 1/8" pipe plug located near throttle lever and manual lever, and install pressure gauge hose (pressure gauge should be in drivers compartment). Connect a tachometer to engine and position it so it can be read from driver's compartment. Make the following tests:

►*FLUID PRESSURE TEST CAUTION (CARS WITH CLOSED CRANKCASE VENTILATION):* Disconnect airflow valve from carburetor or manifold, and temporarily plug carburetor or manifold vacuum port during pressure tests or adjustments.

1) Idle Pressure Test - With engine and transmission at normal operating temperature, and with engine at normal idle speed, move selector lever to "D", "L" & "R" positions. The pressure reading should be approximately 50-60 lbs. (6 Cyl.); 50-80 lbs. (V8, Exc. Taxicab); 59-95 lbs. (V8 Taxicab), in all ranges. If pressure is low in any one range, a fluid leak in that circuit is indicated. If pressure is high, the throttle linkage should be checked and adjusted. *See CARBURETOR on Car Model pages.*

2) Pressure Regulation Test - Move selector lever to "D" (Drive) range and firmly set hand brake and foot brake. Run engine at 1000 RPM and check pressure gauge. Pressure should be approximately 70-75 lbs. (6 Cyl.); 80-85 lbs. (V8, Exc. Taxicab); 95-100 lbs.

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC TRANSMISSION (Continued)

(V8 Taxicab). If pressure is less, it indicates the throttle linkage is too long and must be adjusted. If pressure is greater, it indicates throttle linkage is too short.

3) Stall Pressure Test - Firmly set hand and foot brakes and operate engine at full kickdown position. Move selector lever to "D", "L", "R" ranges and check pressure gauge. Pressure in "D" & "L" should be 100-130 lbs. (6 Cyl.); 130-175 lbs. (V8, Exc. Taxicab); 132-184 lbs. (V8 Taxicab). In "R" range, the pressure should be 160 lbs. minimum (6 Cyl.); 170-190 lbs. (V8, Exc. Taxicab); 184-203 lbs. (V8 Taxicab). If pressure is not within limits, control valve assembly and pressure regulator valve assembly must be removed and cleaned.

FLIGHTOMATIC SHIFT SPEEDS

Minimum Throttle Upshift

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
1-2	7-9 MPH	6-8 MPH	
2-3	16-19 MPH	14-17 MPH	12-18 MPH

Maximum Throttle Upshift

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
1-2	35-38 MPH	28-32 MPH	34-42 MPH
3-2	59-64 MPH	41-46 MPH	63-73 MPH

Maximum Kickdown

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
3-2	50-55 MPH	34-39 MPH	60-70 MPH
3-1	15-19 MPH	10-14 MPH	20-26 MPH
2-1	10-14 MPH	6-10 MPH	12-18 MPH

Closed Throttle Downshift

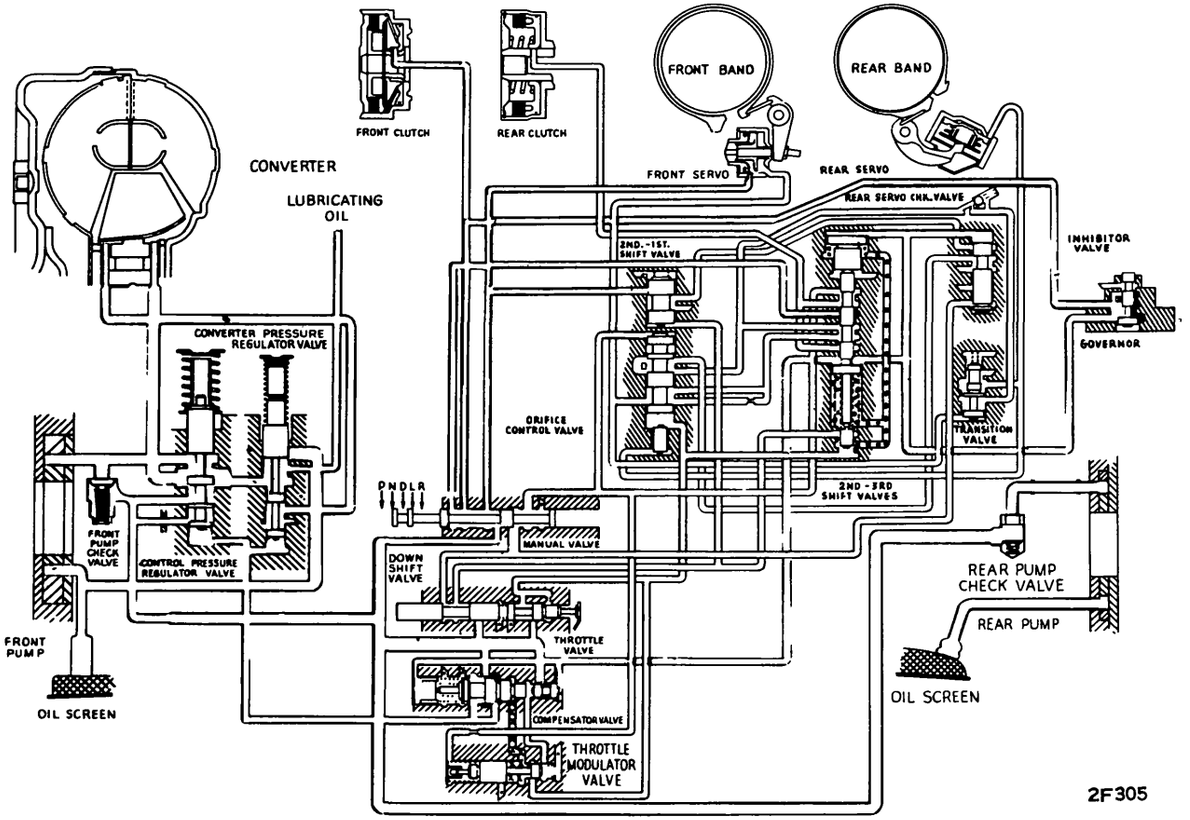
Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
3-2	7-11 MPH	6-10 MPH	3-8 MPH

Inhibited Downshift (Selector Lever in "L")

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
2-1	15-22 MPH	14-18 MPH	15-21 MPH

AIR PRESSURE TEST (With Transmission in Car): Raise car on hoist and remove transmission oil pan and control valve assembly. Proceed as follows:

Front Clutch: Apply pressure to front clutch and governor input passage (case rear flange). Listen for dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of the system.



Governor Valve: Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

Rear Clutch; Apply air pressure to rear clutch oil passage (case rear flange). Listen for a dull thud to indicate clutch is operating. Check for leaks in same manner as for front clutch (above).

Rear Band & Servo: Apply pressure to rear servo oil passage (case rear flange), observe band application.

Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application.

►*TESTING NOTE: If servos, bands, clutches and governor operate with air pressure, then no drive problems, erratic shifts, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" below.*

HYDRAULIC CIRCUIT DIAGRAM (V8 MODELS)

TROUBLE SHOOTING

►*DIAGNOSIS OF TRANSMISSION SLOW ENGAGEMENT OF FRONT & REAR CLUTCHES: This condition noted* at times when manual selector lever is shifted to a position that requires application of either front or rear clutch with car standing still, and at idle (transmission at normal operating temperature). Check as indicated below.

1) Perform "Initial Engagement Delay" below.

2) Check control pressure at 1000 RPM and at idle during time complaint condition is noticeable. Make comparative readings in all ranges.

3) Isolate rear clutch or rear band areas by adjusting rear band so it mechanically locks rear drum. If trouble is corrected, leakage within rear band servo is indicated. If complaint remains, it indicates that problem is in rear clutch circuit.

4) If the above procedures do not correct the complaint, but indicate a pressure leak in either front or rear clutch circuits, remove and disassemble transmission, then inspect all parts for nicks, scores and wear. Check all seal rings and grooves. Check all valves and valve bores.

►*CONTROL VALVE BUZZ (PARK & REVERSE RANGES) CORRECTION:* This condition may be due to highly aerated oil in the transmission which could be caused by a leak in the transmission. When abnormally severe valve buzz is encountered, remove the dipstick and check for indications of air bubbles in the oil. If air is present, check and correct as follows:

1) Sand holes or porosity in transmission case.

2) Leakage between pressure regulator valve assembly and the machined surface of case. This condition can be due to nicks or other damage on either of the mating surfaces, or by improper torqueing of the capscrews.

3) Leakage between front pump and transmission case due to damaged gasket or improper torqueing of capscrews.

4) Incorrect control pressures or sticking valves.

INITIAL ENGAGEMENT TOO ROUGH: Idle speed may be too high. Control pressure may be too high caused by improper throttle valve linkage or dirt in control valve assembly or regulator valve assembly. Check throttle valve stop and reset if necessary.

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC TRANSMISSION (C ntinu d)

INITIAL ENGAGEMENT DELAYED: Check fluid level. Adjust rear band as it may be loose. Control pressure may be too low at idle speed. Clean control valve assembly and pressure regulator assembly. Check front pump for wear. Check fluid circuits for leaks and correct as necessary.

INOPERATIVE IN ALL RANGES: Check fluid level. Manual linkage may be disconnected. No control pressure which may be caused by trouble at front pump. Check rear band adjustment. Check rear servo action with air pressure. Inspect and clean control valve assembly. Check engine stall speed, as converter may not be operating properly.

NO DRIVE IN "D" OR "L" POSITION: Check fluid level. Manual linkage may be disconnected. Control pressure may be low. Adjust throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Check front clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly as it may be stuck.

NO DRIVE IN "R" POSITION: Check fluid level. Check and adjust manual linkage. Control pressure may be low. Check and adjust throttle valve linkage, and clean control valve and regulator valve assemblies. Check rear clutch action with air pressure. Check rear servo action with air pressure. Check transition valve in control valve assembly.

LOCKS UP IN "D" POSITION: Rear clutch or front band may be applied. Clean control valve and governor valve assemblies. Check rear clutch and front band and servo for mechanical failures.

LOCKS UP IN "D" POSITION (2ND GEAR): Check rear band and servo, and rear clutch for mechanical failure.

LOCKS UP IN "D" POSITION (3RD GEAR): Front or rear band may be applied. Check bands and servo for mechanical failure. Clean control valve assembly.

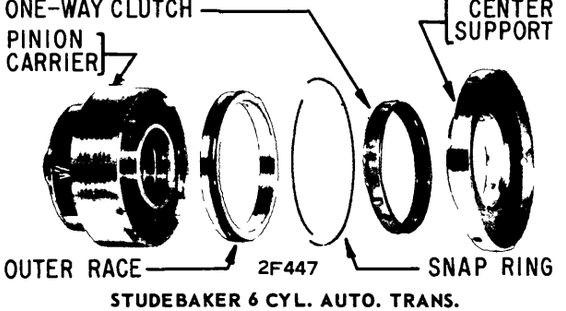
LOCKS UP IN "R" POSITION: Check front clutch and band and front band servo for mechanical failure. Clean control valve assembly.

SLIPS IN "D" OR "L" POSITION: Check fluid level. Control pressure may be low. Check throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited; check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.

SLIPS IN "R" POSITION: Check fluid level. Check and adjust throttle control linkage. Clean control valve and regulator valve assemblies. Check rear servo for limited travel. Check front clutch for mechanical failure as it may be slipping. Rear pump check valve may be stuck open.

1-2 UPSHIFT ROUGH: Check and correct throttle control linkage as control pressure may be too high. Clean and adjust bands. Governor valve may be stuck.

1-2 UPSHIFT SLIPS: Check and adjust throttle control as control pressure may be too high. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.



NO 1-2 UPSHIFT: Check for stuck governor valve or 1-2 shift valve.

1-2 UPSHIFT TOO EARLY: Check for stuck governor valve.

1-2 UPSHIFT TOO LATE: Check for stuck governor valve or leak in governor circuit. Check and adjust throttle control linkage. Clean control valve assembly.

2-3 UPSHIFT ROUGH: Control pressure may be too high; adjust throttle control linkage and clean control valve assembly. Adjust front band. Check tor stuck governor valve.

2-3 UPSHIFT SLIPS: Control pressure may be too low; adjust throttle control linkage and clean control valve assembly. Adjust front band. Check for internal leaks and for stuck governor valve.

STUDEBAKER 6 CYL. AUTO. TRANS.
ONE-WAY CLUTCH

NO UPSHIFT 2-3: Governor valve or 2-3 shift valve may be stuck.

2-3 UPSHIFT EARLY: Check for stuck governor valve.

2-3 UPSHIFT LATE: Check for stuck governor valve or leak in governor circuit. Adjust throttle control linkage.

3-2 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Orifice control valve stuck

3-2 KICKDOWN (EARLY): Adjust throttle control linkage.

NO KICKDOWN: Adjust throttle control linkage.

2-1 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Rear servo check valve may be stuck.

WILL NOT START BY PUSHING: Rear pump not operating. Pressure regulator valve may be stuck.

NO PARK POSITION: Adjust throttle control linkage. Check for damaged internal linkage or pawl.

TRANSMISSION & CONVERTER REMOVAL & INSTALLATION

►*TRANSMISSION REMOVAL & INSTALLATION PROCEDURE NOTE: See Page 515 in 1961 Final Data.*

TRANSMISSION OVERHAUL

CONVERTER OVERHAUL: Converter assembly is welded together and cannot be disassembled for servicing or overhaul.

TRANSMISSION OVERHAUL: *See "Warner Automatic Transmission" in 1960 Final Data, page 506, or later Manual edition and note the following:*

Control Valve Assembly (6 Cyl. Models): Lower Valv Body Cover - Rear Servo Check Valve and Spring not used. The only valve at this location is the 1-2 shift valve and spring.

Pinion Carrier & One-Way (Sprag) Clutch: Disassembly - *NOTE - Pinion Carrier cannot be disassembled exc pt as follows:* The one-way clutch may be removed by slipping it out of outer race, then the outer race can be remove by removing the snap ring. *NOTE - Do not remove outer race unless replacement is necessary.* **Reassembly** - Install one-way clutch outer race and secure in position with snap ring. Install one-way clutch into pinion carrier and outer race assembly with flanged end of one-way clutch towards pinion carrier. Properly assembled, the brass drag strips attached to inner cage of one-way clutch will be located away from pinion carrier

FORD MOTOR CO.
ELECTRIC TYPE

Ford Galaxie (1962)
Mercury Monterey (1962)
Thunderbird (1962)

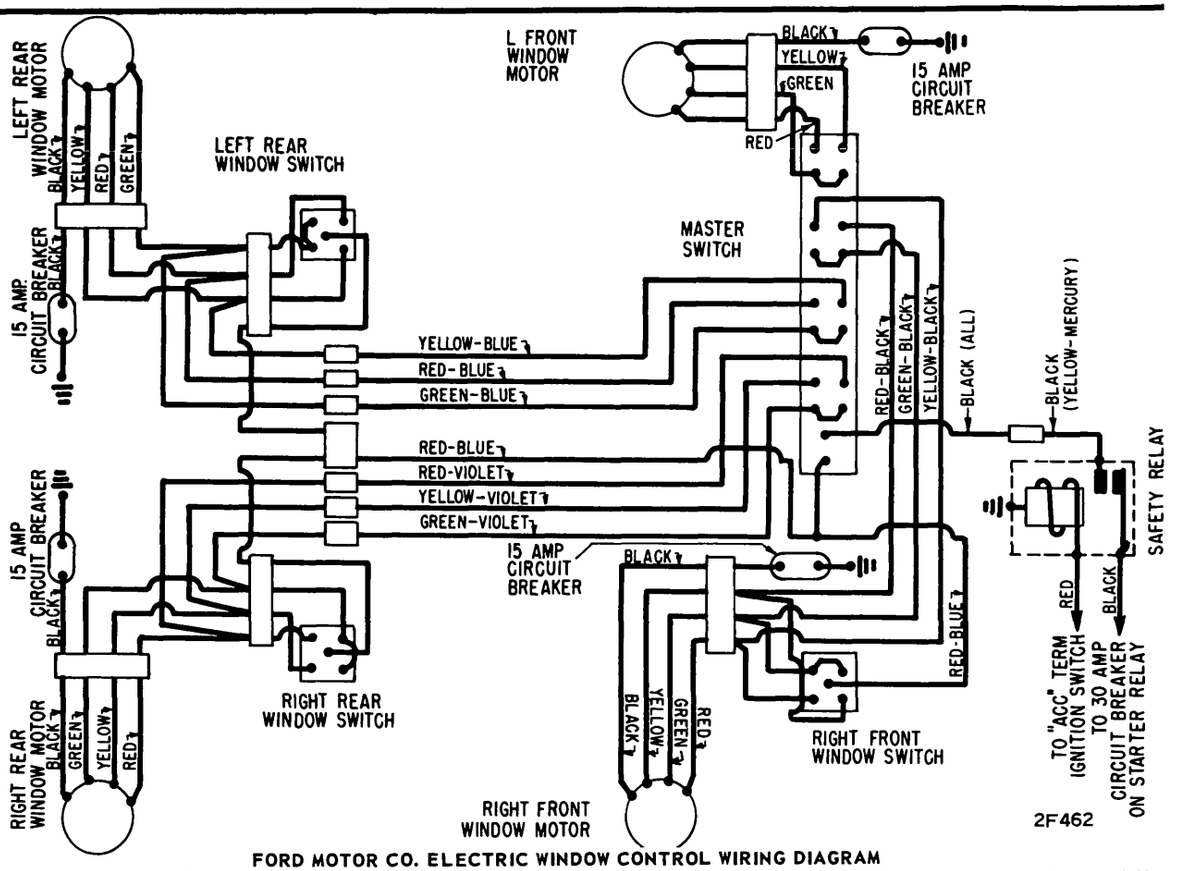
►CHANGES, CAUTIONS, CORRECTIONS

►*WINDOW SWITCH FAILURE PREVENTION:* If a switch has failed because of water entering switch, seal replacement switch with waterproof tape before installing.

DESCRIPTION: Electrically controlled windows operated a reversible type motor combined with each individual window regulator assembly. Individual switches located near each window for separate control, and a master control switch on left front door to control all windows. A lock-out switch on master control switch enables windows to be operated only by the driver of the car. A safety relay on right side of cowl prevents window operation except when ignition switch in ON or ACC positions. *NOTE - For electrically operated station wagon tailgate window, see "Ford Motor Co. Tailgate Window" in this section.*

TROUBLE SHOOTING & DIAGNOSIS: All Windows Will Not Operate In Either Direction - Trouble will be in main feed circuit breaker, safety relay, ignition switch, or lock-out switch; or any of appropriate control wiring. with a voltmeter or jumper wire, test for current at various parts of control circuit.

One Window Will Not Operate In Either Direction Through Either Switch Circuit: If motor runs freely, it is loose and pulled away from coupling. Check for defective motor circuit breaker, faulty wiring from switches to motor (or faulty switch feed wire), motor armature or field windings faulty.



One Window Operates In One Direction Through Either Switch: Check for faulty switch or faulty wiring between switch and motor. Check for faulty motor field coil.

Window Operates In Both Directions Through One Switch Only: Check for defective switch or faulty wiring between switch and motor.

Window Operates Opposite To Switch: Check for improperly mounted switch.

Window Operates Sluggishly: Check regulator and window runs for binding. Check for frayed insulation on wires which may cause partial ground. Check that paint does not insulate ground wires or ground circuit breakers. Check for loose connections or corrosion causing high resistance. Check motor current draw with an ammeter. Normal current draw during operation should not exceed 20 amperes. Current draw with mechanism against a stop should be 30-50 amperes. If current draw excessive, replace motor. Motor no-load current draw should not exceed 14 amperes at 12 volts.

REMOVAL & INSTALLATION: Motor (Ford & Thunderbird) - Remove door trim panel, disconnect wires, remove motor mounting nuts and motor brace. Pull motor free of rubber coupling and remove motor.

FORD MOTOR CO. ELECTRIC WINDOW CONTROL WIRING DIAGRAM

Motor (Mercury - Front Doors): Disconnect battery, remove door trim panel and trim water shield. Disconnect motor wires, and remove motor bracket attaching screw. Disconnect motor and coupling from regulator assembly, then remove motor.

Motor (Mercury - Rear Doors or Quarter): *Motor removed with regulator as an assembly. See "Regulator Removal" below.*

►*REGULATOR ARM TENSION SPRING REPLACEMENT NOTE:* Spring can be replaced after regulator removed. Regulator arm must be at point of maximum upward travel to reduce amount of spring tension to overcome.

Front Door Regulator: Ford - Remove door trim panel and loosen water shield. On 2-door and 4-door hardtop models, disconnect regulator at arm and plate. On other 4-door models, disconnect regulator from glass channel roller. Secure glass by hand in raised position. On 4-Door models (except hardtop), disconnect front run bracket from inner panel to provide access. On all models, remove regulator retaining screws and remove regulator. To install, reverse removal procedure.

Mercury - *NOTE - Procedure is for removal of regulator and motor as an assembly.* Disconnect battery, remove door trim panel and trim water shield. Remove window lower stop. Disconnect motor wires. With wire hook, remove retainers from window rollers and separate regulator arm pivots from rollers. Secure window in fully raised position. Remove regulator assembly attaching screws and remove regulator and motor assembly.

Thunderbird - Remove door trim panel and loosen water shield. Block window in fully raised position, and remove regulator arm from plate assembly. *NOTE - If arm and plate assembly are to be removed, lower window and disconnect arms from the two glass roller assemblies, then remove arm and plate assembly.* Remove regulator assembly retaining screws and remove regulator. To install, reverse removal procedure.

Rear Door Regulator: Ford - Remove door trim panel and loosen water shield. Lower glass about halfway and disconnect regulator arms, then support glass in fully raised position. Remove regulator retaining screws, slide equalizer arm out of bracket or guide, then remove regulator. To install, reverse removal procedure.

Mercury - With window fully raised, disconnect battery, remove door trim panel and trim water shield. On 4-door hardtop, remove window upper stop. On all models, disconnect motor wires, and remove retainers from window rollers with a wire hook. Separate regulator arms from rollers and prop window up. On 4-door hardtop, remove center guide assembly. On all models, remove regulator and motor bracket mounting screws.

CONTINUED ON NEXT PAGE

FORD MOTOR CO.
ELECTRIC TYPE (C ntinued)

Slide equalizer arm out of bracket and remove regulator and motor as an assembly. To install, reverse removal procedure.

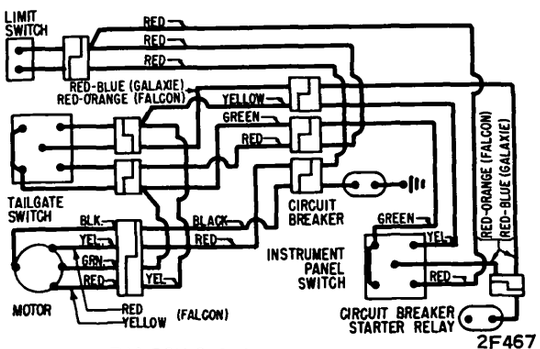
R ar Quarter R gulator: Ford - Remove rear seat cushion and back, remove trim panel and pull water shield away from access holes. Lower window, disconnect regulator from glass channel rollers, and support window in fully raised position. Remove regulator retaining screws, slide regulator arm out of equalizer bracket, and remove regulator. To install, reverse removal procedure.

Mercury - Remove rear seat cushion, back and trim panel. Lower window, remove retainer clips from window rollers, separate regulator arms from rollers, then remove rollers. Secure window in fully raised position. Remove motor from regulator. Disconnect regulator from quarter panel, slide equalizer arm out of equalizer arm bracket and remove regulator assembly. To install, reverse removal procedure.

Thunderbird - Remove quarter trim panel and water shield. Remove window upper stop. Disconnect regulator arms from glass channel. Lower glass, lift glass from front guide, then remove glass assembly. Remove regulator retaining bolts, slide regulator equalizer arm roller out of bracket, and remove regulator. To install, reverse removal procedure.

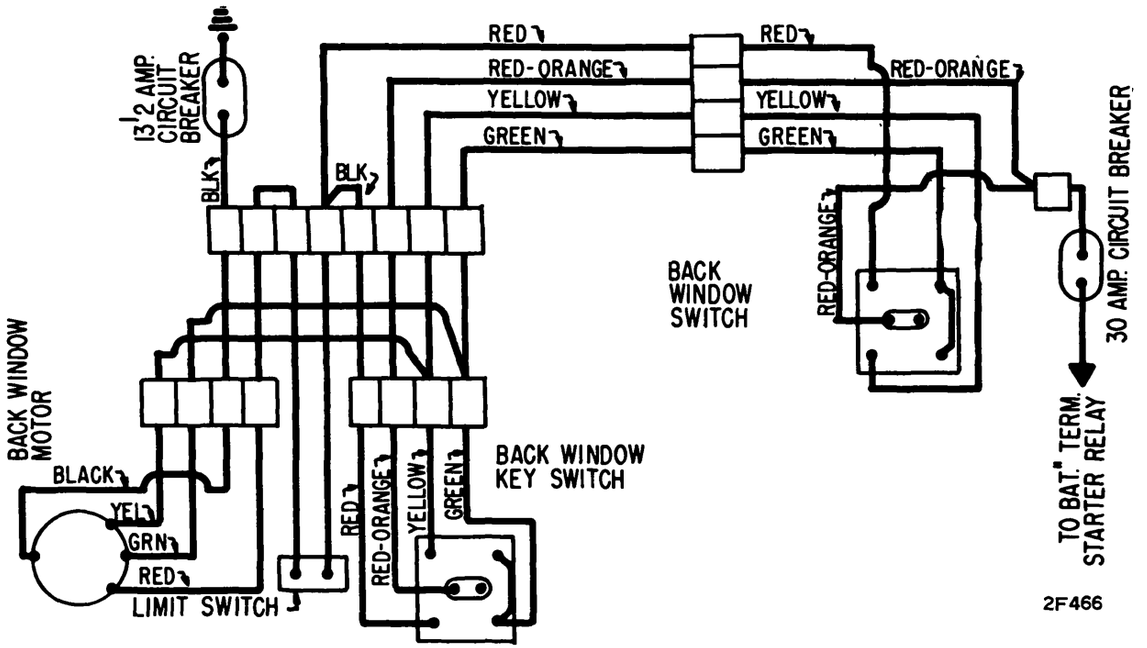
FORD MOTOR CO. TAIL GATE WINDOW

F rd Falc n & Galaxie, Station Wagon (1962)
Mercury C m t & Monter y, Station Wagon (1962)



►CHANGES, CAUTIONS, CORRECTIONS

►*1962 MERCURY MONTEREY TAILGATE SWITCH OR WIRE SHORTING OUT CORRECTION:* May be caused by wiring at switch rubbing lower edge of tailgate inner access panel. To correct, install ¼" diameter rubber tubing or electrical tape on lower edge of panel.



DESCRIPTION: Electrically controlled station wagon tailgate window operated by a reversible electric motor and a window regulator mechanism in tailgate. Control is through a key operated lock switch on upper center of tailgate outer panel, and a toggle switch on left front door for driver control. A limit switch located at right side of tailgate pillar post prevents operation of window when tailgate is open.

EMERGENCY MANUAL OPENING: Opening Tailgate If Window Is Fully Raised - Remove trim panel retaining screws, trip lock handle to relieve pressure, then remove trim panel by pulling up and forward to slide it out of lower retainer. Remove water shield and access hole cover from inner panel. Remove regulator arm roller retaining pins and disengage rollers from regulator arms. Push window into full down position and open tailgate.

Op ning Tailgate If Window Is Partially Raised: Remove quarter window rear garnish moldings, and quarter window outside rear moldings. Remove tailgate window glass upper side run retaining screws. Open tailgate and window as an assembly by removing upper runs simultaneously.

FALCON & GALAXIE STATION WAGON TAILGATE WINDOW WIRING DIAGRAM

COMET & MONTEREY STATION WAGON TAILGATE WINDOW WIRING DIAGRAM

TROUBLE SHOOTING & DIAGNOSIS: *CAUTION - When testing circuits with tailgate lowered and limit switch held closed, operate circuit only momentarily. Continuous operation of window in horizontal position will damage motor,*

Window Will Not Operate Through Either Switch Circuit: Check control circuit for continuity. Check feed and ground circuit breakers. Check all wiring for continuity. Motor armature or field coil windings may be faulty. Limit switch or wiring may be defective (down cycle).

Window Operates Through One Switch Only: The other switch is defective. Wiring from other switch faulty.

Window Operates In One Direction Only: Check for continuity of wiring for the inoperative cycle. Check relay or circuit breaker. Check for faulty limit switch or motor.

REMOVAL & INSTALLATION: Window - Lower tailgate, disconnect hinge supports at tailgate, remove trim panel and trim panel water shield. Remove retainers from window channel rollers and disconnect regulator arms from rollers. Remove window.

Motor: Remove window (see above), disconnect wiring from motor, and remove motor-to-regulator attaching nuts .Remove motor.

Regulator: *NOTE - Motor and regulator may be remov d as an assembly if desired.* Remove window (see above), disconnect motor wiring at motor, and remove regulator attaching nuts. Remove regulator and motor assembly.

Limit Switch: Lower tailgate. If switch not visible, remove access cover behind tail light or trim panel and water shield as necessary. Remove limit switch attaching screws and remove switch.

L ck Switch: Switch can be removed after window, motor, and regulator are removed.

LINCOLN CONTINENTAL ELECTRIC TYPE

Lincoln Continental (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 INOPERATIVE REAR WINDOWS CORRECTION:* If cause of failure is not immediately evident, trouble may be due to wiring harness assembly being damaged by contact with rear seat assembly. To correct, remove rear seat back and cushion assembly, make necessary repairs to wiring, and relocate wiring away from seat toward center of car.

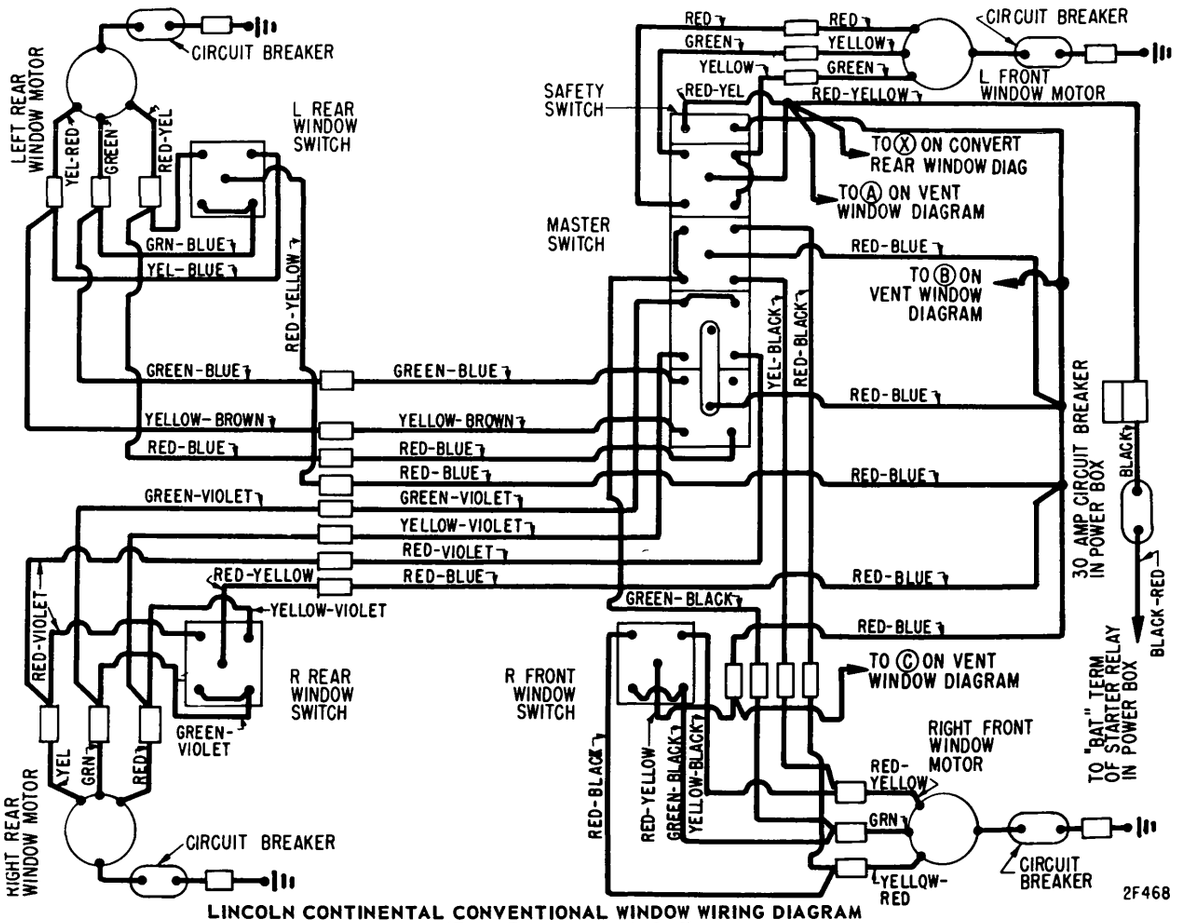
DESCRIPTION: Two kinds of system used as follows:

Conventional Type - Similar in design and operation to previous 1961 models. Power operated front door vent windows are now available and may be found on some cars. Design and operation of vent windows is similar to door windows.

Automatic Type - Similar in design and operation to previous 1961 type except that door handle switch has been eliminated and automatic lowering action is initiated by the striker plate switch. *See "Operation" below for 1962 sequence.*

OPERATION (AUTOMATIC TYPE): Window operation is divided into down and up cycles as follows:

Window Down Cycle: 1) When door inside handle or outside pushbutton is moved to open door, door striker plate switch upper contacts are closed and current flows through upper contacts of striker plate switch, to window stop switch, to down relay coil and stop relay contacts. Down relay is now energized and down relay contacts are closed. Down relay is kept energized by a "lock-in" circuit with current supplied and recirculated from down relay contacts.



2) When down relay contacts are closed, current flows through down relay contacts, to motor down field, to armature relay coil, and stop relay coil to ground. Energizing armature relay coil closes armature relay contacts and current flows from battery, through armature relay, motor armature, and stop relay coil to ground. Motor is then energized and window begins to lower.

3) When window is 4-6" down, window down stop switch will be opened to open down relay and motor down field circuits to stop motor.

4) No. 1 contacts of door striker plate switch are closed when door is open. Current now flows through door striker plate switch No. 1 contacts, window cut-off switch, up relay coil, stop relay contacts and coil, and bypass switch to ground. Up relay is now energized but window will not raise until striker plate switch is depressed when door closed to close motor up field circuit. As soon as up relay coil is energized a "lock-in" circuit is completed through the up relay contacts to keep the circuit functioning until door is closed.

Window Up Cycle: 1) When door is closed, striker plate switch is depressed to close striker plate switch No. 2 contacts. Current now flows through up relay contacts, striker plate switch No. 2contacts, motor up field, armature relay coil, stop relay coil, and bypass switch to ground. Energizing armature relay coil closes armature relay contacts and current flows from battery, through armature relay, to motor armature, and stop relay coil to ground. Motor is then energized and window begins to rise.

2) About ¼" before window reaches closed position, window actuates bypass switch to open switch contacts. Current now flows only through stop relay coil to ground. Stop relay coil now carries full motor current (becomes an overload cutout). When window is fully closed, motor stalls and draws maximum current. This current energizes stop relay coil to open stop relay contacts which open complete window up circuit and deactivate the system.

LINCOLN CONTINENTAL CONVENTIONAL WINDOW WIRING DIAGRAM (EXCEPT VENT WINDOWS)

►*MANUAL OPERATION & CUT-OFF SWITCH FUNCTION NOTE:* **1)** If window has been lowered more than 6" before door is opened, cut-off switch is actuated (contacts open) and relay circuit is disconnected so no automatic window operation will take place.

2) When window has been lowered automatically and door is open, motor up field can be completed only through No. 2 contacts of door striker plate switch when door is closed. Therefore window cannot be raised manually.

3) With door open and window lowered automatically, either switch can be operated to lower window completely. However cut-off switch contacts will be opened and window will not raise automatically when door is closed. Window must be raised manually after door is closed to reset circuit for automatic operation.

ELECTRICAL COMPONENTS & LOCATIONS (AUTOMATIC WINDOWS): Following list of electrical components and their locations will aid in testing and in trouble shooting.

30 Ampere Circuit Breaker: Main power window feed. In power box.

10 Ampere Circuit Breaker: Protects relay and motor field circuits. On relay panel behind rear seat.

Motor: In lower inner door panel.

Window Stop Switch: On plate inside door panel above door lock.

Window Cut-Off Switch: On plate inside door panel above door lock.

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL ELECTRIC TYPE (C ntinued)

Door Strik r Plate Switch: In door latch striker plate.
Window Bypass Switch: Inside door panel at top of door on window rear up-stop bracket.
Armatur Relay: Relay panel behind rear seat.
Stop Relay: Relay panel behind rear seat.
Up Fi ld R lay: Relay panel behind rear seat.
D wn Field Relay: Relay panel behind rear seat.

TROUBLE SHOOTING & DIAGNOSIS (CONVENTIONAL WINDOWS): Bypass switches and relays as necessary when making tests. Use a continuity light for checking circuits.

One Window Op rates In One Direction Only Through Eith r Switch: Motor field or field circuit wiring open or shorted.

Window Operates In B th Directions Through One Switch Only: Switch defective or open wiring.

One Window T tally Inoperative: Motor armature and/or field windings, or circuit wiring open or shorted. Motor circuit breaker improperly grounded or faulty.

All Wind ws T tally Inoperative: 30 ampere main feed circuit breaker or main feed wiring defective.

TROUBLE SHOOTING & DIAGNOSIS (VENT WINDOWS): Use a voltmeter or test lamp for making tests. Check circuits and wiring in the usual manner.

On Wind w Op rates In One Direction Only Through Eith r Switch: One motor field winding has an open or short circuit.

Wind w Op rat s Thr ugh One Switch Only: Defective switch or open wiring.

One Wind w In perativ : If window will not operate in either direction from either switch, check for open circuits or faulty motor.

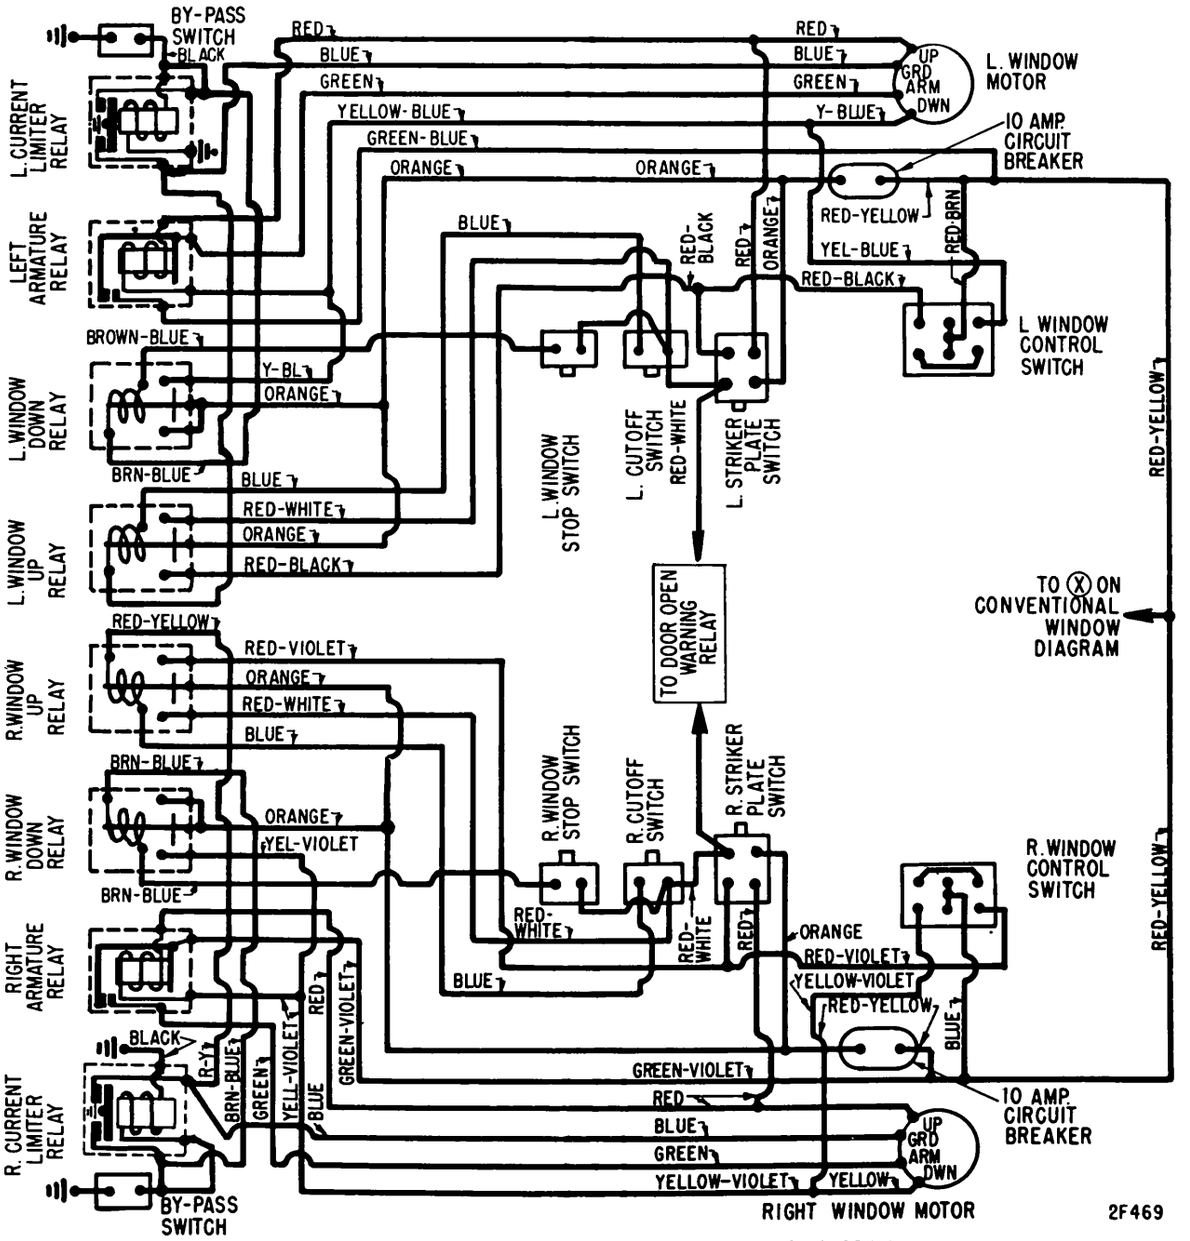
All Wind ws In p rativ : Feed circuit breaker faulty.

TROUBLE SHOOTING & DIAGNOSIS (AUTOMATIC WINDOWS): *NOTE - Sinc automatic window circuit is built around conv nti nal electric window system, ch ck that conventional part of system is in proper op rating conditi n b fore checking automatic window circuits. Us th f llowing guide for automatic window ch cks.*

Window Will N t Low r Aut matically: Check 10 ampere circuit breaker, motor down relay, striker plate switch, window stop switch.

Window L wers C mpletely: Check stop switch actuator lever spring, window stop switch, motor down relay.

Wind w Will Not Raise: Check 10 ampere circuit breaker, motor up relay, window cut-off switch, door striker plate switch.



Window Cl ses But M tor D s Not Stop: Check window stop relay and window bypass switch.

SWITCH ADJUSTMENTS (AUTOMATIC WINDOWS):

Bypass Switch: Open door, remove trim panel, disconnect battery and switch leads. Mark window up stop position and remove stop and bypass switch as an assembly. Adjust switch so threaded part of switch is flush with lower surface of window stop bracket. *NOTE - Threaded part must not protrud b yond bracket.* Reinstall switch and window stop.

Striker Plate Switch: Open door, remove center pillar trim, disconnect battery and switch leads. Mark striker plate position and remove striker plate and switch assembly. Adjust switch so threaded part of switch is flush with inner surface of striker plate. *NOTE - Threaded part must not protrude into lock throat of striker plate.* Install striker plate and switch assembly.

Window Cut-Off & Stop Switches: *NOTE - Both switches m unted on a singl mounting plat and two typ s of mounting plat hav been used. Typ 1 uses hairline meth d for cut-off switch adjustment. Typ 2 uses gaug pin h l m thod for cut-off switch adjustment.* Adjust switches as follows: Open door, lower window, disconnect battery, and remove access cover just above door lock. Remove outer switch plate mounting screws, pull on switch plate, and remove inner screw and switch plate together (prevents dropping inner screw inside door). Disconnect switch leads and remove assembly.

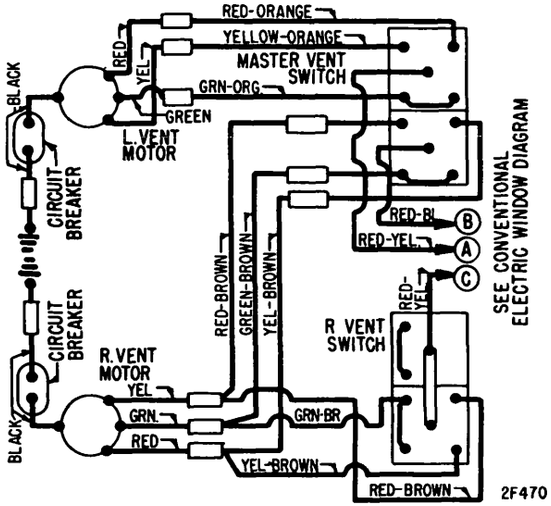
CONVERTIBLE AUTOMATIC REAR WINDOW WIRING DIAGRAM

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL ELECTRIC TYPE (C ntinued)

Cut-Off Switch Type 1 - Loosen cut-off switch (switch without roller) on mounting plate and align switch actuator lever surface contacting switch with vertical hairline scribed on switch. Move switch toward actuator until contacts click, then tighten switch retaining screws. Check adjustment by moving actuator arm against switch. Click should occur when actuator is in line with hairline.

Cut-Off Switch Type 2 - Insert 1/8" diameter pin into aligning hole in switch mounting plate and swing switch actuator against pin. Hold actuator lever against pin and move switch toward actuator until contacts click. Tighten switch mounting screws. Check adjustment by moving actuator arm against switch. Click should occur just as actuator contacts gauge pin.



Stop Switch - Loosen switch retaining screws and place actuator arm so it just touches cut-off switch blade. Hold actuator in this position and adjust switch tightly against actuator until no free travel is present, then tighten switch retaining screws. When installing assembly in door, position actuator lever on top of window mechanism actuating pin.

REMOVAL & INSTALLATION: Door Window Motor - Remove door trim panel, access cover, and rear guide on rear doors. With window in fully raised position, remove motor-to-regulator attaching nuts, disconnect wiring, and remove motor. To install, reverse removal procedure.

Vent Window Motor - With door glass in fully raised position, remove door hardware, power window switches, trim panel assembly and watershield, and front door air duct panel assembly. Remove motor attaching screws and remove vent motor. To install, reverse removal procedure.

Window Cut-Off & Stop Switches - *See "Switch Adjustments" above for removal.*

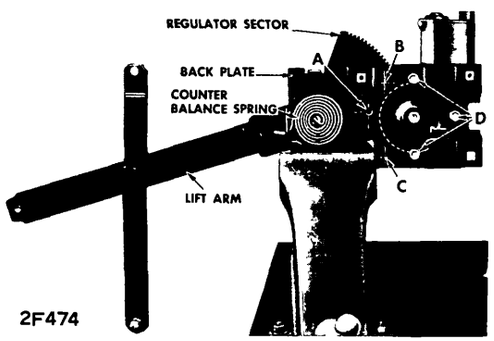
Bypass Switch & Striker Plate Switch - *See "Switch Adjustments" above for removal.*

ELECTRIC VENT WINDOW WIRING DIAGRAM

G.M. ELECTRIC TYPE

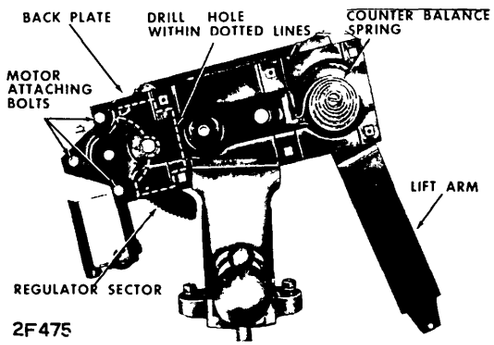
Buick & Buick Special (1962)
Cadillac (1962)
Chevrolet Pass. Cars (1962)
Chevy II (1962)
Oldsmobile & Oldsmobile F-85 (1962)
Pontiac & Pontiac Tempest (1962)

►CHANGES, CAUTIONS, CORRECTIONS



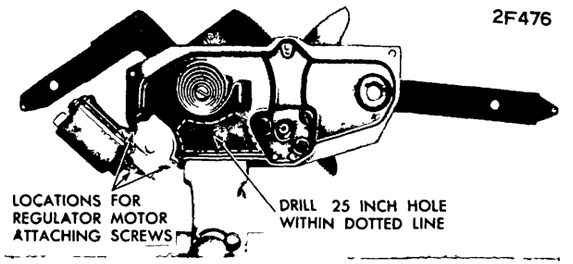
►*1962 BUICK WIRING MODIFICATION NOTE:* Some cars may have wiring modified so that top, electric window, and electric seat operation occurs only through ignition switch. Modification consists of a relay in circuit in series with power feed circuit breaker and ignition switch terminal of fuse box.

DESCRIPTION: Door Windows - Window regulators individually powered by reversible electric motors in each door which are geared directly to regulator assembly. On Cadillac, vent windows in both front and rear doors are also power operated. On Buick and Oldsmobile, front door vent windows are also power operated. Two-way switches on each door and a master control switch on left front door control window operation. On Oldsmobile, a control relay wired to power source and to ignition switch prevents window operation until ignition switch is in ON or ACC positions. **Tailgate Window** - Dropping type window in tailgate operated by a reversible electric motor in tailgate. Control is by a switch on instrument panel. Tailgates which are hinged at the bottom have a lock switch in center of tailgate outer panel. Three-seat station wagons have additional passenger control switch at rear of rear quarter inner panel trim.



EMERGENCY OPENING OF TAILGATE: On tailgates hinged at bottom, safety switch may fail and prevent window being lowered to open tailgate. Proceed as follows: Remove spare tire cover and all accessible screws from tailgate inner panel. Pull panel forward, cut water deflector over right hand access hole, remove access cover upper screws, and remove cover. Reach into bottom of tailgate and remove green wire from retaining clip and pull up far enough to pierce wire with pick or knife. Ground pick and lower window by means of control switch. *NOTE - If necessary to remove inner panel lower attaching screws to perform above operation, chisel screws off with a long, thin chisel inserted between tailgate inner panel and tailgate inner cover panel.*

TROUBLE SHOOTING & DIAGNOSIS (DOOR WINDOWS):
All Windows Inoperative - Power feed circuit faulty. Check feed wires, feed circuit breaker, and control relay (where equipped).
One Window Inoperative From Both Switches: Faulty circuit wiring; both switches faulty; motor defective; mechanical bind or failure in linkage.
One Window Inoperative From One Switch Only: The other switch or wiring from that switch is defective.
TROUBLE SHOOTING & DIAGNOSIS (TAILGATE WINDOW): *NOTE - On Oldsmobile, instrument panel and third seat control switches are wired through window control relay. Rear windows can be operated through these switches only if ignition switch is in ON or ACC positions.*
Window Inoperative From All Switches: Power feed circuit or control relay defective. Safety switch faulty or motor not grounded. Motor faulty. Mechanical bind or failure in linkage.



CONTINUED ON NEXT PAGE

FRONT DOOR REGULATOR ASSEMBLY

REAR DOOR AND QUARTER WINDOW REGULATOR ASSEMBLY

TAIL GATE REGULATOR ASSEMBLY

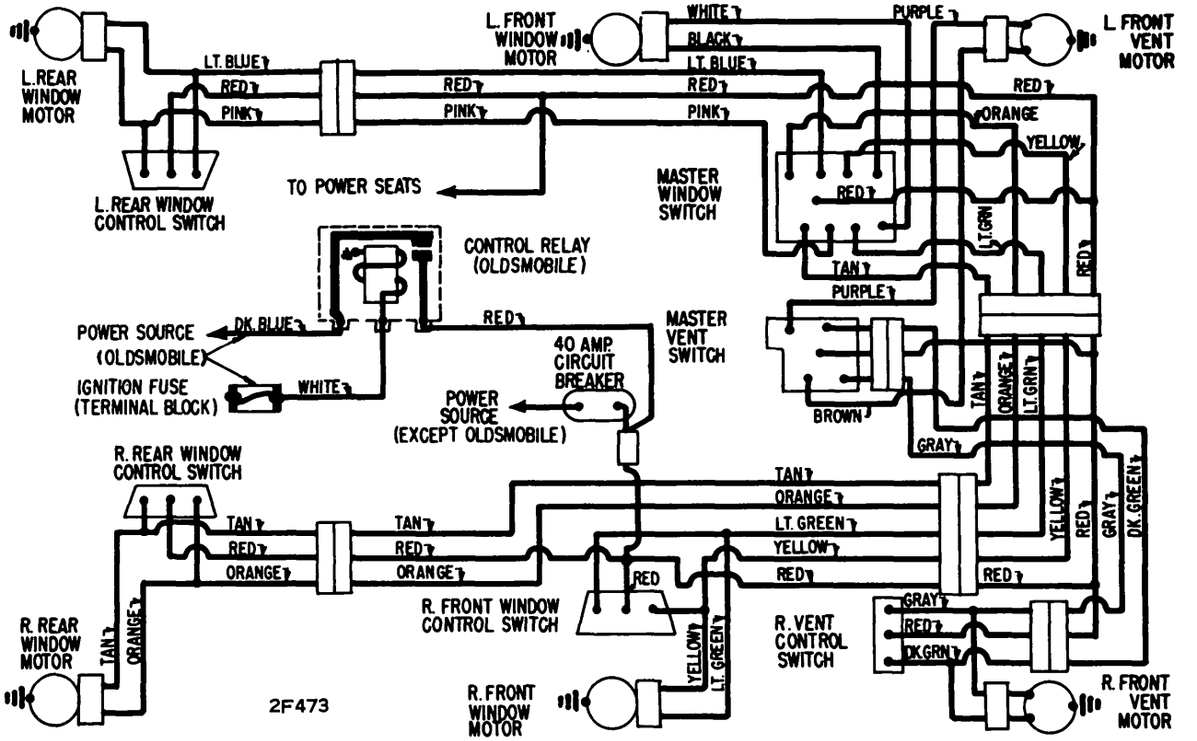
G.M. ELECTRIC TYPE (C ntinued)

Window In perativ From One Switch Only: Circuits to or from affected switch are defective. Affected switch is faulty. If both instrument panel and rear quarter switches are inoperative, check for faulty control relay.

Window Cann t Be Raised From Any Switch: Up cycle feed wire defective. Motor defective.

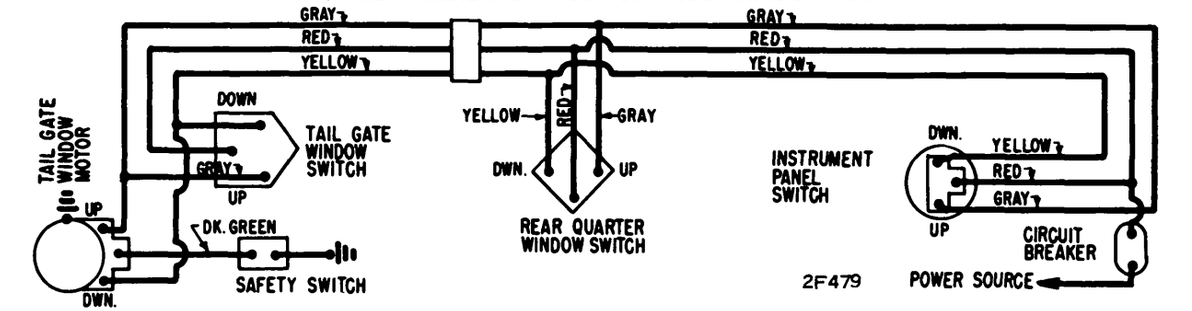
REGULATOR ASSEMBLY REMOVAL & INSTALLATION: *CAUTION - Do n t op rat regulator motor after window ass mbly is dis ngaged from regulator. Operation with load r mov d will damag motor.*

Fr nt D rs: All Mod ls (Except Buick Special & Oldsm bil F-85) - Lower door window, then remove door trim panel assembly and detach inner panel water deflector. Disconnect wiring harness feed wires from regulator motor at connector. Remove ventilator division channel lower adjusting stud and nut. On hardtop and convertible models, remove door ventilator assembly (see below). Disconnect lower sash channel cam from sash channel and remove cam. On hardtop and convertible models, remove window front and rear stops and remove window. On other models, prop window in "up" position. On all models, remove regulator assembly attaching screws, disengage regulator balance arm from inner panel cam, then remove regulator and motor assembly. To install, reverse removal procedure.



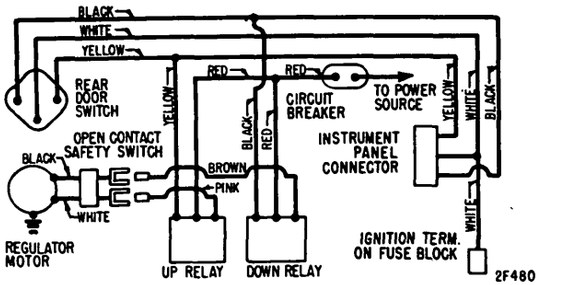
Buick Sp cial & Oldsmobile F-85 (Sedan & Stati n Wag n) - Remove door trim panel assembly and detach water deflector. On 2-door models, remove inner panel cam attaching bolts, slide cam rearward to disengage nylon roller of regulator balance arm, then remove cam through access hole. On all models, raise window and tape securely in "up" position. Remove control assembly and ventilator division channel lower adjusting stud and nut. Remove regulator attaching screws, disconnect wiring, and remove regulator and motor assembly. To install, reverse removal procedure.

Buick Special & Oldsmobile F-85 (Hardtop & Conv rtibl) - Remove door trim panel and detach water deflector. Remove ventilator division channel lower adjusting stud and nut, ventilator casting-to-frame attaching screws, and remove casting. Remove ventilator attaching screws and remove ventilator. Remove inner panel cam attaching bolts, slide cam rearward to disengage nylon roller of regulator balance arm, then remove cam through access hole. Remove window uptravel stop and glass run channel outer strip assembly. Raise window until lower sash channel cam is visible above inner and outer panels, slide window forward, and remove from door. Remove regulator attaching screws, disconnect wiring, and remove regulator and motor assembly. To install, reverse removal procedure.



Fr nt D r V ntilators: Hardtops & Convertible - *NOTE - R gulator and motor assembly may be removed after door trim panel and wat r deflector removed. Procedure b low is for compl t v ntilator assembly removal (for door r gulator r moval).* Remove door trim panel assembly and detach inner panel water deflector. Lower door window and remove ventilator-to-door outer panel return flange attaching screw. Break cement bond holding front door hinge pillar sealing strip (at belt) to ventilator assembly (at front of ventilator). Remove ventilator division channel lower adjusting stud and nut. On electrically operated types, disconnect motor and regulator assembly from vent frame and remove motor and regulator assembly through large access hole. Loosen ventilator frame adjusting stud nut and remove ventilator attaching bolts. Lift ventilator assembly upward and rearward, and remove from door. To install, reverse removal procedure.

Sedan, Station Wagon & Limousine - Raise door window and remove door trim panel assembly, then detach inner panel water deflector. Disconnect ventilator regulator motor wires at connector. Remove ventilator tee shaft attaching bolt and ventilator regulator attaching screws. Disengage the ventilator regulator shaft



CONTINUED ON NEXT PAGE

G.M. (EXCEPT CADILLAC) WINDOW CONTROL WIRING DIAGRAM

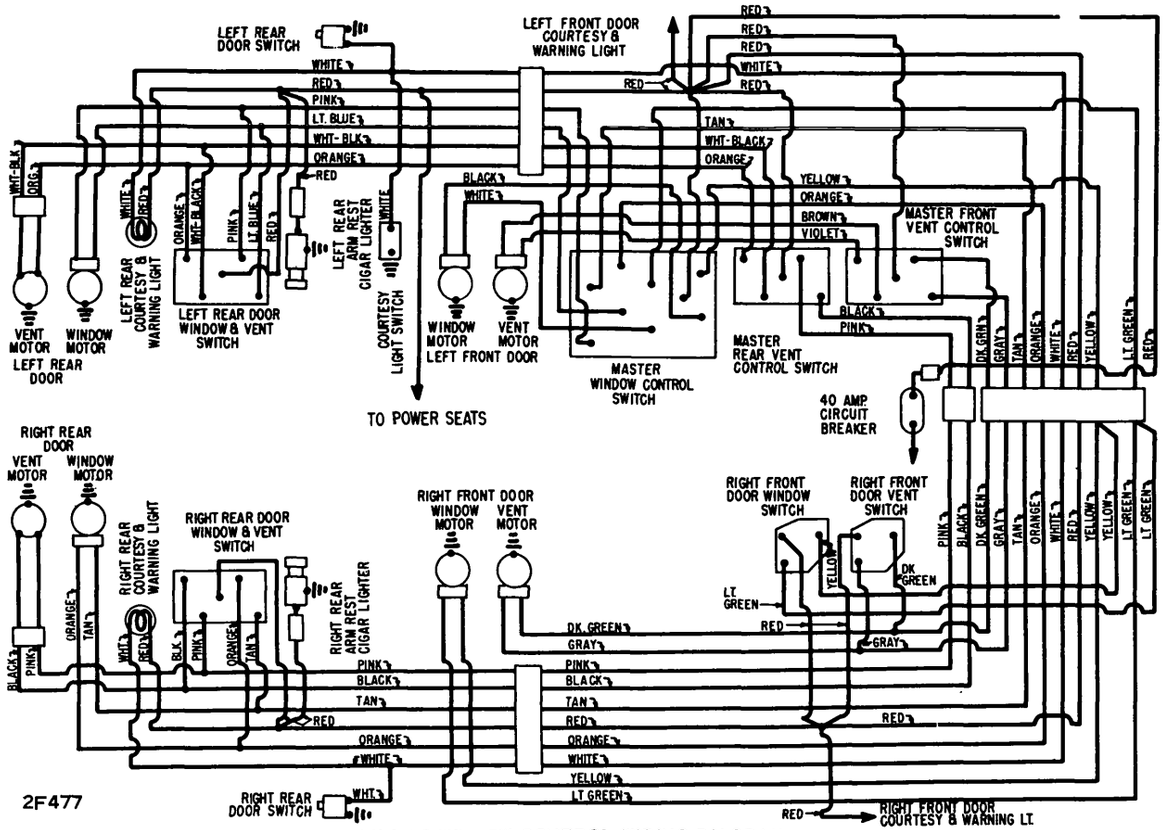
CHEVROLET, CHEVY II, PONTIAC STATION WAGON TAILGATE CONTROL WIRING DIAGRAM

BUICK SPECIAL, OLDSMOBILE F-85, PONTIAC TEMPEST STATION WAGON TAILGATE CONTROL WIRING DIAGRAM

G.M. ELECTRIC TYPE (C ntinued)

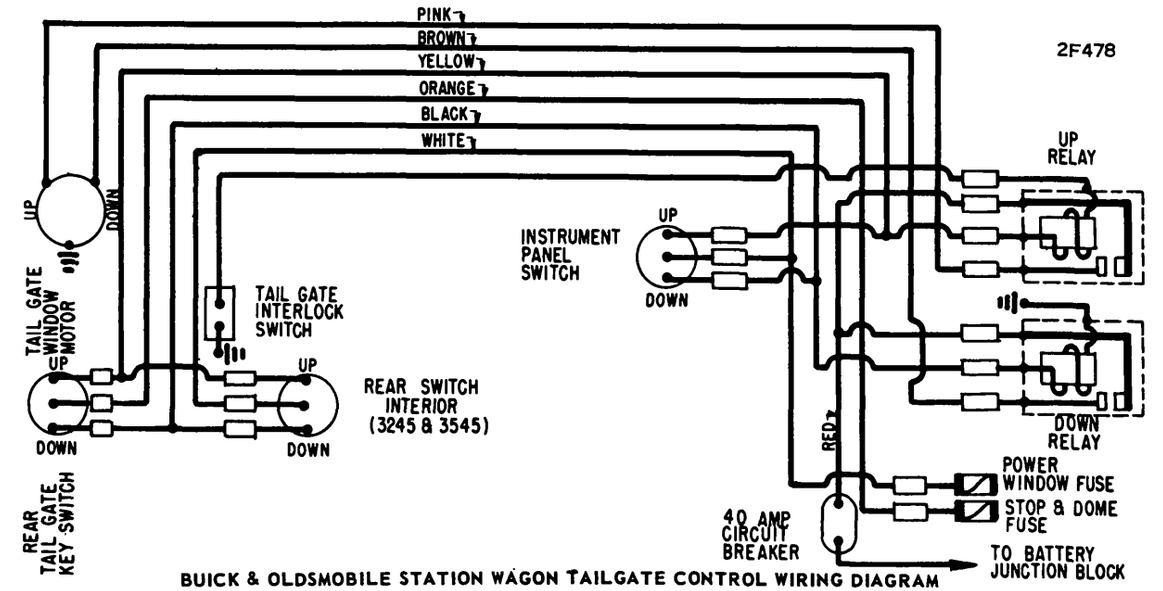
from tee shaft and remove regulator and motor assembly through door access hole. To install, reverse removal procedure.

Re ar Doors (All Models): Lower door window and remove door trim panel assembly and detach inner panel water deflector. Remove door window lower sash channel cam and raise window and prop in "up" position. Disconnect wiring harness from motor at connector. On hardtop models, loosen rear guide cam upper attaching screws and remove lower adjusting stud and nut (to permit regulator removal). Remove regulator attaching screws, disengage balance arm from inner panel cam and remove regulator and motor assembly through access hole. To install, reverse removal procedure.



Rear Door Ventilator (Cadillac): Raise door window, remove door trim panel assembly, and detach inner panel water deflector to expose large door access hole. Disconnect wiring harness from ventilator motor connector. Remove ventilator tee shaft attaching bolt and ventilator regulator attaching screws. Disengage regulator from tee shaft and remove regulator and motor assembly. To install, reverse removal procedure and note the following: Too much play or flutter of ventilator at pivot can be corrected (with ventilator open) by tightening ventilator tee shaft-to-regulator attaching bolt. *CAUTION - Do not strip threads in regulator spiral gear shaft.*

Rear Quarter Window (Except Buick Special & Oldsmobile F-85): Sedan - Lower window and remove rear quarter trim assembly, then remove access hole cover from inner panel. Remove front guide upper attaching screw and glass run channel attaching screw. Disconnect wiring from motor at connector. Remove regulator attaching screws, disengage regulator arm roller from lower sash channel cam and remove regulator and motor assembly through access hole. To install, reverse removal procedure.



Hardtop (Except Buick Electra, Oldsmobile 98, & Cadillac) - Remove rear seat cushion and back assembly, rear quarter trim and arm rest, and inner panel access hole cover. Disconnect wiring from motor at connector Remove rear guide attaching screws, disengage rear guide from roller on lower sash channel and remove guide. Place window half-way down and remove lower sash channel cam attaching screws. Remove cam and front guide adjusting stud nuts. Disengage front guide adjusting studs from stud holes in inner panel, then disengage front guide from rollers on window. Remove window by lifting upward and inward. Remove regulator attaching screws and remove regulator and motor assembly through access hole. To install, reverse removal procedure.

Hardtop (Buick Electra, Oldsmobile 98, & Cadillac) - Remove rear seat cushion and back, arm rest and trim panel, and inner panel access hole cover. Disconnect wiring from motor at connector. Remove rear guide. Place window halfway down and remove lower sash channel cam attaching screws, detach cam from regulator arm roller and remove cam. Scribe mark position of lower stop on front guide for reassembly, loosen lower stop attaching screw and slide stop to bottom of

CADILLAC WINDOW CONTROL WIRING DIAGRAM

BUICK & OLDSMOBILE STATION WAGON TAILGATE CONTROL WIRING DIAGRAM

G.M. ELECTRIC TYPE (C ntinu d)

guide. Lower window so lower roller on sash channel frame runs out of front guide channel at bottom, then lift window upward and inboard to disengage upper roller on sash channel from rear channel on front guide. Remove window assembly. Remove regulator attaching ing screws and remove regulator and motor assembly through access hole. To install, reverse removal procedure.

C nvertibl - Remove rear seat cushion and back, top compartment side trim panel and rear quarter trim assembly. Remove inner panel access hole cover, then operate window to full "up" position and prop in place. Disconnect feed wire plug from motor, then remove regulator attaching screws. Disengage regulator lift arm roller from lower sash channel cam and remove regulator assembly through access hole. To install, reverse removal procedure.

R ar Quart r Wind w (Buick Special & Oldsmobile F-85): **Sedan** - Remove rear quarter trim panel, inner panel access hole cover, and inner sealing strip. With window up, remove window rear guide, then lower window enough to tilt rearward and disengage regulator lift arm roller from lower sash channel. Lift window upward and rearward to disengage lower sash channel roller from front guide, then remove window assembly. Disconnect wiring from motor at connector, remove front guide upper attaching bolt and regulator attaching bolts, then remove regulator and motor assembly through access hole. To install, reverse removal procedure. **Hardt p** - Remove trim panel and large inner panel access hole cover. With window almost completely down, remove lower sash channel-to-lower support assembly attaching screws. Bring window half-way up, disengage from lower support assembly, and remove window. Remove window rear guide and front guide adjusting stud nuts so front guide and lower support assembly can be disengaged from inner panel. Disengage regulator lift arm roller from lower support cam. Disconnect wiring from motor at connector, remove regulator attaching bolts, and remove regulator and motor assembly. To install, reverse removal procedure. **Convertible** - *Procedure is same as for other car models (see above).*

Tailgate Window (Types Hinged At Bottom): *NOTE - Use following procedure to avoid removal of tailgate glass and regulator assembly to service motor.* Lower window and place tailgate in horizontal position. Remove trim panel, then pull string used to open water deflector for service firmly in same direction as curvature of edge of panel to uncover right half of tailgate (to expose motor access door). Remove access door. *NOTE - Disengage remote control lock rod from clip on underside of access door as door is removed.* Block safety switch and use dash panel switch to run window to normally raised position (tailgate still horizontal), then support glass to prevent damage. Drill a 11/64" hole through main sector of regulator and regulator back plate 1/2" inboard from edge of large existing hole. *CAUTION - Do not allow drill to penetrate outer panel.* Install a sheet metal screw in this new hole to lock regulator assembly to retain counterbalance spring tension. *NOTE - Screw, Part No. 3783002, is recommended.* Remove motor mounting screws and loosen regulator mounting screws. Lift regulator slightly and remove motor, then disconnect wiring harness from motor. To install, reverse removal procedure and be sure to remove screw installed during removal.

Tailgat Wind w (Typ s Hinged At T p): Lower window, remove garnish moldings, and remove right stationary side window frame attaching screws and division channel lower adjusting stud; or rubber channel filler strip from side window rubber channel, depending on construction. Remove right division post, then remove right side stationary window. With dropping window almost fully up, move window to right to disengage regulator rollers from lower sash channel cams, then remove window. Disconnect wiring from motor at connector. Remove back door lock inside handle, remove control attaching screws, disconnect remote control from connecting rod, and remove remote control. Move remote control support plate to right side of door to disengage inner panel cam from regulator arm roller, then remove support plate. Remove regulator attaching screws and remove regulator and motor assembly. To install, reverse removal procedure.

REGULATOR MOTOR REMOVAL (WITH REGULATOR ASSEMBLY REMOVED FROM CAR): Clamp regulator and motor assembly securely in a vise, then drill a ¼" hole through back plate at the location indicated in illustrations. *NOTE - Drill the ¼" hole in front do r window regulators at either "A", "B" or "C" (s illustration), depending on position of lift arm. On other regulator assemblies, drill the hole within th area outlined by dotted lines in illustration. Do not locate hole less than ½" from edge of back plate or sector.* Insert a 3/16" bolt through hole in back plate and sector and install a nut but do not tighten. Remove motor attaching bolts and remove motor assembly from regulator. Clean all chips from regulator and motor pinion gear after drilling. To install, reverse removal procedure. *CAUTION - Be sure to remove temporary nut and bolt from regulator before installing in car.*

FORD THUNDERBIRD 4-WAY SEAT CONTROL

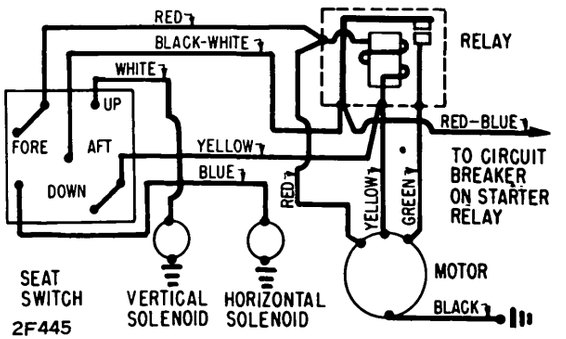
F rd Thund rbird (1962)

►*1962 SEAT CONTROL SWITCH, LIMIT SWITCHES, & WIRING PRODUCTION CHANGE NOTE:* Some early cars before September 26, 1961, have four limit switches in power seat circuit with additional two terminals on main control switch for appropriate wiring. *See 1961 Final Data, Pag 518, for details on this early type circuit.*

DESCRIPTION & OPERATION: Four-way power seat mechanism consisting of a reversible electric motor, control switch, motor control relay, gear housing and screw shaft, and two solenoid actuated nuts. Two duplicate assemblies are used, one for each front seat. Gear housing and screw shaft has a driving worm gear connected to motor by a rubber coupling and a driven gear which rotates screw shaft. Horizontal and vertical nut and solenoid assemblies are meshed to screw shaft and connected to seat track. When solenoid is energized, internally threaded nut is locked by solenoid pawl (ball), engaging a notch on nut. When screw shaft is rotated through locked nut, nut and solenoid move along shaft and move seat track.

1962 POWER SEAT CONTROLS

TROUBLE SHOOTING & DIAGNOSIS: Seat Will Not Operate - Check for properly grounded system at main (black) ground wire. Check for voltage to circuit breaker, at circuit breaker, and to main junction block at console panel. Check for voltage from junction block to control to control relay. Check for voltage from relay to control switch, and at each terminal of control switch. Check relay, motor, and wiring for voltage.



Motor Runs But Seat Does Not Move: Check for loose or broken motor coupling; faulty seat regulator worm, gear, or screw shaft; faulty wiring from control switch to solenoid; faulty solenoid and nut assembly.

Seat Moves In One Plane Only: If no voltage present at any switch terminal, switch is faulty. Check for inoperative solenoid.

Seat Ratchets At End Of Travel: Faulty solenoid and nut assembly.

REMOVAL & INSTALLATION: Seat M chanism - Remove seat track retaining nuts and washers and disconnect wiring to junction block. Remove seat assembly from car. Remove seat track-to-seat assembly retaining bolts, disconnect wiring at control switch, and remove seat track mechanism. To install, reverse removal procedure.

Seat Motor: Remove motor-to-drive assembly retaining nuts and washers and remove motor. Remove rubber coupling from motor shaft, and wiring from motor. To install, reverse removal procedure.

THUNDERBIRD 4-WAY SEAT CONTROL WIRING DIAGRAM

CHRYSLER CORP.
6-WAY SEAT CONTROL

Chrysler & Imperial (1962)
Dodge & Dodge Dart (1962)
Plymouth (1962)

DESCRIPTION: 6-Way power seat operated by a single reversible electric motor located under the front seat. Motor drives a gear assembly which transmits power to slave units located in the seat tracks. Solenoid clutches in gear assembly, when energized by actuation of control switches on left side of front seat, engage the flexible drive cables with the gear assembly to operate the seat horizontally, vertically, and to tilt it.

TESTING & TROUBLE SHOOTING: Entire Unit Inoperative - Disconnect wire connector from switch to seat actuator and connect jumper wires as listed in table below for each seat operation. If operation normal when jumper wires connected, switch is faulty and should be replaced.

Electrical Testing Table

Seat Operation	Connect These Wires
Forward Horizontal	Red, Blue, Green
Forward Tilt	Red, Blue, Yellow
Straight Up	Red, Blue, Yellow, Brown
Rearward Horizontal	Red, White, Green
Rearward Tilt	Red, Blue, Brown
Straight Down	Red, White, Yellow, Brown

Motor Inoperative: Red feed wire, or control circuit breaker faulty. Relay or motor faulty.

Seat Inoperative (Motor Runs): Wiring harness to solenoid faulty, solenoid armature seized, or solenoid burned out.

Seat Inoperative (Motor Runs & Solenoids Click): Drive cable broken.

REMOVAL & INSTALLATION: *NOTE - Right and left seat tracks are not interchangeable, not adjustable, and are replaceable as an assembly only.*

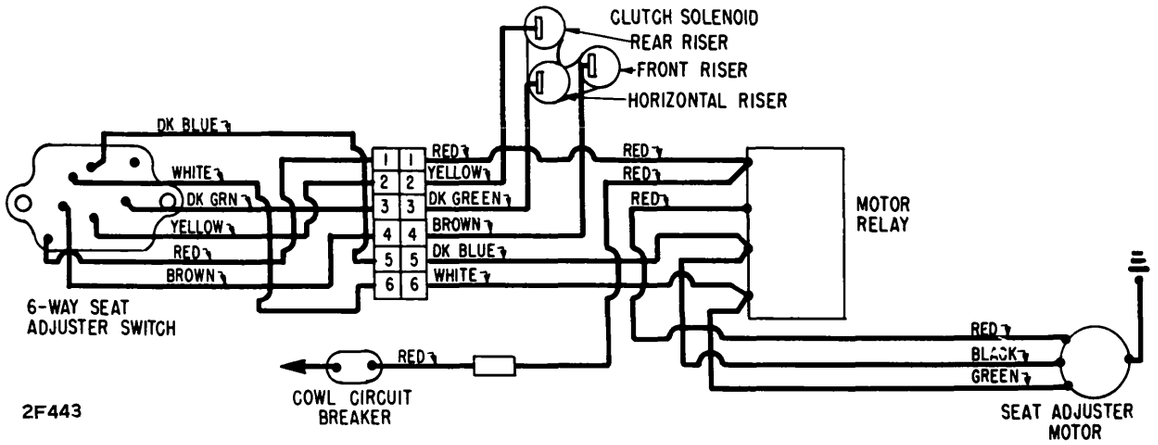
Seat Assembly & Adjuster: Removal - Disconnect battery and remove mounting stud nuts holding front seat to adjuster, then tilt complete seat back assembly forward. Disconnect control wires at connector and remove front seat and cushion assembly. Disconnect seat adjuster red feed wire. Remove seat guide attaching stud nuts and remove adjuster.

Installation - Reverse removal procedure.

Flexible Cables: Removal - Remove front seat assembly and disconnect red feed wire. Remove retainer plate holding right side tubes to drive assembly and remove left seat guide attaching stud nuts, then remove guide and drive assembly. *CAUTION - Do not bend or damage right side tubes when sliding tubes from drive assembly.* Pull flexible cables from right side tubes. Remove bolts holding motor and drive assembly to left guide bracket. Remove drive assembly with tubes from left slave unit. Remove flexible cables from tubes.

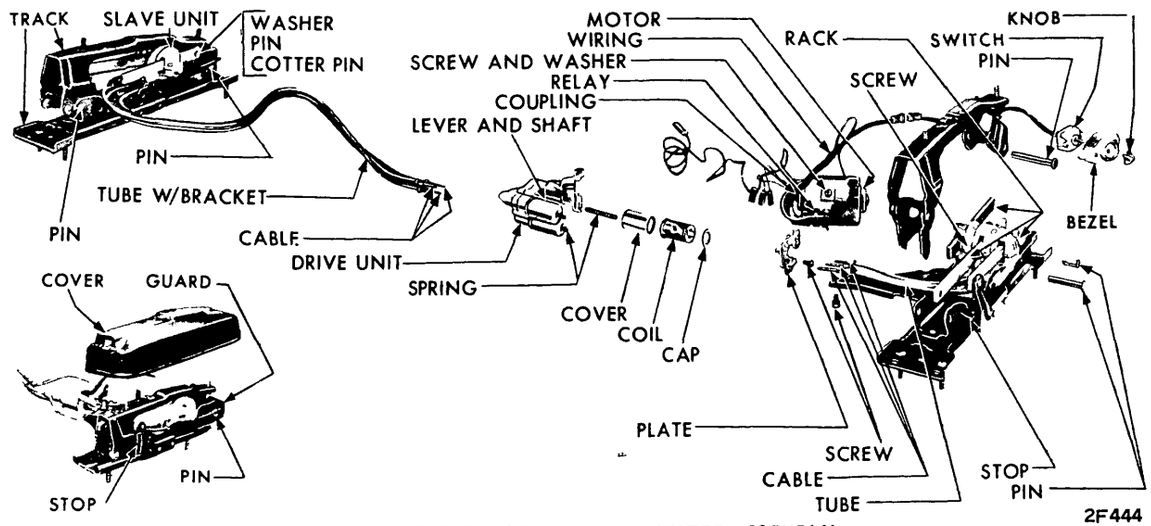
Installation - *CAUTION - Seat guides must be in up and forward position when installing cables. Both guides must be at same position (in alignment).* Place all three left cable tubes into left slave unit, with shortest tube on inside and longest on outside, then install flexible cables in tubes (cables must seat in slave unit). Place drive unit on left side tubes, making sure cables seat in slot in drive unit. Bolt drive unit to guide bracket. Place right side cables in right side tubes, then place left guide and drive assembly on right side tubes, making sure cables seat in drive assembly Install right side tubes retainer plate, and bolt left guide assembly to floor pan. Connect red feed wire and check seat operation.

Seat Motor: Removal - Disconnect motor wires at relay and disconnect motor from drive unit. Remove motor from drive unit and rubber coupling, then remove relay from motor.



Installation - Reverse removal procedure.

Slav Unit: R m val - Remove drive unit and cables (see "Flexible Cables" above). Seat guide should be up and forward. Remove long clevis pin from front of guide, then remove front rack clevis pin. Remove slave unit cap. *CAUTION - Do not los springs und r cap (springs are between racks and slav cap).* Disconnect slave unit from guide and remove slave unit.



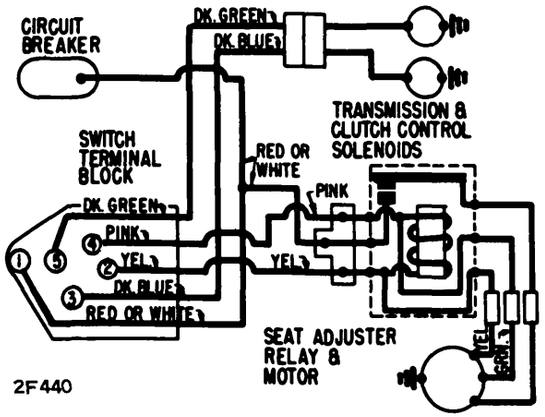
Installation - Reverse removal procedure.

OVERHAUL: Drive Unit & S l n id Ass mbly - Disassembly - Remove drive unit from seat assembly (see "Flexible Cables" above), then remove screws holding plate and solenoids from drive unit. Remove plate and solenoid assembly being careful not to lose three springs under solenoid. Bend back tabs of solenoid cover, unsolder coil ground wire at cover tab and remove coil cover from coil. Remove cover from drive unit and lift out clutch lever and shaft.

R assembly - Reverse disassembly procedure.

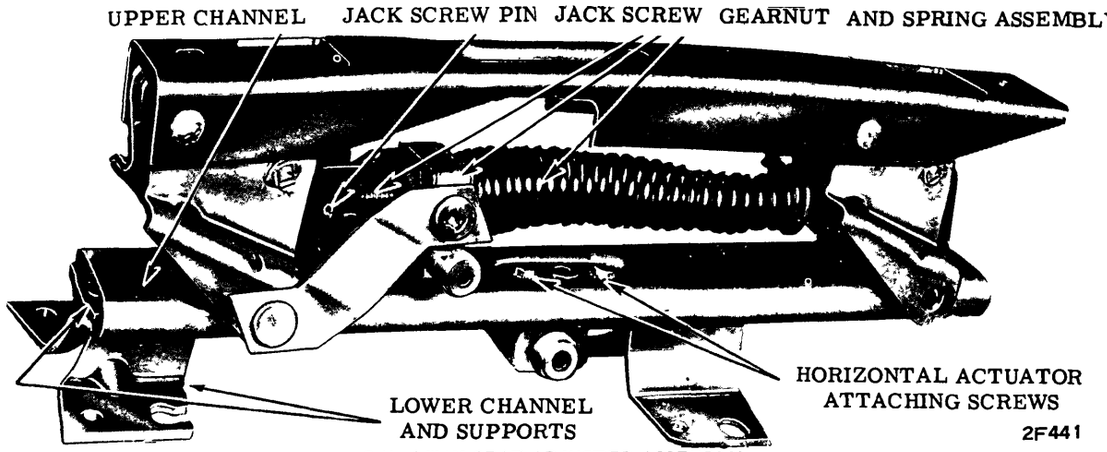
CHRYSLER CORP. 6-WAY SEAT ADJUSTER WIRING DIAGRAM

CHRYSLER CORP. 6-WAY SEAT ADJUSTER ASSEMBLY



G.M. 4-WAY SEAT CONTROL

Buick (1962)
Oldsmobil (1962)



►*BUICK WIRING MODIFICATION NOTE:* Some cars may have wiring modified so that top, electric window, and electric seat operation occurs only through ignition switch. Modification consists of a relay in circuit in series with power feed circuit breaker and ignition switch terminal of fuse box.

DESCRIPTION & OPERATION: Similar in design and operation to previous models. Shunt-wound type motor is used.

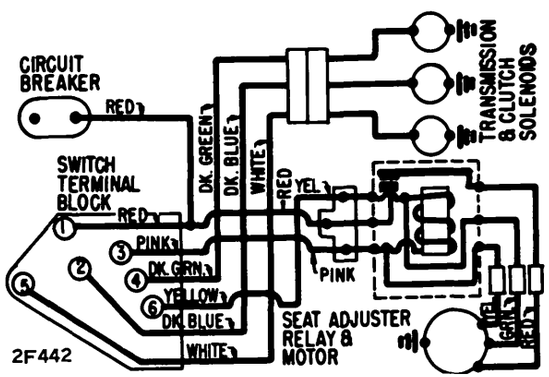
TROUBLE SHOOTING & DIAGNOSIS: *See Page 515 in 1960 Final Data or later Manual edition.*
TESTING: *See Page 515 in 1960 Final Data or later Manual edition.*
REMOVAL & INSTALLATION: *See Page 515 in 1960 Final Data or later Manual edition.*

G.M. 4-WAY SEAT WIRING DIAGRAM

G.M. 4-WAY SEAT ADJUSTER ASSEMBLY

G.M. 6-WAY SEAT CONTROL

Buick (1962)
Cadillac (1962)
Ch vrol t Pass. Cars (1962)
Oldsm bil (1962)
P ntiac (1962)



►*BUICK WIRING MODIFICATION NOTE:* Some cars may have wiring modified so that top, electric window, and electric seat operation occurs only through ignition switch. Modification consists of a relay in circuit in series with power feed circuit breaker and ignition switch terminal of fuse box.

DESCRIPTION & OPERATION: Similar in design and operation to previous models except as noted below:
Buick & Cadillac - When seat control switch is mounted in door arm rest, pink wire at No. 3 position controls seat forward and up cycle, and yellow wire at No. 6 position controls seat rearward and down cycle as shown in wiring diagram. When seat control switch is mounted in seat side panel, No. 3 and No. 6 switch position operations are reserved so that No. 3 position controls seat rearward and down cycle and No. 6 position controls seat forward and up cycle. This change is accomplished by reversing green and yellow leads from relay to seat motor.
Oldsm bil - Switch control circuit is from ignition switch through control relay to control switch, and power circuit is through seat circuit breaker and control relay to seat relay and motor. Ignition switch must be on for both motor and switch operation.

TROUBLE SHOOTING & DIAGNOSIS: *See Page 516 in 1960 Final Data or later Manual edition.*

TESTING: *See Page 516 in 1960 Final Data or later Manual edition, and note the following:*

►***OLDSMOBILE NOTE:* Ignition switch must be on before making any electrical tests.**

G.M. 6-WAY SEAT CONTROL WIRING DIAGRAM

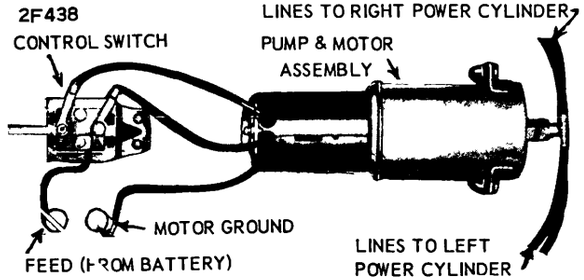
Checking Seat Control Switch: Substitute known good switch or use a 3-way jumper wire and connect to switch block as listed below.

Three-Way Jumper Wire - Join two pieces of 12 gauge wire together at one end and insert joined end into feed location (No. 1 on diagram) in switch block. Insert other ends of wires into a field and a solenoid location (Nos. 2 through 6 on diagram) in switch block.

With Switch In Seat Side Panel -
1) To raise front edge, jumper in 6 & 5.
2) To lower front edge, jumper in 3 & 5.
3) To raise rear edge, jumper in 6 & 4.
4) To lower rear edge, jumper in 3 & 4.
5) To move seat forward, jumper in 6 & 2.
6) To move seat rearward, jumper in 3 & 2.

With Switch In Door Arm Rest -
1) To raise front edge, jumper in 3 & 5.
2) To lower front edge, jumper in 6 & 5.
3) To raise rear edge, jumper in 3 & 4.
4) To lower rear edge, jumper in 6 & 4.
5) To move seat forward, jumper in 3 & 2.
6) To move seat rearward, jumper in 6 & 2.

REMOVAL & INSTALLATION: *S Pag 516 in 1960 Final Data r later Manual edition.*



HYDRAULIC-ELECTRIC TYPE

Buick & Buick Special (1962)
Cadillac (1962)
Chevrolet Pass. Cars (1962)
Chevy II (1962)
Corvair (1962)
Chrysler & Imperial (1962)
Dodge & Dodge Dart (1962)
Ford Pass. Cars (1962)
Mercury Monterey (1962)
Oldsmobile & Oldsmobile F-85 (1962)
Plymouth (1962)
Pontiac & Pontiac Tempest (1962)
Rambler American (1962)
Studebaker Lark (1962)

►*BUICK WIRING MODIFICATION NOTE:* Some cars may have wiring modified so that top, electric window, and electric seat operation occurs only through ignition switch. Modification consists of a relay in circuit in series with power feed circuit breaker and ignition switch terminal of fuse box.

DESCRIPTION: Similar in design and operation to models previously used. System is a sealed unit and is not vented to the atmosphere, making it unnecessary to replace hydraulic fluid periodically. System is "self-air bleeding".

CHECKING FLUID LEVEL: With top in raised position, disconnect positive or negative battery cable. Remove pump and motor shield, in rear compartment, and place absorbent material below reservoir. Remove filler plug from reservoir. On motor and pump assemblies installed horizontally, fluid should be at lower edge of filler cap hole. If fluid low, add hydraulic fluid Delco No. 11 (GM Hydraulic Brake Fluid Super No. 11).

PUMP, MOTOR & SWITCH ASSEMBLY

REPLACING FLUID (After Repairs): Cylinders and hydraulic system contains more fluid than one filling of reservoir will supply. Check reservoir frequently during refilling of system. Air in system will automatically bleed out with a few operations of top.

CHECKING HYDRAULIC PRESSURES: Remove motor and pump assembly. Install plug in one port and pressure gauge in port to be checked. Actuate motor with an applied terminal voltage of 9.5-11.0 volts. Gauge should show a pressure as specified below. Check pressure in other port. *NOTE* - A difference in pressure readings may exist between pressure port for top of cylinders and port for bottom of cylinders. This condition is acceptable if both readings are within limits specified. If pressure not within specified limits, unit is defective and should be repaired or replaced. **Hydraulic Pressure** - 340-380 lbs. (General Motors Cars), 240-280 lbs. (Rambler & Studebaker).

CHECKING OPERATION OF LIFT CYLINDERS: Remove rear seat cushion and folding top compartment side panel assembly. Operate folding top control switch and observe lift cylinders during up and down cycles for these conditions:

1) If movement of cylinder rods is not coordinated or sluggish when motor is actuated, check hydraulic hoses from the motor and pump to cylinders for kinks.
2) If one cylinder rod moves slower than other, cylinder with slow moving rod is defective and should be replaced.
3) If both cylinder rods move slowly, or do not move at all, check pressure of pump. See "Checking Hydraulic Pressure" above.

MOTOR & PUMP ASSEMBLY: *See "Power Operated Top Motor & Pump (Rotor Type)" in Miscellaneous Section of Manual.*

LINCOLN CONTINENTAL TOP CONTROL

Lincoln Continental (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 INOPERATIVE TOP CORRECTION:* If cause of failure is not immediately evident, trouble may be due to wiring harness assembly being damaged by contact with rear seat assembly. To correct, remove rear seat back and cushion assembly, make necessary repairs to wiring, and relocate wiring away from seat toward center of car.

DESCRIPTION: Completely automatic power top mechanism which is the same as late production 1961 models with all of the production changes included.

OPERATION: Same as late production 1961 models with all of the production changes included. *See 1961 Final Data, Page 530.*

EMERGENCY MANUAL OPERATION: *See 1961 Final Data, Page 532, and note the following:*

Manually Opening Deck Lid (Control Circuit Inoperative) - If top control circuit inoperative, bypass control circuit components to open deck lid as follows: Remove rear seat back and remove multiple plug from deck unlock relay. Make a three-ended jumper wire and energize deck unlock motor directly through multiple plug. *NOTE - If motor does not operate, unlock deck lid manually.* If deck lid will not operate through top control switch, remove multiple plug from deck open relay and energize deck motor and pump assembly directly through multiple plug. *NOTE - If motor inoperative, pendock lid manually.*

ELECTRICAL COMPONENTS & LOCATIONS: *See 1961 Final Data, Page 532.*

TESTING & TROUBLE SHOOTING: *See 1961 Final Data, Page 532.*

WIRING DIAGRAM: *See 1961 Final Data, Page 531.*

SWITCH ADJUSTMENTS: Deck Lock Limit Switch - With a test lamp attached to the two top terminals of switch, adjust switch so test lamp is lighted when deck lock screws contact deck lock nuts but goes out after lock screws engage lock nuts by one or two threads.

Top Down Limit Switch: With top retracted and a test light attached to upper terminals of switch, adjust switch against pivot arm until test light goes out, then tighten mounting screws.

Back Panel Erect Limit Switch: With top erected, deck lid raised, and back panel partially open, loosen switch mounting screws so switch plunger is not depressed when back panel fully open. With test light attached to two upper terminals of switch and back panel fully open, move switch against actuator until plunger is depressed and test light goes out. Tighten mounting screws.

Back Panel Retract Limit Switch: With top erected, deck lid raised, and back panel partially open, loosen switch mounting screws so switch plunger is not depressed when back panel fully folded. Attach test light to top terminals of switch. Fold back panel until rubber pads on underside of deck lid are compressed and back panel motor stalls. Move switch against actuator until plunger is depressed and test light goes out, then tighten mounting screws.

Top Lock Limit Switch: With top erected, but unlocked, remove access cover in No. 1 bow and move switch so plunger will not be compressed when top is locked. Operate top motor until top locks and motor stalls, then release control switch. With a test light attached to red wire terminals of switch, adjust switch against actuator until switch plunger is fully depressed and test light is on, then tighten mounting screws.

Top Unlock Limit Switch: With top erected and No. 1 bow access cover removed, raise deck lid and back panel until top just starts to unlock. Loosen switch so plunger will not be depressed when top is unlocked. Insert a .060" shim between switch plunger and actuator then unlock top fully until lock arm is firmly seated to rubber stop. With a test light attached to yellow and brown wire terminals of switch, adjust switch plunger against actuator until light goes out and plunger is fully depressed. Remove shim and tighten mounting screws. *CAUTION - Lock linkage stop must be adjusted so switch actuator will not hit switch body.*

Top Up Limit Switch/Top Lock Limit Switch No. 1: With No. 1 bow access cover removed and switch loosened, raise top until No. 1 bow rests firmly on windshield header and lock hooks are aligned with hook pockets. Attach a test light to yellow and red wire terminals of switch and adjust switch forward until test light comes on, then tighten mounting screws.

Top Up Limit Switch (In Main Pivot Casting): With deck lid opened, slide switch down so plunger will not be depressed when top fully erected. Raise top until No. 1 bow almost contacts windshield header. Disconnect double connector from switch, attach a test light to

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL TOP CONTROL (C ntinued)

switch terminals, and slowly raise top until No .1 bow contacts windshield header and package tray reaches proper position. *NOTE - Make sure best weather seal at packag tray and rear side rail weatherstrips is obtained.* Move switch against top linkage until test light just goes out, then tighten switch mounting screws.

D ck Op n Limit Switch s No. 1 & 2: With deck lid partially opened, move switches so they will not be activated when deck lid fully open. Insert a 1/8" shim between both deck lid hinges and their opening stops, then open deck lid. Shims should be held in place by deck lid hinges. With a test light attached to rear two terminals of either switch, adjust switch plunger against actuator until test light goes on. Tighten switch mounting screws. Repeat for other switch.

Top Lock Cut-Off Switch: With deck lid fully raised and back panel completely folded under so it contacts rubber pads, place a .060" shim between switch plunger and actuator. Attach a test light to red and orange wire terminals of switch. Adjust switch until plunger is fully depressed and test light is out. Remove shim and tighten mounting screws.

HYDRAULIC FLUID LEVEL CHECK: *See 1961 Final Data, Page 533.*

LINCOLN CONTINENTAL DOOR LOCK

Linc ln C ntinental (1962)

►*1961-62 DOOR LOCK OPERATION WITHOUT DRIVER'S ASSISTANCE CORRECTION:* If door locks operate by themselves, trouble may be due to control knob being too far out on shaft and hanging up on bezel in down position, thereby keeping lock system energized. To correct, loosen control knob setscrew and relocate knob away from bezel, then retighten setscrew.

DESCRIPTION: Vacuum lock system similar in design to 1961 models. Rear door warning light system is same as late production 1961 models. *For Wiring and Vacuum Diagrams, Removal and Installation, Testing and Trouble Shooting, see Page 520 in 1961 Final Data.*

FORD THUNDERBIRD TOP CONTROL

F rd Thunderbird (1962)

DESCRIPTION & OPERATION: *See "Ford Thunderbird T p Control" on Pag 530 in 1960 Final Data or later Manual edition and n t th following:*

Relays - Deck solenoid power relay and top solenoid power relay have been eliminated. *See 1962 Wiring Diagram f r d tails.*

EMERGENCY MANUAL OPERATION: Unlocking Deck Lid - If deck lock motor fails to operate, manually unlock deck lid to gain access to deck lock motor as follows: Place floor jack under frame rear crossmember and raise car approximately 10". Remove each deck lid lock retaining screw (underside of each wheelhouse). Lift front edge of deck lid about 1 inch and operate top control switch to complete opening of deck lid.

Op ning D ck Lid - Unlock deck lid by operating top control switch or by using the above procedure. Loosen the two straps supporting the fuel tank and lower tank approximately 1 inch. DO NOT remove straps or tank. From beneath lower back panel, remove both deck cylinder retaining screws from each side. Complete opening of deck lid. If deck lid locks have been released from wheelhousings the nut and housing portion of locks will remain attached to deck lid.

Er cting Top - *NOTE* - It may be necessary to erect top manually if: Electric-hydraulic motor fails; there is an open circuit in motor feed; the top solenoid valves fail; there is an open circuit in the feed line; a top cylinder or linkage fails. Unlock and open deck lid. Energize both top solenoid valves using suitable jumper wires and 12 volt source. If either valve is inoperative, disconnect the hydraulic lines connected to the valves so that there will be no hydraulic block in top cylinders , then manually erect top

TROUBLE SHOOTING & DIAGNOSIS

►*TESTING NOTE:* Usual cause of top malfunction is a defective or improperly adjusted switch. Make switch checks before making further tests.

SUPPLY CIRCUIT TESTING: Use a continuity light between ground and various points in supply circuit. With ignition switch in ON or ACC position and selector lever in N or P, check the following in sequence: Circuit breakers, neutral switch relay, actuator switch, and relay power bus bar.

SWITCH CIRCUIT TESTING: Check switch for improper adjustment by depressing switch stem. Check for electrical failure by bypassing switch with jumper wire directly at switch contact terminals or wire connectors. *NOTE - Continuity light cannot be used to test switch circuits as current draw required by light will not allow relay coils to energize.* To bypass switch circuit, connect jumper wire between relay bus bar and relay coil terminal. If motor or solenoid operates, check switch circuit for defects. If audible "click" of relay is heard, switch circuit troubles are indicated. If motor or solenoid fails to operate and relay operates, check for defective motor, solenoid, or respective circuits.

MOTOR & SOLENOID TESTING: Use a 12-volt power source and jumper wire directly to motor or solenoid, or bypass motor ground circuit breaker to isolate trouble.

UNIT & OPERATION TESTING: Use a 100 Ampere scale ammeter between main feed 50 ampere circuit breaker on starter relay and motor supply lead (black wire) supplying control relay bus bars. If a switch is improperly adjusted so it closes the relay circuit for any cycle but still does not open the cycle just finishing; or if switch is faulty, ammeter reading will indicate the trouble. *See "Electrical Test Specifications" below.*

1962 ELECTRICAL TEST SPECIFICATIONS

Operation	Maximum Amperage Draw ℂ Amperes
Deck Lid Unlock	30
Deck Lid Open	63
Package Tray Extend	30
Package Tray Fold	20
Top Erect or Retract	65
Deck Lid Close	60
Deck Lid Lock	22

ℂ - Battery must be 11.5-12.5 volts for these tests.

Unit	Electrical Unit Current Draw ② Amperes
Pump Motor (Normal)	32-48
(Bypassing)	58
Tray Motor (Normal)	30-35
(No Load)	18-21
(Stalled)	100
Lock Motor (Normal)	18-22
(No Load)	15-18
(Stalled)	50
Solenoids (Each)	10

② - With 100 ampere scale ammeter between 50 amp. circuit breaker and relay feed wire.

HYDRAULIC CHECKS

►*NOTE:* Faulty hydraulic system operation can be caused by lack of fluid, leaks, air in system, obstructions or kinks in hoses, or faulty operation of cylinder or pump.

Fluid Level: Retract top, remove filler plug and check fluid level (bottom edge of filler hole). If low, check for leaks, adding heavy duty brake fluid as necessary.

Lift Cylinder Operation: Operate top control switch and observe operation of lift cylinders. If movement of piston rods is sluggish or uneven, check hoses from pump to cylinders for kinks. If one piston rod moves more slowly than the other, the cylinder with the slower rod is defective and should be replaced. If both rods move slowly or not at all, disassemble and repair pump.

ADJUSTMENT

Top Down Switch: Place switch in midpoint of adjustment slots, then lower top to full down position. Adjust switch as necessary to delay or advance deck lid closing operation.

Deck Closed Switch Adjustment: Use Tool T61B-15780-A. Pull apart the switch quick disconnect and attach a continuity test light to wires that go to bottom set of contact terminals. Press tool firmly into the lock nut and adjust switch upward until the test light attached to bottom set of contacts just goes on, then tighten switch mounting screws and remove tool.

Deck Closed Switch Actuator Adjustment: Use Tool T61B-15780-A. Position tool over lock screw, press tool firmly against lock screw shoulder. Pivot tool to line up with switch actuator. Bend actuator until it touches raised portion of tool. If operation of deck lid disclosed that deck lid pops up when opening, the switch actuator may be bent very slightly away from deck lid.

Top Up Switch: Raise top to full up position. Place .060" shim between end of switch shaft and roof hinge arm. Adjust switch firmly to the end of its travel against shim. Tighten switch mounting screws and remove shim.

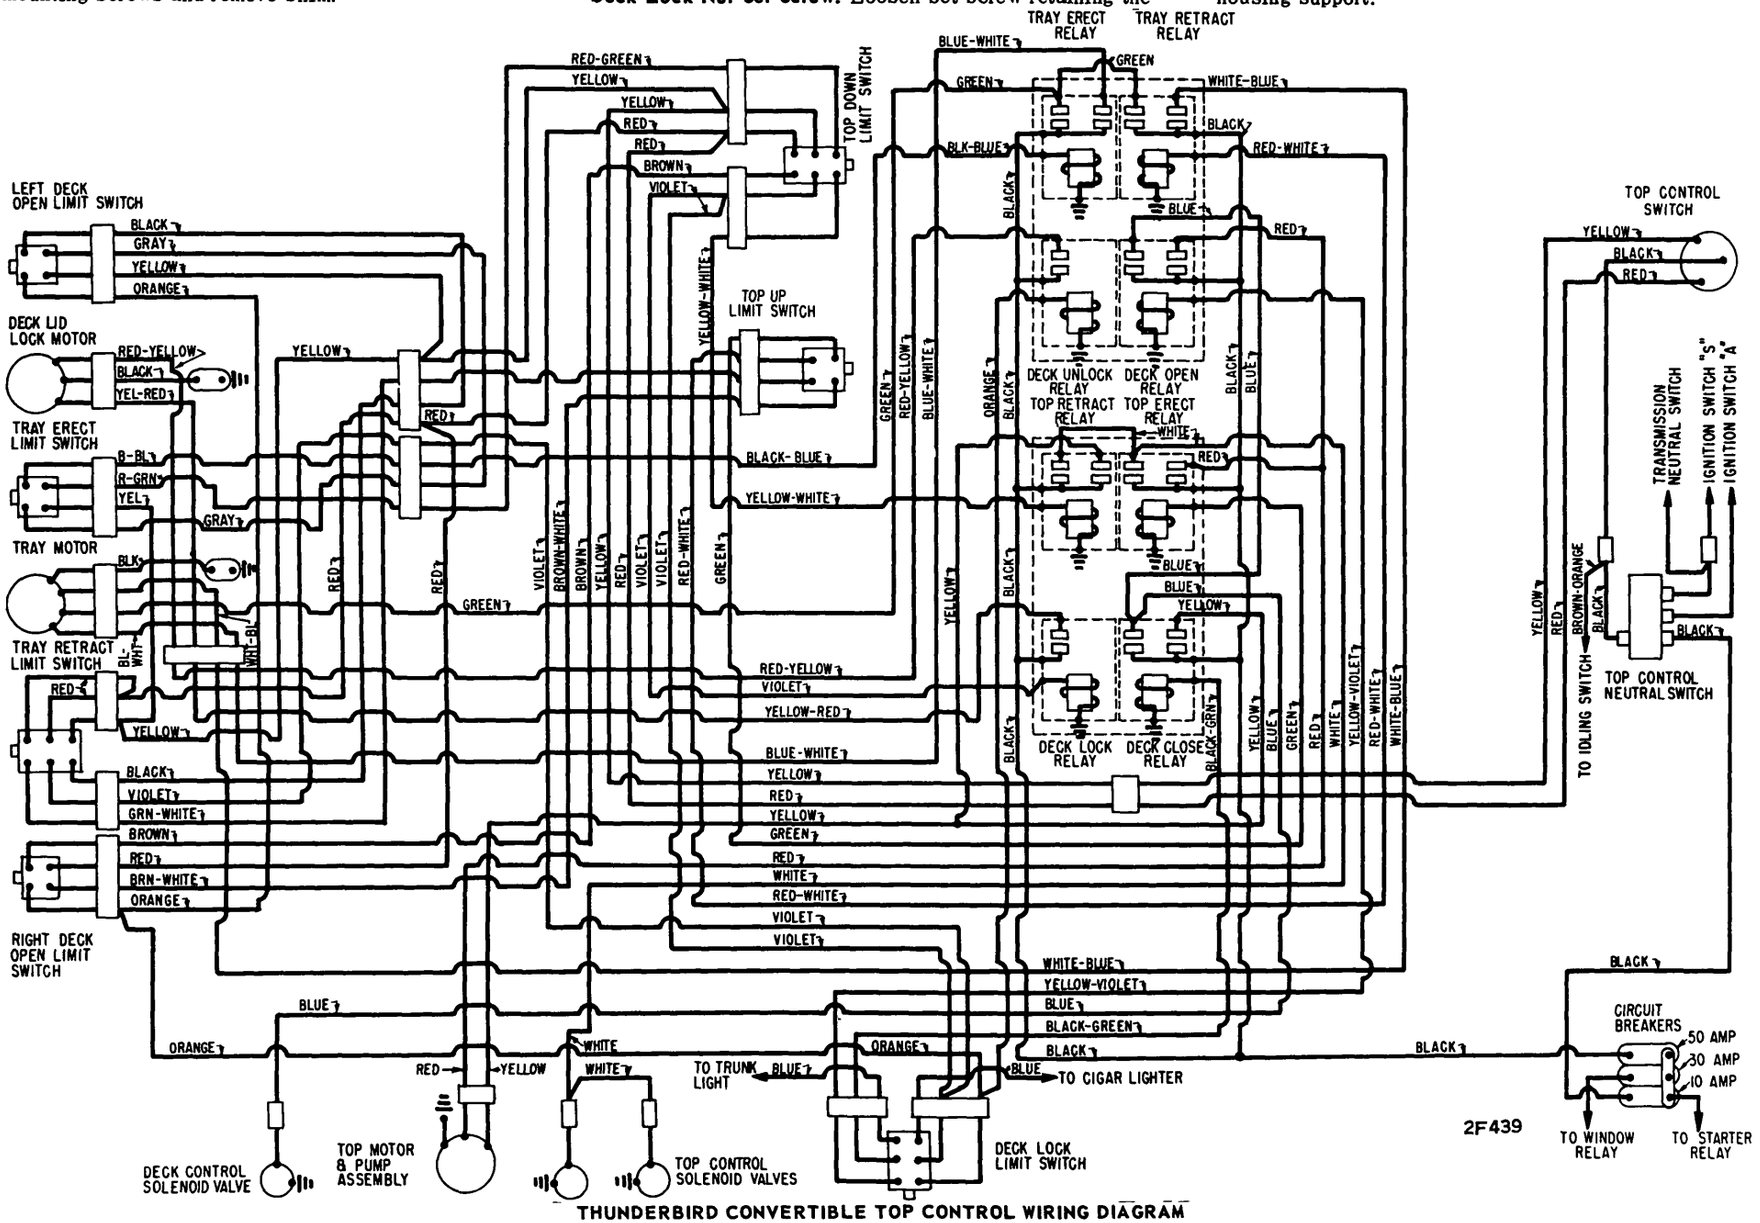
Tray Erect Switch: Extend package tray on the deck lid to end of its travel. Place .060" shim between end of switch shaft and switch actuator on the tray support arm. Adjust switch firmly to the end of its travel against the shim. Tighten switch mounting screws and remove shim.

Tray Retract Switch: Retract the package tray on the deck lid to the end of its design travel. Place .100" shim between end of switch shaft and the switch actuator on tray support arm. Adjust switch firmly to the end of its travel against shim. Tighten switch mounting screws and remove shims.

CONTINUED ON NEXT PAGE

FORD THUNDERBIRD TOP CONTROL (C ntinued)

D ck Open Switches: Both right and left deck open switches are adjusted in same manner. Raise deck lid to full open position, place .060" shim between end of switch shaft and actuator. Adjust actuator so that the switch shaft is fully depressed. Tighten actuator mounting screws and remove shim.



DECK LOCK ADJUSTMENT: *NOTE* - For adequate seal, deck lock screw assembly must be adjusted to engage properly with the lock nut assembly.

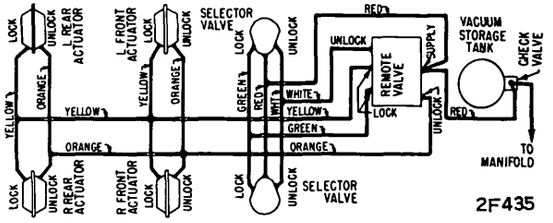
Deck Lock Screw Assembly: Loosen two nuts retaining lock screw assembly to deck lid and adjust the assembly fore and aft to align with lock nut assembly.

Deck Lock Nut Housing Support: Loosen two screws retaining lock nut housing support to quarter panel and adjust support side to side to align with lock screw.

Deck Lock Nut Set Screw: Loosen set screw retaining the locknut in housing assembly and turn lock nut in or out to the required position. The Tool T57P-53510-A may be used to turn lock nut as necessary. *CAUTION* - DO NOT attempt any trial locking of deck unless set screw is properly tightened.

Deck Lock Nut Housing Height: The foot of the lock nut housing assembly may be adjusted up or down from the wheelhouse to insure the correct positioning of the "O" ring. The "O" ring should be centrally located in housing support.

THUNDERBIRD CONVERTIBLE TOP CONTROL WIRING DIAGRAM



BUICK & CADILLAC VACUUM DOOR LOCK

Buick (1962)
Cadillac (1962)

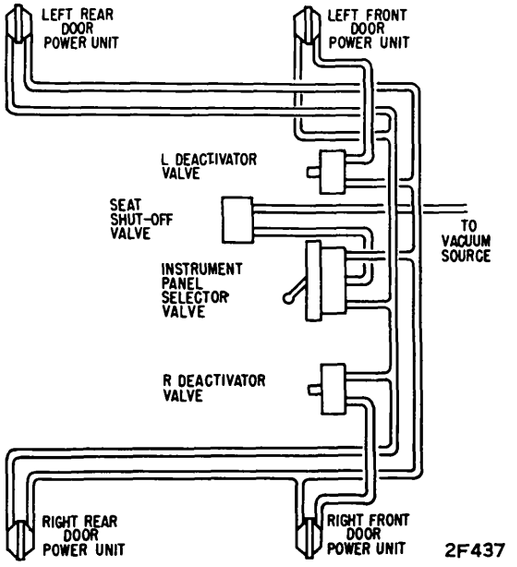
DESCRIPTION & OPERATION: Consists of vacuum storage tank, vacuum lock remote control valve assembly, selector valve, and actuator assemblies.
Vacuum Tank - Attached to front of power brake mounting support on left side of body. Connected by hose to engine manifold with check valve in the line. A minimum of three complete cycles of operation (lock and unlock) is available immediately after engine has been shut off.
R mote Control Valv - Attached with screws below right hand defroster duct. Supplies vacuum from tank to lock actuators when selector valve is actuated.
S lector Valve - Located on each front door trim assembly.
Actuat r Assemblies - Located in each door are double acting vacuum diaphragms with vacuum supplied to each side. Diaphragm moves a linkage or bell crank connected to locking lever of lock.
►*NOTE:* All vacuum hoses and corresponding actuator ports are color coded, see diagram.

TROUBLE SHOOTING: Condition and cause as follows:
Syst m In p rativ - Hoses crossed at vacuum supply tank, vacuum supply hose pinched at remote control valve, door valve supply hose pinched at remote control valve, vacuum supply hose disconnected at tank, remote valve or engine, remote valve diaphragm leaking.
All Do rs Can Be L ck d But Not Unlocked - Main supply hose crossed with lock supply hose at remote control valve, unlock selector hose or supply hose disconnected at remote valve.
All D rs Can Be Unlocked But Not Locked - Main supply hose crossed with unlock hose on remote control valve, lock selector hose or supply hose disconnected at remote valve.
M ving Eith r Do r Valv t Unlock or Lock Produces the Opp sit Acti n f All Locks - Door lock selector valve hoses (small) crossed at remote control valve, actuator supply hoses (large) crossed at remote valve.
M ving One of Do r Valves to Lock or Unlock Produc s th Opp site Action of the Lock-Valve selector hoses crossed at one door valve, door selector valve reversed in trim assembly.
System Will N t L ck Fr m D r Valv r System Will Not Unlock From One Door Valve - Lock or unlock selector valve hose pinched or disconnected from affected door valve.
Lock Movement on Any Door Not Synchronized with Other Doors - Hoses crossed at affected door lock actuator.
One Door Lock Lags Behind Others When Locked or Unlocked - Lock or linkage binding.
System Inoperative from One Door Valve - Vacuum supply hose pinched or disconnected at affected door valve.
One Door Lock Will Not Lock or Unlock - Actuator hoses pinched or disconnected.
System Will Not Hold Vacuum for 48 Hours - Leak at remote control valve, any two door locks, storage tank and check valve, any part of harness connections.
L cks Inoperativ with Front Do r Cl sed, But Operative with Door Open - Door valve vacuum supply hose pinched at front body hinge pillar on side affected.

TESTING: For leaks not severe enough to be heard, use a suitable water testing device made from a quart jar and flexible tubing. I.D. of tube connected to remote control valve should be 7/32", and I.D. of tube connected to storage tank should be 5/32". Install tester hose not protruding into the water on bottom of check valve on tank. Install hose with end in the water to hose leading to remove control valve. After pressures in system normalized, a bubble will appear in water every 15 seconds or faster if there is an appreciable leak in system. Isolate system in usual manner by pinching hoses when making tests.

BUICK & CADILLAC VACUUM DOOR LOCK CONTROL DIAGRAM

RAMBLER VACUUM DOOR LOCK



Rambler, Except American (1962)

DESCRIPTION: Vacuum operated door locking system consisting of the following components:
Selector Valve - Located on left lower edge of instrument panel. Controls locking and unlocking of doors when seat shut-off valve is opened by someone sitting in driver's seat.
Seat Shut-Off Valve - Fastened into driver's seat cushion springs by a bracket clamped to four of the coil springs. Valve is a master control and vacuum passes through valve **only** when someone sits in driver's seat. All vacuum to selector valve is shut off when seat valve is closed and doors will remain locked or unlocked as they were when driver moved from the seat cushion regardless of position of selector valve.
Deactivator Valve - Mounted on each front door body pillar. Serves as booster for operating front door locks when front doors are closed. When front door is closed, deactivator valve is pushed in to open valve so vacuum can lock or unlock door automatically.
Door Lock Units - Consist of special door lock and vacuum locking unit for each car door.

TESTING & TROUBLE SHOOTING: *CAUTION - DO NOT apply air pressure to any part of system or serious damage will result.* Insufficient vacuum may be due to kinked or broken hoses, or poor connections. Check for vacuum loss from source of vacuum to unit which does not operate according to Vacuum Route listing below.

Vacuum Route: *NOTE - When checking itesm 2,3,4 & 5 below, engine must be running, pressure applied to driver's seat cushion to open seat shut-off valve, and selector valve on instrument panel in "On" position. Front doors must also be closed so deactivator valves are opened.*
1) From engine source to seat shut-off valve.
2) From seat shut-off valve to selector valve.
3) From selector valve to hoses at both sides of car.
4) Hoses from "T" connectors at selector valve to "T" connectors in both front body pillars to doors.
5) From "T" connectors at both front body pillars to deactivator valves, then to door lock power unit.
6) From "T" connectors at both front body pillars to each rear door power unit.

►*HOSE REPAIR NOTE:* Unnecessary to replace entire hose. Cut hose at break and use copper tubing as connector repair. Copper tube should be of same inside and outside dimensions as "T" connectors.

RAMBLER VACUUM DOOR LOCK CIRCUIT DIAGRAM

CADILLAC TRUNK LID LOCK

Cadillac, Except Series 75 (1962)

DESCRIPTION: Vacuum operated trunk lid locking system used with a rotary bolt type lock. Vacuum release unit is attached to lock, and vacuum storage tank is located on cowl under hood. A vacuum switch located in glove compartment controls unit. A mechanical type lid closing unit is used in conjunction with vacuum lid lock to reduce effort required to close trunk lid.

OPERATION: Vacuum System - Operating vacuum switch in glove compartment introduces vacuum to vacuum unit which then pulls the lock to unlock the trunk lid. Trunk can be unlocked and opened with a key in the usual manner.

Mechanical Closing Unit: When trunk lid is lowered manually and lid lock engages striker, mechanical closing unit pulls lid to closed position. A hydraulic cylinder attached to a bellcrank at right trunk lid hinge and to closing unit by a cable acts as a safety feature to slow action of closing unit. When lid is lowered and lock latches to striker, but before mechanical closing unit is tripped, hydraulic piston extends to full out position. As lid is lowered to actuate mechanical closing unit, piston compresses fluid in cylinder to retard closing action of spring.

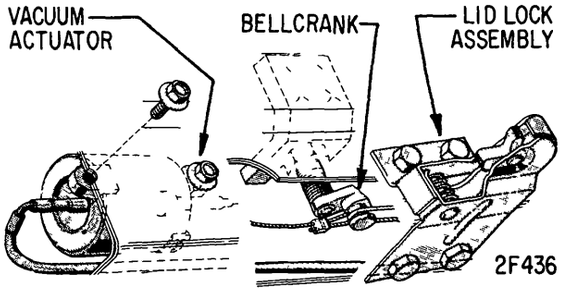
ADJUSTMENT: 1) *NOTE - No adjustment at lid lock. All adjustments must be made at pull-down unit on back panel.* Check lid alignment by lowering lid and checking visually. Adjust by loosening pull-down unit attaching screws and adjust unit to desired position. To check up and down adjustment, make sure that locking lever locks in second (upper) notch when lid is in closed position. If not correct, adjust pull-down unit upward. 2) *NOTE - Cable tension must be properly adjusted for proper operation of pull-down unit. If cable too tight, pull-down unit will not return to full up position and "cock". If cable too loose, pull-down effort in unit is lessened and trunk lid will be misaligned (too high). Adjust cable as follows:* To increase tension, place hydraulic cylinder end of cable in upper slot on lower end of cylinder. If more tension required, loosen cable adjusting bracket attaching screw and adjust bracket downward to increase cable travel. To decrease cable tension, place hydraulic cylinder end of cable in lower slot on hydraulic cylinder. For finer adjustment, move cable attaching bracket upward. *CAUTION - Point of contact between toggle and detent lever must be lubricated with Lubriplate to avoid excessive effort required to trip (unlock) pull-down unit.*

REMOVAL & INSTALLATION: Vacuum Release Unit - Remove lid lock cover panel and lid lock cylinder assembly. Remove vacuum unit attaching screws, disconnect vacuum line and remove unit. To install, reverse removal procedure.

Lid Lock: Remove lid lock cylinder assembly and vacuum release unit (see above). Remove lid lock attaching screws and remove lid lock. To install, reverse removal procedure.

Mechanical Pull-Down Unit: Remove pull-down unit cover panel, depress striker slightly to relieve tension on cable, then disengage clip holding cable to pull-down unit control arm. Disconnect clip holding cable conduit to cable adjusting bracket, then disengage cable and conduit from pull-down unit. Remove warning light switch attaching screw and remove switch from pull-down unit. Scribe mark position of pull-down unit to aid installation, then remove attaching screws and remove pull-down unit. To install, reverse removal procedure.

Pull-Down Unit Cable: Pull clip from cable at lower end of hydraulic cylinder, then disengage cable from slot in cylinder. Disengage cable conduit retaining clip from support on wheelhouse and remove cable and conduit from support. Repeat procedure at other end of cable, then remove cable. To install, reverse removal procedure.



Hydraulic Cylinder: Remove cable from lower end of cylinder (see above). Lift cylinder to disengage upper end from shoulder of shaft on link assembly, then remove hydraulic cylinder. To install, reverse removal procedure.

LINCOLN CONTINENTAL TRUNK LID LOCK

Lincoln Continental, Except Convertible (1962)

DESCRIPTION: Vacuum operated system consisting of a control valve assembly (switch) located in glove compartment, and a door lock actuator assembly (vacuum motor) located on luggage compartment back panel. Vacuum source for system is from vacuum door lock system through a tee connection at door lock vacuum distributor supply line. Trunk lid can also be unlocked in the usual manner with a key.

TROUBLE SHOOTING: *CAUTION - DO NOT apply air pressure to system, or serious damage to vacuum actuator will result. If system inoperative, proceed as follows:* With engine running, listen for any obvious air leaks. Disconnect left hand hose from control valve in glove compartment and touch a finger to hose end. If vacuum not present, trouble is at source from door lock system. If vacuum present, reconnect hose. Disconnect right hand hose from control valve. If vacuum not present at hose, control valve is faulty. If vacuum present, reconnect hose. Unlock trunk lid with key and disconnect hose at actuator. Have a helper operate control valve and touch a finger to end of hose. If vacuum not present, hose from control valve to actuator is faulty. If vacuum present, actuator assembly is faulty.

LINCOLN CONTINENTAL
VACUUM TRUNK RELEASE MECHANISM

BUICK, OLDSMOBILE, PONTIAC TRUNK LID LOCK

Buick LeSabre, Invicta, Electra (1962)
Oldsmobile (1962)
Pontiac (1962)

DESCRIPTION & OPERATION: Vacuum operated trunk unlocking device consists of control lever in glove box, vacuum reserve tank on left inner fender skirt, and vacuum power unit in trunk lock mechanism. Vacuum reserve tank vacuum supply line located in "T" fitting in distributor vacuum advance line near carburetor. A check valve in tank prevents vacuum loss when intake manifold vacuum drops. If vacuum unit fails, trunk can be unlocked in the usual manner.

►*TRUNK LOCK & DISTRIBUTOR CAUTION:* To restore vacuum to supply tank, engine must be run above idle speed as there is no distributor vacuum advance at idle speed. Also, make sure that vacuum line from "T" fitting to reserve tank is in good condition and that there are no leaks at fittings or distributor vacuum advance will fail to operate.

REMOVAL & INSTALLATION: Open deck lid and remove screws holding vacuum unit to deck lid inner panel. Disconnect vacuum hose from vacuum unit and remove vacuum unit. To install, reverse removal procedure.

AIR CONDITIONING SERVICE CAUTIONS

HANDLING FREON: Though considered the safest and best refrigerant for use in Air Conditioning systems, the following precautions must be observed to avoid serious accidents or damage to the system.

Drum: 1) Do not leave drum uncapped (metal cap furnished with drum is for protection of valve and safety plug). It should be replaced after each use of drum.
2) Do not carry drum in passenger compartment of car. Place drum in luggage compartment or, if in an open truck, cover drum to protect it from radiant sun heat. If precaution not taken, resultant increase in pressure may cause safety plug to release or drum to burst.
3) When charging system, do not subject drum to high heat. Use water no warmer than 125°F (Hot rags will suffice). *Never place drum on radiator, stove, or use torches for heating during charging.* Keep drums upright.
4) Never permit a drum to be dropped or strike another drum violently.
5) Do not fill drum completely (when filling one drum from another). Leave space above liquid for expansion.

Personal: 1) Do not discharge Freon into room with exposed flame because concentrations of this gas in contact with open flame will produce a toxic gas.
2) Do not expose eyes to liquid, *USE GLASSES OR GOGGLES. Liquid Freon will freeze anything with which it comes in contact.* If Freon should strike eyeballs, splash water to area of eye to gradually get temperature above freezing point, apply a few drops of sterile mineral oil to eyes as an irrigator. If irritation continues, wash eyes with a weak solution of boric acid. *DO NOT RUB EYES. See an eye specialist at once.*
3) Do not inhale large quantities of Freon vapor as it will act an an anesthetic.
4) If Freon comes in contact with skin, injury should be treated for frostbite.

HANDLING REFRIGERANT LINES: 1) Keep refrigerant lines dry and clean. Whenever a connection or joint is broken, clean all dirt from joint or connection.
2) Parts from stock are capped and dehydrated. Caps should only be removed just prior to installation. Lines removed from system to be used again, should be capped immediately, to prevent dirt and moisture from entering lines.
3) Lines should be free of kinks, and should be carefully stored to avoid crushing or bending.
4) Proper size wrenches should be used when tightening fittings. Always use two wrenches to prevent twisting copper tubing.
5) Tubing that is left free to vibrate will harden and crystallize the area of the tubing at flare sections so that it may become brittle and break.
6) When using paint drying lamps, ovens, steam cleaners, or other heat producing devices, avoid heating any part of system. If sufficient heat applied, pressure will increase to a point where some part of system will rupture.
7) When undercoating, use care to see that undercoating does not plug evaporator drain. Do not coat air conditioning joints and connections.
8) Keep gauge set and lines free of moisture.
9) Compressor lubricant container must not be left open longer than necessary as the special oil is moisture free and will absorb moisture from air if left uncapped.

AIR CONDITIONING LEAK TESTS

LEAK TESTING CONFINED AREAS: For leak testing confined areas, such as sections of evaporator and condenser, a torch or flame type detector must be used. Two types are available. One type uses anhydrous methyl alcohol, under pressure, for producing the testing flame. The cylinder is refillable, and must be preheated to pressurize cylinder. The other type uses propane gas, under pressure, to produce the testing flame. The cylinder is replaceable and comes already pressurized, making it unnecessary to pre-heat cylinder in order to produce testing flame. Instructions for use of the detectors are furnished with the detector.

Leak Testing: With flame adjusted, explore for leaks by moving end of hose or sampling tube around all points where a leak may be. Especially check around bottom of connections, since Freon is heavier than air and will be more apparent at bottom of fitting. Color of flame will turn to a yellow-green when a small leak is detected. Large leaks will be indicated by a change in color to bright or brilliant blue or purple. When hose or tube is moved away from leak, flame will clear to an almost colorless pale-blue or green. *CAUTION*—Do not use lighted detector in any place where combustible or explosive gases, dust or vapors may be present. Do not breathe fumes and black smoke that are produced if leak is a big one. Before leak testing, be sure car is thoroughly aired (particularly if Freon tank used or if system opened for any reason) and moved to a Freon-free area in order that false readings may be prevented.

PIN-POINTING LEAKS: There are a number of fittings and places throughout the air conditioning unit where a leak detector solution or detergent may be used to pin-point leaks. Apply solution to suspected area with swab that is attached to bottle cap. Bubbles will form, within seconds, if there is a leak.

AIR CONDITIONING TROUBLE SHOOTING

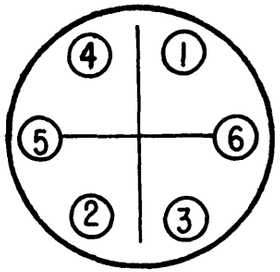
►*CAUTION: Do not disconnect refrigerant lines, replace parts, or attempt adjustments without complete instructions. See "Air Conditioning Service Cautions".*

POOR COOLING: 1) Blowers Not Operating—Fuse blown or faulty circuit breaker; switch in "Off" position; defective switch; switch resistors or blower rheostats inoperative; broken wire or loose connections; blower motor defective; blower fans or motor improperly installed.
2) Restricted Air Flow—Filters clogged; dirt or other obstructions in air ducts; evaporator fins or coils clogged or restricted with frost or ice.
3) Refrigerant Flow to Cooling Coils or Fins Incorrect—Expansion valve improperly adjusted or defective; power element or temperature bulb does not contact pressure line properly; restriction in liquid line between receiver and cooling coils or fins; power element or temperature bulb discharged; insufficient refrigerant; by-pass valve, thermostatic switch or solenoid (if so equipped) not properly set or inoperative; modulator valve (if so equipped) defective; break in any part of closed refrigeration system.
4) Refrigerant Not Condensing Properly—Air flow through condenser, restricted, high engine operating temperatures; air or excess refrigerant in system; restriction in high pressure side of compressor and condenser.
5) Clutch (If So Equipped) Does Not Engage—Defective coil or relay; clutch plate lining worn or saturated with oil causing slippage; air conditioning "On" switch defective; thermostat inoperative; clutch adjustment incorrect.
6) Compressor—Belts not adjusted properly, worn, or broken; operating above normal pressures; disconnect pulley bolts not in place; valves faulty; service valves not fully open.
7) Electrical—Loose connections or broken wires between electrical units, blown fuses or faulty circuit breakers.

TOO COLD: 1) Clutch (If So Equipped) Does Not Disengage—Thermostat inoperative; relay stuck closed; air conditioning "On" switch inoperative.
2) Blower Speed Cannot be Reduced—Defective blower switch.

VIBRATION—NOISE: 1) Blowers—Loose on shaft; striking housing; foreign material; motor bearings or mounts loose or worn.
2) Compressor—Mounting brackets loose; loose internal parts; insufficient oil; too much refrigerant.
3) Air Flow—Foreign material in air system; small slits or openings in ducts.

INCORRECT OPERATING PRESSURE: 1) Excessive Pressure on High Pressure Side—Air or excess refrigerant in system; air flow through condenser core restricted; kinks or restrictions in line on high pressure side; high engine temperature; shut-off valve on high pressure side of compressor not fully open; insufficient air flow through cooling coil; defective expansion valve or incorrect adjustment.
2) Insufficient Pressure on High Pressure Side—Shortage of refrigerant; defective expansion valve or incorrect adjustment; leaky or broken compressor valves.
3) Excessive Pressure on Low Pressure Side—Power element or temperature bulb not making correct contact with pressure line; expansion valve needle stuck open or leaking.
4) Insufficient Pressure on Low Pressure Side—Restriction in lines, shortage of refrigerant; expansion valve needle stuck shut; expansion valve not open far enough, plugged, or defective; dehydrator-filter (strainer-drier) plugged; power element or temperature bulb charge lost or line plugged; compressor valves faulty; blower fans inoperative; temperature control thermostat does not cut out; moisture or freeze-up.



FORD MOTOR CO.

F rd Falc n, Fairlan , & Galaxi (1962)
Mercury Comet, Meteor, & Monterey (1962)
Lincoln Continental (1962)
Thunderbird (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961-62 LINCOLN CONTINENTAL HOSE ROUTING NOTE:* To avoid hose interference in area of left hood hinge, route fuel hoses below rather than between air conditioner hoses and tape all hoses together. Check hoses and hinge for proper clearance.

►*1961-62 LINCOLN CONTINENTAL FREON LEAK AT COMPRESSOR SHAFT CORRECTION:* May be caused by seal plate gasket taking a set, or uneven torque at seal plate retaining bolts. To correct, loosen seal plate attaching bolts until free, then torque bolts evenly in sequence shown in diagram to 13-15 ft. lbs.

2F492

YORK COMPRESSOR SEAL PLATE BOLT TORQUE SEQUENCE

►*1962 LINCOLN CONTINENTAL "YORK" COMPRESSOR SHAFT SEAL REPLACEMENT NOTE:* Some cars may have an "O" ring seal in shaft seal plate. If replacement of "O" ring necessary, use standard York seal plate gasket.

►*1961-62 MERCURY MONTEREY (352" & 390" ENGINES) COMPRESSOR MOUNTING BRACKET NOTE:* Improved bracket, Part No. C2SZ-2882-A, available to minimize compressor induced car vibration, and to insure more accurate belt alignment.

DESCRIPTION: Conventional design air conditioning system similar to previous models. Two types system used: Larger (Select Aire) type has evaporator used in conjunction with conventional heater system to allow use of both fresh and recirculated air for cooling. Smaller "hang-on" (Polar Aire) type uses recirculated air only, and evaporator and air ducts are a self-contained unit.

ADJUSTMENT

COMPRESSOR BELT: Use a strand tension gauge (T62L-8620-A) and adjust belt tension as indicated in table below. On new belts, adjust tension initially and then adjust for used belt specifications after 15 minutes operation.

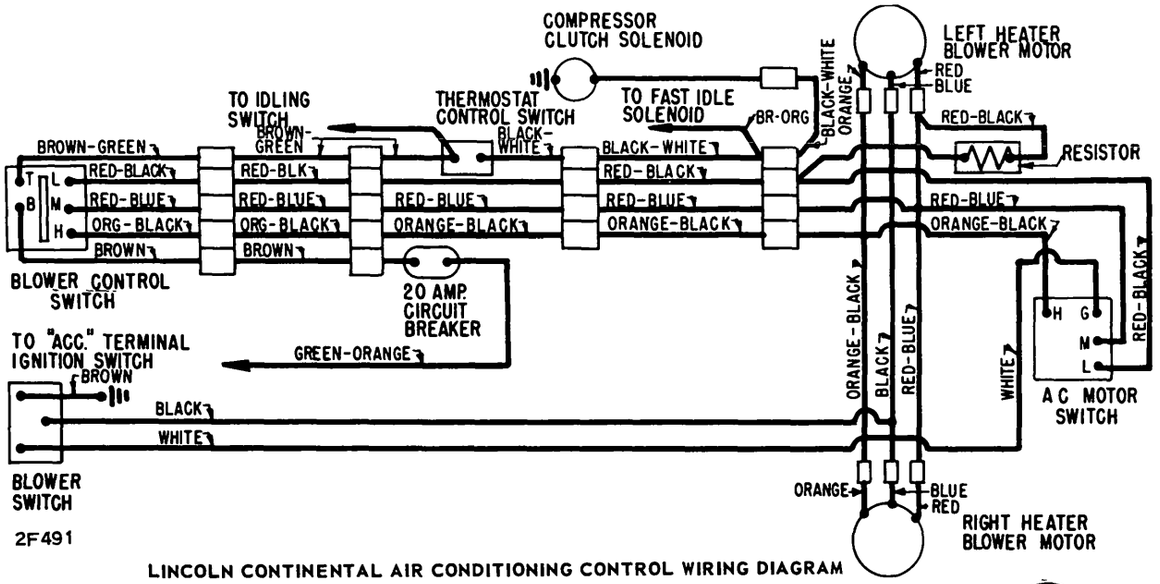
Compressor Belt Tension

Car Model	New	①Used
Lincoln Continental	100-150 lbs.	80-120 lbs.
All Others	120-150 lbs.	90-120 lbs.

①- Any belt operated 10-15 minutes or longer.

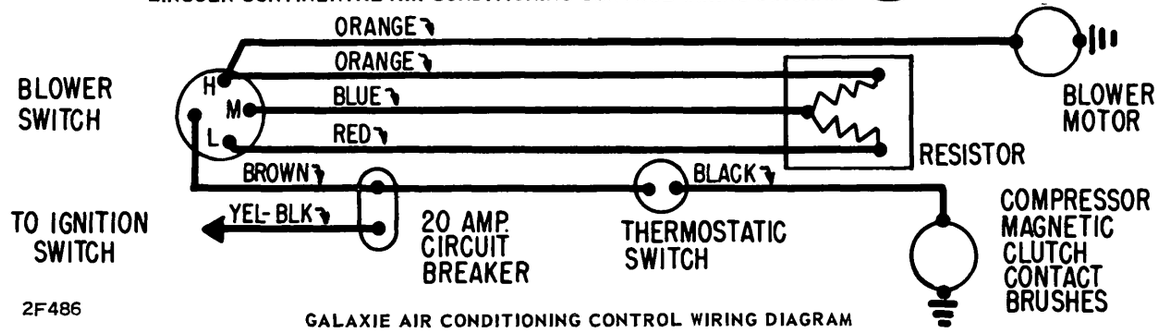
CONTROL ADJUSTMENTS: F rd Galaxi - *For hand control adjustm nt, s Car Mod l pages.* 1) With upper lever in "Low" position (to left of panel), adjust heater temperature regulator valve cable at control head so valve crank is at maximum forward (off) position. 2) With lower lever in "Off" position, adjust toe-board heat door at door or control head so door is closed, then adjust defroster cable at control head so defroster air valve is closed. Move lower lever to "Heat" position and make sure vacuum valve is opened so vacuum is applied to vacuum solenoid. Adjust solenoid and recirculating air door linkage so both doors close opening to passenger compartment when vacuum applied to solenoid. 3) Push both "Air" knobs all the way in and adjust left and right fresh air inlet valves so valves close openings into passenger compartment.

Mercury Monterey: Hand Throttle - *See Car Model pages.*



Air Vent Control - Make adjustment at both right and left ventilator doors. Loosen cable housing retainer screw at ventilator door and position vent control about 1/16" from fully in position, then move ventilation lever fully clockwise. Tighten cable retainer and check operation so that door opens and closes fully.

Heater Dump Door - Loosen cable housing retainer screw at door, then move lower control cable in off detent position and move door lever fully counterclockwise. Tighten retainer screw and check operation. In "Off" position, door should be closed; in "Heat", door should be fully open; in "Defrost", door should be closed.



Defroster Air Door - Make adjustment at control head. Loosen cable housing retainer screw and place lower control lever in "Off" position. Adjust defroster door cable so door lever is fully clockwise and door is closed. Tighten retainer screw and check operation. Door should be closed in "Off" and "Heat", and open in "Defrost" position.

Heater Temperature Regulator Valve - Make adjustment at control head. Loosen upper cable housing retainer screw and place upper lever in "Low" position. Adjust cable so regulator valve lever is completely forward and valve is closed (move cable toward regulator valve). Tighten retainer screw and check operation. Valve should be fully closed with lever at "Low", and fully open with lever at "High".

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL AIR CONDITIONING CONTROL WIRING DIAGRAM

GALAXIE AIR CONDITIONING CONTROL WIRING DIAGRAM FRESH AIR (SELECT AIRE) TYPE

FORD MOTOR CO. (Cont.)

Vacuum Valv Switch - Loosen switch retaining screw so switch bracket will move, then place lower lever in "Heat" position. Move vacuum valve switch against control lever flange until switch plunger is depressed, then tighten retaining screw. Connect vacuum hoses to switch and check operation of recirculating air doors.

R circulating Air D r Vacuum Unit - Set vacuum unit preload by positioning attaching bracket (with slotted holes) so, with no vacuum applied to unit, preload indicator is in line with edge of vacuum unit body. Check that recirculating air door is properly sealed.

Line In C ntinental: Th rm static Switch - Remove lower left instrument panel cover and loosen link adjusting screw on switch. Adjust link until preload indicator is flush with unit body (switch arm must be in full forward position for adjustment). Tighten adjusting screw and install instrument panel cover.

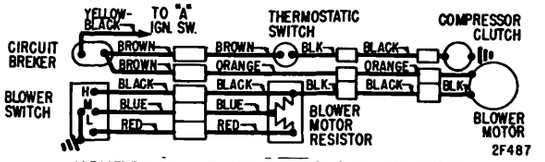
Ford Thund rbird: Vacuum Units - 1) Move right lever all the way to left and adjust cable at control head so defroster outlets are closed, then check adjustment by turning on blower and making sure no air comes out of defroster outlets.

2) Adjust cooling outlet register door vacuum unit so outlet door is closed (move crank fully counterclockwise), and preload notch in vacuum unit arm is flush with front face of unit. With vacuum applied, door should be wide open.

3) Adjust heater core outlet door vacuum unit so door to core is open (move crank fully counterclockwise), and preload notch in vacuum unit arm is flush with front face of unit. With vacuum applied, door should open recirculating grille opening.

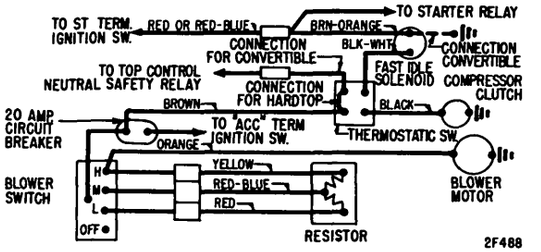
4) Adjust each toe-board heat door vacuum unit so toe-board doors are open, and preload notch in vacuum unit arm is flush with front face of unit. On left door, make adjustment at adjustable actuating arm. To check, turn on blower. Air should come out of toe-board openings. With vacuum applied (control lever at "Defrost"), no air should come through.

Therm static & Fast Idle Switches - Set center lever in air outlet register in "Off" position, and adjust bowden cable at thermostatic switch so switch lever is at bottom position, then adjust fast idle switch adjusting screw so that fast idle switch is open.



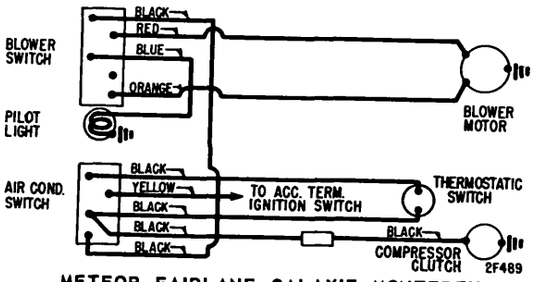
SERVICING

►*INTAKE & DISCHARGE SERVICE VALVE NOTE:* Intake and discharge service valves are hand-operated type mounted on top of compressor. Rotating valve stems *COUNTERCLOCKWISE* until fully seated is the normal operating position. This position also isolates the service valve gauge ports for connecting gauge manifold set. Rotating valves *CLOCKWISE* until fully seated isolates the compressor from the system. *CAUTION - Do not op rate compressor with service valv s fully s at d clockwis .*

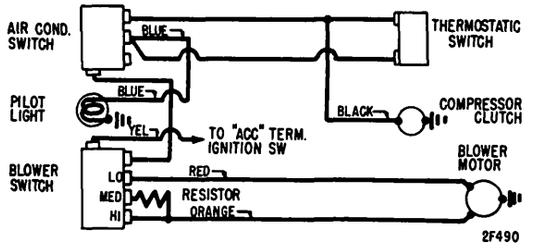


COMPRESSOR OIL LEVEL: Checking & Filling - Operate engine at 1500 RPM with compressor running, for 15 minutes, then turn off engine and isolate compressor. Remove oil filler plug from compressor and insert a flattened 1/8" diameter rod in oil filler hole until it bottoms. *NOTE - On some compr ssors, it may b necessary to bend rod slightly or rotate crankshaft by hand so dip rod will reach to bottom of compressor.* Oil level on rod should be as indicated in table below. Add refrigerant compressor oil as necessary. *NOTE - If oil level too high, withdraw oil as necessary.* Replace filler plug, evacuate and cut compressor back into air conditioning system.

C mpress r Oil L v l
(On Dip R d)



Car M d l	H ight	Capacity
Lincoln Continental	1½-1½"	10 ozs.
All Others	¾"	9 ozs.



MONTEREY AIR CONDITIONING CONTROL WIRING DIAGRAM (FRESH AIR TYPE)

THUNDERBIRD AIR CONDITIONING CONTROL WIRING DIAGRAM

METEOR, FAIRLANE, GALAXIE, MONTEREY AIR CONDITIONING CONTROL WIRING DIAGRAM "HANG ON" (POLAR AIRE) TYPE

COMET & FALCON AIR CONDITIONING CONTROL WIRING DIAGRAM "HANG ON" (POLAR AIRE) TYPE

GAUGE SET INSTALLATION: Remove service valve stem covers and make sure that both service valves are turned fully counterclockwise. Remove service valve gauge port covers, and attach flexible hoses of gauge set to gauge ports. Connect hoses from center fitting on gauge set manifold to tank of Freon and to vacuum pump. Turn both manifold gauges to a fully seated clockwise position and close vacuum pump valve. *NOTE - Manifold valves are so arranged that when turned fully clockwise, center manifold connection is cut off from gauges, but gauges continue to read pressures in their respective hoses.*

DISCHARGING THE SYSTEM: *CAUTION - Discharge refrigerant from system before replacing any part of the system except compressor.* Connect gauge set to manifold as indicated above (do not connect manifold center connection hoses to Freon tank or to vacuum pump). Place open end of hoses from center connection on manifold in garage exhaust outlet or into an open area having sufficient air movement to dissipate gas. Set high pressure gauge valve on manifold to open position (fully counterclockwise). Open high pressure service valve a slight amount and allow refrigerant to discharge from system. *CAUTION - Do not allow refrigerant to rush out, as compressor oil will be forced along with refrigerant.*

EVACUATING THE SYSTEM: Connect gauge set, refrigerant tank, and vacuum pump to system (see "Gauge Set Installation" above). Refrigerant tank valve must be tightly closed. Place both compressor service valves at mid-position, and both gauge manifold valves at open (counterclockwise) position. *CAUTION - If Gauge Set ACL-53-3 is used, close service and gauge set high pressure valves (vacuum will damage high pressure gauge).* Open vacuum pump valve and operate pump until low pressure gauge reads at least 25", and as close to 30" of vacuum as possible. Operate pump for 20-30 minutes until system is completely evacuated, then close pump valve and turn pump off.

►*FREON CHARGING NOTE:* Correct amount of refrigerant introduced into system must be accurately determined as follows: Before charging, place refrigerant tank in a container of warm water (not to exceed 150°F), then place container and tank on an **accurate** scale. Weigh assembly and record total weight. As refrigerant enters system, the exact amount in pounds can be determined.

CHARGING THE SYSTEM (PARTIAL CHARGE): *NOTE - If a loss of refrigerant is indicated by bubbles appearing in sight glass, system can be brought up to proper charge of refrigerant as follows:* Use same procedure as detailed below for completely charging system (do not evacuate system), and charge system until all foam or bubbles disappear from sight glass, then add an additional ¼-pound (Comet & Falcon), ½ pound (All Others) of Freon.

CHARGING THE SYSTEM (COMPLETE CHARGE): Evacuate system (see above). Set compressor service valves at mid-position and close vacuum pump valve. Open both manifold gauge valves and refrigerant tank valve and purge hoses at compressor, then close high pressure gauge valve and refrigerant tank valve. Place refrigerant tank in warm water and then on an accurate scale (see "Freon Charging Note" above). Open refrigerant tank valve, set air conditioner controls for

CONTINUED ON NEXT PAGE

FORD MOTOR CO. (C nt.)

maximum cooling and operate engine at 1500 RPM. Charge system until proper amount of refrigerant has been weighed in and no bubbles appear in sight glass. *See table below for system capacity. CAUTION - Do not let low pressure gauge exceed 60 lbs., or high pressure gauge exceed 240 lbs. (see below).* After proper charge made, close refrigerant tank valve, check system for proper operation and for leaks, place both service valves fully counterclockwise, remove gauge set, and cap service valve gauge ports and valve stems.

System Refrigerant Capacity

Car Model	Capacity
Comet & Falcon	2 lbs.
Fairlane & Meteor	2 lbs.
Galaxie & Monterey	2½ lbs.
Thunderbird	2¾ lbs.
Lincoln Continental	2½ lbs.

►*HIGH PRESSURE (DURING CHARGING) NOTE: If system pressure exceeds 60 lbs. (low pressure gauge), 240 lbs. (high pressure gauge), stop engine and check for cause which may be due to overcharge of refrigerant, overheated engine, or air in lines in combination with high surrounding temperatures.*

PURGING COMPRESSOR: Remove service valve stem caps and turn both valves fully clockwise (front seated). Remove both valve port caps and connect a hose from low pressure valve to a tank or can of refrigerant. Open tank valve slightly and let refrigerant flow into compressor from low pressure side, then close tank valve and install port cap on high pressure service valve. Remove hose from low pressure valve and install cap on valve port. Turn both valves fully counterclockwise (back seated) and install valve stem caps.

REMOVAL & INSTALLATION

CONDENSER: Comet & Falcon - Discharge system, then remove front grille-to-radiator support bracket and hood latch. Disconnect hoses from condenser and remove condenser. To install, reverse removal procedure, evacuate and charge system, and check for leaks.

Fairlane & Meteor: Discharge system and remove hoses from condenser. Remove fan, radiator and shroud. Remove condenser mounting bolts and remove condenser. To install, reverse removal procedure, evacuate and charge system, and check for leaks.

Galaxie & Monterey: Remove radiator and shroud, then discharge system. Disconnect hoses from condenser, remove condenser attaching bolts and remove condenser. To install, reverse removal procedure, evacuate and charge system, and check for leaks.

Thunderbird: Discharge system and remove upper radiator shield. Disconnect hoses from condenser, then remove condenser lower mounting bolts. Push top of radiator backwards a few inches and remove condenser. To install, reverse removal procedure, evacuate and charge system, and check for leaks.

Linc ln Continental: Discharge system. Remove upper radiator support shield and front bumper splash shield. Disconnect condenser hoses, remove condenser attaching bolts and remove condenser. To install, reverse removal procedure and tighten condenser attaching bolts to 60-65 inch-lbs. Evacuate and charge system, and check for leaks .

COMPRESSOR: All Models - Isolate compressor as follows: Turn both service valves fully clockwise (front seated), and loosen cap on high pressure valve gauge port so gas will escape until compressor is relieved of refrigerant pressure. To remove compressor, disconnect hoses from both service valves and clutch wire at bullet connector. Loosen mounting bracket bolts and remove drive belt, then remove mounting bolts and compressor. To install, reverse removal procedure and cut compressor back into system by evacuating at high pressure valve and turning both service valves fully counterclockwise (back seated). Add a partial charge of refrigerant if necessary, and check compressor oil level. *NOTE - If necessary to r mov compressor clutch, do so b for r moving compressor for ease in breaking clutch loos from shaft as f llows: Energize clutch, remov mounting bolt, and install a 5/8 - 11 bolt in clutch drive shaft hole. Tighten bolt until clutch breaks loos from shaft, th n disconnect clutch wire .*

GENERAL MOTORS CARS

Buick & Buick Special (1962)
Cadillac (1962)
Chevrolet Pass. Cars (1962)
Chevy II (1962)
Corvair (1962)
Oldsmobile & Oldsmobile F-85 (1962)
Pontiac & Pontiac Tempest (1962)

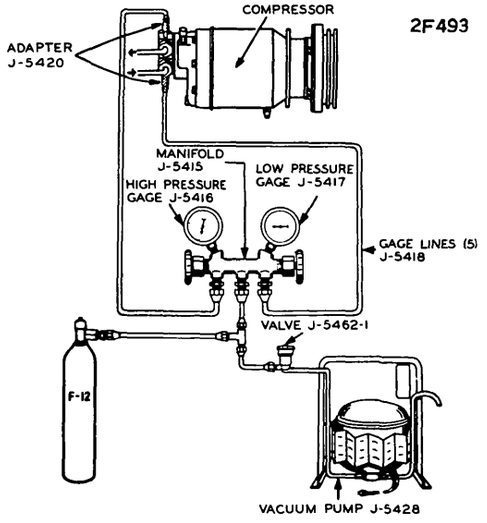
►CHANGES, CAUTIONS, CORRECTIONS

►*1962 BUICK (EXCEPT SPECIAL) REFRIGERANT LEAK CORRECTIONS:* 1) If system is known to be leaking and leak cannot be found, check for possibility of leak in suction throttle valve piston diaphragm. Leak at piston diaphragm will let refrigerant be drawn into engine through intake manifold and no external leak will exist. To check, remove vacuum hose from suction throttle valve vacuum diaphragm, allow a few seconds for refrigerant to collect in diaphragm, then leak test at vacuum hose connection. If leak exists, replace piston diaphragm.

2) If leak exists between Schrader valve gauge connector fitting and suction throttle valve body, make sure connector is tightened to 10 ft. lbs. If leak still not corrected, install later type valve body and connector having an "O" ring at fitting. *CAUTION - Various types of valve body used, make sure correct parts are obtained.*

►*1962 CHEVY II INADEQUATE AIR CONDITIONING BLOWER SPEED CORRECTION:* Make sure correct blower resistor, Part No. 3791410, located in blower housing, is installed.

►*1962 CHEVROLET PASS. & CHEVY II RESTORATION OF BLOWER HIGH SPEED AT NIGHT PROCEDURE (ALTERNATOR EQUIPPED CARS ONLY):* On alternator equipped cars **only**, night blower cut-back feature may be eliminated (blower high speed restored) if desired, as follows **Chevrolet** - Cut yellow wire from rectifier adapter terminal (which connects to relay), and ground this wire to blower at blower-to-case screw. **Chevy II** - Cut yellow wire at dimmer switch (from switch to rectifier adapter), and ground this wire beneath dimmer switch.



DESCRIPTION: Conventional type air conditioning systems similar to previous models. On most models, a suction throttle valve to control air outlet temperature is used in place of previous hot gas bypass valve. In this system, compressor operates all the time air conditioning is desired. On some other models a thermostatic switch on evaporator is used to control air outlet temperature by stopping and starting compressor as required. All models use a 6 cylinder compressor of double action piston design. All units are mounted in engine compartment or on front of dash. Cadillac Series 75 has an additional evaporator, suction throttle valve, and blower assembly in trunk. Some models use a "blower night cut-back" feature which does not permit blower to operate in high speed when headlights turned on. *NOTE - This cut-back feature may be eliminated on some cars - see above.* A muffler in compressor high pressure line is used on some models to reduce compressor noise.

►*SHUT-OFF VALVE NOTE:* Hand operated or Schrader type valves used in intake and discharge lines. *CAUTION - Schrad r typ valves ar op n d by sp cial adapters n charging h s s and h s s must b prop rly connected to th gaug s t, and s t manif ld valves must b completely closed b fore making c nn ctions to valves.*

►*SERVICE CAUTION: Before disconn cting any part of air conditioning system or lines, s "Air Conditioning Service Cautions" at b ginning of Air Conditioning Section.*

LEAK TESTING & TROUBLE SHOOTING: *S "L ak Testing & Trouble Shooting" at b ginning of Air Conditioning Section.*

CONTINUED ON NEXT PAGE

GAUGE SET INSTALLATION

GENERAL MOTORS CARS (C ntinued)

ADJUSTMENT

COMPRESSOR BELT: Adjust belt as follows:

Buick (Except Sp cial): Adjust belt so strand tension gauge J-7316 reads 90.

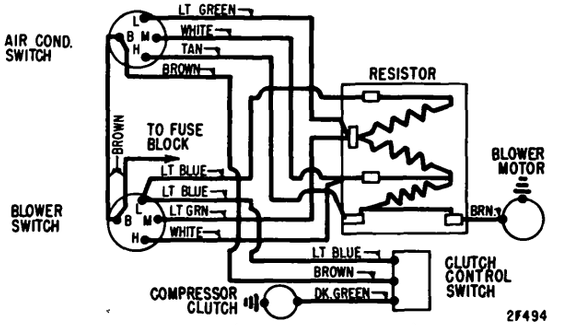
Buick Special: Adjust belt so strand tension gauge J-7316 reads 72.

Cadillac: Adjust belt tension for 90 lbs. (new belt), 60 lbs. (used belt) with Tension Gauge J-9646. *NOTE - This gauge should b us d to avoid internal compressor damage.*

Ch vr let, Ch vy II, C rvair: ½-¾" deflection with 15 lbs. load applied midway between crankshaft and compressor pulleys.

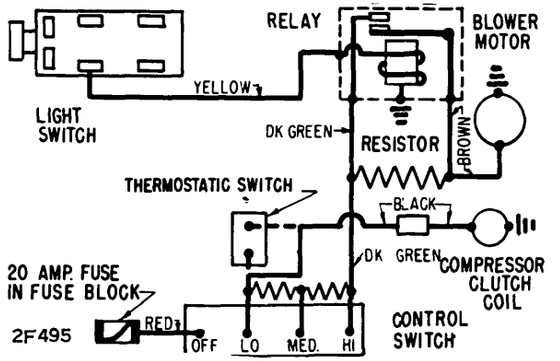
Oldsm bil & Oldsm bil F-85: With a strand tension gauge, adjust belt tension to 90 lbs. *This supersedes pr vious sp cifications. NOTE - If Gauge BT-33-70 is used, index groove on tool plunger should be aligned with th notches just above pointer. This supersedes pr vious setting.*

P ntiac & P ntiac Temp st: Adjust belt with Burroughs Belt Tension Gauge to obtain 100-105 lbs. belt tension.



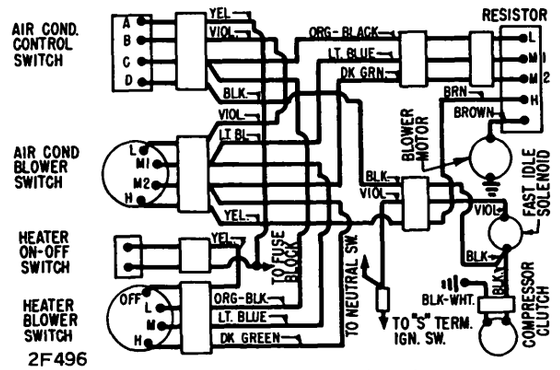
SERVICING

GAUGE SET INSTALLATION: Connect gauge set into system (see illustration and "System Gauge Connection Note" below). *NOTE - F r purging or adding oil to syst m, Freon tank and Vacuum Pump are not connected to cent r conn ction n manifold.* Make sure that shut-off valves on gauge set are fully closed and that shut-off valves on compressor head (cars with this type valve) are turned fully COUNTERCLOCKWISE (back seated).



►*SYSTEM GAUGE CONNECTION NOTE:* Usual location for gauge set connections is at the compressor, however some cars may have high pressure valve at compressor muffler inlet and low pressure valve in line near air intake pipe at dash panel. On cars with suction throttle valve, a low pressure gauge valve is also located on suction throttle valve (or on a pipe attached to valve). *CAUTION - Gauge valve at suction throttle valv MUST NOT BE USED TO CHARGE SYSTEM unl ss th r is no low pr ssure valve at compressor, or severe damage to suction throttle valve will result.*

►*SCHRADER TYPE VALVE CONNECTION CAUTION: On cars using this type valve in place of hand operated shut- ff valv s in r frigerant lines at compressor h ad, it is n c ssary to connect Adapters J-5420 to gauge conn cting lin s and to make sure that both valv s on gaug s t ar completely closed before conn cting adapt rs to Schrader type valves as the adapters will automatically open these valves.*



►*HAND OPERATED SHUT-OFF VALVE NOTE:* These are two-way valves. When turned COUNTERCLOCKWISE (back seated), compressor is connected to refrigerant lines and line to gauge fitting is closed. This is the normal operating position. When turned CLOCKWISE (front seated), compressor is closed off from refrigerant lines and open to gauge fitting. When valves are turned to middle position, compressor is open to both refrigerant lines and to gauge fitting. In this position, gauge readings can be taken with system in operation.

BUICK (EXCEPT SPECIAL)
AIR CONDITIONING WIRING DIAGRAM

BUICK SPECIAL AIR CONDITIONING WIRING DIAGRAM

CADILLAC SERIES 60 & 62
AIR CONDITIONING WIRING DIAGRAM

►*HIGH PRESSURE GAUGE CAUTION: Due to high operating capacity of compressor, a 600 lb. gauge must be used.*

ALL MODELS (EXCEPT CADILLAC, CHEVROLET & CORVAIR)

PURGING SYSTEM: Connect gauge set (see above), and turn hand shut-off valves (where equipped) partially clockwise. Open high pressure gauge valve so refrigerant escapes through gauge set and out the center fitting and hose. *CAUTION - DO NOT op n gauge valve too much as oil and liquid refrigerant will sc p . R frig rant should scap in vapor form only.* When hissing ceases, all refrigerant has been discharged from system. Close gauge high pressure valve. Leave gauge set connected in preparation for evacuating and charging.

CADILLAC

PURGING SYSTEM: Install Adapters J-5420 on high and low pressure valve fittings. Tighten adapters to depress valve cores until a **slight** hissing sound is heard. When hissing stops, system is discharged. *CAUTION - DO NOT overtighten adapters or oil and liquid refrigerant will escape. Refrigerant should escape in vapor form only.* Remove adapters as soon as system is purged.

CHEVROLET & CORVAIR

PURGING SYSTEM: Connect gauge set (see above).Open both compressor hand shut-off valves ¼-turn clockwise from fully counterclockwise position. *NOTE - Corvair has Schrader type valves and this step is unnecessary.* Remove cap from gauge center connection and open high pressure gauge valve, being careful not to open it too far, and slowly discharge **vapor** through center connection. *CAUTION - Opening valve too far will cause compressor oil to be discharged with th refrigerant.* When pressure is reduced below 100 lbs. on high pressure gauge, open low pressure gauge valve and continue discharging until all refrigerant has been released or pressure does not exceed 5 lbs. Close both gauge valves, and compressor hand shut-off valves. Leave gauge set connected in preparation for evacuating and charging.

ALL MODELS

EVACUATING SYSTEM (WITHOUT VACUUM PUMP): Connect gauges as indicated in illustration, but substitute a bottle or other suitable container in place of vacuum pump (container will catch the evacuated oil so it may be measured and a like amount of clean oil replaced). *CAUTION - Be sure the fitting on discharge valve is open to compressor with no restricti n from valve closure, caps, or plugs in attached lin before starting engine.* Turn both high and low pressure valves on compressor clockwise to gauge position. Leave low pressure gauge valve tightly closed, carefully open high pressure gauge valve and hand shut-off valve (vacuum line valve), being careful to avoid any accidental discharge of liquid refrigerant. Discharge refrigerant, air, and any oil into bottle. Start engine and set at low idle speed and turn air conditioner to maximum cooling position. *Maintain engin speed at slow idle at all times during evacuation.* Turn high pressure service valve to shut-off position. Operate system at low idle for five minutes, then turn off engine and air conditioner and close hand shut-off valve immediately. If system holds 26-28" of vacuum *(see "Vacuum Note" below)* for 10 minutes, system is not leaking. If not, locate and correct leak. Close high pressure gauge valve, open low pressure gauge valve and charge system with refrigerant at cylinder pressure, then repeat evacuation as indicated above. Again close high pressure gauge valve and open low pressure gauge valve and then complete charging with correct amount of refrigerant *(see "Charging System" below).*

EVACUATING SYSTEM (WITH VACUUM PUMP): Connect gauge set, vacuum pump, and container of refrigerant as shown in illustration. Check fluid level in vacuum pump and add correct oil if necessary. Make sure dust

GENERAL MOTORS CARS (C ntinu d)

loss, add oil according to table below plus amount for compressor as in 1) above.

1962 System Component Oil Capacity

Component	℄ Capacity
Evaporator	3 ozs.
Condenser	1 oz.
Receiver-Dehydrator	1 oz.

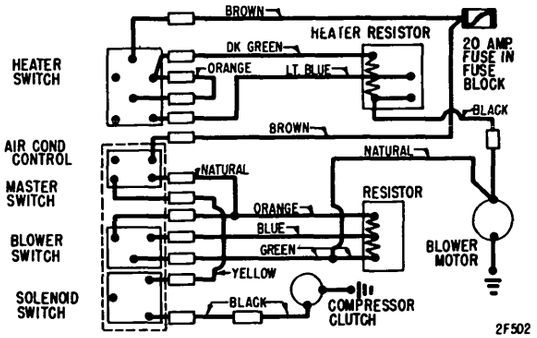
℄ - Fluid measure.

REMOVAL & INSTALLATION

►*CAUTION: To prevent dirt and moisture entering air conditioning system, it is very important to cap all openings and to complete work on system as soon as possible.*

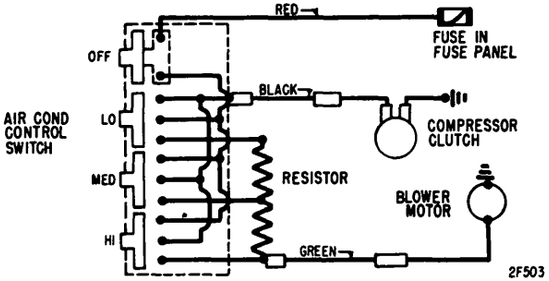
►*COMPRESSOR REMOVAL NOTE (TO WORK ON ENGINE):* If practicable or desirable, compressor may be repositioned in engine compartment for work on engine without disconnecting refrigerant lines. Follow procedure listed below but do not discharge system or disconnect compressor hoses.

COMPRESSOR: Buick (Except Special) - Purge system, then remove valve retaining plate from rear of compressor. Cover openings in lines and compressor. Disconnect clutch coil wire, loosen belts, and remove compressor from mounting bracket. To install, reverse removal procedure.



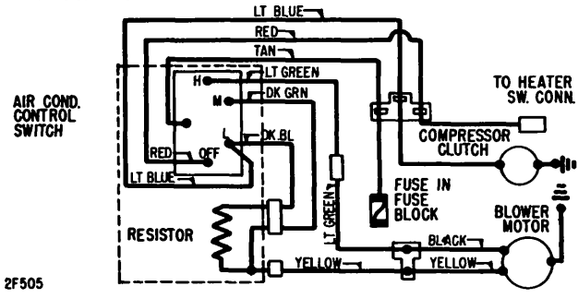
Buick Special (V6 Engine): Purge system, then remove line retaining plate bolt and remove lines from rear of compressor. Disconnect clutch wire from compressor, then remove belts. Remove rear head-to-rear bracket retaining bolts, then disconnect adapter from front mounting bracket and remove compressor. To install, reverse removal procedure.

Buick Special (V8 Engine): Discharge system and disconnect hoses from compressor. Raise car and disconnect front stabilizer bar. Disconnect compressor adapter from front bracket (or oil pump front bracket), then remove bolt holding compressor rear brace and rear head to cylinder block. Disconnect rear head from rear brace. Support compressor with stabilizer bar, roll compressor over and remove adapter from front head. Remove belt from pulley, slide stabilizer bar forward and remove compressor. To install, reverse removal procedure.



Cadillac: Purge system and disconnect hoses from compressor. Disconnect clutch coil wires and remove belt from compressor. Disconnect compressor from mounting brackets and remove compressor. To install, reverse removal procedure.

Chevrolet Pass. Cars: Purge system, and remove hose connector from compressor. Disconnect clutch coil lead, then loosen brace and pivot bolts and remove belt. Disconnect compressor brackets from mounting bracket and remove compressor. To install, reverse removal procedure.



Ch vy II: Purge system, then remove service valve connector from compressor. Disconnect clutch coil lead and remove compressor belt. Disconnect compressor brackets from mounting bracket and remove compressor. To install, reverse removal procedure.

OLDSMOBILE (EXCEPT F-85) AIR CONDITIONING WIRING DIAGRAM

OLDSMOBILE F-85 AIR CONDITIONING WIRING DIAGRAM

PONTIAC & TEMPEST "COOL PACK" AIR CONDITIONING WIRING DIAGRAM

Corvair: Removal - Purge system, remove fittings block, and cap openings. Remove nut from compressor mounting bracket pivot bolt and remove compressor-to-adjusting bracket attaching parts. Remove belt. Disconnect electrical wires from compressor. Remove bolts attaching triangular bracket to front of compressor. Work long pivot bolt forward until threaded end is moved out of compressor rear mounting boss. Remove compressor.

Installation - Support compressor on mounting bracket and work mounting bracket pivot bolt rearward through compressor rear mounting boss. Loosely install pivot bolt nut and washer. Attach triangular bracket to compressor. Connect wiring, install drive belt, and compressor-to-adjusting bracket attaching parts. Adjust belt tension (see above), then tighten pivot bolt nut to apply light pressure on rubber mounting.

Oldsm bile (Exc pt F-85): Remove caps from hand shut-off valves and turn both valves fully clockwise. Disconnect clutch coil wire from compressor, then remove belts. Remove shut-off valve assembly from compressor, disconnect generator from compressor and bracket, remove compressor-to-bracket bolts, and remove compressor. To install, reverse removal procedure.

Oldsmobile F-85 (With Pow r St ring): Drain radiator and remove power steering pump pulley and belt. Remove power steering pump front and rear stud nuts. Disconnect refrigerant hoses from service valves (either turn valves fully clockwise before disconnecting hoses, or purge system). *CAUTION - Disconnect hoses carefully to avoid sudd n discharg of refrigerant and oil.* Raise car and remove compressor front and rear pivot bolts and compressor adjusting bolts (leave front compressor bracket attached to compressor). Loosen power steering pump bracket-to-cylinder block bolt. Lower car and remove compressor bracket-to-engine front cover bolts, then power steering pump and bracket. Disconnect compressor bracket from cylinder head, and remove compressor and hoses by rotating pulley upwards. To install, reverse removal procedure.

Oldsmobile F-85 (Without P wer St ring): Drain radiator, then disconnect refrigerant hoses from service valves (either turn hand shut-off valves fully clockwise, or purge system). *CAUTION - Disconnect hos s carefully to avoid sudden discharge of refrig rant and oil.* Raise car and remove compressor front and rear pivot bolts and adjusting bolts (leave front compressor bracket attached to compressor). Loosen compressor bracket-to-cylinder block lower bolt. Lower car and disconnect brackets from engine front cover and cylinder head. Remove compressor and hoses by rotating pulley upward. To install, reverse removal procedure.

Pontiac (Except Tempest): *NOTE - Procedure below is for compressor removal to servic engine (without disconnecting refrigerant lin s).* Disconnect wiring from compressor, then remove drive belt. Disconnect rear brace from cylinder head, then remove compressor front plate and lower adjusting mounting bolts. Disconnect compressor rear plate from mounting bracket. Place compressor on fender. *CAUTION - Do not kink or place excessive tension on hoses.* To install, reverse removal procedure.

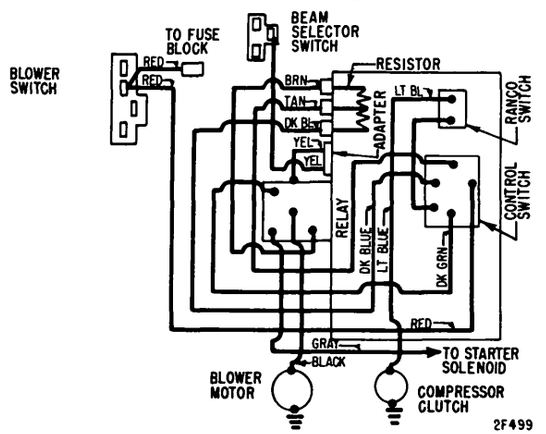
Pontiac Tempest: *NOTE - Proc dure b low is for compressor removal to service ngin (without disconnecting refrigerant lines).* Disconnect wiring from compressor, remove front and rear mounting plate-to-compressor bolts, and remove drive belt. Place compressor on fender skirt and secure in position. *CAUTION - Do not kink or place excessive t nsion on hoses.* To install, reverse removal procedure.

CONDENSER: Cadillac - Purge system and disconnect lines from condenser and sight glass. Remove cradle support-to-lock pilot bracket. Disconnect condenser from support brackets on radiator cradle, then remove condenser and receiver-dehydrator assembly. To install reverse removal procedure.

Chevrolet: Remove hood lock catch support, catch, and horns. Purge system and disconnect lines from condenser and receiver-dehydrator. Remove condenser-to-radiator support attaching bolts and remove condenser. To install, reverse removal procedure.

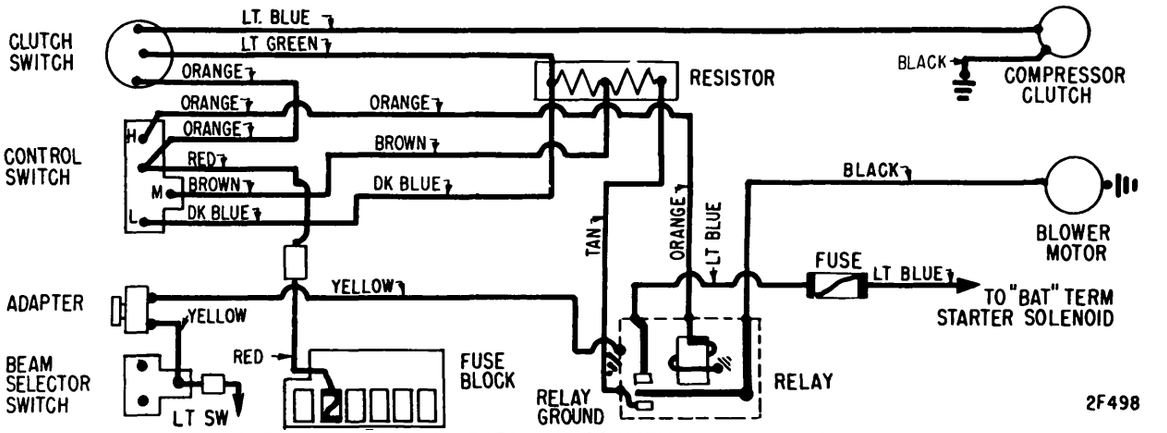
CONTINUED ON NEXT PAGE

GENERAL MOTORS CARS (C ntinued)



cap on discharge side of vacuum pump has been removed. Open high and low pressure valves on gauge set. *CAUTION – Shut–off valve on vacuum pump must be cl s d.* Start vacuum pump and SLOWLY open shut–off valve at pump. *NOTE – If oil is blown from pump, il must be r placed.* Operate pump to obtain approximately 28" of vacuum *(s e "Vacuum Note" below)* for 10 minutes. If vacuum of 28" cannot be obtained, close valve at pump and note low pressure gauge to see if vacuum in system holds. If vacuum holds, pump or gauge may be at fault. If vacuum will not hold, charge system with refrigerant, check for leaks, and repair as necessary, then purge system. Repeat evacuation procedure and when vacuum of 28" has been obtained for 10 minutes, close valve at pump, stop pump and check vacuum to see that it will hold. If vacuum holds and no leaks are apparent, open refrigerant container valve to charge system to cylinder pressure, then close valve. Evacuate system again and close gauge valves. The system is now ready for a complete charge.

►*VACUUM NOTE:* Vacuum specification of 28" is for sea level. For each additional 1000 feet of elevation above sea level, lower vacuum specification by 1".



ALL MODELS

►*CHARGING SYSTEM CAUTION: DO NOT CHARGE SYSTEM THROUGH GAUGE VALVE AT SUCTION THROTTLE VALVE UNLESS THERE IS NO LOW PRESSURE VALVE AT COMPRESSOR. Severe damage to suction thr ttl valv will result if system charged through this valv . Gaug valve at suction throttle valve is for syst m p rformance check only (unless th r is no gaug valv at compressor).*

CHARGING SYSTEM: With system completely evacuated (gauge set and refrigerant tank connected), place refrigerant cylinder in a bucket of hot water (not to exceed 125°F). *CAUTION – Do not heat refrigerant cylind r above 125°F b cause fusible plug in cylinder valve m lts at 157°F and softens at a slightly l wer t mp ratur .* Place cylinder and bucket on a suitable scale and record total weight. Open low pressure valve on gauge set (high pressure valve on gauge set closed). Set both high and low pressure service valves on compressor in gauge position. Wearing goggles to protect eyes, fully open refrigerant cylinder valve and allow refrigerant vapor to flow into system. Operate engine at slow idle speed until the correct amount of refrigerant has been charged into the system (see "Refrigerant Capacity Table" below). *NOTE – It may be necessary to reheat water in bucket to maintain required pressure.* Close both valves on gauge set, close valve on cylinder and remove cylinder from bucket. Operate compressor with engine running at 1600 RPM, and check removal performance of air conditioner. If performance satisfactory, stop engine, then firmly backseat both high and low pressure service valves on compressor. Remove gauge lines and replace protective caps over gauge connections and shut–off valves. Check oil level in compressor (see below).

CHEVROLET "COOL PACK" AIR CONDITIONING WIRING DIAGRAM

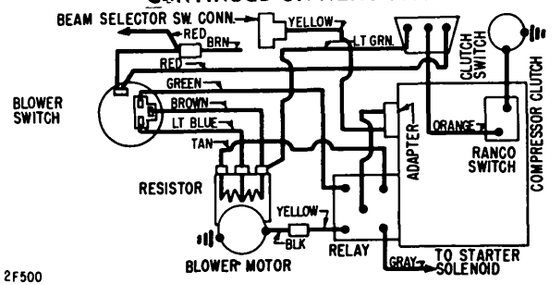
CHEVROLET "ALL WEATHER" AIR CONDITIONING WIRING DIAGRAM

1962 Refrigerant Capacity Table

Car Model	Capacity
Buick (Except Special)	4½ lbs.
Buick Special	2½ lbs.
Cadillac (Except Series 75)	4 lbs.
Cadillac, Series 75	5¼ lbs.
Chevrolet Cars (All Weather System)	3 lbs., 12 ozs.
Chevrolet Cars (Cool Pack System)	3 lbs.
Chevy II	2 lbs., 8 ozs.
Corvair	5 lbs.
Oldsmobile (Except F-85)	4 lbs., 4 ozs.
Oldsmobile F-85	2 lbs., 8 ozs.
Pontiac (Circ-L-Aire System)	4¼ lbs.
Pontiac (Cool Pack System)	3¼ lbs.
Pontiac Tempest	3 lbs.

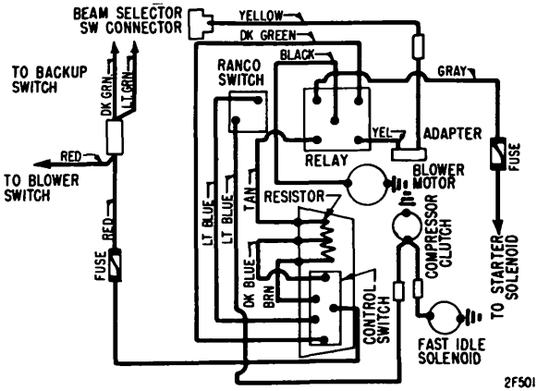
CHECKING & ADDING OIL: *CAUTION - Use only 525 viscosity refrigeration oil. See table below for system total capacities.*

1962 System Oil Capacity



Car Model	① Capacity
Buick & Buick Special	10½ ozs.
Cadillac	②
Chevrolet, Chevy II, Corvair	10 ozs.
Oldsmobile (Except F-85)	10½ ozs.
Oldsmobile F-85	10 ozs.
Pontiac & Tempest	③ 11 ozs.

① - Fluid measure. ② - Not specified. ③ - Full charge new.



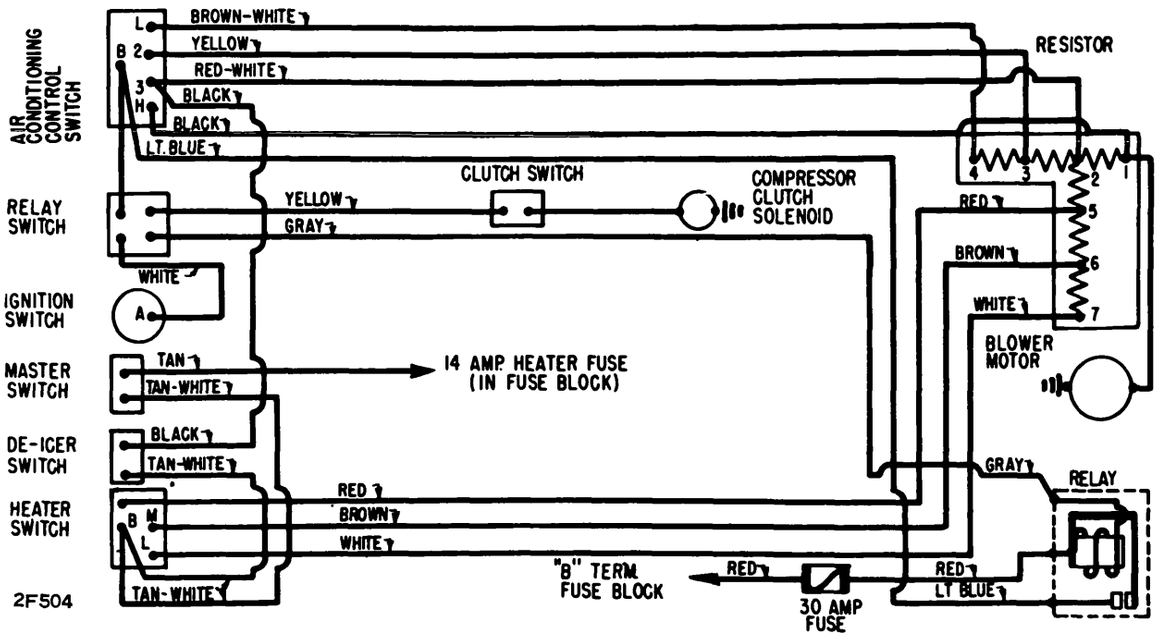
1) Compressor - Ordinarily compressor oil level need not be checked unless there has been a major oil loss from a broken hose or severe leak, or due to a collision. To check and determine how much oil to install, remove compressor, then drain and measure oil. If more than 4 ozs. drained, add the same amount. If less than 4 ozs. drained, add 6 ozs.

2) Other Components - If a system component (evaporator, condenser, receiver-dehydrator) being replaced (no major oil loss), pour oil directly into new unit according to table below. If there has been a major oil

CONTINUED ON NEXT PAGE

CHEVY II AIR CONDITIONING WIRING DIAGRAM

CORVAIR AIR CONDITIONING WIRING DIAGRAM



GENERAL MOTORS CARS (Continued)

Chevy II: Purge system. Remove bumper, bumper filler panel, grille, grille support, hook lock catch support and catch. Disconnect hoses from condenser and disconnect hoses from condenser baffle. Remove condenser-to-radiator support attaching bolts and remove condenser. To install, reverse removal procedure.

Corvair: *See "Engine Access Procedure Note" under TUNE-UP on Car Model pages.*

P ntiac (Except Tempest): Purge system. Remove right and left headlight doors and headlight assemblies. Remove upper grille bar and compressor discharge hose clamp. Disconnect hoses from compressor and cap openings. Remove battery and tray and disconnect right and left horns. Remove condenser. To install, reverse removal procedure.

Pontiac Tempest: Purge system, remove battery and right and left headlight doors. Remove radiator grille assembly, and hood latch bracket. Remove front fender and radiator brace assembly. Disconnect hoses from condenser and cap openings. Remove condenser attaching bolts and remove condenser. To install, reverse removal procedure.

PONTIAC "CIRC-L-AIRE" AIR CONDITIONING WIRING DIAGRAM

STUDEBAKER CORP. CARS

Studebaker, All Models (1962)

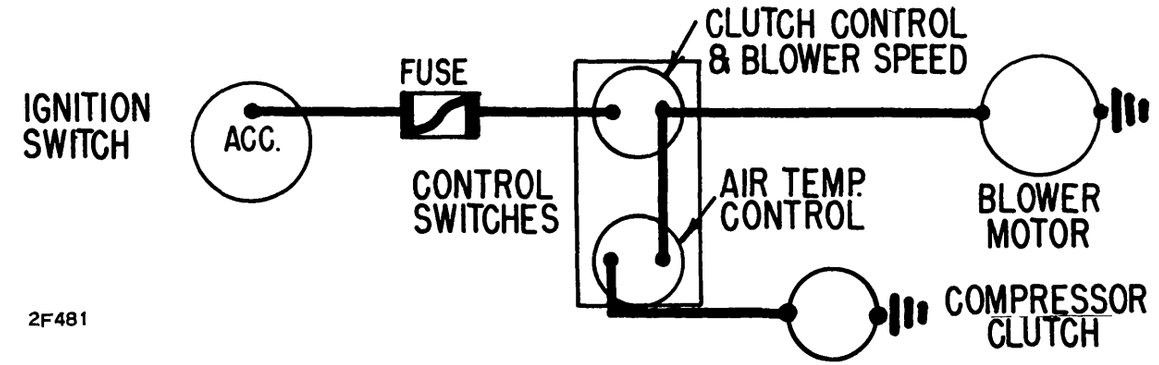
DESCRIPTION: Design and operation is similar to previous 1961 models. Sight glass is integral part of expansion valve and is located on right side of evaporator.

►*SERVICE CAUTION: Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.*

ADJUSTMENT

COMPRESSOR DRIVE BELT: Loosen idler pulley retaining nut and move pulley as required to tighten belt so a pull of 20 lbs. will deflect belt ½" with spring scale located midway between compressor pulley and idler pulley (6 cyl. models), between compressor pulley and fan pulley (V8 models).

SERVICING



►*AIR CONDITIONER SERVICE NOTE: All service operations except for removal and installation of compressor for engine repairs should be performed by a competent refrigerant service man.*

Refrigerant Capacity - 3 lbs.

►*COMPRESSOR REMOVAL NOTE:* For access to engine on Silver Hawk models, the compressor hoses can be released from clamps on body and fender and the compressor can be moved out of the way. On other models, if necessary to remove compressor from its mounting, see *"Compressor Removal" below.*

COMPRESSOR REMOVAL (When Necessary to Disconnect Hoses): Remove caps and close the upper and lower service valves on compressor, then remove capscrews securing the two valves to compressor. Place tape over openings in compressor and valves. Remove compressor from engine compartment. *CAUTION* - Keep compressor in its horizontal position.

Installation: Reverse removal procedure and install new valve-to-compressor gasket. Secure both valves in positions before opening valves. *NOTE - Before installing compressor belt, turn compressor over a few times by hand to discharge any oil that may have collected on top of piston.*

STUDEBAKER AIR CONDITIONING CONTROL WIRING DIAGRAM

RAMBLER

Rambler, All S ri s (1962)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961-62 AMERICAN (L-HEAD ENGINE) VIBRATION DURING AIR CONDITIONER OPERATION CORRECTION:* On cars without power steering, caused by slack in belt on drive side of compressor pulley which causes belt to pile-up and vibrate. To correct, install Idler Pulley Assembly Kit, Part No. 3203205. *NOTE - Belt adjustment on models with this idler pulley is diff rent (see below).*

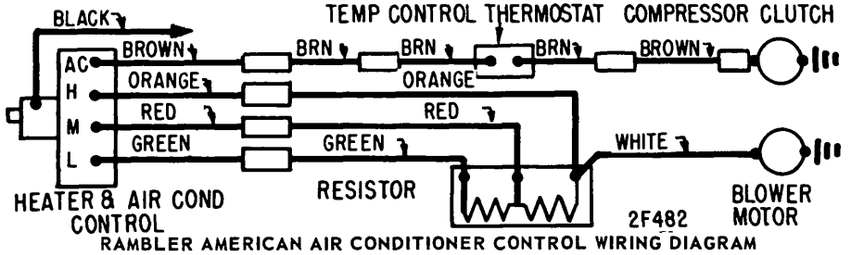
►*1962 AMBASSADOR VIBRATION DURING AIR CONDITIONER OPERATION CORRECTION:* May be caused by vibration in long belt span between crankshaft and compressor pulleys. To correct, install Idler Pulley Kit, Part No. 3204341.

►*1962 CLASSIC & AMBASSADOR AUXILIARY AIR VENT PRODUCTION CHANGE:* On cars after Body No. 46207, auxiliary air vent incorporated in discharge duct and grille for additional cooling for driver floor area. This outlet may be installed on 1961 and early 1962 cars if desired. Part Numbers are as follows: No. 3462647 (Deflector), No. 3462648 (Air Outlet Tube), No. G-161869 (Cross Recess Pan Head Screw).

►*1962 TEMPERATURE CONTROL THERMOSTAT PRODUCTION CHANGE & NOTE:* On cars after Build Sequence No. W-38579 (Classic), W-38321 (Ambassador), Body Nos. 28678 & A-10908 (American), manually adjustable temperature control thermostat installed in production to replace automatic type previously used. Conversion to manual type may be made if desired, by installing Kit, Part No. 3166229 (American), No. 3166230 (Classic & Ambassador). *See below for thermostat location and operation.*

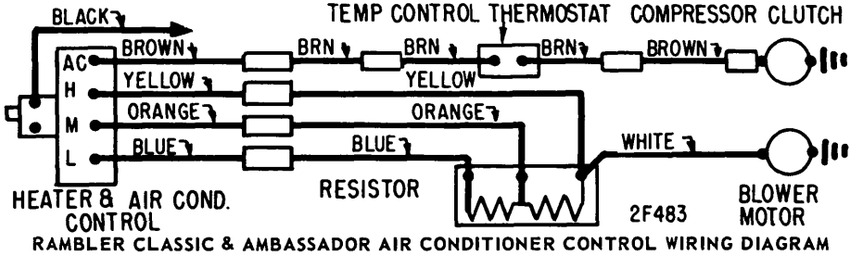
DESCRIPTION: Similar in design and operation to previous models with a manually operated temperature control thermostat on later cars (see "Production Change" above).

Temperature Control Thermostat (Manually Operated Type) - Located on left side of instrument panel over control console (American), over right hand ash tray (Classic & Ambassador) provides a temperature control range and a continuous operation feature. Control has variable temperature range of 37-62°F. When knob is turned clockwise through detent (click) position, system will run continuously in cold range of 37°F. *CAUTION - Use continuous operation position ONLY in desert or low humidity areas as evaporator coil will freeze up and result in loss of cooling.*



LEAK TESTING & TROUBLE SHOOTING: *See "Leak Testing & Trouble Shooting" at beginning of Air C nditioning Section.*

SERVICING



COMPRESSOR BELT: Use a strand tension gauge and place gauge between longest span between pulleys and move compressor or power steering pump on adjusting bracket to obtain a reading of 70-80 lbs. (used belt), 110-120 lbs. (new belt). *NOTE - On cars with idler pulley installed to correct vibration, adjust belt tension initially at compressor, then move idler pulley down into lower belt span until all slack is remov d from belt and tighten idler pulley mounting bracket nuts.*

►*OTHER DATA: See Page 539 in 1960 Final Data, or later Manual edition, and note the following:*

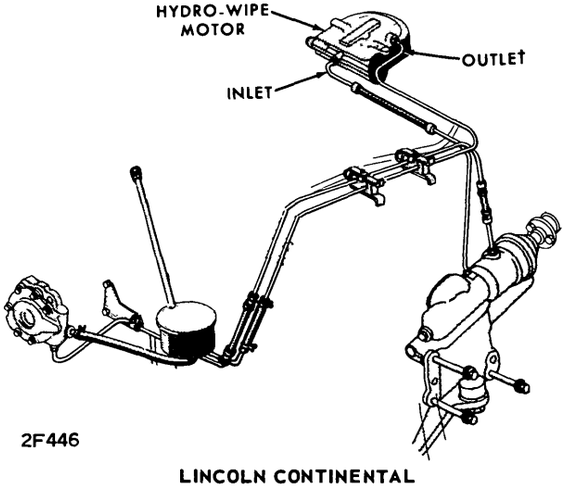
Freon Capacity - 2½ lbs. (American), 3 lbs. (Others).

RAMBLER AMERICAN AIR CONDITIONER CONTROL WIRING DIAGRAM

RAMBLER CLASSIC & AMBASSADOR AIR CONDITIONER CONTROL WIRING DIAGRAM

LINCOLN HYDRAULIC WINDSHIELD WIPER

Lincoln Continental (1962)



DESCRIPTION: Wip rs - Hydraulic type similar in design to previous models. Pressure regulator valve is now part of hydraulic motor assembly. Because radiator oil cooler is no longer used, oil return line is connected directly to power steering pump reservoir.

Wash r - An electric pump with a reservoir is mounted on right fender apron and controlled by washer switch mounted on windshield wiper control on instrument panel.

OPERATION: Wip rs & Washer - Operation is same as previous 1961 models.

TROUBLE SHOOTING: If power steering pump is operating properly but wipers do not, check control cable for proper operation and wiper arms for binding. If these items operate correctly, replace pressure regulator and motor assembly.

1962 WINDSHIELD WIPERS

LINCOLN CONTINENTAL HYDRAULIC CONTROL WINDSHIELD WIPER

REMOVAL & INSTALLATION: Pivot Shaft & Housing - Remove wiper arms and blades and cowl top ventilation grille and screen. On right side, disconnect drive arm from pivot shaft. On left side, disconnect drive arm from pivot shaft and from auxiliary drive. Remove pivot shaft retaining screws and nuts and remove pivot shaft and housing. To install, reverse removal procedure.

Wiper Motor: Remove washer coordinator hose, and oil return, feed, and control lines from motor. Disconnect and control cable at motor. Disconnect motor from auxiliary drive and remove motor. To install reverse removal procedure *and bleed power steering lines.*

Auxiliary Drive: Remove wiper arms and blades, ventilation grille and screen, and both washer nozzles. Disconnect pivot shaft drive arm from auxiliary drive. Remove attaching screws and remove auxiliary drive assembly. To install, reverse removal procedure.

Pressure Regulator Valve: Disconnect fluid lines at valve and remove valve attaching screws. Remove valve. To install reverse removal procedure *and bl ed power steering lines.*

CHRYSLER CORP. ELECTRIC TYPE

Chrysler & Imperial (1962)
Dodge & Dodge Dart (1962)
Plymouth (1962)
Lancer & Valiant (1962)

►*1962 DODGE & DART 2-SPEED WIPER ERRATIC OPERATION CORRECTION:* If equipped with foot operated windshield washer and wipers do not shut off or blades do not park properly after washer is used, trouble may be due to binding sliding switch contacts in washer pump. To correct, install a new switch, Part No. 2290628, as follows: Remove washer assembly from firewall and install the new switch on back side of washer assembly. Reinstall and check operation.

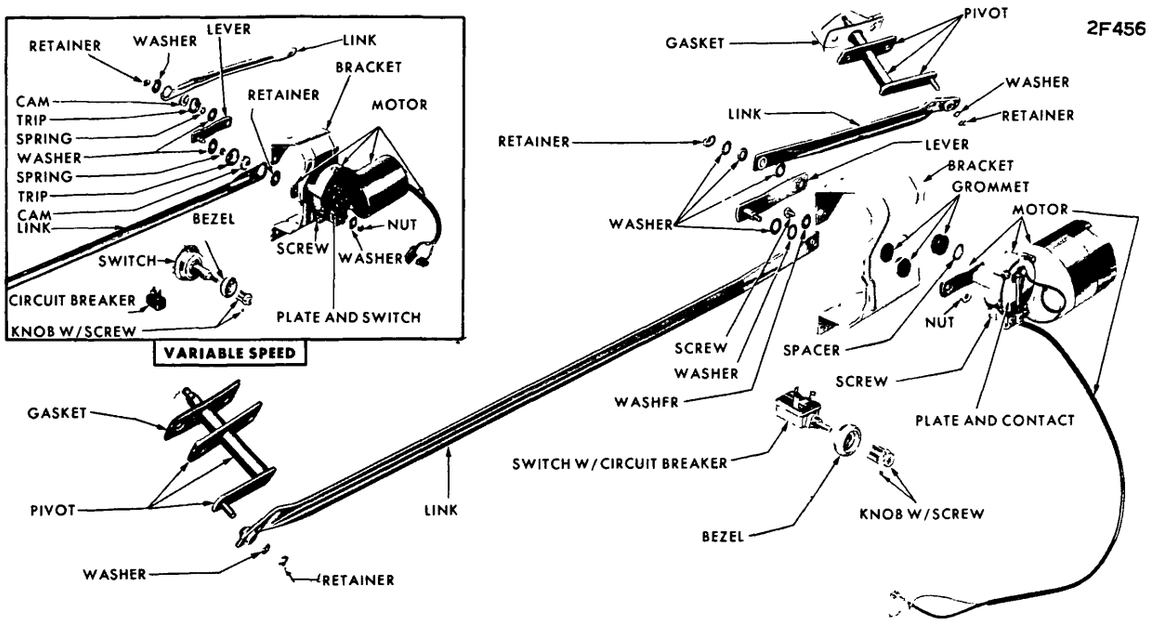
DESCRIPTION: Single and variable speed types used similar in design to previous models. Circuit breaker is built into wiper switch on single speed type, and attached to "B" terminal of switch on two-speed type. Two-speed type has "Off Glass" parking feature accomplished by reversing of motor and use of parking cams at pivot pins of intermediate crank arm.

TROUBLE SHOOTING & DIAGNOSIS: Wiper Operates Slowly - Linkage binding; High brush-to-armature contact; Carbon deposit in armature slots; Poor ground connection; Control switch faulty.

Wiper Inoperative: Linkage binding; Motor faulty; Wiring grounded or open; Control switch faulty. To check switch, connect a jumper wire from ammeter terminal post to windshield wiper motor terminal (A) on switch.

Motor Will Not Park: Poor ground at motor or control switch; Parking spring in parking switch plate bent too low and not breaking contact; Contact spring leaf on parking switch plate distorted; Contact points dirty or worn.

Wiper Blades Not Parking Off Glass (2-Speed Type): Parking switch out of adjustment; Link spring broken, not releasing, or not engaging stop on linkage.



Blades Slap Windshield Moldings: Link spring trip improperly installed; Motor and pivots misaligned.

Blades Chatter: Wax on glass; Improper type blade; Arm twisted. *CAUTION - DO NOT try to straighten bent or twisted arm.*

Wiper Switch Testing (1-Speed): Remove switch from instrument panel. Connect a test light between "B" terminal of switch and battery negative post. Connect battery positive post to switch "P" terminal. With switch in "off" position, lamp should light. Lamp should go out when switch turned to "on" position. Connect battery positive post to switch "A" terminall Test lamp should light when switch turned "on", and go out when switch turned "off".

Wiper Switch Testing (2-Speed): Remove switch from instrument panel. Connect battery positive post to switch case and to "F1" switch terminal. Connect a test lamp between battery negative post and switch "B" terminal. Lamp should light when switch turned on and gradually dim when switch rotated clockwise. Lamp should go out when switch turned "off".

ADJUSTMENT: Wiper Blades - Adjust motor switch plate so blades park as low as possible, then loosen blade arms at pivots. Place blades 1" above windshield molding (single speed), against windshield molding (2-speed), and tighten pivot attaching nuts.

CHRYSLER CORP. ELECTRIC WINDSHIELD WIPER MOTOR & TRANSMISSION ASSEMBLY (TYPICAL)

Armature Endplay: Turn endplay adjusting screw in until it bottoms and back out ¼-turn.

REMOVAL & INSTALLATION: Wiper Motor (Chrysler & Imperial) - Remove glove box door and glove box. Disconnect motor bracket from cowl panel and from instrument panel brace. Disconnect wiring from motor. Disconnect links at pivot cranks (remove clips by lifting top tab and sliding sideways out of engagement with groove in pivot crank pin). Remove spacer washer and link from pivot crank. Slide motor and link assembly to left so right hand link clears glove box opening, then remove assembly. *Do not bend links.* To install, reverse removal procedure and adjust blades.

Wiper Motor (Dodge, Dart, Lancer, Plymouth, Valiant): Remove radio, speaker grille, and radio speaker. Disconnect motor bracket from cowl panel and instrument panel brace. Disconnect wiring from motor. Disconnect links at pivot cranks (remove clips by lifting top tab and sliding sideways out of engagement with groove in pivot crank pin). *NOTE - Access to right pivot is through glove box opening.* Tip motor and bracket on its side and remove left link. Remove right defroster tube, and pencil brace between instrument panel reinforcement and wiper motor mounting. Remove motor and bracket through speaker opening. To install, reverse removal procedure and adjust blades.

MOTOR BENCH TEST: Single Speed - Connect battery positive terminal to motor ground strap, then connect black and blue wires to battery negative terminal. Motor should run. Remove black wire from battery (leave blue wire connected). Motor should park.

Two-Speed: Connect yellow wire to motor ground strap, then connect battery positive terminal to motor ground strap. Connect red and black wires to battery negative terminal. Motor should operate in wipe direction. Connect blue and yellow wire to battery negative terminal and connect battery positive terminal to motor ground strap. Momentarily touch black wire to yellow and blue wire. Motor should park.

OVERHAUL: Disassembly (1-Speed) - Disassemble wiper links from motor crank arm being careful to note exact position and sequence of all parts for correct reassembly. Remove switch plate, then remove motor crank nut, washers, and motor crank arm, being careful to note exact position and sequence of washers for reassembly. Remove nylon gear after noting its position. Remove endplate through bolts and remove endplate. Remove armature.

Disassembly (2-Speed): Disassemble wiper links from motor crank arm being careful to note exact position and sequence of all parts for correct reassembly. Remove endplate through bolts and remove endplate using care not to break lead wire to brush holder. Remove switch plate and cover, then remove crank arm nut, washers, crank arms, gear, and armature.

Inspection & Repair: Clean, inspect, and test motor parts in the usual manner for electric motors. Commutator may be refaced and mica undercut in the usual manner if necessary.

Reassembly (1 & 2-Speed): Reverse disassembly procedures and note the following: Be sure gear teeth are covered with long fibre grease. On single speed type, after armature, nylon gear, and crank arm are installed, index contact plate on nylon gear with slot pointing in **opposite** direction as motor crank arm. On two-speed type, install contact follower with open cam pointing in same direction as motor crank arm. Reassemble wiper links in the same order as they were originally assembled.

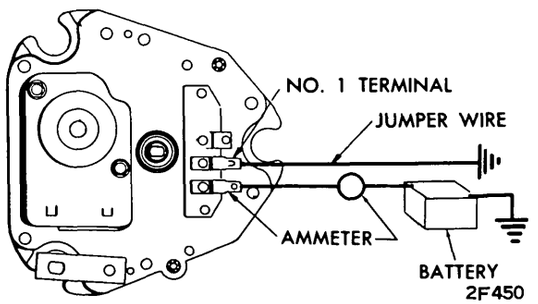
G.M. ONE-SPEED & TWO-SPEED ELECTRIC WIPER & WASHER (RECTANGULAR MOTOR)

Buick LeSabre, Invicta, Electra (1962) ℂ
Buick Special (1962)
Chevrolet Passenger Cars (1962) ℂ
Chevrolet Trucks (1962) ℂ
Corvair (1962)
Chevy II (1962)
Pontiac (1962) ℂ
Pontiac Tempest (1962)

ℂ - 2-Speed wiper is "Round Motor" type. *See Page 544 in 1960 Final Data, or later Manual edition.*

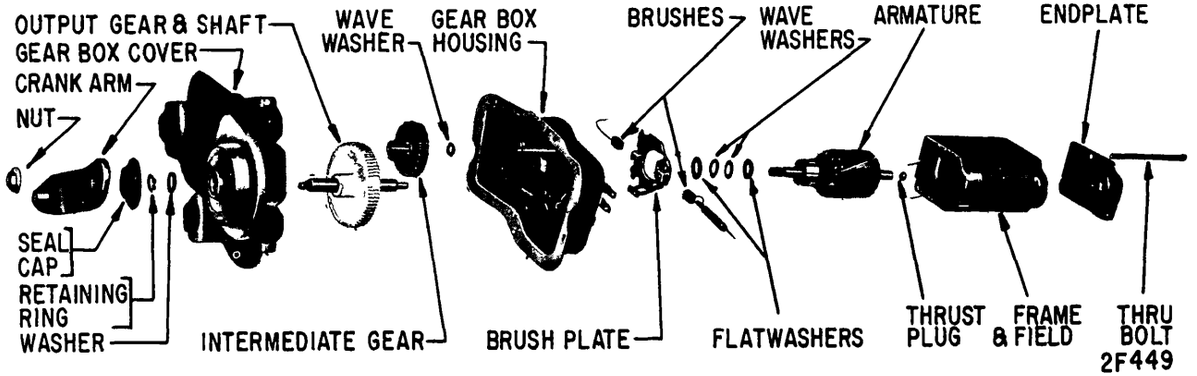
►*OLDSMOBILE & OLDSMOBILE F-85 NOTE:* 1 & 2-Speed wipers are same design as 1961 models. **1-Speed** - *See Page 544 in 1961 Final Data.* **2-Speed** - *See Page 544 in 1960 Final Data, later Manual edition.*

WIPER



DESCRIPTION: Single speed motor is a rectangular shaped shunt wound type motor similar to previous models. Two speed motor is also rectangular shaped and is compound wound (series and shunt field). Gear train consists of a helical gear at end of armature shaft which drives an intermediate gear and pinion assembly. Pinion drives output gear and shaft; and crank arm, attached to output gear shaft, drives wiper transmissions through connecting link arms. No internal circuit breaker in motor is used. Circuit protection for wipers is through a fuse on fuse block. *See individual Car Model Wiring Diagram on Car Model Pages.*

TESTING & TROUBLE SHOOTING



(1-SPEED)

ON CAR: Proceed as follows:

Wiper Inoperative; Check fuse, check for proper wiring harness terminal connections, ground strap at wiper properly connected, dash switch mounted securely. Disconnect wiring harness from wiper and check for voltage at harness terminals. No voltage indicates faulty car wiring. *CAUTION - DO NOT connect a hot line to No. 1 wiper terminal.* Connect 12 volts to No. 2 wiper terminal and a jumper wire from No. 1 terminal to ground. If wiper operates, dash switch or wiring is faulty. If wiper does not operate, disconnect transmission from crank arm. If wiper operates, linkage or transmission is faulty. If wiper does not operate, remove wiper and check as described under "Off Car" below.

SINGLE SPEED WIPER TEST CONNECTIONS

WINDSHIELD WIPER MOTOR & DRIVE ASSEMBLY (EXPLODED)

Wiper Will Not Shut Off: If wiper shuts off with wiring at dash switch disconnected, dash switch is faulty. If wiper operates with dash switch wiring disconnected, connect 12 volts to wiper No. 2 terminal. *CAUTION - DO NOT connect any jumper wire to No. 1 terminal.* If wiper shuts off correctly, lead between No. 1 terminal and dash switch is grounded. If wiper does not shut off, remove wiper and check as described under "Off Car" below.

Wiper Operates Intermittently: Check for loose ground strap, dash switch mounting, or loose connection.

Blades Fail To Return To Park Position: Check for dirty or broken park switch (remove wiper from car to check).

OFF CAR: Proceed as follows:

Wiper Inoperative: Connect a battery and ammeter to No. 2 wiper terminal and a jumper wire from No. 1 terminal to ground. If current draw 0 amps., check solder connection at terminal board, or disassemble motor (if necessary) and check all splice connections. If current draw 2-3 amps., disassemble motor and check for open armature, sticking brushes, improperly positioned brush springs, or faulty brush pigtail connections at splice joints. If current draw 10-12 amps., check for open shunt field circuit, or broken gear.

Wiper Runs Slow, Vibrates, and Current Draw Approximately 7-9 Amperes: Check for gear train binding, or shorted armature.

Wiper Shuts Off Before Crank Arm Reaches Park Position: If crank arm stops rotating as soon as jumper wire is disconnected from wiper No. 1 terminal, check for dirty, broken, or bent park switch contacts. *NOTE- When crank arm reaches park position, crank arm index grooves will line up approximately with ridges on gear box cover.*

Wiper Will Not Shut Off: If crank arm does not stop in park position when jumper wire removed from wiper No. 1 terminal, check that park switch contacts are opening, and that there is no ground in internal motor lead to No. 1 terminal.

(2-SPEED)

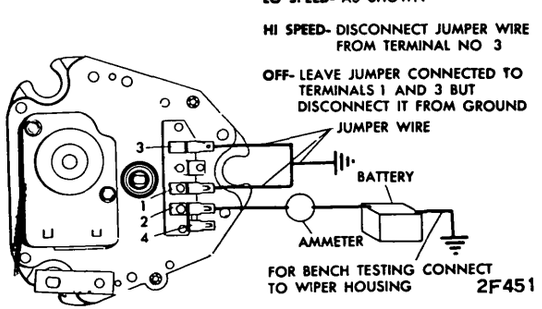
ON CAR: Proceed as follows:

Wiper Inoperative: Check wiring harness, wiper ground strap, and dash switch for proper connections and mounting. Check fuse. Check for voltage at wiper No. 2 terminal. To bypass switch, disconnect wiring at motor and connect a jumper wire from No. 1 & 3 terminals to ground, and a 12-volt source to No. 2 terminal. If wiper does not operate, disconnect transmissions from crank arm and operate. If wiper still does not operate, remove from car and test as indicated under "Off Car" below.

Wiper Will Not Shut Off: *NOTE - Wiper must operate in low speed during parking cycle.* Determine whether wiper has both speeds, low speed only, or high speed only, then operate wiper by bypassing switch as detailed under "Wiper Inoperative" above. If wiper operates correctly and had both speeds, lead to switch from No. 1 terminal is grounded. If wiper had low speed only, lead to switch from No. 3 terminal is grounded. If wiper had high speed only, lead to switch from No. 3 terminal is open. If wiper still does not operate, remove from car and check as indicated under "Off Car" below.

Wiper Operates In Low Speed Only and Shuts Off With Dash Switch In High Position: Reverse harness leads connecting to wiper No. 1 & 3 terminals.

Blades Do Not Return To Park With Wiper Off: Wiper ground strap may not be connected properly, or park switch contacts may be dirty, bent, or broken.



Wiper Speed Normal In Low, But Too Fast in High: Terminal board resistor may be open (remove from car to check).

Wiper Operates Intermittently: Loose wiper ground strap or dash switch mounting.

OFF CAR: Proceed as follows: *NOTE - Use ammeter of reading of 30 amperes minimum in feed wire circuit.*

Wiper Inoperative: Connect an ammeter and battery to No. 2 terminal, and a jumper wire from No. 1 & 3 terminals to ground (wiper will operate at low speed).

CONTINUED ON NEXT PAGE

TWO SPEED WIPER TEST CONNECTIONS

G.M. ONE-SPEED & TWO-SPEED ELECTRIC WIPER & WASHER (RECTANGULAR MOTOR) Cont.

If ammeter reading is 0, check for loose splice joints, or loose solder connection at No. 2 terminal. If reading 1-1.5 amps., check for sticking brushes, open armature, or loose splice joint. If reading 11.0 amps., check for broken gear or other stalling condition.

Wiper Will Not Shut Off: If wiper had both speed, park switch contacts may not be opening, or internal motor lead to No. 1 terminal is grounded. If wiper had low speed only, shunt field coil may be grounded, or internal wiper lead to No. 3 terminal is grounded. If wiper had high speed only, shunt field is open or internal lead to No. 3 terminal is open.

Wiper Operates Intermittently: Check for sticking brushes, loose splice joints, or other loose connections.

REMOVAL & INSTALLATION

TRANSMISSION: Remove arm and blade assemblies. Remove air intake grille and washer nozzles if equipped. Remove retaining clips holding crank arms to drive arms. Remove transmission attaching screws, and remove transmission.

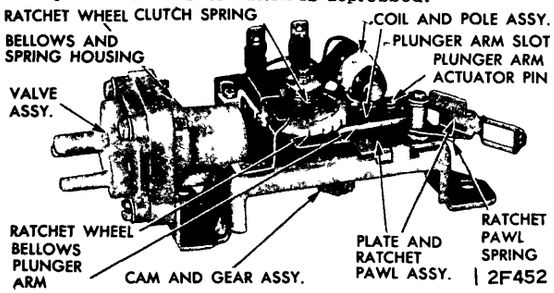
WIPER MOTOR: *NOTE - On some cars, motor is mounted under air intake grille. On other cars, motor is mounted on engine side of firewall and connected to transmission arm on inside of car.* Remove air intake grille if necessary. Remove hoses and wiring from motor, then disconnect motor crank from transmission arm. Remove motor attaching screws and remove motor (and washer pump). To install, reverse removal procedure.

OVERHAUL

GEAR BOX: Disassembly - If equipped with washer pump, remove pump from wiper. Remove pump drive gear if required by wedging off shaft with two screwdrivers. Loosen crank arm retaining nut, then remove seal cap, retaining ring and endplay washers. Drill out gear box cover rivets and remove cover. *CAUTION - Mark ground strap location for reassembly.* Remove output gear and shaft assembly, then slide intermediate gear and pinion assembly off shaft. Remove terminal board and park switch by unsoldering motor leads from terminals and drilling out rivets holding terminal board and park switch ground strap to plate.

Reassembly: *NOTE - Service kit is available which contains necessary screws, nuts, and washers to replace rivets removed at disassembly.* Reverse disassembly procedure and make sure cover is located properly over locating dowel pins. Be sure to install ground strap. Install crank arm on output shaft so identification marks line up with marks in cover. Clamp crank in vise before tightening retaining nut.

WIPER MOTOR: Disassembly - After gear box disassembled (see above), remove through bolts, tap motor frame lightly, and remove motor from mounting plate. Release brush spring tension and slide armature and endplate from motor frame. Pull endplate from armature. *NOTE - Some models have a thrust plug between armature shaft and endplate.* Remove endplay adjusting washers (note arrangement for proper installation).



R assembly: Reverse removal procedure. Lubricate armature shaft bushings with light machine oil. *CAUTION - Armatur ndplay is aut matically c ntr lled by proper installation f ndplay adjusting wash rs. Install wash rs with c ncav sid f wash rs t ward each oth r.*

1962 Wiper Sp cificati ns

	1-Sp d	2-Sp d
Current Draw (Amps.)		
No Load	3.0 max.	3.6 max.
Dry Windshield	3.5 max.	4.5 max.
Stall	11.0 max.	12.0 max.
Shunt Field Resistor	24 ohms	
Crank Arm Speed (RPM - No Load)		
Low Speed	43 min.	34 min.
High Speed	65 min.	

WASHER

DESCRIPTION: Positive displacement, bellows type pump mounted on shaft of wiper output gear. Starting and completion of a wash cycle is accomplished electrically and mechanically by a relay assembly and ratchet wheel arrangement. Washer is controlled by a dash switch washer button which mechanically turns on wipers when washer button is depressed.

WASHER PUMP & DRIVE ASSEMBLY

TESTING & TROUBLE SHOOTING

ON CAR: Proceed as follows:

Washer Inoperative: **1)** Check the following: Sufficient water solution in jar; hoses undamaged and connections tight; screen in jar cover hose not plugged; electrical connections tight; nozzle not plugged.

2) If washer inoperative after items listed above are checked, start **wiper motor only,** then push washer button and listen for "click" of washer relay. If no "click" heard, check for voltage at washer No. 2 terminal. No voltage indicates faulty wiring. If "click" is heard, proceed to **4)** below.

3) If voltage correct in **2)** above, connect a jumper wire from washer No. 1 terminal to ground and turn on wiper. If washer relay "clicks" and pump operates correctly, dash switch is faulty, or there is an open circuit between pump and switch. If no "click" heard, relay coil open.

4) If relay "click" was heard in **2)** above, listen for soft clicking of pump ratchet wheel rotating. If soft click not heard, pump is faulty. If soft click is heard and pump does not operate, valve assembly faulty.

OFF CAR: Proceed as follows:

Washer Inoperative: **1)** Remove pump cover and connect a battery to washer No. 2 terminal and to ground. Connect a jumper wire from washer No. 1 terminal to ground. Turn ratchet pawl so holding contacts are closed. Pawl should be pulled toward relay pole and engage ratchet teeth. If not, relay coil is open.

2) If relay and ratchet pawl operate correctly in **1)** above, manually rotate three-lobe cam 1 lobe clockwise (looking at cam). Relay holding contacts should close and pump plunger arm should be released from lock-out position.

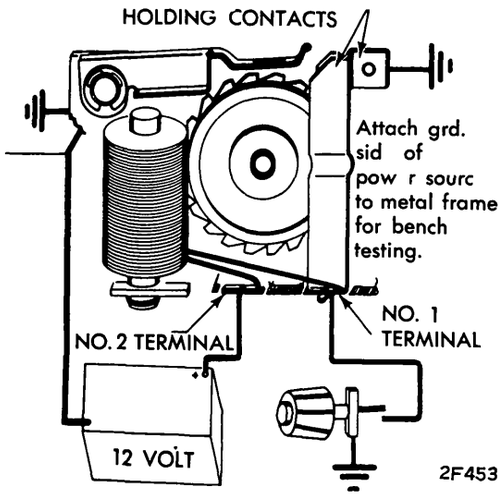
3) Disconnect jumper wire from No. 1 terminal. Relay coil should remain energized and hold ratchet pawl against ratchet wheel. If not, holding contacts are dirty.

4) If pump operated properly in **3)** above, manually rotate three-lobe cam until ratchet wheel has turned 360° or 21 teeth. At this point holding contact should be opened by "hump" on wheel and pump plunger arm should be in lock-out position.

Valve Assembly Checking: Attach a hose to intake (large) pipe. You should be able to blow through pipe, but not draw through it. Attach a hose to each exhaust (small) pipe. You should be able to draw through each pipe but not blow through them. If any valve allows air to pass in both directions, valve assembly is faulty.

OVERHAUL

RELAY: Remove washer pump cover and unsolder coil leads from terminals. Remove coil retainer clip and remove coil assembly from mounting bracket. To install, reverse removal procedure.



RATCHET PAWL: Remove washer pump cover and disengage spring from ratchet pawl. Remove "E" ring and slide pawl from shaft. To install, reverse removal procedure, and make sure spring is properly assembled before replacing pump cover.

VALVE ASSEMBLY: Remove valve assembly-to-bellows housing attaching screws and remove valve. *CAUTION - If necessary, car fully pry b ll ws lip ut of valve body groove.* To install, reverse removal procedure (make sure bellows lip in valve body groove).

BELLOWS: Remove valve body (see above), then manually operate pump to release pump from lock-out position. Hold bellows plunger arm from moving, push in on bottom of bellows with thumb and twist bellows 90°. Bellows and bellows spring should be released. To install, reverse removal procedure.

1962 Washer Pump Specificati ns

Number of Squirts - 12 (at full pressure).
Pressure - 11-15 lbs.
Coil Resistance - 20 ohms.

WASHER PUMP TEST CONNECTIONS

CHECKER, RAMBLER, WILLYS VACUUM TYPE

Checker (1962)
Rambler, All Models (1962)
Willys Utility Models & Trucks (1962)

DESCRIPTION: Vacuum operated type controlled by a pull type control on instrument panel. Drive is through link and crank arm arrangement (Checker & Rambler), through tension cables and pulley arrangement (Willys).

CABLE TENSION ADJUSTMENT (WILLYS): Make sure tensioner-to-firewall bolts are tight. *NOTE - Adjustment can be made at either right or left tensioner, or at both tensioners.* Loosen cable tensioner locknut on tensioner bracket. Slack in cables should be taken up automatically. If necessary, tap stud lightly to unseat lockwasher between bracket and base, then pry tensioner bracket slightly outboard to induce tensioner spring to take up slack. Tighten locknut firmly. If wipers still slap, reposition wiper arms one serration at a time until slap eliminated. *NOTE - If slap not eliminated, modify tensioners as indicated below.*

►*WILLYS TENSIONER MODIFICATION (TO ELIMINATE WIPER BLADE SLAP):* Elongate mounting holes in tensioner bracket toward center of vehicle 1/16". Bracket will now move outboard 1/16" additional for more tension on cables. Install bracket in new mounting position and check that cables have no interference.

REMOVAL & INSTALLATION (RAMBLER): As follows:

Wiper Arm: Lift arm against spring tension and slide cap away from serrated pivot shaft with screwdriver. To install, reverse removal procedure and note that motor should be in park position and that right blade should rest above left blade.

Pivot Shaft & Link (American): Remove glove box and defroster hose (unnecessary to remove radio). Remove wiper arm and blade assembly, then remove pivot shaft-to-cowl top nut and spacer. Disconnect link end from motor arm. Remove pivot shaft. To install, reverse removal procedure.

Pivot Shaft & Link (Classic & Ambassador): Disconnect link from motor and remove cowl vent intake cover-to-cowl top screws. Close hood and remove wiper arms and blades from pivot shaft. Remove pivot shaft hexagon nut and spacers, then remove cowl vent intake cover by lifting upward and disengaging from pivot shafts. Remove brass french nuts holding pivot shafts to cowl top and remove pivot shafts through opening in cowl top or wiper motor compartment. To install, reverse removal procedure.

Wiper Motor (American): Motor is mounted on a cover plate fastened to dash panel under instrument panel. Remove radio and bezel, and lower complete air conditioning unit from dash. Disconnect pivot shaft links from motor arm studs (remove spring clips), then remove cover plate-to-motor, and cover plate-to-dash mounting screws. Turn motor arm to vertical position (use wiper control), then raise cover plate high enough so upper end of motor arm will pass through cover plate hole. Lower plate and remove from wiper motor. Feed additional wiper hose and control cable into air intake chamber to lower motor so hose and cable can be disconnected from motor. Plastic cover must be removed before control can be disconnected. To install, reverse removal procedure and note the following: Control cable must be installed with washer at end of wire inserted in slot in slide valve. Conduit must butt against shoulders of anchoring slot and be fastened securely for proper valve operation. Check mounting gasket for proper sealing and control cable for kinks and bends.

Wiper Motor (Classic & Ambassador): Disconnect water hoses from heater core and plug (unnecessary to drain cooling system). Remove wiring harness clips at each hood hinge, then disconnect heater motor wires. Remove heater shroud, heater core and motor as an assembly. Mark location of wiper motor access hole cover and remove cover (cover holes must align with holes in shroud at reassembly). Disconnect link-to-motor retainers (retainers are key slotted and slide into a groove in actuating stud). Disconnect motor from bracket. Remove plastic cover, hose, and control cable from motor. Note location of control cable arm as it must butt against shoulder in recess in mounting bracket for proper adjustment when reinstalled. Remove motor. To install, reverse removal procedure and check hose and control cable for interference with pivot body shaft link, and air intake chamber hoses for drainage.

Wiper Control & Cable (American): Remove cable control knob. Remove wiper motor (see above) and disconnect control cable from motor. Remove control retaining nut on instrument panel, then remove control and cable. To install, reverse removal procedure and do not kink cable. *NOTE - Cable must be installed with washer at end of control wire inserted in slot in slide valve, and conduit must butt against shoulders of anchoring slot and fastened securely to insure proper operation of slide valve.*

Wiper Control & Cable (Classic & Ambassador): Remove wiper motor (see above). Remove control knob from shaft (retained by setscrew), then disconnect cable and conduit from motor. Remove control body-to-instrument panel attaching french nut and remove control unit and cable assembly. To install, reverse removal procedure making sure cable is routed properly through underside of instrument panel. *NOTE - To prevent kinks, cable should pass under defroster tube.*

STUDEBAKER CORP. ELECTRIC TYPE

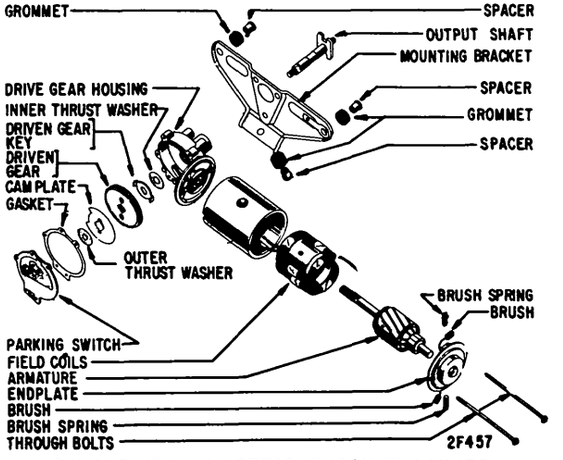
Studebaker, All Models (1962)

DESCRIPTION: Two-speed electric type windshield wiper with drive to wiper blades through link and crank arm arrangement. Design and operation is similar to that used on previous models

►*WIPER MOTOR NOTE:* Prestolite (Autolite) and American Bosch type motors used.

ADJUSTMENT: Wiper Blade Park Position - Operate wiper for a few minutes to bring to operating temperature. If blades do not park properly move lever (Prestolite), turn hex head (Bosch) on front of wiper drive as required. Test operation and readjust as necessary.

Wiper Arm Tension: Hook a spring scale under wiper arm at point where connected to blade. Pull away from windshield and right angle until blade is just off glass. Jiggle wiper arm with free hand until arm reaches free rest position. Scale reading should be 7½-8½ ozs. If below 7½ ozs., oil tension spring and arm pivot rivet. If tension does not increase, replace arm. If reading above 8½ ozs. bend outer section of arm slightly. If correct pressure cannot be obtained by bending, replace arm.



TESTING: Wiper blade speed should be 80-90 sweeps per minute (low speed), 132-135 sweeps per minute (high speed) on wet windshield (or with paper boot on blade). If wiper speed slow, check for fully charged battery and good electrical connections. Wiper arm tension may be too high (see "Adjustment" above). Links and drivers may be binding. If speed not within limits with main link disconnected from motor, replace motor.

REMOVAL & INSTALLATION:

Wiper Motor (Except Hawk): Disconnect battery and remove cowl air intake grille and screen. Disconnect multiple connector near motor and remove main wiper link retaining nut from motor drive shaft, then remove links from shaft. Remove wiper motor attaching nuts and remove motor. To install, reverse removal procedure.

Wiper Motor (Hawk): Remove radio and disconnect wiring from wiper switch. Swing aside cover on main link and remove main link nut, then remove main link from motor drive shaft. Disconnect motor from cowl panel and cowl panel flange, then remove motor. To install, reverse removal procedure.

Wiper Link & Driver: Remove clip from main link pin and remove right connecting link from pin. Remove wiper arms. Remove driver retaining nuts on outside of cowl and remove spacers and gaskets. Slip drivers down through cowl panel and remove driver and connecting link assemblies. *NOTE - Left connecting link cannot be removed from main link, and driver and connecting link for each side is serviced as an assembly. DO NOT disassemble driver.* To install, reverse removal procedure and note the following: Flanges of connecting links must face to rear of car, and links must be below drivers. To position main link properly on drive shaft, start motor and turn switch off. When motor stops place main link on drive shaft so lugs fit in drive slots. End of left link must be to left of center of main link and pin must be to right of center of main link. Install and tighten main link nut, then install right connecting link.

STUDEBAKER ELECTRIC WINDSHIELD WIPER MOTOR & DRIVE ASSEMBLY

1963 FINAL
NATIONAL SERVICE DATA

NATIONAL AUTOMOTIVE SERVICE
BERKELEY 10, CALIFORNIA

An entirely new system of indexing has been developed for the 1963 Final Data. It has been designed to quickly locate each and every subject.

The GENERAL INDEX, starting on the next page, lists individual car service items alphabetically by car models.

The EQUIPMENT INDEX, on pages 11 to 13 following the General Index, lists Equipment Articles alphabetically.

LATEST CHANGES & CORRECTIONS are printed on ORANGE paper at the end of this issue, starting on page 561. See individual Car and Equipment pages for other Changes & Corrections.

TUNE-UP NOTES

► *1963 AMERICAN WITH RBS CARB (L-HEAD ENG) STEP-UP ROD DIAPHRAGM COVER PRODUCTION CHANGE* For positive seal at step-up rod diaphragm cover, new method of retaining cover used on carburetors effective Date Code K-2 (date stamped on carburetor flange) New method uses a flat washer pressed into diaphragm retainer Split Wire Ring, No 3204528, and Conical Washer, No 3204529, are available for service *See "Carter RBS Single Barrel Carburetor" in Carburetion Section*

► *1963 AMERICAN (OHV ENGINE) CONSTANT THROTTLE SURGE & ACCELERATION STUMBLE CORRECTION* 1) On cars before Sequence No E-40006, install Carburetor No 2387-1A (Holley No) This is the later production carburetor used on Classic models *Be sure to install the dashpot on "E-Stick" cars*

2) On cars after Sequence No E-40005, Kit, No 3204569, may be installed *See "Holley 1909 Single Barrel Carburetors" in Carburetion Section for details*

► *1963 AMERICAN (L-HEAD ENG) COIL PRODUCTION CHANGE* For improved cold weather starting, higher capacity coil, Delco-Remy No 1115033, installed effective Engine Code No 410A08 Coil may be installed on 1960-63 earlier cars to improve cold weather starts

► *1963 DISTRIBUTOR HOLD-DOWN CLAMP SCREW PRODUCTION CHANGE (OHV 6 CYL ENGINES)* Revised torque of 10-15 ft lbs supersedes previous 4-6 ft lbs

IGNITION TIMING

Set timing at specified idle speed. Degrees given are BTDC except as noted.

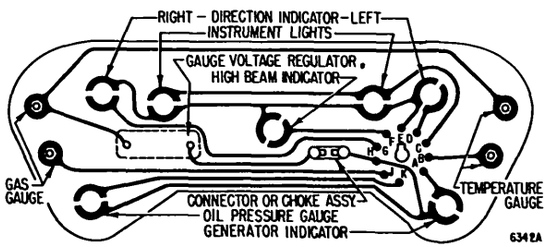
ALTERNATOR REGULATOR

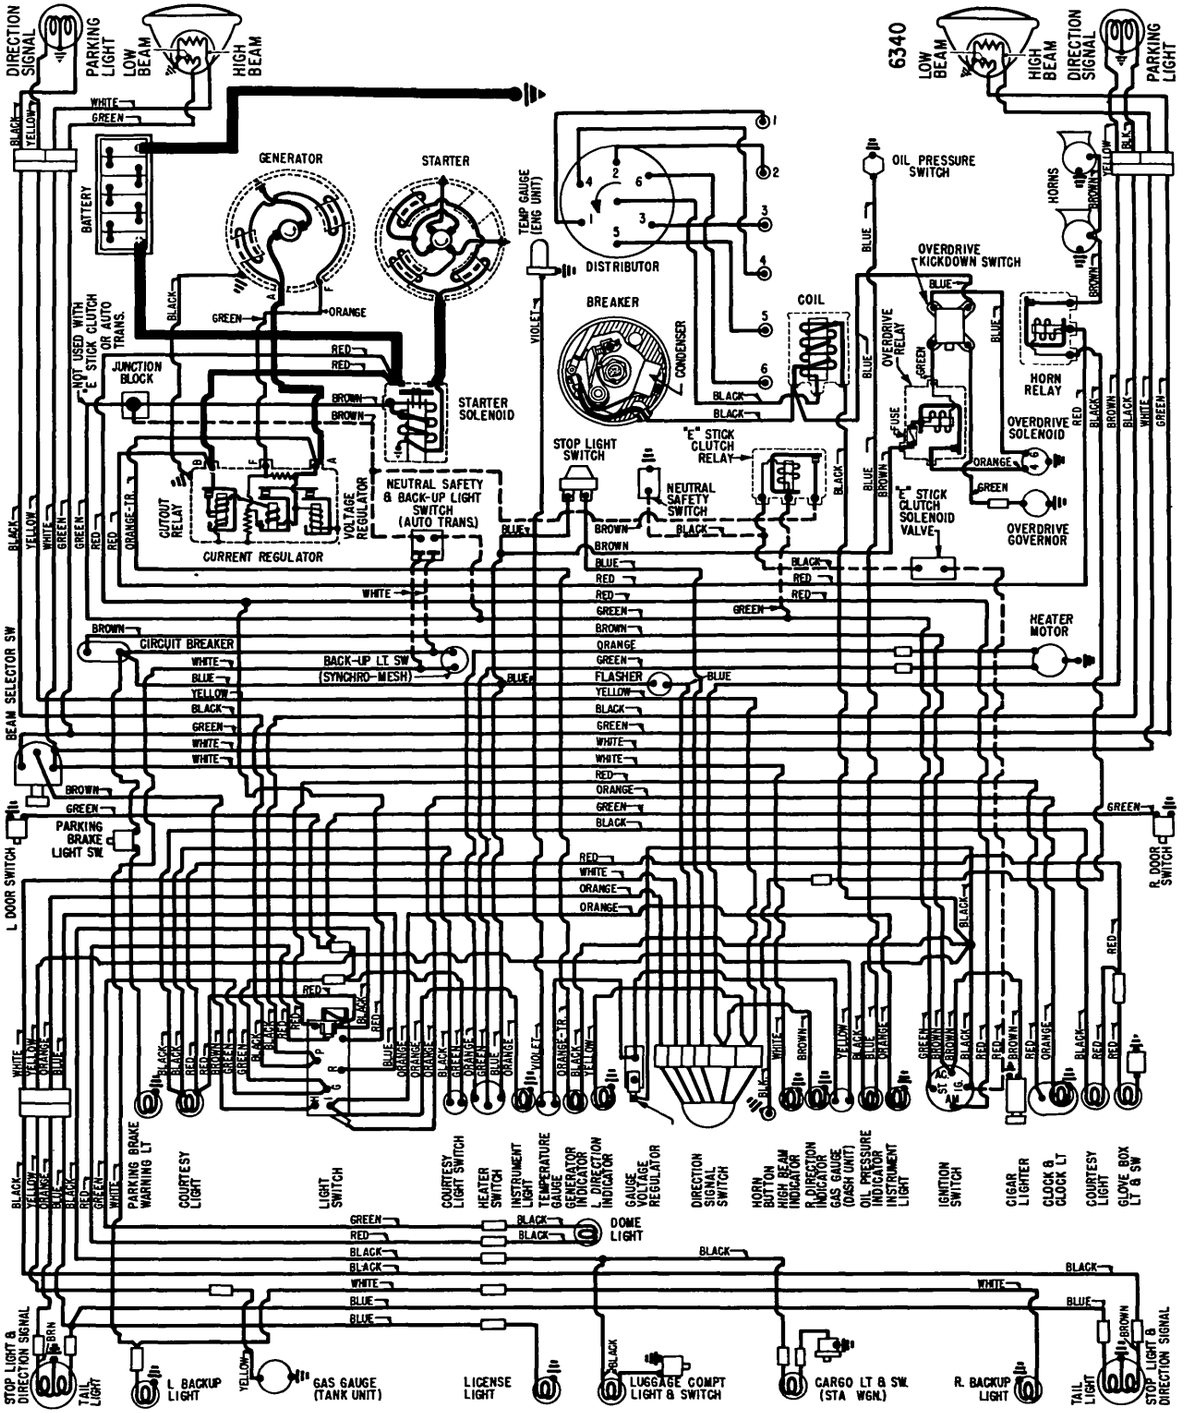
DELCO-REMY

D lc -Remy 1119512



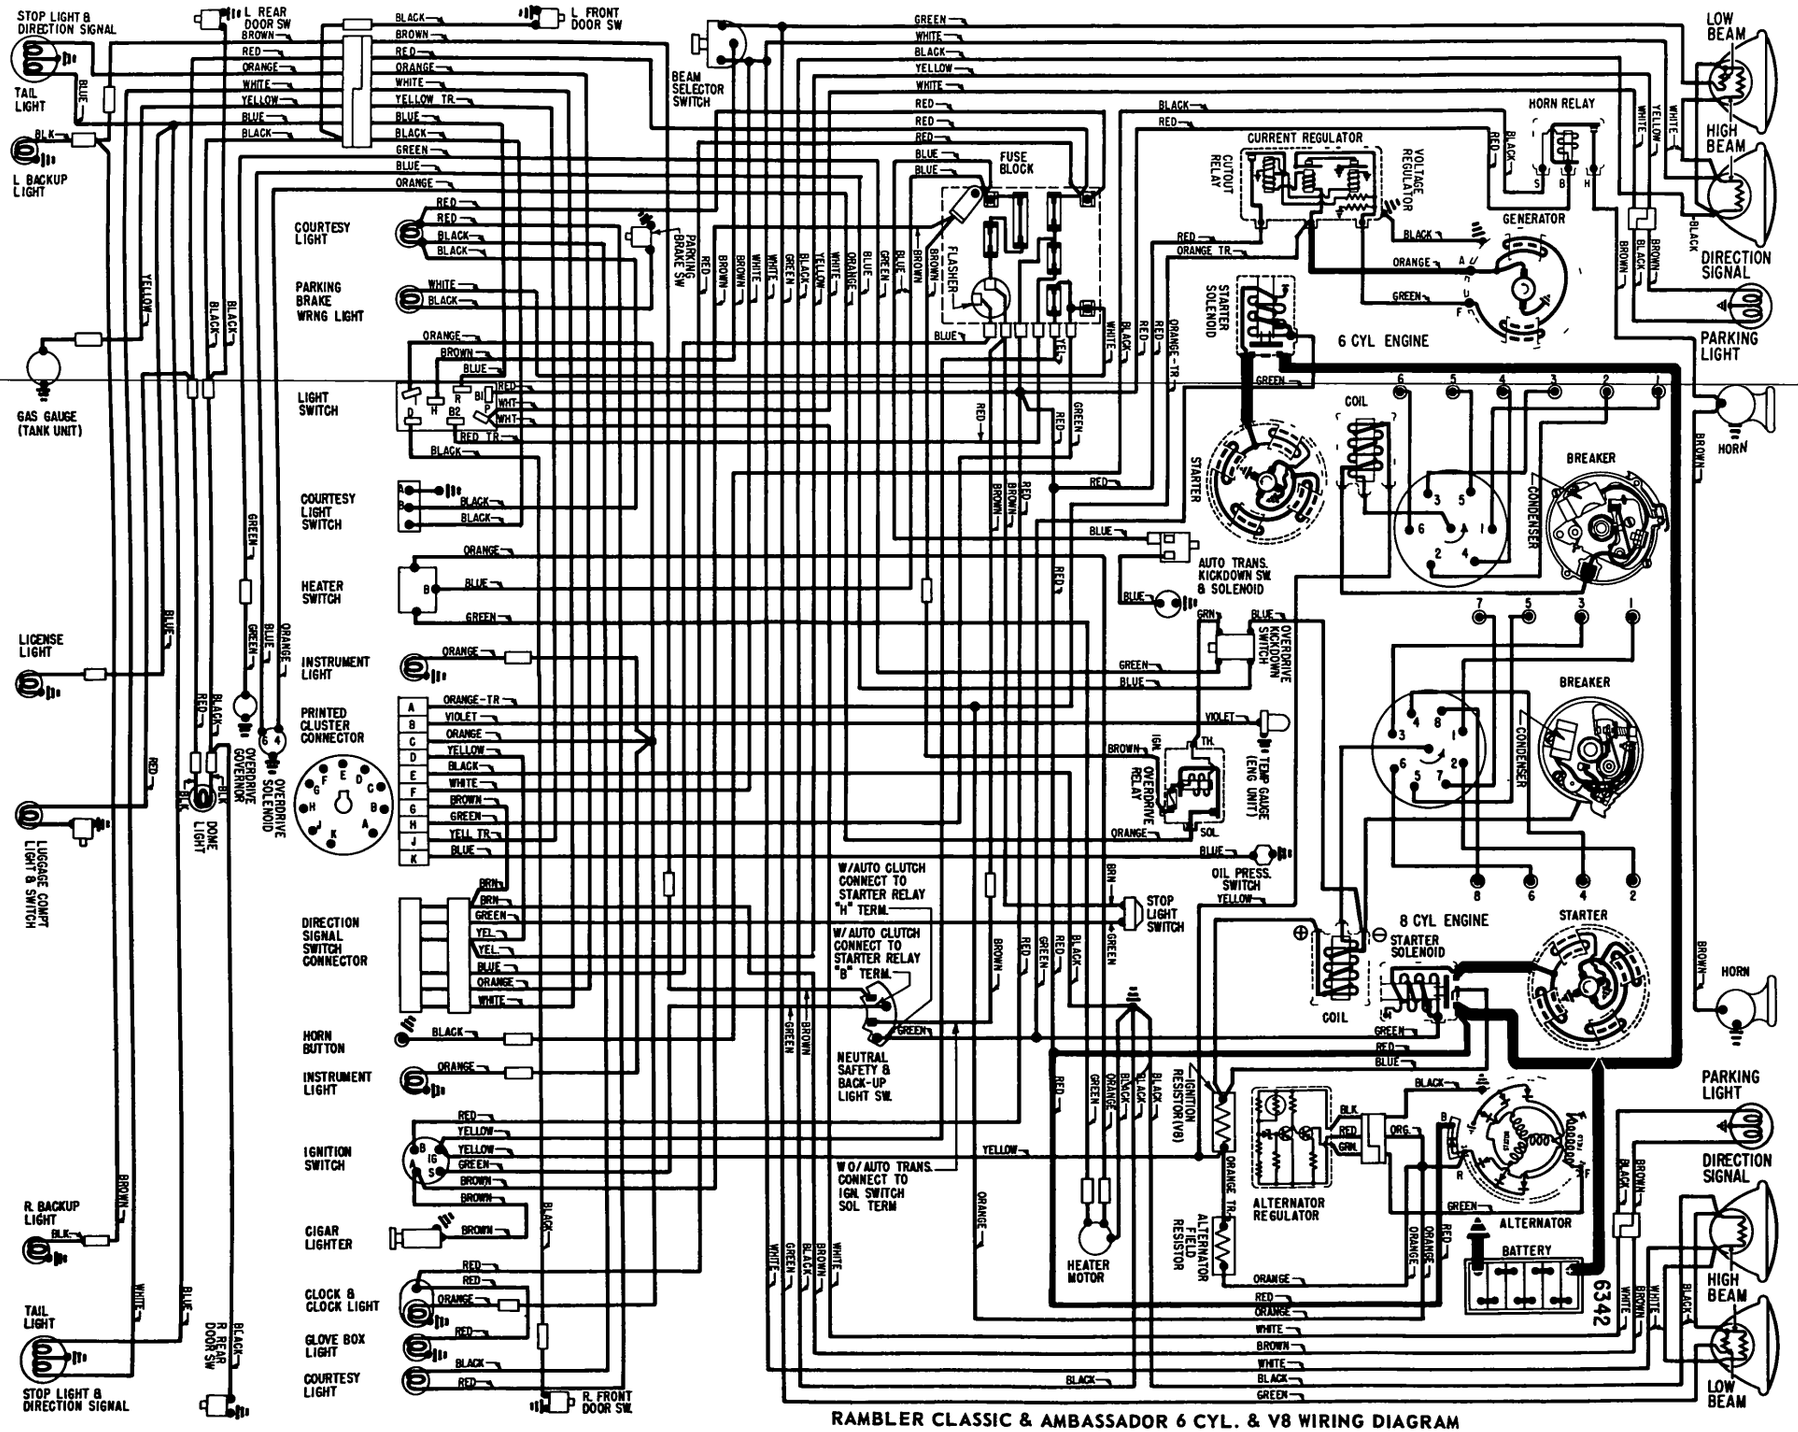
Conventional type containing a double contact voltage regulator, and a field relay.

Fi ld Relay



Cl sing V ltag - 1.5-2.7 volts.
C ntact Gap - .030".
Air Gap - .015" with contacts just touching.

V ltage Regulator



V ltag Setting - 13.5-14.4 volts at 125°F ambient temperature operating on upper contacts. .1-.3 volt lower when operating on l ower contacts.
C ntact Gap - .014" (upper contacts) with lower contacts just touching.
Air Gap - .067" with lower contacts touching.

CLASSIC & AMBASSADOR PRINTED CIRCUIT

RAMBLER AMERICAN WIRING DIAGRAM

RAMBLER CLASSIC & AMBASSADOR 6 CYL. & V8 WIRING DIAGRAM

MOTOROLA
Motorola TVR-12NAM6

Transistor type, permanently sealed, no adjustments. *For testing and circuit diagrams, see "Motorola Alternators & Regulators" in Electrical Section.*

LEECE-NEVILLE
Leece-Neville R-0013533-RA

Conventional type containing a double contact voltage regulator, and a load relay.

Load Relay

Closing Voltage - 6.8-7.0 volts.
Contact Gap - .024-.026".
Air Gap - .011-.013" with contacts closed.

Voltage Regulator

Voltage Setting - 13.6-13.8 volts (Upper Contacts), 13.7-13.9 volts (Lower Contacts). Transfer Voltage is 14.0-14.2 volts.
Contact Gap - .018-.020" (Upper Contacts - with lower contacts closed).
Air Gap - .031-.039" with lower contacts closed.

CIRCUIT BREAKERS

American

1 & 2 - Head and Tail light circuits. On lighting switch.
3 - Stop light and direction signal circuits. On ceiling of cowl under dash panel.

Classic & Ambassador

1 - Headlight circuit. In headlight switch.
2 - Electric windows. In fuse block.

FUSES

American

1 - Interior lighting circuits. On lighting switch.

Classic & Ambassador

Fuse block on left side of dash panel.

SWITCHES, GAUGES, & SPEEDOMETER

►*1963 INTERMITTENT HORN OPERATION CORRECTION (CLASSIC & AMBASSADOR):* May be caused by too much solder on horn brush transferring to horn contact plate. To correct, clean brush and contact plate with crocus cloth or fine file. Apply a thin film of lubriplate to contact plate. In some cases, variables in mounting of index plate to horn ring may also cause this condition. To correct, rotate index plate 120°.

NEUTRAL SAFETY SWITCH

E-Stick Cars - Located on steering column jacket tube under instrument panel.

Adjustment - **Adjust neutral safety switch in mounting bracket so there is the same amount of gear shift lever movement when coming out of 2nd gear as there is when coming out of 3rd gear before neutral switch "clicks". Place gear shift lever in 3rd gear and adjust actuator cam stop nut (upper nut at small end of spring) to take up approximately ½ of lever free movement (will center slot in 2nd and 3rd operating lever over selector key to remove any tension).**

Automatic Transmission Cars - Located on steering column jacket tube under instrument panel.

Adjustment - **Adjust so engine will start in "N" or "P" only. Loosen switch on column tube and put selector lever in "N". Insert a 3/32" pin in hole on switch face, then tighten switch attaching screws and remove pin.** ***NOTE - Tang of switch must enter into channel on operating shaft before switch is secured to jacket tube.***

INSTRUMENT CLUSTER & SPEEDOMETER REMOVAL

American - Disconnect wiring and speedometer cable from back of cluster. Remove two cluster attaching screws, loosen side brackets, slide cluster down to disengage tabs, remove through front face of instrument panel.

Classic & Ambassador - Disconnect wiring and speedometer cable from back of cluster. Remove cluster hood top (retained by 3 screws). Remove cluster attaching screws, lift cluster to disengage tabs, then tilt unit to right and remove through front face of instrument panel. *INSTALLING NOTE* - Install through front face of panel at an angle. The 2 locating lugs must have rubber insulators in place before cluster installed.

PRINTED CIRCUIT BOARD REMOVAL

Classic & Ambassador - With instrument cluster removed (see above), remove temperature and fuel gauge attaching nuts, the screw holding printed circuit board to instrument cluster, and the voltage regulator. Remove printed circuit board.

HEADLIGHT SWITCH

To remove, disconnect battery, put switch in "Off" position, and press release button on switch to remove shaft and knob assembly. Remove switch retaining nut (American), switch and bracket attaching screws (Classic & Ambassador),and remove switch.

STOP LIGHT SWITCH

Located on brake master cylinder. No adjustment.

TURN SIGNAL FLASHER

American - On ceiling of cowl under dash panel near stop light and turn signal circuit breaker.
Classic & Ambassador - On fuse panel (left side of dash).

BELT ADJUSTMENT

	New Belt	Used Belt
All Belts, All Applications	110-120 lbs.	70-80 lbs.

Use a strand tension gauge.

ENGINE

ALUMINUM ENGINE SERVICING

Extreme caution must be observed when working on aluminum engines to prevent damage by scratching, nicking, or scoring. Carefully note the following:
1) Do not drop or slide machined surfaces on bench or floor.
2) Do not use gasket cement unless specifically indicated.
3) Tighten bolts and nuts to the specified torque. DO NOT OVERTIGHTEN.

ALUMINUM THREAD REPAIR

Use "Heli-Coil" thread repair kits to repair stripped or damaged threads in aluminum parts.

ENGINE REMOVAL

American (L-Head Engine) - *NOTE - Engine and transmission assembly is removed from below the car.* 1) Disconnect all wiring, hoses and lines from engine. Remove hood and radiator, and remove air conditioning compressor from engine and place or tie out of way. *NOTE - Unnecessary to discharge system.* Disconnect fuel line from carburetor, and loosen exhaust pipe from engine.
2) Attach a lifting fixture to cylinder head studs, and a block and tackle to the lifting fixture. Raise car (2-post hoist preferred) and support front of car with high-jacks under body side sills just forward of front crossmember. Disconnect fuel line from fuel pump and move exhaust pipe away from engine.
3) Remove front suspension crossmember (K brace). Move idler arm bracket from side sill mounting (or power steering).
4) Disconnect all controls, cables, and wiring from transmission. Remove parking brake linkage from rear crossmember. Drain engine and transmission oil.
5) With engine supported under tension by block and tackle, remove engine front and rear support crossmembers. Lower and remove engine by sliding forward to clear front U-joint.

American (OHV Engine) - 1) Remove hood, drain cooling system, and crankcase. Remove air cleaner, starter, radiator, heater cover, and water pump. Disconnect exhaust pipe from manifold.
2) Disconnect all wiring, lines, and hoses from engine and power steering. Remove air conditioning compressor from engine and tie out of way. *NOTE - Unnecessary to discharge system.*
3) Disconnect flywheel housing from engine, and flywheel from torque converter. Remove flywheel housing lower cover. Disconnect engine front mounts. Remove engine from above.

Classic & Ambassador (All Engines) - 1) Remove hood, battery, air cleaner, starter, and radiator. Disconnect all wiring, lines, and hoses from engine. Disconnect exhaust pipe. Remove flywheel lower cover.
2) *CAUTION - At this point, support flywheel housing at all times.* Attach a lifting fixture to engine. Disconnect flywheel housing from engine, and converter from flywheel. Remove power steering pump. Remove air conditioning compressor from engine and tie out of way *NOTE - Unnecessary to discharge system.*
3) Disconnect engine front mounts and remove engine from above.

(Continued)

See Pages 2 to 13 for complete Car Model General Index and Equipment Indexes

ENGINE (Continued)

GENERAL SPECIFICATIONS

Engine	HP at RPM	Compr. Ratio	Bore	Stroke	Displacement
6 Cyl. L-Head	90 at 3800	8.0-1	3 1/8"	4 1/4"	195.6 cu. ins.
6 Cyl. OHV 1-Bbl. Carb.	127 at 4200	8.7-1	3 1/8"	4 1/4"	195.6 cu. ins.
6 Cyl. OHV 2-Bbl. Carb.	138 at 4500	8.7-1	3 1/8"	4 1/4"	195.6 cu. ins.
Classic V8 2-Bbl.	198 at 4700	8.7-1	3 3/4"	3 1/4"	287 cu. ins
Ambassador V8 2-Bbl	250 at 4700	8.7-1	4"	3 1/4"	327 cu. ins.
Ambassador V8 4-Bbl.	270 at 4700	9.7-1	4"	3 1/4"	327 cu. ins.

ENGINE IDENTIFICATION

Engines can be identified by letter between 3rd. and 4th. digit of Engine Code Number stamped on left upper front corner of block beneath cylinder head (6 Cyl.), on plate attached to alternator mounting bracket (V8 Engines) as follows:

Engine	Code Letter	Engine	Code Letter
6 Cyl. (L-Head)	A	Classic V8	G
6 Cyl. (Al OHV)	B	Amb. V8 (8.7-1)	E
6 Cyl. (Cast Iron OHV)	C	Amb V8 (9.7-1)	F

SPECIAL ENGINE MARKS

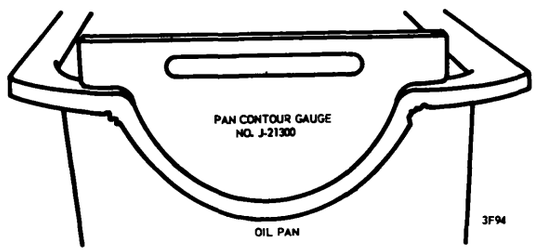
Following marks, stamped under Engine Code Number, indicate special equipment or deviations from standard specifications.

Three Letter Group (A,B,C) - As follows for all engines:
First Letter - Size of bore.
Second Letter - Size of main bearings.
Third Letter - Size of connecting rod bearings.
A - Standard
B - .010" Undersize.
C - .010" Oversize.

OIL PAN REMOVAL

Classic & Ambassador - Remove front springs, support car, then support engine from above. Remove engine support cushion at engine. Remove idler arm from bracket, or power steering piston rod from bracket. Remove stabilizer bar. Disconnect front suspension crossmember from body sills and pry crossmember down for clearance (use wood blocks between crossmember and body side sill). Remove flywheel dust cover. Drain crankcase, remove oil pan. ***NOTE - On Classic, put No. 1 piston on upstroke.***

OIL PAN INSTALLATION (6 CYL. CAST IRON ENGINES)



CAUTION - Following procedure for oil pan and gasket installation must be followed exactly to prevent oil leaks and for proper installation of new type gaskets, Set No. 3204493. See "Oil Leak Correction & Oil Pan Gasket Production Change" above.

1) Use special Oil Pan Contour Gauge J-21300 to check pan shape at rear seal area With gauge installed on oil pan, there should be complete contact between gauge and pan through entire arc of seal area. Maximum clearance of 050" is permitted. *See illustration.* Also make sure that pan gasket surface at attaching screw holes is flat and even.

2) Install rubber seal into rear of pan **without cement or lubrication.** Cement cork side gaskets to pan, maintaining perfect alignment with screw holes, and making sure tongue of cork gaskets is in cutout of rear rubber seal on both sides. *NOTE - For ease of assembly, a very small amount of fast drying cement may be used to hold cork gaskets into rubber seal.*

3) Use a small amount of No. 2 Permatex on threads of pan attaching screw hole in block which is directly under fuel pump (to prevent leak). Put a bead of No 2 Permatex along front edge of cylinder block at the two corners where cylinder block and engine front cover spacer meet. Apply Permatex also to each rear side surface of rear main bearing cap from the crankcase surface down about 1½".

4) Install oil pan being careful not to dislodge seal and gaskets, and torque attaching screws to specified 8-11 ft. lbs. *CAUTION - If screws overtightened, pan will be distorted, gasket will crack, and leaks will occur.*

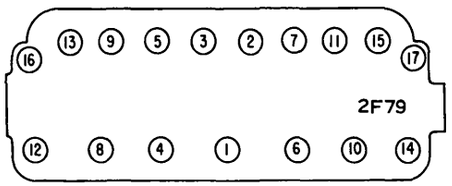
6 CYL. (CAST IRON) OIL PAN CONTOUR GAUGE INSTALLATION

ENGINE NOTES

►*1963 CLASSIC & AMBASSADOR (ALL ENGINES) ENGINE VIBRATION CORRECTION & REAR MOUNT PRODUCTION CHANGE:* New dual rate rear mount insulator used on cars after Engine Code No. 502 (B,C,E,F, or G)16 to correct harmonic vibrations at various speeds. To correct vibration on early cars, Kit No. 3204537 (Classic), No. 3204538 (Ambassador), containing new type mount and bracket is available *NOTE* - On Ambassador with synchro-mesh or overdrive, grind transmission adapter slightly if necessary for a flat mating surface for new bracket. *CAUTION - Do not install insulator or crossmember-to-sill cushions under tension.*

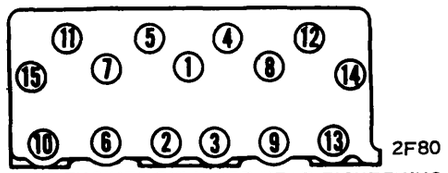
►*1963 AMERICAN & CLASSIC 6 CYL. CAST IRON ENGINES OIL LEAK CORRECTION & OIL PAN GASKET PRODUCTION CHANGE:* 1) New type oil pan gaskets used on cars effective Engine Code No. 412A08 & 412C08. On early cars, Gasket Set No. 3204493, is available *Special procedures must be followed when installing these gaskets to prevent and correct oil leaks. See "Oil Pan Installation".*
2) New procedures, tool, and specifications for installing rear main bearing oil seal must be followed to correct and prevent oil leaks. *See "Crankshaft Rear Oil Seal Replacement."*

►*1963 V8 ENGINES CRANKSHAFT REAR OIL SEAL INSTALLATION CAUTION:* New procedures, tool, and specifications must be followed to prevent and correct oil leaks. *See "Crankshaft Rear Oil Seal Replacement".*



►*1963 V8 ENGINES VALVE GUIDE & VALVE STEM SEAL PRODUCTION CHANGE & INSTALLATION CAUTION:* New type valve guides and valve stem seals used on all 287" (Classic) engines, and on 327" (Ambassador) engines after Engine Code No. 411E02 & 411F02 for improved oil control. New type seals, Kit No. 3204513, to be used **only** on engines having new type valve guide. *Special seal installation procedures must be used to prevent damage to seal. See "Valve Stem Seal Installation".*

►*1963 ALUMINUM 6 CYL. ENGINE CYLINDER HEAD & EXHAUST VALVE PRODUCTION CHANGE & NON-INTERCHANGEABILITY CAUTION:* Beginning Engine Code No. 502B05 & 502B06 new cylinder head with larger coolant passages around valve seats and different pushrod opening angle used in production. Also new type exhaust valves used with new type head. 2nd type exhaust valves MUST BE USED WITH 2ND TYPE HEADS ONLY. **Identification of 2nd type parts: Cylinder Head** - 9 chaplet pads (bosses) adjacent to valve guides. **Exhaust Valves** - Valve stem length is 3 31/32" from tip of stem to relieved section near valve head (3 9/32" on early type).



CYLINDER HEAD INSTALLATION

Cast Iron Engines - Tighten cylinder head stud nuts and head bolts in sequence shown in diagram to 58-62 ft. lbs. *V8 ENGINE NOTE* - Four different cylinder head bolt lengths are used and bolts must be correctly installed. Long (6 3/8") drilled bolt must be installed at rear rocker arm bracket location to provide for rocker arm and valve stem lubrication.

Aluminum Engin - Replace "O" ring seals on hollow guide pin at right front corner of block each time cylinder head removed (this is oil delivery tube to rocker arm shaft assembly). To replace seals, remove guide pin (gently rotate and pull pin out to free lower seal in block). Install new seals in guide pin grooves, lubricate with engine oil and tap guide pin lightly into cylinder block to one-half length, install head using care not to damage upper seal on guide pin. Tighten head bolts in 20 lb. increments and in sequence shown in diagram to 50-53 ft. lbs. Recheck head bolts with engine at normal operating temperature.

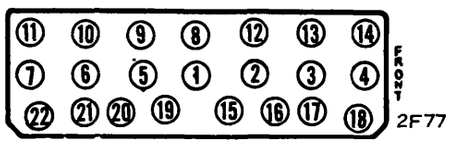
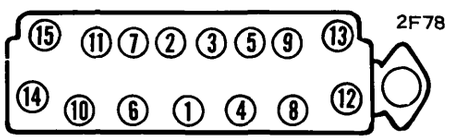
V8	③ .0009-.0025" ④ .0009-.0015"	①	②	Compr. Oil	.010-.020" .015-.055"	.002-.006" .0001-.004"



① - Palm press fit at room temperature. ② - Press fit. *See Replacing Pins*

③ - Measured at top of skirt. ④ - Measured at bottom of skirt.



PISTON PIN REPLACEMENT

Pin must be a tight press fit in connecting rod.

Removal - Use Remover & Replacer Set J-6360 and an arbor press. Place piston in remover support so pin will enter support when pressed out with piloted driver.

6 CYL. (L-HEAD) CYLINDER HEAD TIGHTENING

6 CYL. OHV (CAST IRON) CYLINDER HEAD TIGHTENING

Installation - Place piston pin pilot in support, insert piston and connecting rod (this aligns piston and connecting rod pin bores). Press piston pin into connecting rod and piston assembly until lower pilot bottoms in support (will properly center pin in rod).

PISTON RING INSTALLATION

On compression rings, beveled inner edges on inside diameter of ring must be up.

PISTON & ROD INSTALLATION

6 Cyl. Engine - Notch or indentation on piston head toward front of engine and cylinder number on rod and bearing cap together and toward right or camshaft side of engine (oil squirt hole in rod on same side).

V8 Engine - Notch on rim of piston head and "F" marks at pin boss toward front of engine. Cylinder number on rod and bearing cap together and toward outside of cylinder bank in which assembly installed (oil squirt hole in rods toward inside of engine for cross-lubrication of cylinder walls).

TIGHTENING SPECIFICATIONS

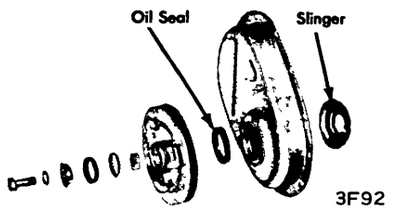
See Pages 2 to 13 for complete Car Mod I General Indexes and Equipment Indexes

CRANKSHAFT REAR OIL SEAL REPLACEMENT

CAUTION - Following tools, specifications, and procedures supersede previous instructions to prevent and correct oil leaks. See "6 Cyl. Oil Leak & Pan Gasket Change" and "V8 Rear Oil Seal Caution" above.
6 Cyl. Cast Iron Engines - *Crankshaft must be removed to replace upper half of seal.* Use Tool J-21309 and press seal into cylinder block. Tool will form seal so that 5/64" of seal material will protrude from seal groove. Cut ends of seal flush with block. Install cap seal with same tool so that 5/64" of seal material protrudes from seal groove, then cut seal ends flush with cap. Partially install side seals into cap so that they are not completely seated in cap side grooves. Apply No. 1 Permatex to machined surface of cap around seal ends, and to chamfered edge of cap which seats in block. Install cap assembly and tighten capscrews to specifications.
6 Cyl. Aluminum Engine - *Crankshaft must be removed to replace upper seal.* Use Tool J-1610 to install and form seal in block and cap, then cut seal ends flush with block and cap surfaces. Dip cap side seals in kerosene and install **immediately** into cap side grooves (seals expand when wet). *CAUTION - Side seals furnished in correct length and must not be cut or altered.*



V8 Engines - *Crankshaft must be removed to replace upper seal.* Use Tool 21315 and press seal into cylinder block and cap. Tool will form seal so that 5/64" of seal material will protrude from seal groove. Cut ends of seal flush with block and cap surfaces. Dip cap side seals in kerosene and install **immediately** into cap side grooves (seals expand when wet). *CAUTION - Side seals furnished in correct length and must not be cut or altered.*

CRANKSHAFT FRONT SEAL REPLACEMENT (IN ENGINE FRONT COVER)

Remover J-9256 (6 Cyl.), J-9233 (V8); and Installer J-9163 (All Engines) are available to remove and replace crankshaft front seal without removing front cover.

ENGINE FRONT COVER REPLACEMENT

To prevent damage to front cover seal, cover must be aligned when installing vibration damper. To do this, install cover screws loosely, partially install vibration damper, then tighten cover screws to correct torque.

6 CYL. ENGINE FRONT COVER (EXPLODED)

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

Engine	MAIN BEARINGS				CONNECTING RODS		
	Bearing Diam.	Clearance	Thrust Bearing	Endplay	Bearing Diam.	Clearance	Sideplay
6 Cyl.	2.4793-2.4798"	.001-.0015"	No. 1	.003-.008"	2.0948-2.0955"	.001-.0015"	.005-.015"
V8	2.4988-2.4995"	.0006-.003"	No. 1	.003-.007"	2.2483-2.2490"	.0007-.0028"	.004-.012"

VALVES

Engine		Head Diam.	Face Angle	Seat Angle	Seat Width	Stem Diameter	Stem Clearance	Valve Lift
6 Cyl. L-Head	Intake	1.469"	44°	45°	.078-.093"	.3407-.3412"	.0025-.004"	.340"
	Exhaust	1.281"	44°	45°	.078-.093"	.3407-.3412"	.0025-.004"	.340"
6 Cyl. OHV	Intake	1.594"	44°	45°	.060-.075"	.341-.342"	.0015-.0035"	ℚ .369"
	Exhaust	ℂ	44½°	45°	.060-.075"	.3405-.3415"	.002-.004"	ℚ .369"
V8	Intake	1.787"	29°	30°	.078-.093"	.3715-.3725"	.001-.003"	.375"
	Exhaust	1.406"	44°	45°	.093-.104"	.3715-.3725"	.001-.003"	.375"

ℂ - 1.343" Cast Iron Engine; 1.250" Aluminum Engine.
ℚ - Cast Iron Engine. .406" Aluminum Engine.

CHECKING VALVE STEM CLEARANCE

Use dial indicator to measure sideplay at end of valve stem with valve 1/16" off its seat.

VALVE STEM SEALS

6 Cyl. L-Head Engine - None used.
6 Cyl. OHV Engine & V8 Engine - Rubber deflector on valve stem on all valves.

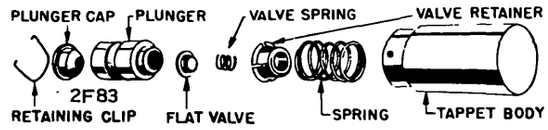
VALVE STEM SEAL INSTALLATION (V8 ENGINES)

CAUTION - Following special procedures are for new type seals (Kit No. 3204513). See "Valve Guide & Valve Stem Seal Production Change & Installation Caution" above. Seals must be installed with extreme care to prevent damage to inner Teflon part of seal.
1) With valve installed in guide, seal protector cap (included in seal kit) **must be installed** over valve stem to protect seal from damage or dislodgment.
2) Install seal on valve stem using both thumb nails on Teflon part of seal to push seal down until it contacts valve guide. Remove protective cap.
3) Place Valve Seal Installing Tool (Perfect Circle No. VSIT-1) on seal just above metal retaining ring. Push down on seal until metal ring is positioned over recess on valve guide.
4) Compress valve spring and install keepers. *CAUTION - If valve spring over-compressed, seal will be damaged.*

VALVE GUIDE SERVICING

Cast Iron Engines - Guides are replaceable. Install guides with Tool J-1429-01 to dimensions indicated in table below and finish ream guides to correct diameter as indicated in table below.

Valve Guide Specifications



Engine	Guide I.D.	Guide Dimension
6 Cyl. L-Head	.3433-.3443" ℂ	ℚ
6 Cyl. OHV	.3433-.3443" ℂ	23/32" above head
V8	.3735-.3745" ℂ	3/4" above head

ℂ - Intake & Exhaust.
ℚ - Flush with guide bore opening in block.

Aluminum Engines - Guides are integral with cylinder head. When stem-to-guide clearance excessive, ream guide for valve with next size oversize stem. Use Reamer J-5830-1 (.003" oversize), J-5830-2 (.015" oversize), J-5830-3 (.030" oversize).

HYDRAULIC LIFTERS

See illustration for arrangement of parts.
Testing - Fill lifter body with kerosene and assemble lifter without snap ring. Check leakdown rate with suitable tester. Normal lifter should require 10-45 seconds to leak down when filled with kerosene (.125" travel with 50 lb. load).
Installation - Install lifters **without** an oil charge. They will fill themselves after 3-8 minutes of engine operation.

HYDRAULIC VALVE LIFTER (EXPLODED)

See Pages 2 to 13 for complete Car Model General Index s and Equipment Indexes

VALVE SPRINGS & LIFTERS

Engine	SPRINGS			LIFTERS	
	Free Length	℄ Pressure (Lbs.)			
		Valve Closed	Valve Open	Diameter	Clearance
6 Cyl. L-Head	.....	37-41 at 1 3/4"	75-82 at 1 7/16"	.....	.....
6 Cyl. OHV Cast Iron	.....	65-70 at 1 13/16"	115-125 at 1 7/16"	.....	.....
6 Cyl. OHV Aluminum	.....	75-85 at 1 13/16"	155-165 at 1 7/16"	.....	.....
V8	2.20"	85-91 at 1 13/16"	150-160 at 1 7/16"	.....	.....

℄ - Without Damper.

VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of spring retainer. *See "Valve Closed" spring length in specification table.*

VALVE SPRING DAMPER NOTE: On cars with V8 engines and floor shift, a valve spring damper is installed in inside diameter of valve spring and must be removed prior to testing valve spring.

2F81

V8 ENGINES ROCKER ARM & SHAFT ASSEMBLY

CAMSHAFT

Engine	Bearing Clearance	Camshaft Endplay	Cam Lobe Lift
6 Cyl. L-Head	.001-.003"	.004-.008"	.340"Int. .340"Exh.
6 Cyl. OHV Cast Iron	.001-.003"	.004-.008"	.262"Int. .263"Exh.
6 Cy.. OHV Aluminum	.001-.003"	.004-.008"	.254"Int. .254"Exh.
V8	.001-.003"	.003-.006"	.254"Int. .254"Exh.

CAMSHAFT & BEARINGS

Camshaft bearings are step-bored (largest at front, smallest at rear) for easy removal and installation of camshaft.

CAMSHAFT END THRUST

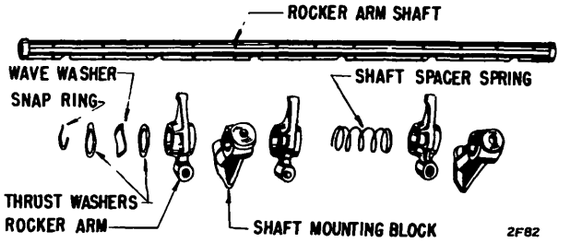
Taken by thrust plate between No. 1 bearing and camshaft sprocket.

CHECKING CAM LOBE LIFT

Check with dial indicator to specificati ns listed in Camshaft Table.

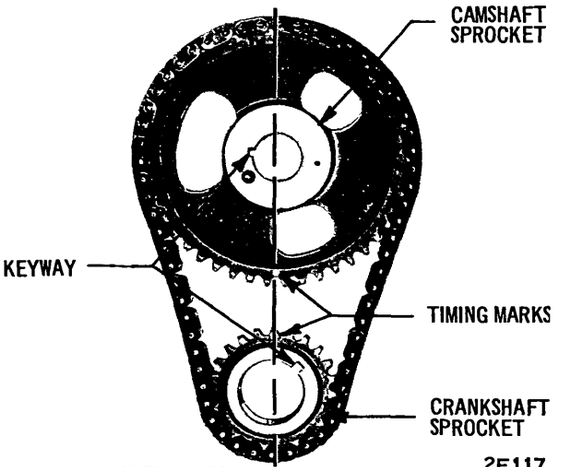
VALVE TIMING

Engine	INTAKE		EXHAUST	
	Open (BTDC)	Close (ALDC)	Open (BLDC)	Close (ATDC)
6 Cyl. L-Head	10°	58°	49°	19°
6 Cyl. OHV	12°30'	51°30'	53°30'	10°30'
V8	12°30'	51°30'	53°30'	10°30'



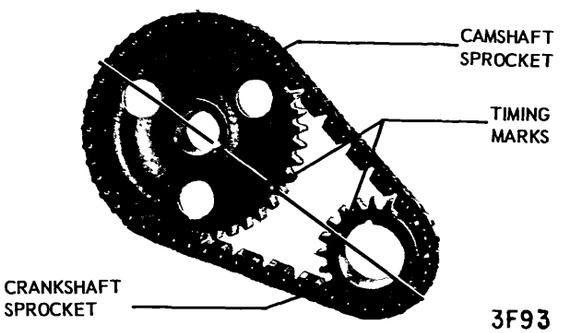
CHECKING VALVE TIMING

All 6 Cyl. Engines - Set valves on No. 1 cylinder at .003" lash. With No. 6 piston at TDC of firing stroke, timing will be correct if exhaust valve opens the same amount before DC on vibration damper as intake valve opens after DC as engine is rocked back and forth over DC.



V8 Engine - Remove rocker arm cover and spark plugs. Turn crankshaft to bring No. 6 piston to TDC of compression stroke (No. 1 piston will be on exhaust stroke in overlap position). Rotate crankshaft 90° **counterclockwise.** Install dial indicator on No. 1 intake rocker arm pushrod end. Crank engine in a **clockwise** direction until dial indicator indicates pushrod movement (hydraulic lifter must be fully charged). At time indicator moves, ignition timing pointer on front cover should align with a point approximately 25/32" before TDC position on vibration damper. If mor than ½" variation in either direction, check timing chain for stretch. If chain deflection exceeds ½", replace.

ROCKER ARM ASSEMBLY



See illustrations for arrangement of parts. Rocker arms are "right" and "left" and must not be interchanged. When installing, lubricating holes in shaft must be down toward cylinder head. On V8 engines, special drilled capscrew must be installed in rear rocker arm support bracket to provide lubrication.

6 CYL. ROCKER ARM & SHAFT ASSEMBLY

V8 ENGINES VALVE TIMING MARKS

6 CYL. ENGINES VALVE TIMING MARKS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE OILING

OIL PRESSURE

6 Cyl. Engines - 12 lbs minimum at 600 RPM, 50-58 lbs. maximum (L-Head & Cast Iron OHV). 15 lbs. minimum at 600 RPM, 60-65 lbs. maximum (Aluminum OHV).

V8 Engines - 10 lbs. minimum at 600 RPM, 55-60 lbs maximum.

PRESSURE REGULATOR VALVE

6 Cyl. L-Head & Cast Iron OHV - In cylinder block where oil enters oil distribution channel. Not adjustable. *NOTE - The two relief valves in valve body (pump cover) on "E-Stick" cars are for "E-Stick" operation only.*

6 Cyl. Aluminum OHV - In oil pump cover. Not adjustable.

V8 Engines - In oil pump body. Not adjustable.

ENGINE LUBRICATION

6 CYL. CAST IRON ENGINES

Description

Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and valve mechanism on cylinder head (Overhead Valve Engines only). All other parts are lubricated by oil spray.

Operation

Gear type oil pump mounted externally on right side of crankcase. Pump draws oil through fixed strainer and intake pipe in oil pan (intake passage in crankcase registers with intake port in mounting face of pump body) and delivers oil through passage around pump body hub to main oil gallery which extends along right side of crankcase. Oil pressure regulator valve under plug on right side of crankcase regulates pressure by bypassing oil from main oil gallery back into oil pan Oil is distributed through main oil gallery as follows:

Crankshaft & Camshaft Bearings - Oil passages in crankcase webs supply oil from main oil gallery to each camshaft and crankshaft bearing (passage intersects lower part of camshaft bearing bore and extends past this point to main bearing bore).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from oil hole in each side of connecting rod when these holes register with oil hole in connecting rod journal (these squirt holes are located 24° and 29° from rod center line).

Timing Chain & Sprockets - Lubricated by oil metered by front camshaft bearing.

Valve Lifters, Cam Lobes, Distributor & Oil Pump Drive Gears - Lubricated by spray and oil mist thrown off by connecting rod and crankshaft bearings.

Rocker Arms, Pushrods & Valve Stems (Overhead Valve Engine) - Oil tube connected to main oil gallery (at front of engine) and to fitting on side of cylinder head (at forward end directly above No. 1 spark plug) supplies oil to passage in cylinder head and through front rocker arm shaft support block to hollow rocker shaft. Rocker shafts have drilled oil holes at each rocker arm. Rocker arms are drilled (upper hole in arm allows oil to run down flat machined surface to each end of arm for pushrod and valve stem lubrication).

6 CYL. ALUMINUM ENGINES

Description

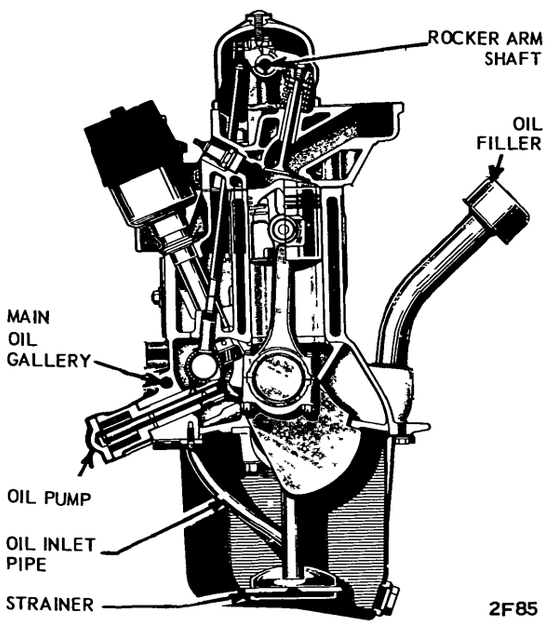
Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, valve lifters, and valve mechanism on cylinder head. All other parts lubricated by oil spray.

Operation

Gear type oil pump mounted externally on right side of crankcase. Pump draws oil through fixed strainer and intake pipe in oil pan (intake passage in crankcase registers with intake port in mounting face of pump body) and delivers oil through passage in pump body to main oil gallery which extends along right side of crankcase. Oil pressure regulator valve in pump cover regulates pressure by bypassing oil back into oil intake passage Oil is distributed through main oil gallery as follows:

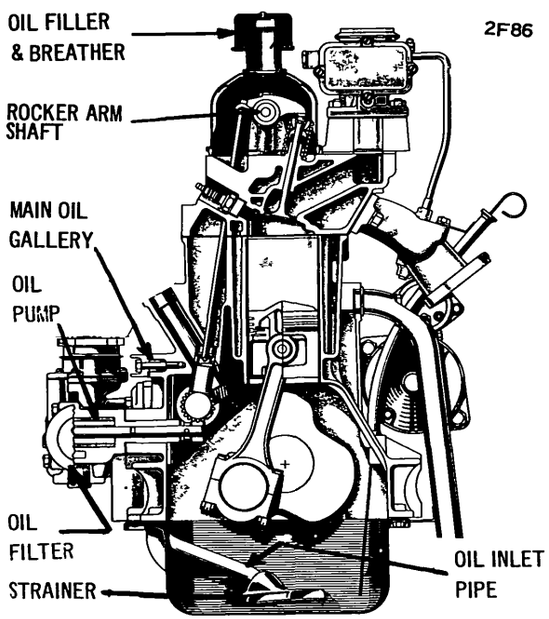
Crankshaft & Camshaft Bearings - Oil passages in crankcase webs supply oil from main oil gallery to each camshaft and crankshaft bearing (passage intersects upper part of camshaft bearing bore and extends past this point to main bearing bore).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.



Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from oil hole in each side of connecting rod when these holes register with oil hole in connecting rod journal (these squirt holes are located 24° and 29° from rod center line).

Timing Chain & Sprockets - Lubricated by oil metered by front camshaft bearing.



Cam Lobes, Distributor & Oil Pump Drive Gears - Lubricated by spray and oil mist thrown off by connecting rod and crankshaft bearings .

Rocker Arms, Pushrods, & Valve Stems - An oil gallery (vertical) located in right front corner of cylinder block distributes oil from main longitudinal oil gallery, through the hollow locator pin into the cylinder head where a pair of drilled passages connect into the front valve rocker arm support block and into the hollow rocker arm shaft. Each rocker arm is drilled to direct oil to flat machined surface of top, then to each pushrod, valve stem and spring. Holes on top of cylinder head drain oil back into oil pan.

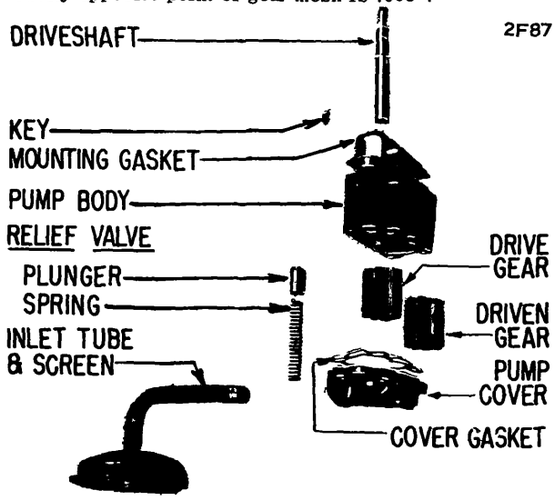
Valve Lifters - Ports in main oil gallery supply lubrication to valve lifters.

6 CYL. CAST IRON ENGINE OILING SYSTEM

6 CYL. ALUMINUM ENGINE OILING SYSTEM

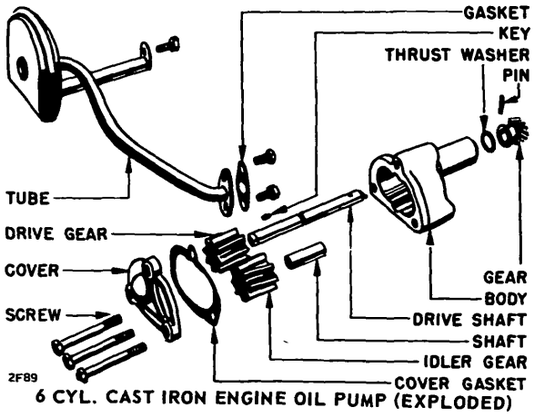
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

V8 ENGINES



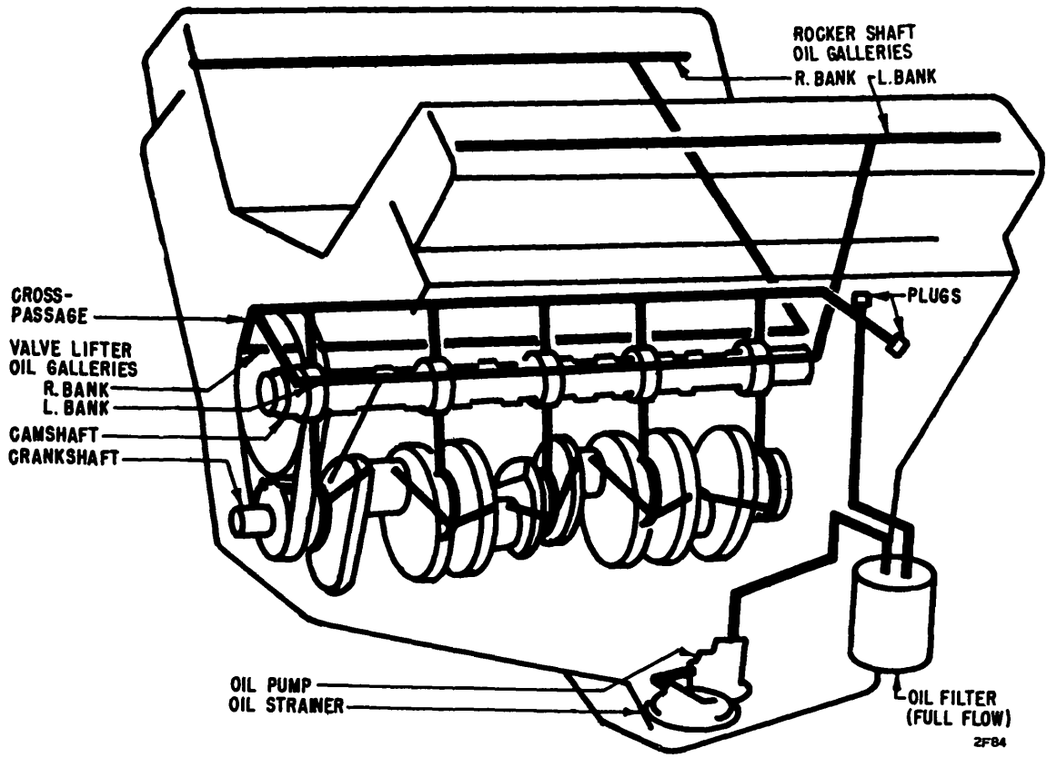
Refer to illustration and note the following:

1) Main oil gallery feeds two lifter galleries located on each side of main gallery and extending full length of block, through grooved channel in rear face of camshaft thrust plate which serves as a cover for the galleries on front face of engine block.
2) Special drilled bolts are used in **rear** rocker shaft bracket bolt holes in block to permit oil to flow upward, through and around undercut bolt stem, and through bracket to hollow rocker arm shaft.

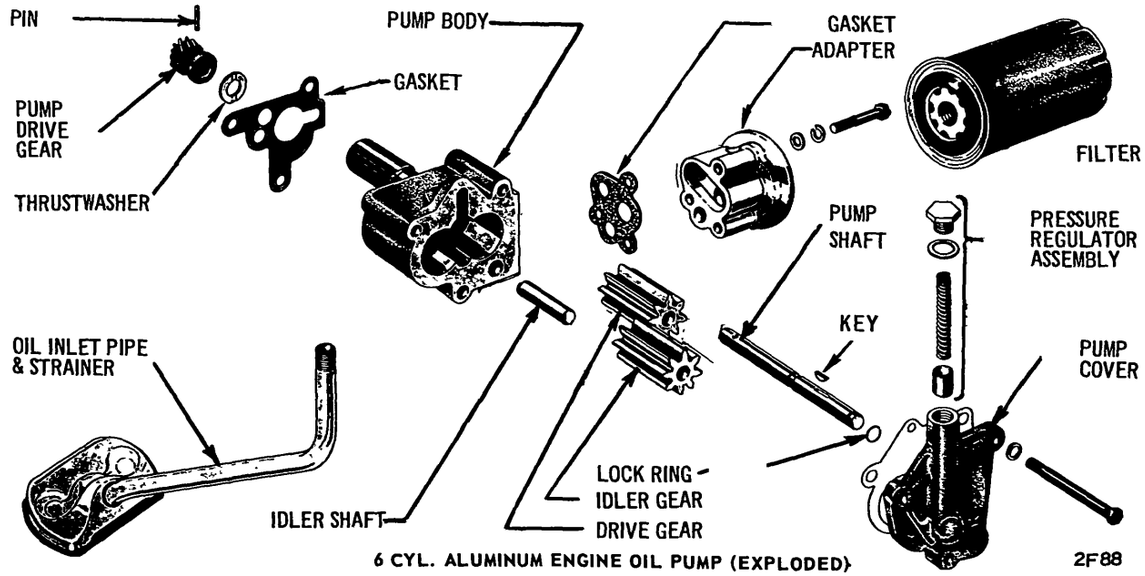


OIL PUMP

6 Cyl. Eng. - See illustration below. Prime new or reassembled pump before starting engine by removing relief valve plunger and filling pump with oil.



V8 Engines - 1) Gear-to-cover clearance should not exceed .004".
2) Maximum clearance between gears and walls of gear cavity opposite point of gear mesh is .008".



V8 ENGINES OIL PUMP (EXPLODED)

6 CYL. CAST IRON ENGINE OIL PUMP (EXPLODED)

V8 ENGINES OILING SYSTEM

6 CYL. ALUMINUM ENGINE OIL PUMP (EXPLODED)

OIL FILTER

6 Cyl. Cast Iron Engines - Partial flow type mounted on bracket on engine. Intake pipe is connected to main oil gallery and return pipe is connected to fitting on crankcase.

6 Cyl. Aluminum Engine - Full flow type externally mounted on adapter on oil pump body.

V8 Engines - Full flow type mounted on pad on left side of engine block. Bypass valve located in filter adapter on filter pad. Bypass valve allows oil to flow directly to outlet passage.

CAPACITIES

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

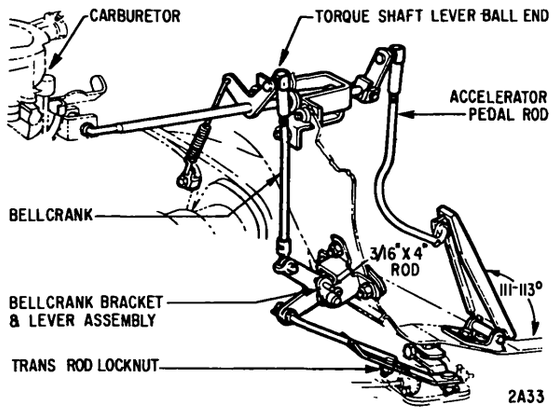
CARBURETOR

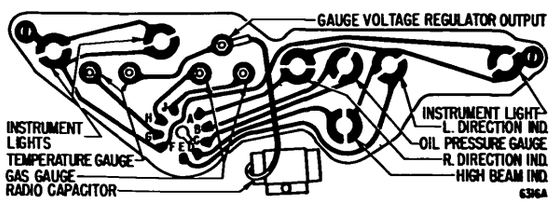


Carburetor	Fl at Level	Choke Setting
Carter BBS 3236S; 3287S, SA 3462S, 3463S, 3464S	① 9/32"	4 Rich
3465S, 3466S, 3468S, 3590S	① 7/32"	4 Rich
	① 7/32"	4 Rich
Holley R-2533A, 2534A	② 11/16"	2 Rich
2535A, 2536A, 2537A, 2538A	② 11/16"	2 Rich
Stromberg WA 3-219	③ 11/32"	2 Rich

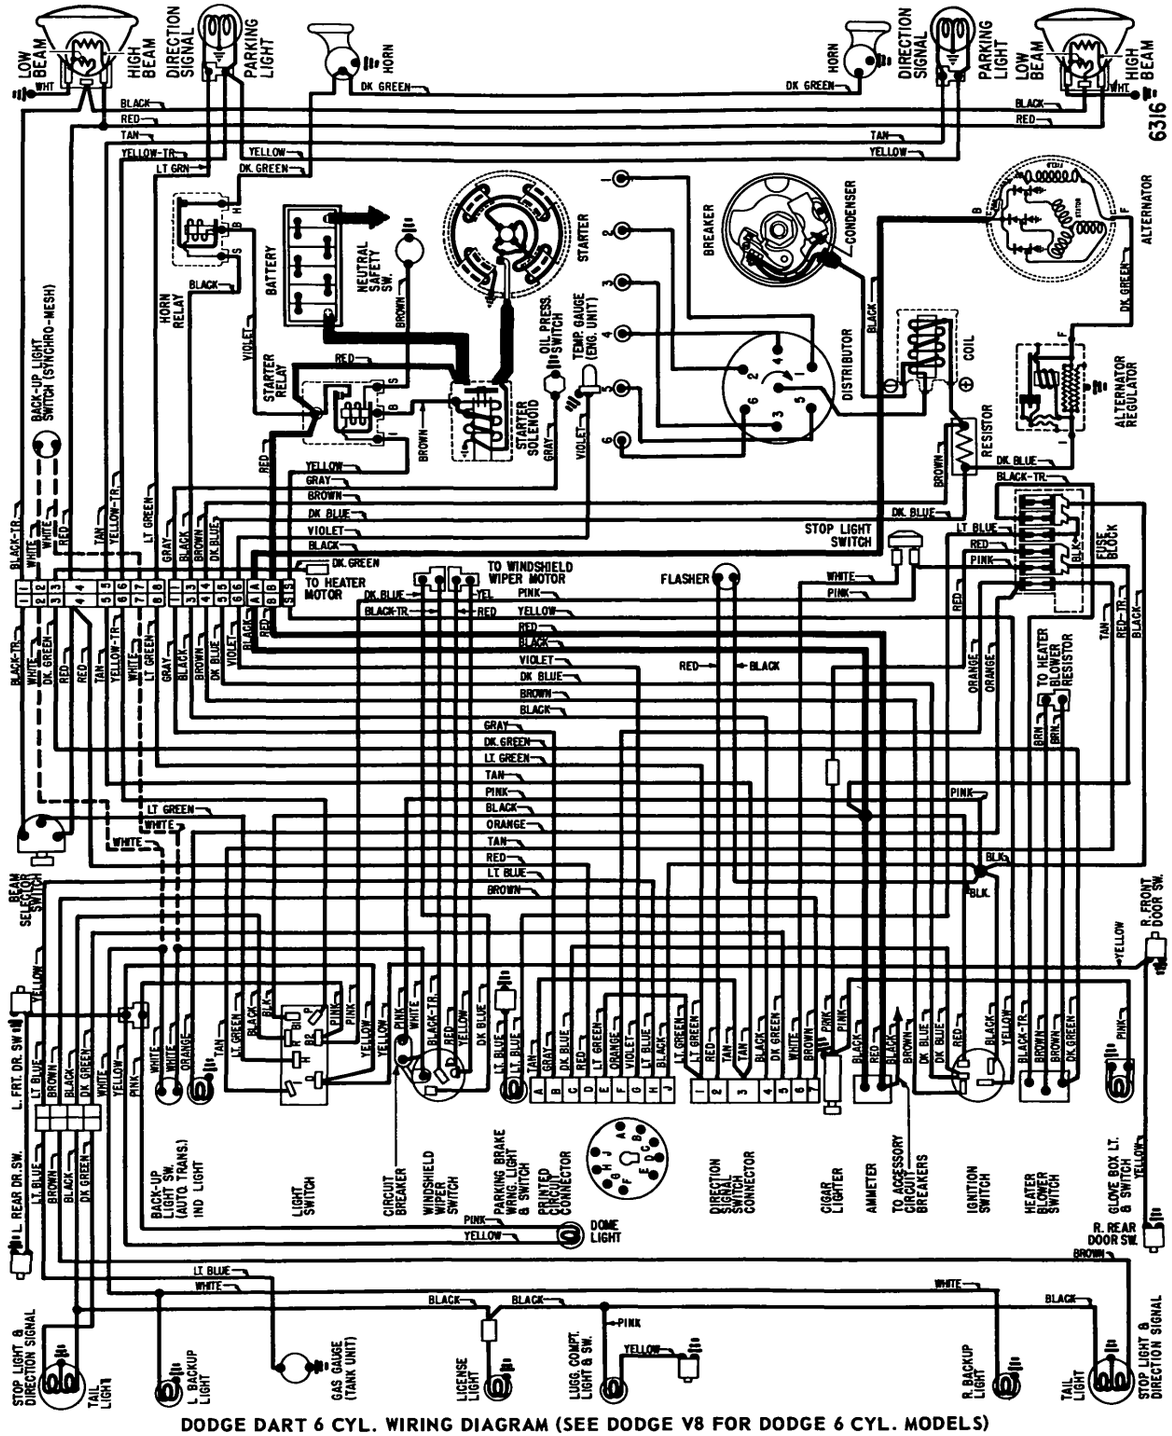
① - Between top of each float ridge (at center of float) and top surface body casting.
② - With engine running (vehicle level), measure through economizer hole (diaphragm opening) using 6" scale with depth gauge. Measure from machined surface of opening.
③ - Use Tool 73725 or "T" scale to measure from surface of fuel bowl (gasket removed) to top of float at center.

ACCELERATING PUMP SETTING

Carburetor	Seasonal Setting
Holley 1920	none
BBS & WW 3	Center hole (normal) -Medium stroke
	Nearest - Short Stroke
	Furthest - Long Stroke



►*NOTE: On BBS and WW 3 carburetors be sure to move bowl vent hairpin clip on pump stem correspondingly.*



AUTOMATIC TRANSMISSION THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT

1) With linkage parts in place and ball joint socket to ball end at torque shaft bellcrank disconnected, lubricate outside surface of carburetor lever isolator grommet, torque shaft at firewall mounted plastic bushing, and ball stud on torque shaft rear lever (inside car).

DART PRINTED CIRCUIT

DODGE DART 6 CYL. WIRING DIAGRAM (SEE DODGE V8 FOR DODGE 6 CYL. MODELS)

2) Disconnect choke at carburetor or block choke valve fully open. Release fast idle cam.
3) With locknut loose in transmission rod, insert a 3/16" diameter rod (about 4" long) in transmission rod bellcrank bracket and lever assembly holes.
4) Move transmission lever forward against its stop and tighten transmission rod locknut.
5) Disconnect top end of accelerator pedal rod. Adjust rod length to provide 111-113° pedal angle. Reinstall top end of rod.
6) Remove 3/16" rod, then adjust length of transmission bellcrank to torque shaft rod (screw adjustment at top end). *NOTE - Corr ct rod length allows ball socket to lin up with ball nd when rod held upward against transmission stop.*
7) Install ball socket on torque shaft lever ball end. Connect choke rod or remove blocking fixture.

ELECTRICAL

BATTERY

12 Volt

Capacity - 38 Amp Hr (170" Eng), 48 Amp Hr (225" Eng) at 20 Hr Rate *NOTE* - 48 Amp Hr battery used on all cars with MDT-7009 Starter
Battery Gr und - Negative

STARTER

Pr st lite MDT-7009

FUSES & CIRCUIT BREAKERS

JUNCTION BLOCK FUSES

Fuse Junction Block located at center, forward edge of instrument panel.

PLYMOUTH 6 CYL. PRINTED CIRCUIT

PLYMOUTH 6 CYL. WIRING DIAGRAM

IN-LINE FUSES

Rear window defroster, trunk light, back-up lights. Back-up lights also protected by windshield wiper circuit breaker.

CIRCUIT BREAKER

Windshield Wipers - Integral with wiper switch
Lighting System - Integral with headlight switch
Others - Located behind left front kick panel

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Located on transmission case Starter operates only when Neutral pushbutton depressed To adjust, make certain control cable properly adjusted, drain about 2 qts oil from transmission unscrew switch from transmission case, make certain switch operating lever aligned with center of switch mounting hole Screw switch into case (with cupped washer and "O" ring in place) until test lamp connected to switch terminal lights, tighten switch additional 1/4-3/8 turn *CAUTION- Switch must be tight to prevent oil leaks If necessary, add thin washer and readjust switch*

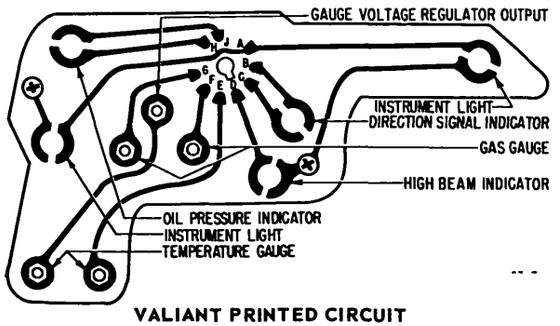
LIGHTING SWITCH REMOVAL

All Models - Disconnect battery Pull switch knob out and rotate it until flat on shaft is down Push knob in all the way Disconnect wires, press spring-loaded release button on top center of switch pull shaft and knob out of switch Remove switch mounting bezel on panel and remove switch

STOP LIGHT SWITCH ADJUSTMENT

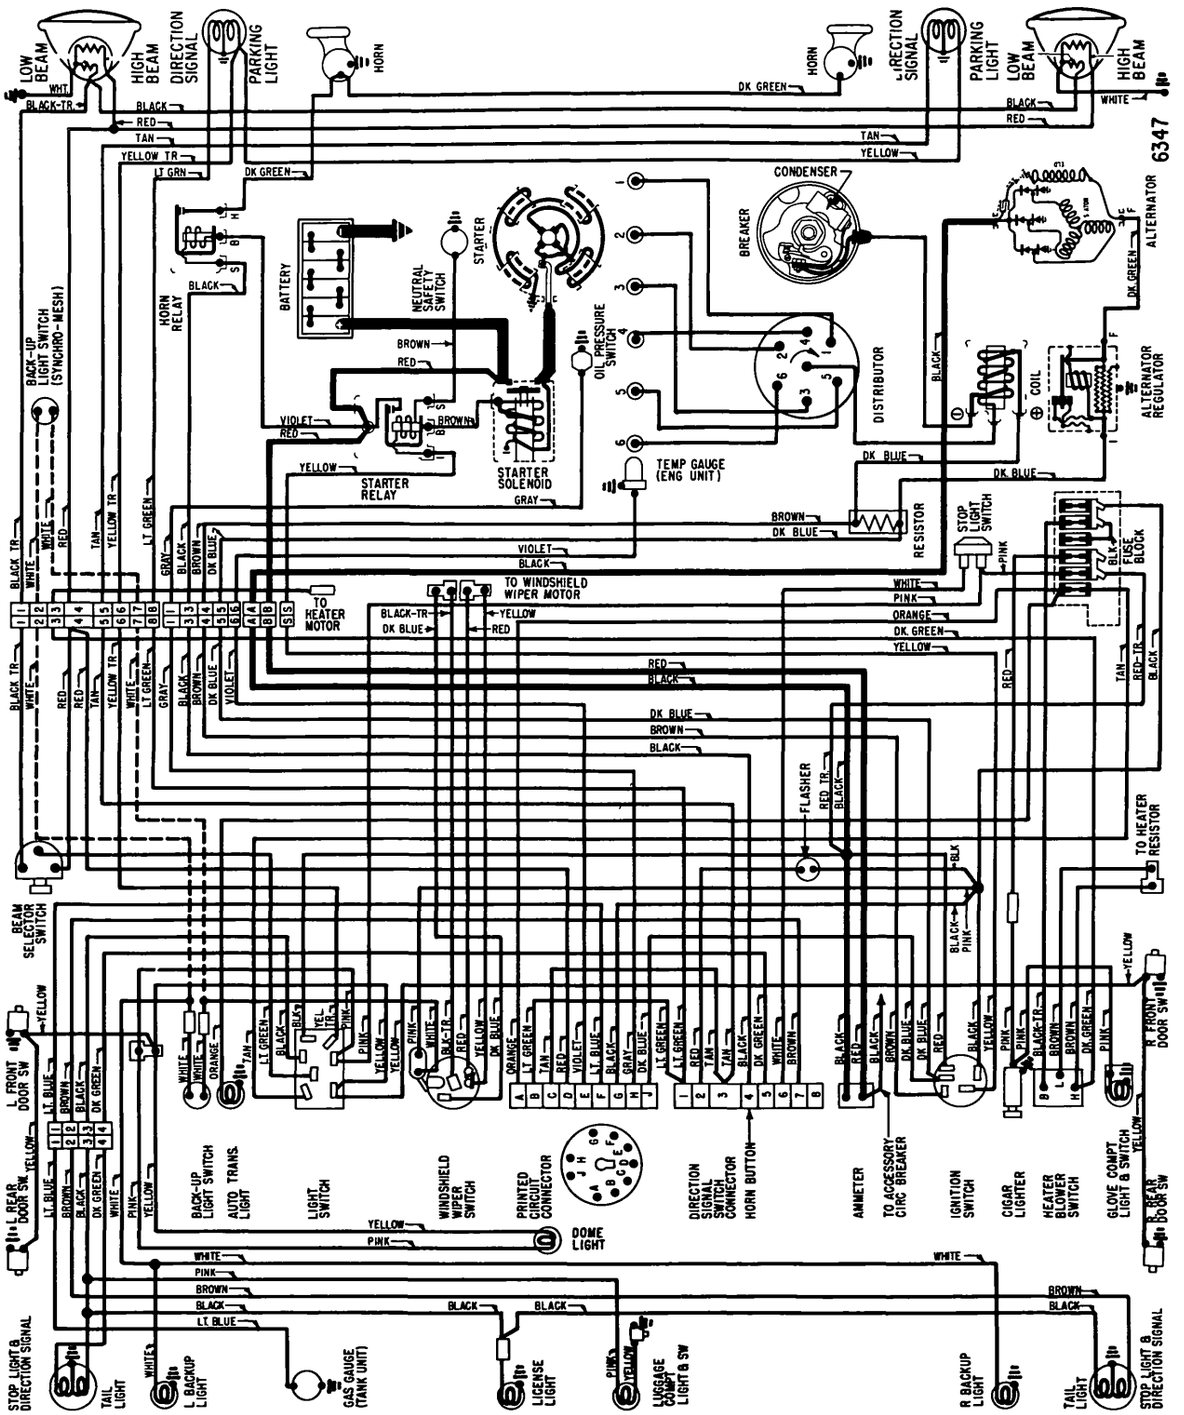
Mounted on brake pedal lever bracket Adjust position of switch so stop light goes on in first 1/8" of pedal pushrod travel

TURN SIGNAL FLASHER



Located behind instrument panel on left side

INSTRUMENT CLUSTER REMOVAL



Dart & Valiant - Remove battery negative cable Loosen steering column clamp screws several turns and lower steering column slightly Disconnect speedometer cable Remove four screws on face of cluster and pull cluster forward Tilt cluster downward and to the right and disconnect all lead wires Remove cluster

Plymouth - Remove battery negative cable Remove temperature control knob and disconnect speedometer

(Continued)

VALIANT PRINTED CIRCUIT

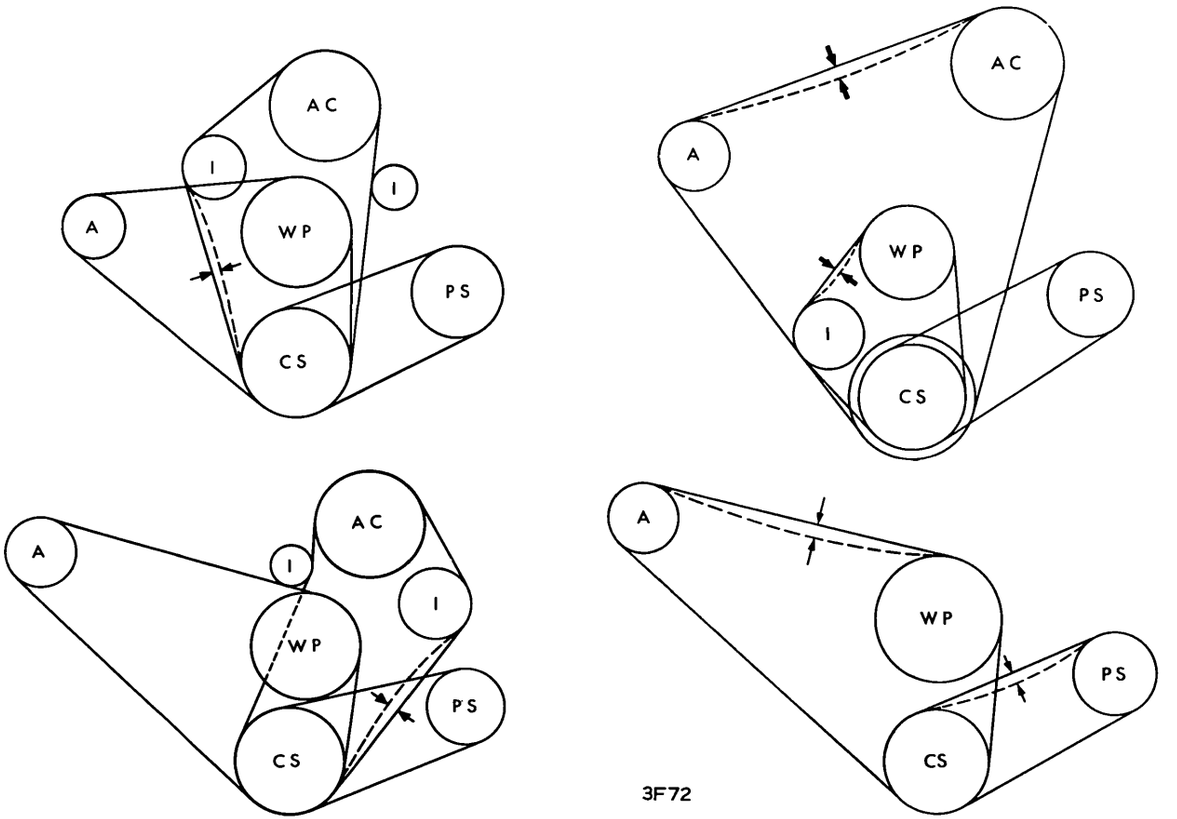
VALIANT WIRING DIAGRAM

cable Remove four screws on cluster face Pull cluster forward and tilt it downward Disconnect lead wires Remove cluster

D dg (Exc pt Dart) - Remove battery negative cable Remove wiper switch knob and retaining bezel Pull headlamp knob to full OUT position and depress spring-loaded button on switch (under instrument panel) With button held down pull out headlamp knob and stem assembly Remove heater or air conditioning control knob Remove sleeve on this lever Remove four screws on cluster trim remove trim plate and remove two lower cluster screws Remove four screws on cluster face and pull cluster forward out of housing Disconnect speedometer cable Roll cluster downward and forward then disconnect wires and remove light sockets Remove cluster

SPEEDOMETER HEAD REMOVAL

Instrument cluster must be removed from vehicle (see above) Disassemble cluster assembly and remove speedometer head



PRINTED CIRCUIT REMOVAL

Instrum nt cluster must be removed from vehicle (see ab ve) Disassemble cluster assembly and remove circuit board

BELT ADJUSTMENT

Deflection applied at belt midpoint under 5 lb. load (see illustration)

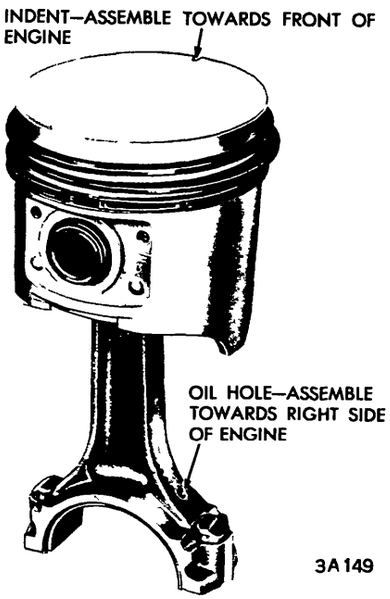
ALUMINUM ENGINE SPECIFICATIONS

Same as for Cast Iron Engine except where noted.

ALUMINUM ENGINE SERVICE CAUTIONS

Extreme caution must be observed when working on aluminum engines to prevent damage to aluminum parts. Note the following:



1) Do not drop or slide machined surfaces.
2) Do not use gasket cement except where indicated.
3) Lubricate all bolts or screws entering aluminum parts. Use engine oil or special thread lubricant on all threads.
4) Tighten bolts and nuts to specified torque. DO NOT OVERTIGHTEN. Torque values are for clean lubricated threads.

ALUMINUM ENGINE THREAD REPAIR

To repair aluminum engine damaged threads, use "Heli-Coil" tool and inserts.

ENGINE REMOVAL

1) Remove hood, drain cooling system, remove battery and air cleaner.
2) Remove radiator (plug transmission oil cooler lines). Remove crankcase vent system and disconnect all lines, wires, cables, and linkages from engine.
3) Disconnect exhaust pipe from manifold, remove clutch torque shaft, brake cables and rods.
4) Remove speedometer cable, gear shift rods, transmission oil cooler lines and filler tube (drain system first), and push button cable.
5) Support rear of engine and remove transmission.
6) Attach lifting fixture to cylinder head and disconnect engine front mounts. Remove engine.

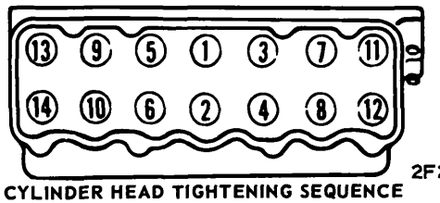
CAST IRON ENGINE PISTON & ROD ASSEMBLY

OIL PAN REMOVAL & INSTALLATION

Hoist vehicle and drain oil. Using tie rod end puller Tool C-3742, remove steering and idler arm ball joints from steering linkage center link. Proceed as follows:

Dart & Valiant - 1) Remove dust shield and front motor mount stud nuts.
2) Lower car and remove horns (and brackets), then disconnect battery negative cable.
3) Install engine lifter plate Tool C-3804 and fixture Tool C-3809. Raise engine 1½-2". Raise car on hoist and remove oil pan.
4) To install oil pan, reverse removal procedure.

Dodge & Plymouth - 1) Remove dust shield.
2) Remove oil pan attaching bolts, rotate crankshaft to clear counterweights and remove oil pan.
3) To install oil pan, reverse removal procedure.



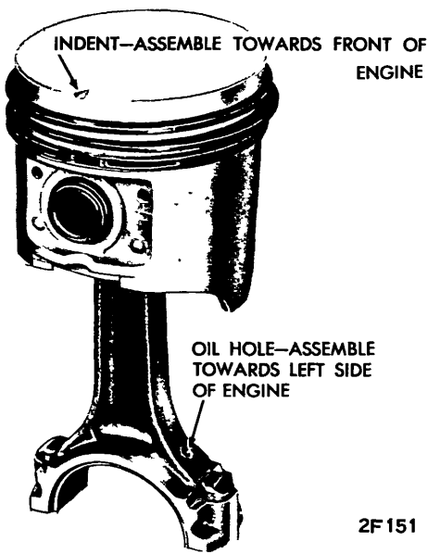
CYLINDER HEAD INSTALLATION

Coat new gasket with suitable sealer, install gasket and head over dowels in block. Tighten all cylinder head bolts in sequence shown in diagram to specifications, then retighten all bolts again to specifications. *CAUTION - Aluminum engine gasket must be installed with copper side down.*

ALUMINUM ENGINE NOTE - Cylinder head is interchangeable with Cast Iron engine head (not interchangeable with previous cast iron engine heads). Head bolts are longer (4 15/16") and use of shorter bolts may damage aluminum block.

MANIFOLD ASSEMBLY

Loosen three intake manifold-to-exhaust manifold bolts before installing assembly. Install manifolds on cylinder head with cup side of conical bolt washers against manifold. Tighten nuts to specifications. Tighten intake manifold-to-exhaust manifold bolts to specifications.



CYLINDER HEAD TIGHTENING SEQUENCE

PISTONS, PINS, RINGS

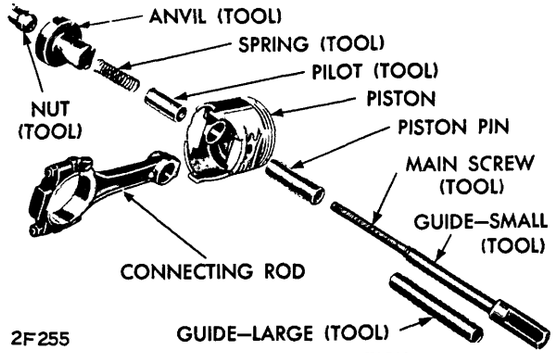
PISTON	PISTON PIN		PISTON RINGS		
Clearance ①	Piston Fit	Rod Fit	Ring	② End Gap	Side Clearance
.0005-.0015"	③ .00045-.00075"	④ .0007-.0012"	Compr. Oil	.010-.020" .015-.062"	.0015-.0040" .009" Maximum

① -Measured at top of skirt. ② - Measured 2" from bottom of cylinder bore.
③ - Sliding fit at 70°F. ④ - Interference fit.

ALUMINUM ENGINE PISTON & ROD ASSEMBLY

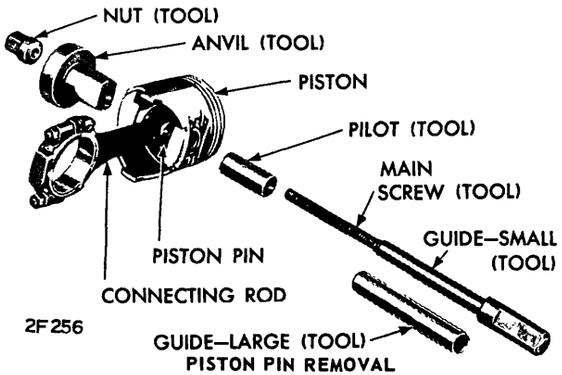
FITTING PISTON

With piston and cylinder wall clean and dry, clearance between top of skirt and cylinder wall should be .0005-.0015". Measure 90° to piston pin axis. Cylinder bores on used engines should be measured halfway down cylinder bore and 90° to crankshaft centerline.



► *CONNECTING ROD INSTALLATION CAUTION:* **Cast Iron Engines** - Rods must be installed with oil squirt hole toward right or valve chamber side of engine (reversed from previous models) for improved lubrication. Numbers on rods should be toward right (visible from below). Notch on piston head should be toward front of engine (unchanged).

Aluminum Engines - Install rods with oil squirt hole toward left side of engine and pistons with notch in head toward front (unchanged from previous models).



PISTON PIN REMOVAL

Press fit in rod. *See CONNECTING ROD INSTALLATION CAUTION below.* To install, lubricate pin bores and use Tool C-3724 shown in illustration. Press pin in until pin bottoms on pilot. To test for proper fit, assemble piston and rod with tool in same manner as for pin removal (see illustration). Clamp screw shaft end of tool in a vise. With torque wrench at nut (anvil end of tool,) apply 15 ft. lbs. torque. If pin does not move, the fit is correct. If pin moves in rod, replace rod.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

PISTON PIN INSTALLATION

PISTON PIN REMOVAL

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

MAIN BEARINGS				CONNECTING ROD BEARINGS		
Journal Diameter	Clearance	Thrust Bearing	Endplay	Journal Diameter	Clearance	Sideplay
2.7495-2.7505"	.0005-.0015"	No. 3	.002-.007"	2.1865-2.1875"	.0005-.0015"	.006-.012"

REAR MAIN BEARING OIL SEAL INSTALLATION

In Block - Install seal in block so both ends protrude Tap seal into position using Tool C-3743 (bridge removed) until tool seats in bearing bore. Hold tool in this position and cut off portions of seal that extend above block.

In Bearing Cap - Install seal in retainer so ends protrude. Install bridge on Tool C-3743 and tap seal into position until tool seats. Trim off portion of seal that protrudes above cap. Install two side seals in grooves in retainer. When installing retainer, torque to specifications.

MAIN BEARING REPLACEMENT (ALL ENGINES)

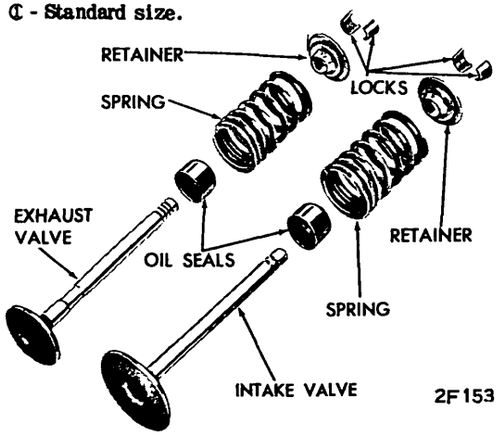
Original equipment bearings in cast iron and aluminum engines have different oil hole locations and must NOT be interchanged (replacement bearings have two oil holes and are interchangeable). Bearings are interchangeable in an engine only as follows: No. 1,2,4 lower bearings; Nos. 2 & 4 upper bearings. No. 1 upper bearing is chamfered on tab side (red marking on edge) and must be installed with chamfer forward to provide timing chain lubrication. Bearing caps are not interchangeable and should be numbered before removal.

MAIN BEARING CAP REPLACEMENT (ALUMINUM ENGINE)

Upper and lower cast iron bearing caps are line-bored and must be replaced as complete matched sets Install caps in numbered position (stamped and cast numbers on caps) with bearing tabs on left side of engine.

ENGINE FRONT COVER

Removal - Remove radiator and fan, pull vibration damper using Tool C-3722 or suitable puller, loosen oil pan bolts to provide clearance between pan and lower flange of cover, remove timing chain cover.
Installation - Install cover and tighten cover bolts to specifications. Check condition of oil pan front gasket, tighten oil pan bolts to specifications.



FRONT COVER OIL SEAL

Use Tool C-3506 or suitable puller and driver to remove and install seal from inside of cover. With seal properly installed, neoprene face of seal should be tight against face of cover (a .0015" feeler should not enter between neoprene face and cover).

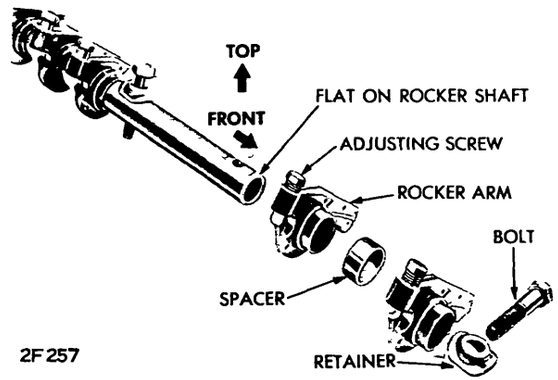
VALVES

Valv	Head Diam.	Face Angle	Seat Angle	Seat Width	℄ Stem Diam.	Stem Clearance	Valve Lift
Intake	1.62"	45°	47°	5/64-3/32"	.372-.373"	.001-.003"	.375"
Exhaust	1.36"	45°	45°	3/64-1/16"	.371-.372"	.002-.004"	.360"

℄ - Standard size.

VALVE ASSEMBLY

VALVE STEM SEALS



Cup type used on all valves. Long seal used on Intake Valve, short seal used on Exhaust Valve.

VALVE GUIDES

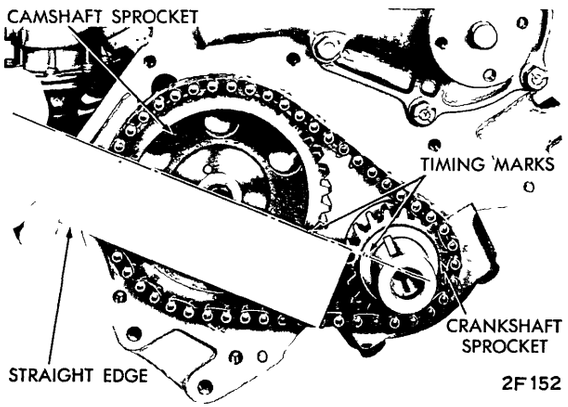
Integral with cylinder head.

Wear Check - Install sleeve, Tool C-3026 to hold valve at working height. Attach dial indicator Tool C-3339 to cylinder head with button against valve head (right angle to valve stem). Total sideplay should not exceed .012" (Intake), .017" (Exhaust).

Servicing - Ream to next oversize with Tool C-3433 (.005"), C-3430 (.015"), C-3427 (.030").

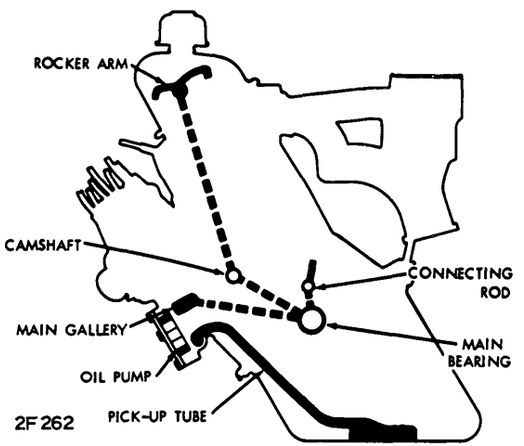
ROCKER ARM ASSEMBLY

ROCKER ARM ASSEMBLY



See illustration for assembly of parts. Install assembly with flat on end of shaft upward and toward front of engine (*CAUTION - Necessary to provide proper lubrication of rocker arms*), make certain that shaft retainers seated **between** extended bushings of rocker arms, install long retainer in center position and long rocker shaft bolt at rear of engine. Tighten shaft bolts evenly to specifications.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



VALVE TIMING				
	INTAKE		EXHAUST	
Engine	Open BTDC	Close ALDC	Open BLDC	Close ATDC
All	8°	44°	48°	TDC

VALVE TIMING CHECK

1) Turn crankshaft until No. 6 exhaust valve is closing (No. 6 intake valve is opening).
2) Turn No. 1 intake valve adjusting screw in 1 turn to remove lash.
3) Install dial indicator so plunger contacts valve spring retainer at a 90° angle. Zero indicator.
4) Turn crankshaft clockwise (normal running direction) until intake valve has lifted .019". Timing indicator of crankshaft pulley should now read 12° BTDC-TDC.

ENGINE VALVE TIMING MARKS

ENGINE OILING SYSTEM

VALVE SPRINGS & LIFTERS				
SPRINGS			LIFTERS	
Pressure (Lbs.)		Free Length		
Valve Closed	Valve Open		Diameter	Clearance
53 at 1.69"	143.5 at 1.31"	1.92"	.9040-.9045"	.0012-.0025"

VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of spring retainer. If height exceeds maximum of 1 11/16", install 1/16" spacer under spring to obtain normal height range of 1 5/8"-1 11/16".

CAMSHAFT				
Journal Diameter				Bearing
1	2	3	4	Clearance
1.998-1.999"	1.982-1.983"	1.967-1.968"	1.951-1.952"	.001-.003"

CAMSHAFT REMOVAL

Remove with engine out of the car.

► *CAMSHAFT OR LIFTER REPLACEMENT CAUTION:* When new parts installed, add one quart of approved Oil Additive to engine oil to aid break-in. Drain oil mixture at time of next normal oil change (minimum of 500 miles).

ALUMINUM ENGINE CAMSHAFT REAR PLUG REMOVAL

To prevent damage to aluminum block, punch a hole in center of plug with 1/8" sharp punch (do not drill hole), then tap hole for threads with 10-24 tap. Use a steel bar 1/4" x 1" x 6" with 1/4" hole drilled in center, across supports to pull plug with a 10-24 x 1 1/8" long screw placed in hole in bar. Remove all foreign material from block before inserting new plug.

CAMSHAFT BEARING REPLACEMENT

Use Tool Set C-3132-A to remove and install bearings. Install No. 1 bearing 3/32" in from front face of block. Install new welch plug at rear (Tool C-897).

TIMING CHAIN REPLACEMENT

To check chain for wear, use torque wrench on camshaft sprocket retaining bolt to rock camshaft sprocket back and forth while holding crankshaft sprocket stationary. Measure movement with scale at edge of chain link on camshaft sprocket. If total movement exceeds 11/64" with 15 ft. lbs. torque (head removed), 30 ft. lbs. torque (head installed), replace chain.

ENGINE OILING

Normal Oil Pressure - 45-65 lbs. at 1000 RPM.
Pressure Regulator Valve - In oil pump body. Not adjustable. *See Oil Pump Specifications.*

PRESSURE REGULATOR VALVE CLEANING (POLICE, TAXICAB, FLEET CARS)

In severe service, disassemble and clean regulator valve yearly (prior to cold weather operation). Use Carburetor Cleaner to remove varnish from plunger and cylinder, polish plunger with crocus cloth and remove all scratches, nicks, and burrs. See Oil Pump specifications for pressure regulator valve spring data.

ENGINE OILING SYSTEM

Refer to Engine Oiling System illustration and note the following:
Rocker Arms & Valves - Transverse channel in rear camshaft journal feeds oil from rear camshaft bearing up through channel in block and cylinder head to rear rocker arm shaft bracket (oil flows around rear bracket bolt into rocker shaft). Trough on upper surface of rocker arms lubricates pushrod seats and valve stems.

Oil Screen & Intake Pipe Installation - Turn pipe in until it is tight in block and right edge of screen is 1 1/8" in from vertical line projected down from inner flat surface of block on right side. Bottom of screen should be parallel with bottom of oil pan with 1/8" clearance when pan installed.

OIL PUMP REMOVAL & INSTALLATION

Removal - 1) Drain radiator, disconnect upper and lower hoses, disconnect fuel line at pump inlet, disconnect throttle linkage at carburetor (lay linkage on engine).
2) Support engine with jack placed under right front corner of oil pan, remove front engine mounts.
3) Raise engine just enough to insert 2" x 4" x 8" wood block between right front of oil pan and "K" member front rail (end of block against right engine mount support at "K" member weld).
4) With engine resting on wood block, pry lightly on right side until engine and wood block moved approximately 1½" to left (engine will tip slightly toward left).
5) Remove oil filter, oil pump cover, and pump outer rotor *(CAUTION - Rotor will fall out when cover removed).*
6) Remove pump mounting screws and slide pump out between engine and "K" member. *NOTE* - Above pro-

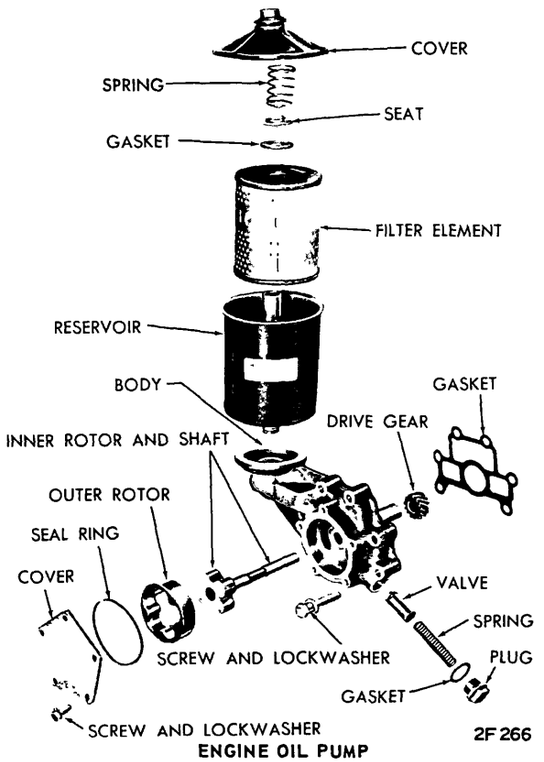
(Continued)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

cedure will provide just enough clearance to slide pump out.

Installation - Reverse removal procedure. Install outer rotor, pump cover, and filter after pump installed on engine.

OIL PUMP OVERHAUL



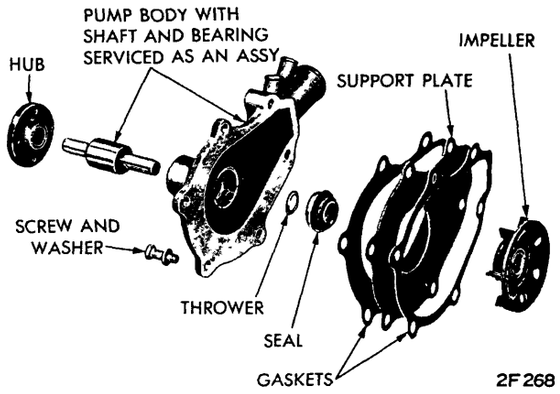
Replace all parts which measure less than specifications listed or where clearances exceed maximum listed.

Pump C v r Wear ..... .0015" Max.
(Place straightedge across inner face of cover, measure clearance between straightedge and face of cover with a feeler gauge).
Inn r & Outer Rotor Thickn ss ..... .649" Min.
Outer Rotor Diameter ..... 2.469" Min.
Outer Rotor Clearance in Body ..... .012" Max.
Inn r & Outer Rotor Clearance ..... .010" Max.
Rotor-to-Cover Clearance ..... 004" Max.
(Install rotors in pump body, place straightedge across pump face between bolt holes, measure clearance between straightedge and face of rotors with a feeler gauge).

Pressure Regulator Spring

Color & Us	Free Length	Pressure at 1 39/64"
Red (Std.)	2 19/64"	14.85-15.85 lbs.
Gray (Light)	2 3/16"	11.85-12.85 lbs.
Brown (Heavy)	2 25/64"	17.90-18.90 lbs.

NOTE - Replace with same color spring unless oil pressure above or below specifications.



ENGINE OIL PUMP

ENGINE COOLING

Pressure Valve - 14 lbs. (Std.), 16 lbs. (Air Cond. Cars). Radiator filler cap.
Thermostat - 180°F (fully open at 200°F). Pellet type in water outlet fitting.

WATER PUMP

Use suitable pullers and press supports when overhauling pump. See illustration for assembly of parts.
Disassembly - If plastic impeller used, break impeller away from sintered metal hub, split hub with a chisel to remove it from shaft. Lift out seal and spring, use puller to remove seal retainer, press shaft and bearing assembly out toward **front** of pump.
Reassembly - Install seal assembly, position thrower ring on longer end of shaft 1/8" from bearing, press shaft and bearing assembly in through front end of housing until outer end of bearing flush with hub end of housing (press on bearing outer race only), press fan hub on so that shaft extends 13/32" beyond front face of hub, press new impeller on flush with end of shaft.

Valiant With 225" Eng. (1963) Ⓒ

Ⓒ - Los Angeles built cars only.

► *TUNE-UP CAUTION: SPECIAL IGNITION AND CARBURETION SETTINGS REQUIRED ON CARS WITH THIS SYSTEM (SEE BELOW).*

DESCRIPTION

Special anti-air pollution system installed on some Los Angeles built Plymouth and Valiant cars. System consists of two separate systems as follows:

Closed Crankcase Ventilation System - Consists of ventilation valve in crankcase vent tube on rocker arm cover with hose to base of carburetor; and a second hose from oil filler cap to carburetor air cleaner. A special air cleaner filter element is used.

Cleaner Air Package (C.A.P) System - A system of exhaust emission control through ignition and carburetion. System consists of a special carburetor and distributor, and a Vacuum Advance Control Valve which provides distributor vacuum advance during deceleration for better burning of fuel flowing into engine during deceleration

VEHICLE IDENTIFICATION

Cars equipped with Cleaner Air Package (C.A.P.) System may be identified by presence of the Vacuum Advance Control Valve in engine compartment and a specification plate attached near this valve. Only cars built at Los Angeles have this system. See "Model Identification" on Car Model Pages for assembly plant designation from serial number plate.

SPECIFICATIONS

► *NOTE: Specifications not listed are same as for conventional 225" 6 Cyl. and 318" V8 Engines. See Car Model Pages.*

Hot (Slow) Idle RPM

With air cleaner installed, headlights on high beam, and auto. trans. throttle rod disconnected.

225" 6 Cyl	580 RPM
318" V8	550 RPM

Fast Idle RPM

225" 6 Cyl.	Ⓒ 1550 RPM
318" V8	② 1650 RPM

Ⓒ - Engine hot, choke open, adjusting screw on second step of cam.

② - Engine hot, choke open, adjusting screw on index mark on cam.

Ignition Timing

Set timing with headlights on high beam, and distributor vacuum line disconnected from distributor and plugged.

225" 6 Cyl.	Ⓒ 5° ATDC at Idle
318" V8	Ⓒ 5° ATDC at Idle

Ⓒ - May be set at 7° ATDC if fuel of sufficient octane to prevent detonation is not available. *Do not exceed 7° ATDC.*

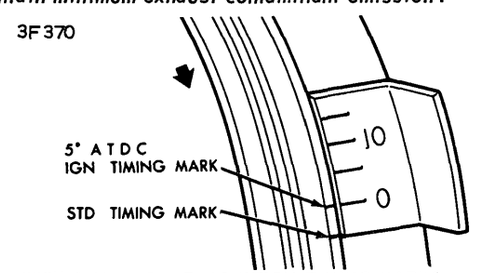
0-8	425	5-6	8.5
9-11	610	6-8.5	10
12½-14½	1700		

For engine degrees & RPM, multiply by 2.

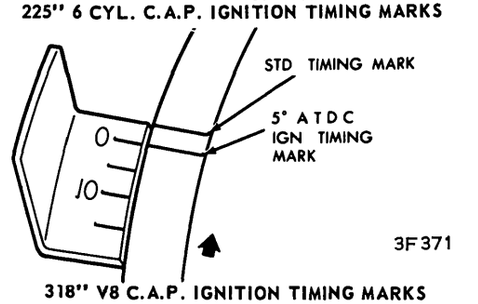
Distributor 2444217 (V8)

Mechanical Advance		Vacuum Advance	
Distr Degrees	Distr. RPM	Distr. Degrees	Vacuum " of Hg
Start	275-425	Start	8-10
0-8	425	5-8	13
9-11	610	8½-11½	15 5
12½-14½	1700		



For engine degrees & RPM, multiply by 2.

TESTING & ADJUSTMENT



TEST EQUIPMENT REQUIREMENTS - Two vacuum gauges connected by "T" fittings at each side of vacuum advance control valve, an accurate tachometer, a timing light, and an exhaust analyzer are required for the following tests and adjustments

Carburetor Air-Fuel Ratio

Adjust idle fuel mixture for highest steady vacuum at specified slow idle speed, then set engine speed at 1400 RPM and hold for 1 minute Insert exhaust sample pick-up tube into tail pipe and turn on exhaust analyzer. Adjust fuel mixture in lean direction until 14.2 analyzer reading is obtained, making sure correct slow idle speed is maintained. *NOTE - Engine may run slightly rougher than normal, but this condition necessary to maintain minimum exhaust contaminant emission.*

225" 6 CYL. C.A.P. IGNITION TIMING MARKS

318" V8 C.A.P. IGNITION TIMING MARKS

Idle Speed & Ignition Timing

With engine at normal operating temperature and carburetor air cleaner in place, set hot (slow) idle speed and ignition timing according to specifications.

Mixture Test

NOTE - Air cleaner must be clean for this test. Note engine idle speed with air cleaner in place, then remove air cleaner and note any RPM change Engine speed should not drop more than 50 RPM. If mixture is too rich, engine speed will not drop but may increase when air cleaner removed *CAUTION - If 14.2 air-fuel ratio not obtainable with manifold vacuum of 15" minimum, let vacuum remain at 15" (exhaust analyzer could be faulty).*

Vacuum Advance Control Valve

Check distributor and manifold vacuum at idle speed (should be as specified) Increase engine speed to 2000 RPM. Distributor and manifold vacuum readings should be within 1" of each other Release throttle. Both vacuum readings should immediately increase to above 22", then drop to 22" or less with decrease in engine speed. Distributor vacuum should gradually lower until manifold vacuum is approximately 21", then suddenly drop below maximum specified slow idle vacuum Manifold vacuum should then stabilize at specified idle setting Make any adjustments by rotating vacuum advance control valve spring adjusting screw clockwise to increase tension, counterclockwise to decrease tension

Fast Idle Speed & Distributor

Set fast idle speed as indicated in specifications, and check and adjust distributor advance curves in the usual manner.

TROUBLE SHOOTING & DIAGNOSIS

Following diagnosis listing is for C.A.P. system only and is in addition to normal diagnosis of engine performance.

Engine Stalls - Idle speed too low Idle mixture leaner than 14.2 air-fuel ratio Vacuum leak in control valve or hoses Air cleaner improperly installed or gaskets missing.

Engine Extremely Rough At Idl - Adjustments not within specifications Vacuum leak in control valve or hoses. Fuel mixture too lean.

Idle Speed Cannot Be Adjust d - Vacuum advance control valve spring tension too weak

Vacuum Does Not Increas During Dec l rati n - Vacuum control valve spring tension too strong. Manifold-to-control valve vacuum hose collapsed.

Loss Of Power - Air cleaner dirty. Vacuum leak at control valve or hoses Ignition timing incorrect Distributor advance curves incorrect.

Vacuum Control Valve Noisy - *Buzzing noise is normal.* Hissing noise indicates faulty valve (engine may also run roughly). Condition usually caused by turning adjusting screw in too far (screw bottoms)

Engin Ov rheats - Ignition timing incorrect. Cooling system restricted.

Engin Det nati n - Ignition timing incorrect Poor grade of fuel.

TUNE-UP SPECIFICATIONS

Mechanical Lifters (Others)	J9Y
426"	J10Y (supersedes J9Y)

VALVE CLEARANCE ADJUSTMENT (HI PERF. ENGINES WITH 300° CAMSHAFT)

Adjustment must be made with lifter on lowest point of cam base circle Use indicator light in ignition primary circuit to determine crankshaft position and make adjustments as detailed below. Set tappet clearance at .028" Intake, .032" Exhaust.

1) Set ignition timing at TDC and make chalk marks at TDC and 180° opposite TDC on vibration damper.
2) With No. 1 piston at TDC of compression stroke, adjust No. 2 & 7 Intake, No. 4 & 8 Exhaust.
3) Rotate crankshaft 180° (No 4 piston at TDC), and adjust No. 1 & 8 Intake, No. 3 & 6 Exhaust.
4) Rotate crankshaft another 180° (No. 6 piston at TDC), and adjust No 3 & 4 Intake, No. 5 & 7 Exhaust.
5) Rotate Crankshaft another 180° (No. 7 piston at TDC), and adjust No. 5 & 6 Intake, No. 1 & 2 Exhaust.
6) Reset ignition timing to specifications.

TUNE-UP NOTES

►*ENGINE CROSS-FIRE ON FIRST START (CAUSING STARTER DAMAGE) CORRECTION:* Clean distributor cap inside and out (use a non-flammable, general purpose type detergent). Inspect cap for carbon tracking. Replace cap if carbon tracking evident. *NOTE* - DO NOT use compressed air when drying cap.

►*HARD COLD WEATHER START CORRECTION (ALL MODELS):* May be caused by gum in air horn causing sticking of choke shaft and piston To correct, remove gum formation by squirting carburetor cleaner through piston link opening in air horn while moving choke blade back and forth Also apply cleaner to choke blade shaft at bearings.

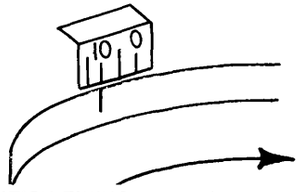
►*1963 HARD COLD START CORRECTION (4-BBL. CARBURETOR ENGINES):* Insufficient choke application, excessive choking, or slow engine warm-up may be due to bind in choke connector rod caused by improperly formed angle at lower end of rod *See "Carter AFB Carburetors" in Carburetion Section for correction.*

►*1963 361" ENGINE HARD STARTING CORRECTION (STROMBERG WWC CARBS.):* May be caused by choke coil prong hanging up in choke pocket. *See "Stromberg WWC Carburetors" in Carburetion Section.*

►*1963 361" ENGINE STALLING ON COLD START CORRECTION & CARBURETOR PRODUCTION CHANGE (STROMBERG WWC CODE 3-221 CARBS.):* Correct by drilling choke piston (later production Code 3-221A carburetors incorporate this change). *See "Stromberg WWC Carburetors" in Carburetion Section.*

►*1963 383" 2-BBL. ENGINE EXTREME RICHNESS DURING WARM-UP CORRECTION (BBD CARB.):* May be caused by choke thermostat coil distortion due to high temperatures To correct, install later type choke coil, No 2463159, which will withstand high temperatures.

DISTRIBUTOR



Point Gap (All)	014- 019"

THROTTLE LINKAGE ADJUSTMENT

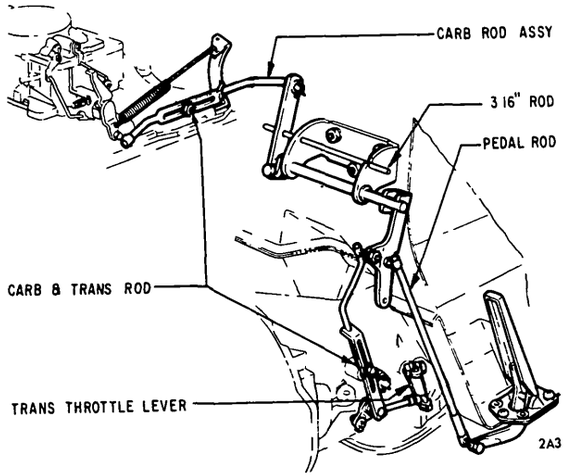
Chrysler (Exc. 300J), Imperial, Dodge 880 Auto. Trans. - 1) With slow (hot) idle properly adjusted, throttle linkage in place, disconnect or block choke valve in wide open position.

CHRYSLER (EXCEPT 300J) & DODGE 880 AUTOMATIC TRANSMISSION THROTTLE LINKAGE

CARBURETOR

2) Loosen nuts on carburetor and transmission rods and insert a 3/16" rod (10" long) through holes in bellcrank bracket and lever assembly.
3) Hold transmission lever forward against stop and tighten transmission rod locknut.
4) Disconnect one end of accelerator pedal rod (at transmission and dash bracket levers) and adjust rod length to obtain a pedal angle of 113-115° from horizontal and reinstall rod.
5) Remove the 3/16" rod and move link of carburetor rod assembly rearward until transmission lever is against stop. Tighten carburetor rod locknut and remove choke block.

Dodge & Plymouth (Except Dodge 880) Single Carburetor Auto. Trans. -



1) With slow (hot) idle properly adjusted, linkage in place (transmission rod ball socket to ball end not assembled), disconnect or block choke in wide open position. Release fast idle cam.

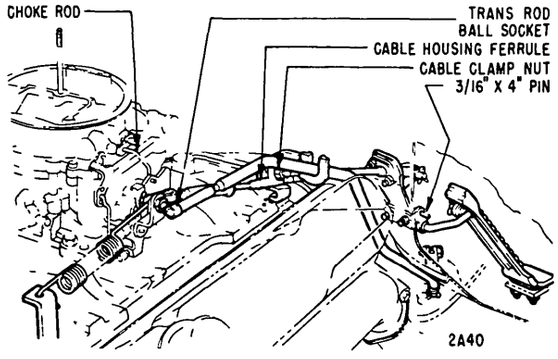
2) Apply a thin film of MS 3608 lubricant to accelerator shaft where it turns in shaft.

3) Hold transmission lever forward against its stop and adjust length of rod at threaded upper end. Ball socket must line up directly with ball end without exerting any force on rod. *Ball socket must be at same height as ball end when checking rod length.* Lengthen rod 1 turn.

4) Assemble ball socket to ball end. When carburetor opens, transmission lever should begin its travel with no vertical movement of lever or rod in lever.

5) Assemble remainder of linkage parts in place. With cable clamp loose, adjust position of cable housing ferrule so all slack removed from cable with carburetor at slow idle. To adjust, move ferrule in clamp away from carburetor lever.

IMPERIAL AUTOMATIC TRANSMISSION THROTTLE LINKAGE



6) Back off ferrule 3/32" (provides freeplay between rear surface of dash cable fitting and front surface of rear cable clevis). Tighten clamp nut.
7) Route cable correctly (should not interfere with full travel of transmission rod).
8) Connect choke rod or remove blocking fixture.

Front & Rear Carb. (Runner Manifold) Interconnecting Linkage Adjustment - Both front and rear carburetor levers should operate freely and in same plane. Correct either bent or damaged levers. Install interconnecting rod with slotted end connected to **lower hol** in **front** carburetor throttle lever, and end connected at **top hole** of **rear** carburetor throttle lever Hold **rear** carburetor throttle wide open (choke in full open position) and adjust slotted end of rod so **front** carburetor throttle valves will also be in wide open position Tighten locknut and check operation. Interconnecting rod must rotate slightly on pivots without bind in any position.

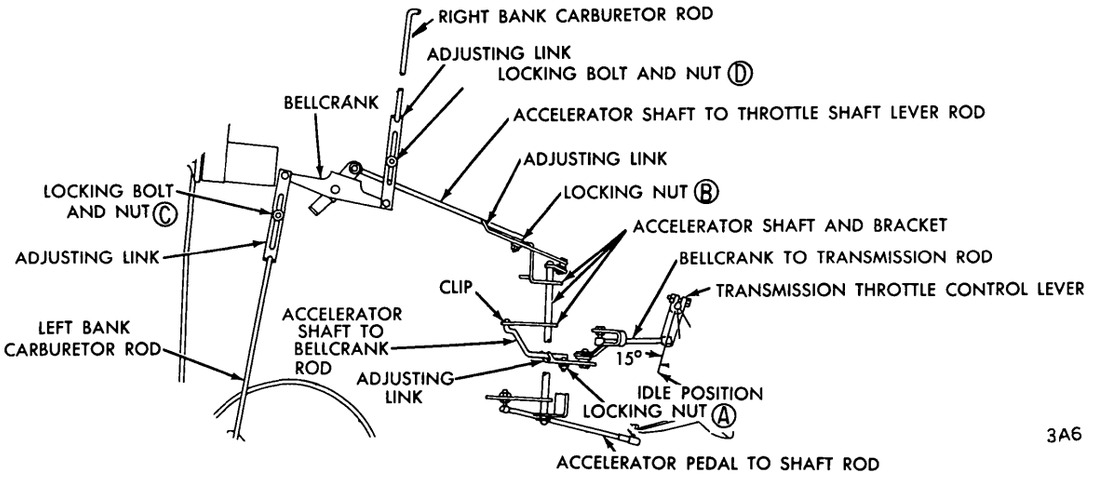
300J (Ram Manifold) Auto . Trans. - *NOTE - On 426" Engine With Short Ram Manifold (one-piece. type fitting between rocker covers), linkage adjustment will be similar to procedure detailed below except that intake manifold bellcrank-to-carburetor rods use threaded type adjustment rather than sliding link type.* With slow (hot) idle properly set, engine at normal operating temperature, carburetor off fast idle, and choke valves open, proceed as follows:

1) *Refer to illustration.* Loosen locknuts "A" and "B". Insert a piece of 3/16" drill rod (10" long) into accelerator shaft bracket and through hole in lever.

2) Move transmission throttle control lever forward against its stop, then tighten locknut "A". Unsnap accelerator pedal-to-shaft rod. Turn threaded end of rod in or out until an angle of 114° is obtained between vehicle floor and flat face of pedal. Reconnect rod and remove locating drill rod.

DODGE (EXCEPT 880) & PLYMOUTH AUTOMATIC TRANSMISSION THROTTLE LINKAGE

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



3) Check to be sure carburetor choke valves are open, fast idle cams are released, and throttle valves are closed

4) Loosen locknuts "C" and "D" (left and right bank carburetor rods) Back off anti-stall adjusting plunger to allow bellcrank to be pivoted

5) Pivot bellcrank until a 3/16" rod (3" long) can be inserted through bellcrank hole and locating hole in manifold Tighten locknuts "C" and "D" and remove locating drill rod from bellcrank

6) Push rearward on accelerator shaft-to-throttle shaft lever rod adjusting link until contact made with transmission stop, then tighten locknut "B"

7) With idle speed properly adjusted and engine at normal operating temperature, disconnect vacuum line from anti-stall unit With engine running and transmission in Neutral, turn anti-stall plunger toward or away from bellcrank to obtain 1500 RPM Reconnect vacuum line

FUSES & CIRCUIT BREAKERS

FUSE BLOCK

Located at center, forward edge of instrument panel

IN-LINE FUSES

In-line fuse for rear cigar lighter located near ammeter

CIRCUIT BREAKERS

1 - Headlight circuit integral with headlight switch
2 - Windshield wipers and Back-up lights integral with, or attached to, wiper switch
3 - Other circuit breakers for electric windows, seats, convertible top electric door locks, cigar lighters, courtesy lamps, and power antenna are located behind left front kick panel

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Located on transmission case Starter should operate only when Neutral push button depressed To adjust, check control cable for proper adjustment Drain about 2 qts oil from transmission, then unscrew switch from transmission case Check to see that switch operating lever is aligned in center of switch opening in case Place cupped washer and "O" ring over switch threads and screw switch into transmission case a few turns Connect one lead of test lamp to battery current and other to switch terminal, then screw switch in until lamp lights Tighten switch additional 1/4-3/8 turn

CAUTION - Switch must be tight enough to prevent oil leak If not, add a thin washer and readjust switch Do not tighten over 60 lbs torque

STOP LIGHT SWITCH

Mechanical type mounted on brake pedal bracket Adjust switch so stop lights go on at 5/8-3/4" (With Power Brakes), 13/16-7/8" (Without Power Brakes) pedal travel, measured at center of brake pedal pad

HEADLIGHT SWITCH REMOVAL

With switch knob in full OUT position, remove knob and shaft by releasing button on switch body Remove bezel nut or retainer and trim plate (On Imperial, remove back plate dial and dial lamp) Remove switch

WINDSHIELD WIPER SWITCH REMOVAL

Loosen setscrew and remove control knob, then remove switch retaining bezel On Imperial, remove back plate dial and dial lamp Remove switch

TURN SIGNAL FLASHER

Located in center of instrument panel near fuse block

SPEEDOMETER REMOVAL

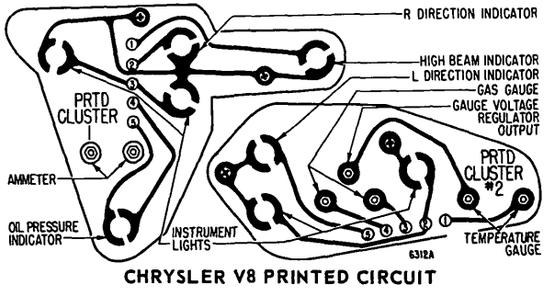
All Models - Speedometer can be removed from instrument cluster after cluster removed from car (see below)

INSTRUMENT CLUSTER REMOVAL

Chrysler - Remove upper and lower moldings at center of panel Remove heater bezel, disconnect Bowden cable, vacuum lines, and wiring at heater switch Remove instrument panel lower hood Remove windshield wiper switch (see above) Remove instrument cluster-to-instrument panel attaching screws, then remove cluster and disconnect wiring

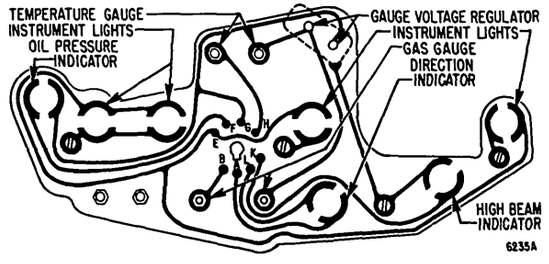
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

Chrysler, Imperial, Dodge, Plymouth V8 1963



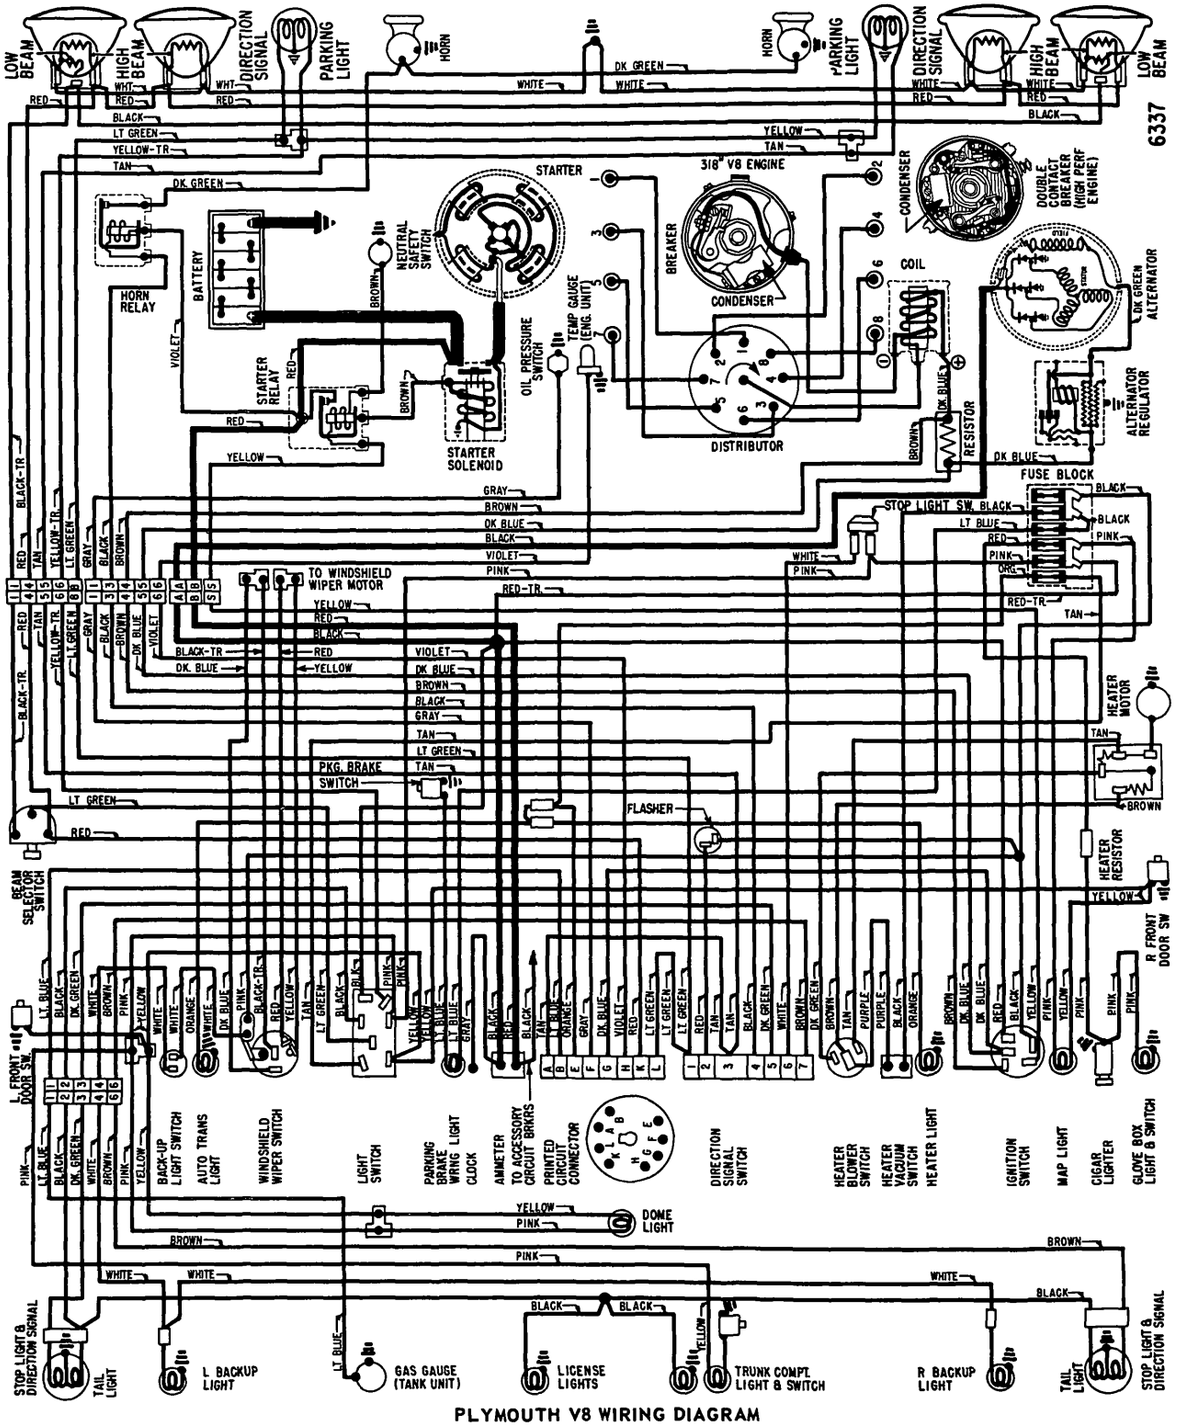
Imperial - *NOTE - Ammeter, Oil Pressure, Fuel, Temperature Gauges can be removed from underneath instrument panel without removing cluster. If car has heater or air conditioning (or both) remove defroster and spot cooler lines first.* Remove cluster as follows: Remove defroster and spot cooler hoses (if equipped). Disconnect speedometer and odometer reset cables. Remove 5 screws holding instrument cluster to instrument panel, tilt lower end of cluster outward, and remove cluster.

Dodge (Except 880) - Remove headlight and windshield wiper switches (see above). Remove heater or air conditioning control knob, then remove sleeve on control lever. Remove cluster trim plate. Disconnect instrument cluster from panel. Pull cluster forward out of panel housing, disconnect speedometer cable, then roll cluster downward and forward and disconnect wire connectors, snap out light sockets, and ammeter lead wires. Remove cluster.



Dodge 880 - 1) Instrument Cluster - Remove heater and transmission push button trim plates and bezels. Remove the 8 cluster attaching screws, disconnect wiring, and remove cluster.

2) Speedometer - After cluster removed, disconnect speedometer cable, remove transmission push buttons and control box. Disconnect speedometer upper housing from instrument panel, then remove speedometer housing from car. Remove speedometer from housing.



Plymouth - Remove heater blower switch and temperature control knobs. Disconnect speedometer cable. Remove the 4 screws from face of cluster bezel, then pull cluster forward and tilt downward to remove wiring and connectors. Remove cluster.

② - No letter **T**.
③ - Dodge Ramcharger 426A and Plymouth Super Stock' 426II Engines *See Engine Notes for details*

Engine Number Location

318" Engine - Left front of block under cylinder head

361", 383", 413", 426" Engines - Right side of block below distributor, or on left front of block behind thermostat housing

Engine Number Pad Markings

Various marks as listed below may be found on Engine Number pad and indicate variations in engine specifications which affect service procedures

Engine Specifications	Marking
Low Compression Engine	LC
High Compression Engine	HC
High Performance Engine	① HP
Maximum Performance Engine	MP
001" Undersize Crankshaft Journals	② Maltese Cross
010" Undersize Crankshaft Journals (318")	② B
(Others)	② Maltese Cross &X
020" Oversize Cylinder Bores	A
008" Oversize Valve Lifters	♦

① - *See "High Performance Engine Note"*
② - *Further identification on crankshaft counterweight See next table*

Other Identifying Marks

The following marks appear in other locations as follows

On End of Cylinder Head - **o/s** indicates valves with 005" oversize stems

On Crankshaft Counterweight - 318" - **M** and **R** indicate all crankshaft journals 010" undersize

361", 383", 413", 426" - **1)** **M** and **R** plus a number indicate which **Main** and **Rod** journals are 001" undersize **2)** **M-10** and **R-10** indicate all crankshaft journals are ,010" undersize

►*HIGH PERFORMANCE ENGINE NOTE:* Conventional engines characterized by hydraulic lifters, standard camshaft, 2 or 4-barrel carburetors, and which are optional engines in some models, may also be designated "High Performance" (HP) engines

ENGINE NOTES

►*"SQUEAK" OR "CHIRPING" NOISE IN ENGINE COMPARTMENT CORRECTION* Noise may be caused by water pump seal, but does not affect pump operation or efficiency To correct, add 2 ozs Silicone Water Pump Lubricant, No 2298997 to cooling system If noise continues after 600 miles of operation, replace pump

►*361", 383", 413" CYLINDER HEAD PRODUCTION CHANGE:* Beginning with date code "2-1" (last digits of engine number), new cylinder heads, covers, and cover gaskets were used Covers and gaskets have two additional mounting holes on exhaust side and heads have bosses added for additional mounting studs New and old parts are interchangeable except *new gasket cannot be used with old head*

►*426" ENGINE (EARLY) DIPSTICK NOTE:* Make sure dipstick is correctly calibrated for correct oil capacity of 5 quarts (6 quarts with filter change)

►*RAMCHARGER (413" & 426") ENGINES CAMSHAFT REPLACEMENT CAUTIONS:* To avoid camshaft lobe failure, observe the following precautions when replacing camshaft· **1)** Always use **all new** lifters, and coat lifters and camshaft liberally with "MS" oil during installation **2)** Adjust valve lash correctly **before starting engine. 3)** Use premium oil, SAE 30W and add 1 can of MoPar Engine Oil Supplement, No 1879406 **4)** Operate engine for 3 hours at 2000-3200 RPM *Avoid unnecessary idling*

►*426" ENGINE DESIGN & OPERATING NOTES & CAUTIONS. Note the following when operating or servicing this engine.*

1) Cylinder Head & Block - Special type head with larger ports, and with heat crossover passage eliminated Extra large exhaust valves are used and cylinder block bores must be notched to provide valve clearance

2) Pistons - Forged type for high output Highest octane gasoline available is required to prevent damage There is no bi-metal thermal control on 13 5-1 ratio pistons *Do not operate engine over 6500 RPM, and wide open throttle bursts must be limited to 15 seconds*

3) Crankshaft - Journals are hardened and fillets are shot-peened Journals are ground 001" undersize to accommodate F-77 Tri-Metal heavy duty bearings

►*426' ENGINE PRODUCTION CHANGES (BEGINNING 5/31/63)* These engines identified by special Engine Number (see data above) and special marking on rocker cover "Ramcharger 426A" (Dodge) or "Super Stock 426II" (Plymouth) have the following changes in specifications and design

1) Cylinder Head Assembly - Heads are relieved in combustion chamber adjacent to intake valve and port approach angle to intake valve has been changed from 15° to 0° Combustion chamber volume is 82 cc (minimum), 87 cc (maximum)

2) Camshaft - Maximum performance type with 300° duration (Intake), 308° (Exhaust) Lift is 520" for all valves

3) Carburetors & Manifold - Carburetors are Carter 3705S with larger (1 11/16") bores Manifold is "Short Ram" type with larger 1 69" openings at carburetor mounting flanges

4) Other Specifications - *See Engine Data for other special specifications*

ENGINE REMOVAL

Engine may be removed in the usual manner after removing hood, battery, fan shroud, radiator, carburetor, and transmission

RAM MANIFOLD REMOVAL (LONG RAM TYPE - 300J)

Remove and install left manifold first Remove fender shield access plates Remove air conditioning compressor and brackets Remove either manifold with carburetor attached

OIL PAN REMOVAL

OIL PAN BOLT NOTE (361", 383", 413", 426") -The two rear center bolts are shorter (9/16") than other bolts and thread into rear bearing seal retainer DO NOT install longer bolts in these holes or retainer will be damaged and there will be an oil leak

Dodge (Except 880) & Plymouth - Observe the following Remove engine-to-torque converter housing brace on 318" Disconnect steering and idler arm ball joints from steering linkage center link Disconnect exhaust cross-over pipe from exhaust manifolds and let hang Remove oil pan *INSTALLING NOTE* - Bottom of oil strainer must be parallel with lower machined surface of engine block, and on 361", 383", 413", 426" engines, foot of strainer should touch bottom of oil pan

TIGHTENING SPECIFICATIONS

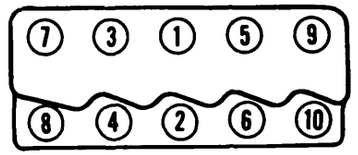
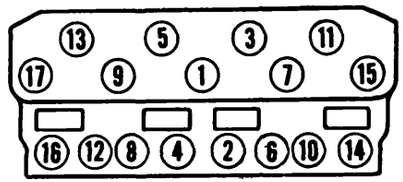
Rear Crossmember-to-Frame	75



① - Tighten bolts 2 times around in sequence to the same torque specification

Dodge 880, Chrysler, Imperial - Observe the following Disconnect steering linkage from idler and pitman arms Remove exhaust pipe and converter dust shield Remove oil pan *INSTALLING NOTE* - Bottom of oil strainer must be on a horizontal plane with machined surface of cylinder block, and foot of strainer should touch bottom of oil pan

CYLINDER HEAD



Removal - On air conditioned cars, No 8 exhaust valve must be open for clearance to remove rocker arm cover Remove intake manifold, carburetor and ignition coil as an assembly Remove exhaust manifold Take off rocker cover, remove rocker arm assembly, lift out all pushrods (keep in order for reassembly in same position)

Installation - Coat cylinder head gasket with suitable sealer, then install cylinder head in the usual manner Tighten head bolts 2 times around to correct torque in sequence shown in diagrams

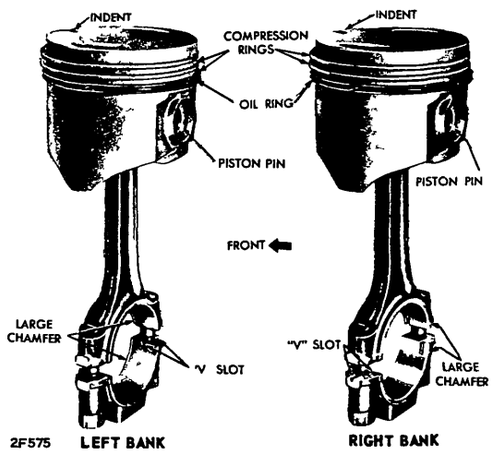
① - Measured at top of skirt ② - Light thumb push fit at 70°F

③ - Measured 2" from bottom of cylinder bore ④ - Press (interference) fit *See text for Removal & Installation procedures*

⑤ - For 13 5-1 ratio 008- 010" ⑥ - 013- 025"(11 0-1), 023- 025"(13 5-1), 013- 050"(426A & 426II)

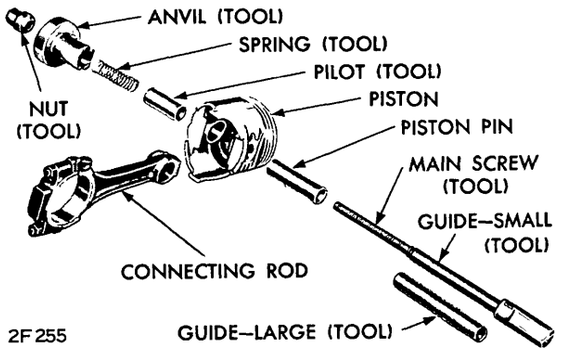


FITTING PISTONS

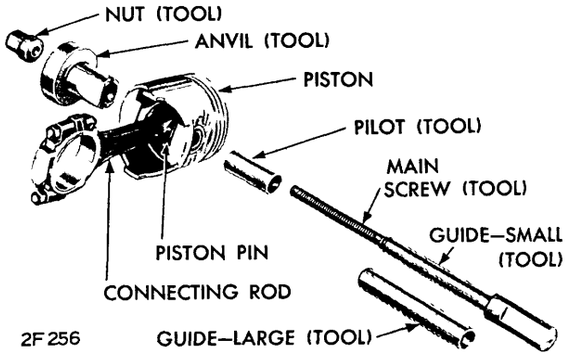
318 Engine - Coat cylinder bore lightly with engine oil and insert piston upside down. With ½" x .0015" feeler gauge inserted between thrust face of piston and cylinder wall, pull to withdraw feeler should be 5-10 lbs.

361, 383, 413, 426 Engines - Measure 90° to piston pin axis and at top of skirt Cylinder bores on used engines should be measured halfway down bore and 90° to crankshaft centerline

PISTON PIN REPLACEMENT (361", 383", 413", 426")



Removal - Use Tool C-3684 as shown in illustration to remove pin from piston and rod assembly When pin falls free of rod, stop press to prevent damage to anvil of tool



PISTON & ROD ASSEMBLY & INSTALLATION

Installation - *Do not ream pistons or connecting rods.* Lubricate pin bores in piston and rod and use Tool C-3684 as shown in illustration. Notch or "Front" on piston must face upwards when assembled in tool and with connecting rod properly positioned (see illustration), press piston pin in until pin bottoms on pilot.

Testing For Proper Fit - Assemble piston and rod with tool in same manner as for pin removal. Clamp screw shaft end of tool in a vise. With torque wrench at nut (anvil end of tool), apply 15 ft. lbs. torque. If pin does not move, fit is correct. If pin moves in rod, fit is incorrect and rod should be replaced.

361", 383", 413", 426" ENGINES PISTON PIN INSTALLATION

361", 383", 413", 426" ENGINES PISTON PIN REMOVAL

CRANKSHAFT REAR SEAL REPLACEMENT

Upper Seal - Use Tool C-3511 (318"), C-3625 with bridge removed (361", 383", 413", 426") and tap seal into position until tool is seated. Cut ends flush with block.

Lower Seal - Use Tool C-3511 (318"), C-3625 with bridge in place (361", 383", 413", 426") and tap seal into position until tool is seated. Cut ends flush with cap or retainer.

Side Seals - Dip side seals in mineral spirits or diesel fuel and install **immediately** into cap or retainer. On 318" engine, short seal must be on doweled side of cap. *CAUTION - Seals expand with oil. Failure to pre-oil seals will cause an oil leak.*

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

Engine	MAIN BEARINGS Journal Diam.	Clearance	Thrust Bearing	Crankshaft Endplay	CONNECTING ROD BEARINGS Journal Diam.	Clearance	① Sideplay
318"	2.4995-2.5005"	.0005-.0015"③	No. 3	.002-.007"④	2.124-2.125"	.0005-.0015"③	.006-.014"
361", 383"	2.6245-2.6255"	.0005-.0015"③	No. 3	.002-.007"④	2.374-2.375"	.0005-.0015"③	.009-.017"

426"	2.7490-2.7500"②	.0015-.0040"⑤	No. 3	.002-.007"④	2.373-2.374"②	.002-.0045"⑥	.009-.017"

① - Total for both rods.
② - Ground .001" undersize to accommodate F-77 Tri-metal Heavy Duty Bearings.
③ - Wear limit .0025". ④ - Wear limit .010".
⑤ - Wear limit .0045". ⑥ - Wear limit .005".

MAIN BEARING NON-INTERCHANGEABILITY

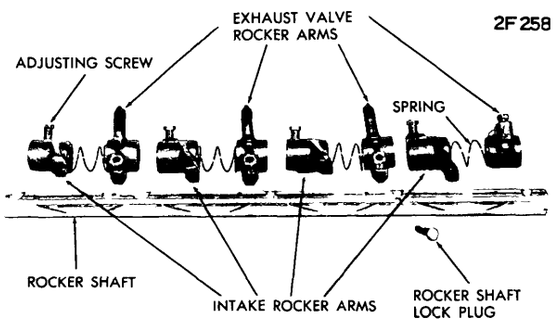
Upper and lower bearing halves are **not** interchangeable because upper halves have oil hole and groove. On 361", 383", 413", 426" engines, No. 1 upper half is **not** interchangeable because it is chamfered on the tab side for timing chain lubrication (insert has red mark on edge).

ENGINE FRONT COVER REPLACEMENT

Front cover may be removed after radiator, water pump, and vibration damper and pulley are removed.

FRONT COVER SEAL REPLACEMENT

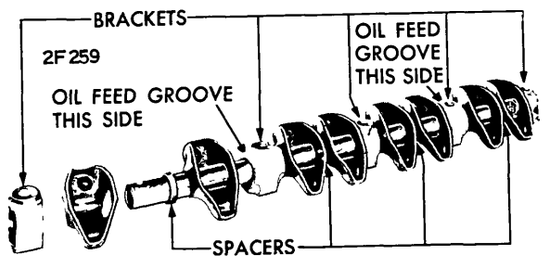
Use Tool C-3506 to replace seal as follows:



Removal - With inside of cover up, put puller screw through seal and position puller blocks directly opposite each other under flange of seal retainer. With washer and nut on puller screw, tighten nut so puller blocks distort seal retainer lip. Place sleeve over retainer and place removing and installing plate into sleeve. Place flat washer and nut on puller screw, hold center screw and tighten nut to remove seal.

Installation - Insert puller screw through removing and installing plate so thin shoulder faces up. Insert assembly through seal opening in front cover (inside of cover up), and place seal in opening with neoprene part of seal down. Place seal installing plate into seal with protective recess toward lip of seal retainer. With flat washer and nut on puller screw, hold screw and tighten nut until neoprene is tight against face of front cover. *If a .0015" feeler gauge CANNOT be inserted between neoprene and cover, seal is installed correctly.*

VALVES



ROCKER ARM SHAFT REPLACEMENT

318" - To install assembly, slide rocker shaft into bore of strut, engage intake rocker arm, install spring and engage exhaust rocker arm. Repeat procedure until all rocker arms are installed. Make sure that rocker shaft bolt holes align with head bolt holes in struts. Also, plug hole in strut must align with hole in shaft. Install new rocker shaft end plugs.

318" ENGINE ROCKER ARM & SHAFT ASSEMBLY

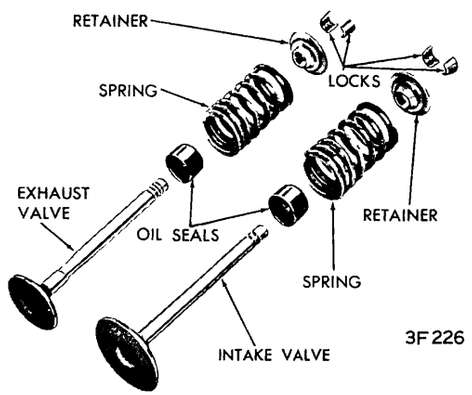
361", 383", 413", 426" - Install rocker shafts so that the 3/16" lubrication holes point downward into rocker arms and 15° angle of holes points outward toward valve end of rocker arm. *NOTE - 15° angle of holes is determined from centerline of th bolt holes through the shaft which attach shaft and bracket assembly to cylinder head.* The two wide support brackets must be installed with oil feed grooves facing pushrod side of rocker arm.

361", 383", 413" ENGINES ROCKER ARM & SHAFT ASSEMBLY (HYDRAULIC LIFTERS - MECHANICAL LIFTERS SIMILAR)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

PUSHROD INSTALLATION

Small diameter end of pushrod must seat in lifter. Large diameter end must contact rocker arm. Improper installation will cause valves to be held open partially.

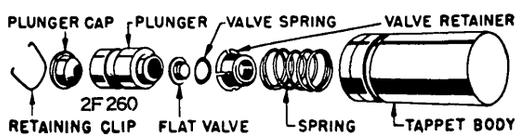


VALVE GUIDE SERVICING

Guides are integral with cylinder head.

Wear Check - Use Sleeve Tool C-3025 Intake, C-3026 Exhaust over valve stem to hold valve at working height. Check valve movement with dial indicator. Total movement should not exceed specifications in table below

Engine	Intake	Exhaust
318"	.008"	.014"
361", 383", 413", 426"	.010"	014"



Servicing - Ream to next oversize with Reamer C-3433 (.005"), C-3430 (.015"), C-3427 (.030")

VALVE ASSEMBLIES (EXPLODED)

HYDRAULIC LIFTERS

See illustration for arrangement of parts. To test, remove cap from plunger, submerge upright lifter completely in clean kerosene and allow to fill. Replace cap. Place lifter upright in Lifter Testing Pliers C-3160 and check leakdown. If lifter collapses immediately, disassemble, clean, and test again. If rapid leakdown persists, replace lifter.

HYDRAULIC VALVE LIFTER (EXPLODED)

VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of spring retainer. If height exceeds maximum (table below), install 1/16" spacer under spring.

Valve Spring Installed Height

Engines	Minimum	Maximum
318"		1 11/16"
361", 383", 413", 426"	1 53/64"	1 57/64"

GRINDING VALVES

Check valve height in head after grinding valves using Tool C-3648. If valve tip exceeds maximum (end of cylinder gauge), grind tip down to approach, but not below minimum height (slotted part of gauge).

VALVE STEM SEALS

Used on all valves except some early 426" engine intake valves. Seals and retainers can be installed on these early engines if desired as guides are already machined for seals.

VALVE TIMING CHECK

318" Engine

1) Turn crankshaft until No 6 exhaust valve is closing and No 6 intake valve is opening Turn No 1 intake valve adjusting screw in 1 turn
2) Install dial indicator so plunger contacts valve spring retainer face at a 90° angle, then zero indicator
3) Turn crankshaft clockwise in normal running direction until No 1 intake valve has lifted 041" Timing indicator on front cover should read from 10° BTDC to 2° ATDC

361", 383", 413" Hydraulic Lifter Engines

1) Turn crankshaft until No 6 exhaust valve is closing and No 6 intake valve is opening Insert ¼" spacer between rocker arm pad and stem tip of No 1 intake valve Allow spring load to bleed lifter down so valve train is solid.
2) Install dial indicator so plunger contacts valve spring retainer face at a 90° angle, then zero indicator
3) Turn crankshaft clockwise in normal running direction until No 1 intake valve has lifted correct amount and timing indicator on front cover reads correctly *See table below*

383", 413", 426" Mechanical Lifter Engines

1) Turn crankshaft until No 6 exhaust valve is closing and No 6 intake valve is opening Turn No 1 intake valve adjusting screw down to zero clearance plus ½-turn
2) Install dial indicator so plunger contacts valve spring retainer face at a 90° angle, then zero indicator
3) Turn crankshaft clockwise in normal running direction until No 1 intake valve has lifted correct amount and timing indicator on front cover reads correctly *See table below*

Engin	Valve Timing Check Valve Lift	Pointer
318"	041"	10°BTDC-2°ATDC
361", 383", 413"	013"	10°BTDC-2°ATDC
413" (300J)	069"	5°ATDC-7°ATDC

DISTRIBUTOR DRIVE GEAR & BUSHING REPLACEMENT

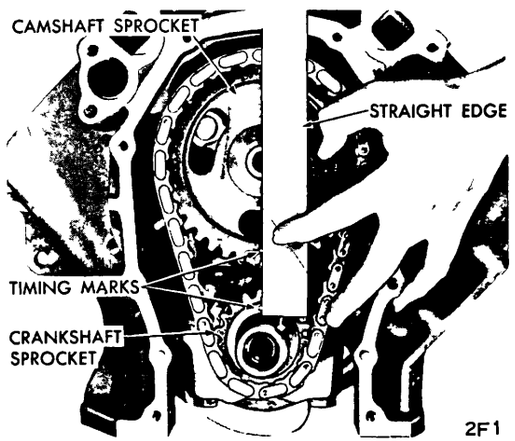
Bushing - Remove bushing with Tool C-3052 To replace, slide new bushing over burnishing end of Tool C-3053 and insert into bore Drive tool and bushing into position with a soft hammer As burnisher is pulled through bushing by tightening puller nut, bushing is expanded for tight fit in block and burnished to correct size *Do not ream bushing*

Drive Gear Installation - Coat shaft and drive gear with engine oil Install shaft so that, after gear spirals into place and indexes with oil pump shaft, slot in top of drive gear will point to first intake manifold bolt on left side of engine (318"), will be parallel with centerline of crankshaft (361", 383", 413", 426")

TIMING CHAIN REPLACEMENT

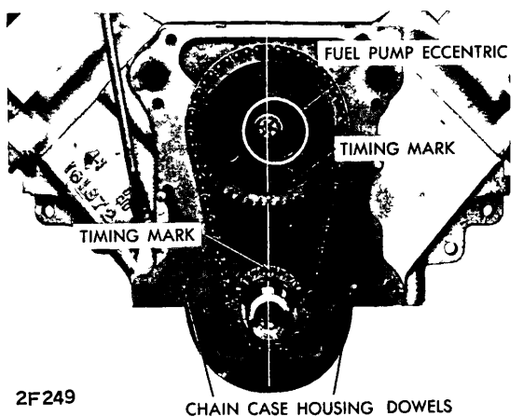
When installing timing chain and sprockets, install Holding Tool C-3509 in place of distributor drive gear and shaft to prevent camshaft from contacting rear welch plug Leave tool in place until after timing chain and sprockets installed, then install distributor drive gear *NOTE - On 361", 383", 413", 426" engines, modify Tool C-3509 by grinding off index lug holding upper arm on tool and rotate arm 180°, th n install tool*

CAMSHAFT REPLACEMENT



When installing camshaft, use Holding Tool C 3509 as detailed under "Timing Chain Replacement"above to prevent camshaft from contacting rear welch plug

CAMSHAFT BEARING REPLACEMENT



Tool Set C-3132A is available for replacing camshaft bearings Make sure all oil holes are perfectly aligned, and install a new rear welch plug On 361", 383", 413", 426" engines, No 1 bearing must be installed 1/32" inward from front face of cylinder block

CAMSHAFT END THRUST

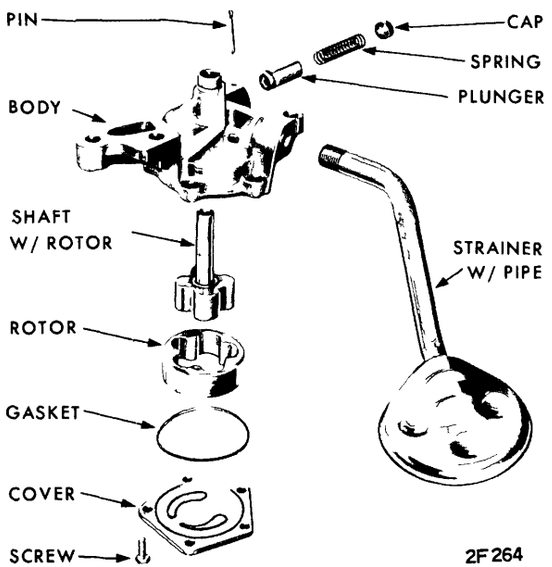
318" Engine - Taken by thrust plate behind camshaft sprocket Endplay is 002- 006" (wear limit 010")
361", 383", 413", 426" Engines - Taken by rear face of camshaft sprocket riding directly on front of cylinder block

361", 383", 413", 426" ENGINES VALVE TIMING MARKS

318" ENGINE VALVE TIMING MARKS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE OILING

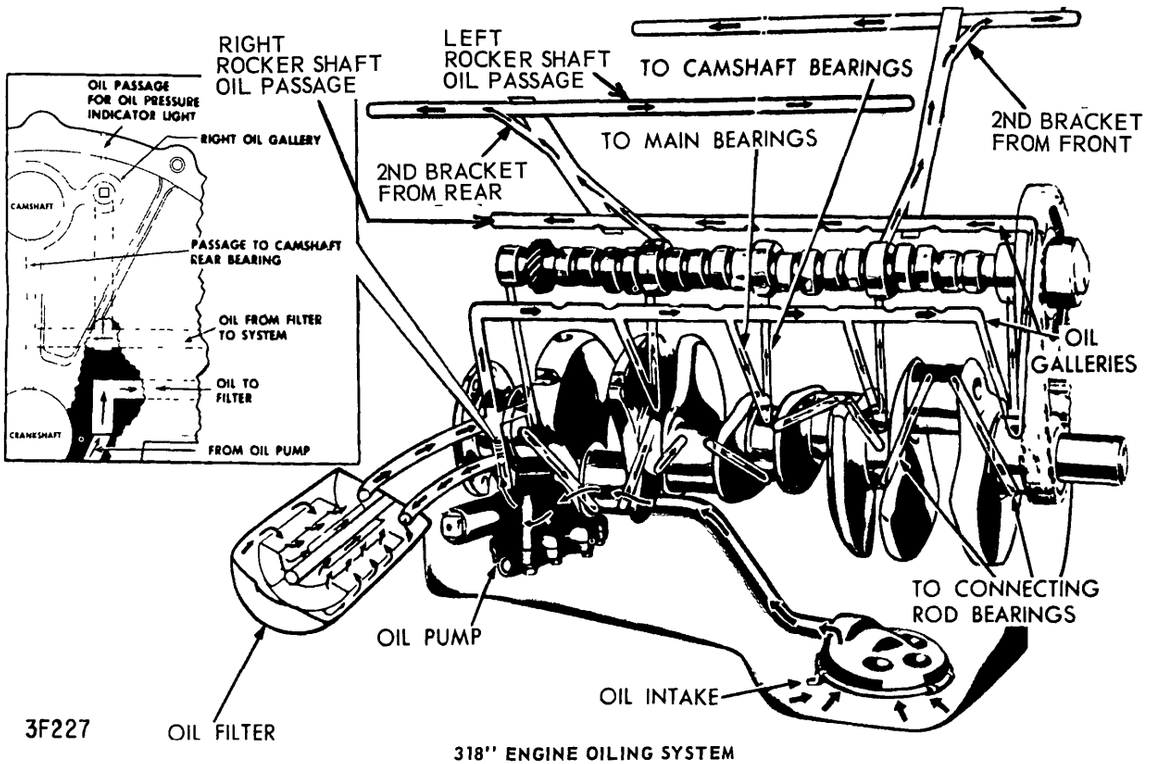


►*OIL PUMP RELIEF VALVE BUZZ OR FLUTTER CORRECTION:* On engines before April 25, 1963, above condition can be corrected by installing new type relief valve identified by narrow milled slot at one of the circumferential openings Later engines have this new type relief valve

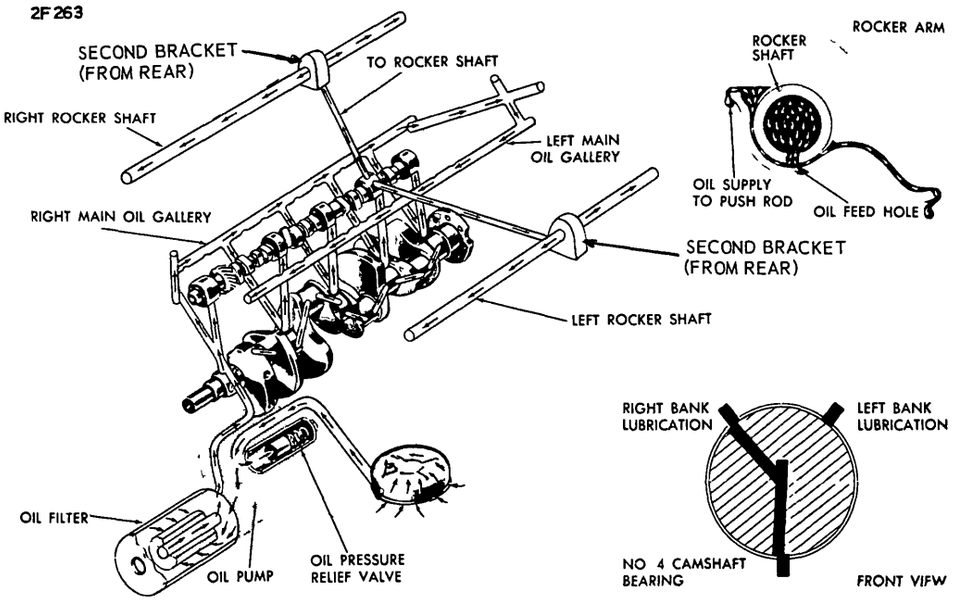
Normal Oil Pr ssur - 45-65 lbs at 40-50 MPH.
Pressur R gulator Valve - In oil pump Not adjustable

ENGINE OILING SYSTEM

318" Engin
Refer to illustration. Force feed type using rotor type pump and **full-flow** oil filter (previous engines used by-pass type filter) Metering orifice in by-pass passage in block replaced by a solid plug so all oil is directed through the filter. *CAUTION - Full-flow filter must be used on 1963 engines.*



361", 383", 413", 426" Engines
Refer to illustration. Force feed type using rotor type pump and full-flow oil filter.



318" ENGINE OIL PUMP (EXPLODED)

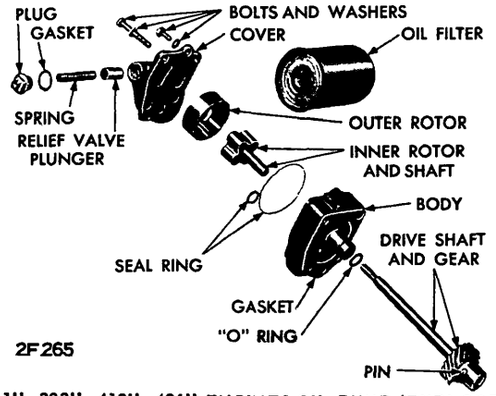
OIL PUMP

Rotor type mounted on rear main bearing cap (318"), on left front corner of block (361", 383", 413", 426") *See illustration for arrangement of parts, and observe the following specifications:* Pump cover bolt torque is 10 ft. lbs

318" ENGINE OILING SYSTEM

361", 383", 413", 426" ENGINES OILING SYSTEM

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



Oil Pump Specifications

Application	Engine 318"	361", 393", 413", 426"

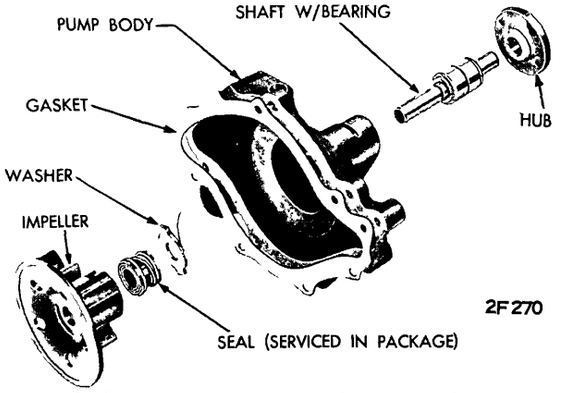
Engine	Free Length	Load Length
318"	2 1/32"	2 1/16" at 19 5-20 5 lbs.
361",383",413"	2 19/64"	1 19/32" at 14 85-15.85 lbs.
426"	2 1/4"	

361", 383", 413", 426" ENGINES OIL PUMP (EXPLODED)

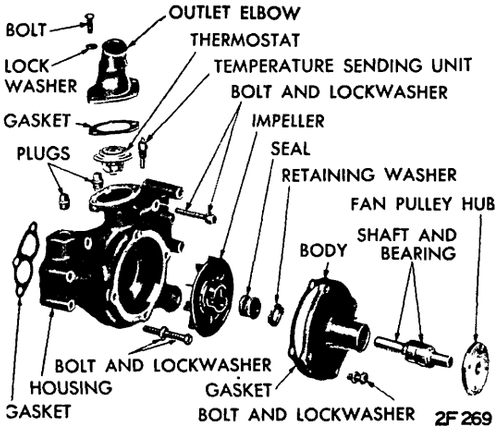


ENGINE COOLING

Thermostat - 180° pellet type in water outlet housing.
Pressure Valve - 14 lb (Std.), 16. lb. (Air Cond.) radiator filler cap.

WATER PUMP

See Illustrations for arrangement of parts.
Disassembly - Remove fan hub, support hub end of pump and remove impeller by breaking it away from metal insert Remove seal by sliding over shaft and insert With Splitter C-3476, split metal insert and remove from shaft Support hub end of pump body and press shaft and bearing through **front** of pump.
Reassembly - With pump body supported as close to center bore of pump as possible, press shaft and bearing assembly into body with Sleeve C-3468 and a press. *Distance from shoulder of seal retainer to front face of pump body must be .090".* Reface pump seal seat of housing (see below). Install new seal into impeller with ears on retaining washer engaged in slots in impeller. Support shaft at hub end and press impeller on shaft until it is flush with end of shaft. Support impeller end of shaft and press hub on shaft until shaft projects .330" beyond front face of hub



Refacing Seal Seat - Place Tool C-551 over pump shaft Turn tool in an even continuous clockwise motion until smooth surface is obtained Remove tool and install abrasive disc SP-1527 over end of tool and down against cutters Polish seat surface to a high polish *Turn by hand in a clockwise direction. Do not use motor.* Blow out with compressed air.

318" ENGINE WATER PUMP (EXPLODED)

FLUID FAN DRIVE

Drive is serviced as an assembly only. To test, cooling system must be at room temperature. Mark one blade of fan with chalk, attach a timing light to engine, and operate engine at 1700 RPM. Adjust engine speed so fan is stopped by timing light between 1550-1800 RPM (1600-1850 RPM on 413" Engine) If fan operates too slowly, overheating will result. If fan operates too fast, there will be excessive noise Replace unit if not within specifications

361", 383", 413", 426" ENGINES WATER PUMP (EXPLODED)

BELT ADJUSTMENT

Deflection applied at belt mid-point under 5 lb. load

Belt	① Used Belt 318	361	383 & 413
Power Steering	1/8"	3/16"	3/16"
Fan Idler		1/8"	1/8"
Alternator (with Air Cond.)	1/4"	3/8"	3/8"
(less Air Cond.)	1/4"	1/4"	1/4"

① - Any belt operated for ½-hour minimum.

Belt	New Belt 318	361	383 & 413
Power Steering	1/16"	1/8"	1/8"
Fan Idler		1/16"	1/16"
Alternator (with Air Cond.)	1/8"	1/4"	1/4"
(less Air Cond.)	1/8"	1/8"	1/8"

FILTERS & CLEANERS

	① Service Interval
Oil Filter	Replace at Oil Change
Air Cleaner	Clean at 8000 miles
Breather Cap	Clean at Oil Change
Fuel Filter	Replace at Tune-Up or 16,000 miles
Auto. Trans. Filter (Normal Use)	None
(Heavy Duty Use)	Replace at 32,000 miles

① - Replace or clean more often if necessary.

AUTO TRANS. FILTER

Located in return line from oil cooler. (Under **extreme** heavy duty use, replace filter at 10,000 miles). Also drain transmission oil and clean screen.

OIL FILTER REPLACEMENT

Full-flow type used on all engines. Screw filter onto base until gasket contacts base, then tighten ½-turn more by hand. *Do not overtighten.* Start engine and check for leaks

CAPACITIES

SERIAL NUMBER

Stamped on plate attached to left front door hinge pillar Number (example below) includes identification data

① ② ③ ④ ⑤
3 3 3 3 100001

① - Car Make **3** Plymouth, **5** Dodge 880, **6** Dodge (Except 880), **8** Chrysler, **9** Imperial
② - Car Series *See Series Designation Tables*
③ - Model Year **3** 1963
④ - Assembly Plant *See listing below*
⑤ - Beginning serial number at each assembly plant regardless of car make or series

Assembly Plant Designation

1 - Detroit (Plymouth)
2 - Detroit (Dodge)
3 - Detroit (Jefferson Ave)
5 - Los Angeles
6 - Newark-Delaware
7 - St Louis

ENGINE NUMBER

318" Engine

Stamped on left front of block under cylinder head Number (example below) includes the following·

① ② ③
T 318 1001

① - Model Year **T** 1963 *NOTE - "D" or "P" following "T" indicates "Dodge" or "Plymouth"*
② - Cubic Inch Displacement
③ - Beginning Serial Number

361", 383", 413" Engines

Stamped on right side of block below distributor, or on left front of block behind thermostat housing Number (example below) includes the following

① ② ③ ④
T 36 8 1

① - Model Year **T** 1963
② - Cubic Inch Displacement **36** 361", **38** 383", **41** 413" *NOTE - Later Chrysler 300J models use* **C300J** *in place of* **41.**
③ - Month Built ④ - Day of Month Built

426" Engine

Stamped on right side of block below distributor, or on left front of block behind thermostat housing Number (example below) includes the following

Before Dec. 19, 1962 - *Same as 361", 383", 413" Engines above*

After Dec. 19, 1962 -

① ② ③ ④ ⑤ ⑥ ⑦
426 T MP HC 12 19 01

① - 426 cu ins
② - Model Year **T** 1963
③ - Maximum Performance Engine (11 0-1 Compr Ratio)
④ - Maximum Performance High Compression Engine (13 5-1 Compr Ratio)
⑤ - Month Built ⑥ - Day of Month Built
⑦ - Consecutive Serial Number for each day's production

ENGINE IDENTIFYING MARKS

Other marks on engine number pad indicate various specifications *See "Engine Identification" under Engine Data for explanation of these marks*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE IDENTIFICATION

Engine can be identified by 5th figure of warranty number stamped on Warranty Plate Plate located on rear face of left front door.

Engine	Standard - CODE - Low Compression
144	S 2
170	U R
200	T
223" (Except Taxi)	V 5
223 (Taxi)	E

COMPRESSION PRESSURE

144" 170" 200'	150-190 lbs
223'	130-170 lbs

Maximum variation between cylinders 10 lbs

VALVE TAPPET CLEARANCE

144 170 200	ℂ Hydraulic
223 (Except Police & Taxi)	② Zero Lash Type
223' (Police & Taxi)	019 Intake & Exhaust

ℂ *For operating range adjustment, see Engine Data*
② - 025 clearance at valve stem tip with eccentric spring compressed *For initial adjustment, checking & minor running adjustment, see Engine Data*

TUNE-UP NOTES

► *1962 63 ENGINE FAILURE TO STAY IN TIME CORRECTION* May be caused by distributor turning from original setting To correct install later 1963 production distributor clamp No C3AZ-12270 A which is 1 3/16 wide No washer required

► *1963 ROUGH IDLE, POOR PERFORMANCE & FUEL ECONOMY CORRECTION* May be caused by carburetor air cleaner element being restricted by oil or water vapor To correct replace air cleaner element and install new type quick-acting carburetor vent lever No C3AZ-9D585-B *NOTE - Oil filler caps with more than 1 air metering hole must not be used on cars with Closed Crankcase Ventilation*

► *COLD HARD START CORRECTION (MANUAL CHOKE CARBURETORS)* May be caused by choke control cable being too long and interfering with pull-down rod or choke shaft lever when choke control knob pulled out To correct shorten cable as required and make sure cable housing extends ¼-½ beyond cable clamp at carburetor

► *1963 ENGINE STALLING AT IDLE CORRECTION* If engine stalls during hot idle operation replace fuel inlet seat fiber gasket with new rubber-coated aluminum gasket No C3AZ-9569 B and correctly adjust dry float level

► *1963 VERY ROUGH OR NO IDLE CORRECTION* May be caused by restricted idle fuel jet (check by removing air cleaner and covering idle air bleed with engine running - increase in RPM indicates restriction) To correct thoroughly clean all passages with compressed air

144' 170 'Mercurys	1'	
200' Fords	15/16'	Centered
200' Mercurys	15/16"	
223 ' Galaxie	1'	

℄ - Measured from bottom of float to air horn with air horn inverted

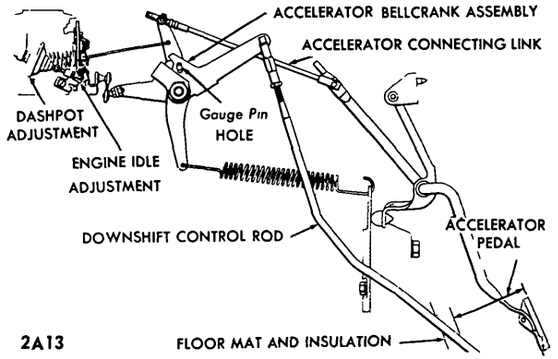
► *1963 HESITATION ON ACCELERATION CORRECTION (Early Cars)* May be caused by improperly seated (staked) accelerator pump ball checks To correct stake balls properly

► *1963 FALCON 144" ENGINE CARBURETOR JET PRODUCTION CHANGE* 1 size leaner jets (stamped 52F) used on later carburetors with yellow or green paint on code tag Jet change made for improved fuel economy If lean condition encountered install 1 size richer jet (stamped 53F)

ACCELERATING PUMP SETTING

Roll pin should be in lower hole (marked HI) for operation in temperatures of 50°F and lower. Roll pin should be in upper hole (marked LO) for operation in temperatures of 50°F and higher and/or 5000 ft. and above altitude

THROTTLE LINKAGE ADJUSTMENT



Galaxie Auto. Trans. Cars - Adjust engine idle speed and anti-stall dashpot (see below) then proceed as follows

1) Stop engine and make sure carburetor throttle lever is against idle adjusting screw.

2) Adjust accelerator connecting link for correct pedal height of 3 11/16" (measured from top front corner of accelerator pedal to floor mat).

3) Adjust downshift control rod length so a ¼" gauge pin will fit freely several times in gauge pin holes in accelerator bellcrank assembly.

Comet, Falcon, Fairlane & Meteor Auto. Trans. Cars - With engine at normal operating temperature and idle speed correctly set, make anti-stall dashpot adjustment (see below). Then proceed as follows

GALAXIE AUTO TRANS THROTTLE LINKAGE

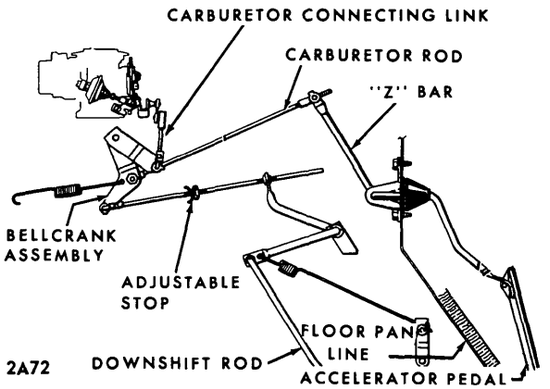
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

1) Stop engine and adjust accelerator connecting link for accelerator pedal height of 3 15/16" (Fairlane); 4 5/16" (Meteor); 4¼" (Comet & Falcon). Measure from front top corner of accelerator to floor mat.

2) On Fairlane & Meteor adjust Tinnerman nut on downshift adjusting rod so there is 2 5/16" (Fairlane); 2 1/8" (Meteor) between nut and "Z" bar. *NOTE* - If downshift adjusting rod dimension must be reduced more than ¼" for proper kickdown shift, check for bent linkage or incorrect pedal height.

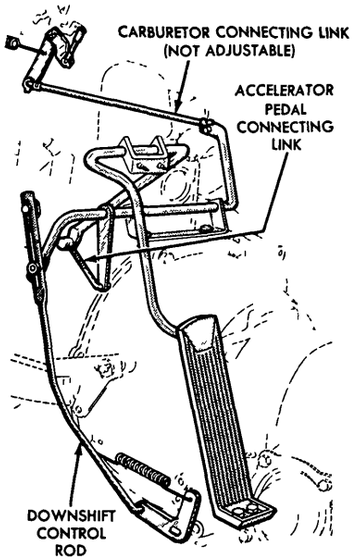
3) On Comet & Falcon, disconnect accelerator return spring at manifold, and kickdown spring at rod and "Z" bar. Pull downshift rod and "Z" bar up to full limit of travel (or hold accelerator pedal depressed and pull on downshift rod only). Slide stop bolt down against "Z" bar and tighten bolt. Install return springs. Check throttle and downshift linkage for full travel.

IDLE SPEED-UP CONTROL (POWER STEERING CARS)



Adjustment - With engine at correct idle speed, turn wheels against linkage stops, loosen locknuts on control valve mounting bracket (on throttle linkage bellcrank) and adjust valve to maintain same idle speed with linkage against stops. *CAUTION - DO NOT hold wheels against stops for more than 15 seconds*

ANTI-STALL DASHPOT ADJUSTMENT



With slow idle correctly adjusted, turn dashpot adjusting screw inward until contact is made with plunger assembly. Turn adjusting screw inward (clockwise) 3¼-3¾ turns against dashpot diaphragm plunger assembly *NOTE - To correct objectionable slow return to idle, specification may be reduced to 2 turns*

MANUAL THROTTLE CONTROL ADJUSTMENT

Air Conditioned Cars - Attach a tachometer to engine and place transmission selector lever in "N" or "P" Turn air conditioning on and make sure magnetic clutch is engaged Using hand throttle, bring engine speed to 750-1000 RPM and secure stop closest to throttle control handle against cable armor so engine cannot be operated higher than above range with hand throttle

FAIRLANE & METEOR AUTO. TRANS. THROTTLE LINKAGE

FALCON & COMET AUTO. TRANS. THROTTLE LINKAGE

ELECTRICAL

BATTERY

► *1963 RECURRING RUN-DOWN BATTERY CORRECTION (60 AMP LEECE-NEVILLE ALTERNATOR CARS): See the Ford V8 Car Pages for correction.*

12-Volt

Capacity

Falcon, Fairlane, Comet, Meteor	**℄ Amp. Hours**
Standard	40
Optional	55
Galaxie	**℄ Amp. Hours**
Standard	55
Optional	65 or 70

℄ - 20 Hour Rate

Battery Ground - Negative to cylinder head

Engine Ground - At cylinder head (Falcon, Fairlane, Comet, Meteor), at converter or flywheel housing (Galaxie)

STARTER

► *1963 GALAXIE STARTER ENGAGEMENT NOISE CORRECTION.* Caused by misalignment of starter drive to flywheel due to tolerance build-up between alignment hole in center lug of starter and mounting hole in flywheel housing To correct, install starter with a shoulder bolt, No 376245-S8, and lockwasher, No 34847-S8, in alignment hole in center mounting lug of starter

Comet & Falcon

Torque	RPM	Volts	Amperes
0 ft. lbs.	℄	12	70
8		5	450

Fairlane & Meteor

Torque	RPM	Volts	Amperes
0 ft. lbs.	℄	12	70
9.6		5	500

Galaxie

Torque	RPM	Volts	Amperes
0 ft. lbs.	℄	12	80-110
14.8		5	580

℄ - Engine idling.

Brush Spring Tension - 45 ozs. (except Galaxie); 48 ozs. (Galaxie).

GENERATOR

Ford No.	Amperes	Volts	Gen. RPM
C2DF-10000-B	25	15	2610
C2DF-10000-C	30	15	2525
C20F-10000-G	30	15	2525
C20F-10000-J	30	15	2600

Brush Spring Tension - 20-26 ozs. (except Comet & Falcon); 32-40 ozs. (Comet & Falcon).

Field Current (All) - 1 2-1 8 amps at 12 volts & 75°F

GENERATOR REGULATOR

Cutout Relay

Cuts In - 12.4-13.2 volts (25 Amp.); 12.0-12.8 volts (30 Amp.).
Cuts Out - 8 amps. (25 Amp.); 6-9 amps. (30 Amp.) reverse current.

Voltage Regulator

Setting - 14.6-15.4 volts at 75°F ambient temperature.

Current R gulator

Setting (25 Amp.) - 23-27 amperes.
Setting (30 Amp.) - 28-32 amperes.

ALTERNATOR

Leece-N ville N . A001 2074-AB

Current Output - 60 amperes at approximately 1600 Engine RPM

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ALTERNATOR REGULATOR

L ece-Neville (Ford C2AZ-10316-A)

Conventional type containing a Load Relay, Double Contact Voltage Regulator, and a Current Regulator.

Load Relay

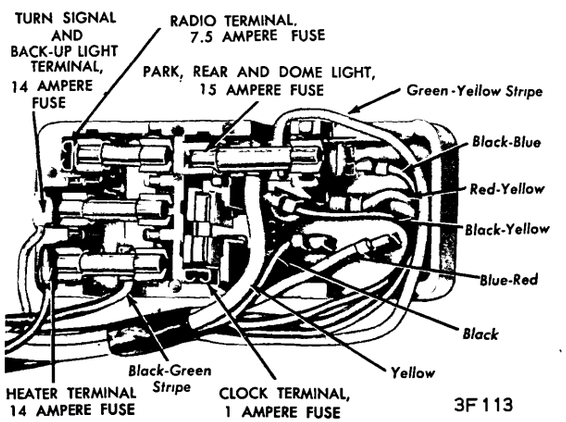
Closing Voltag - 5.6-6.4 volts.

Voltag Regulator

Voltage Setting - 13.5-14.3 volts at normal operating temperature.

Current Regulator

Curr nt Setting - 58-62 amps. at normal operating temperature.

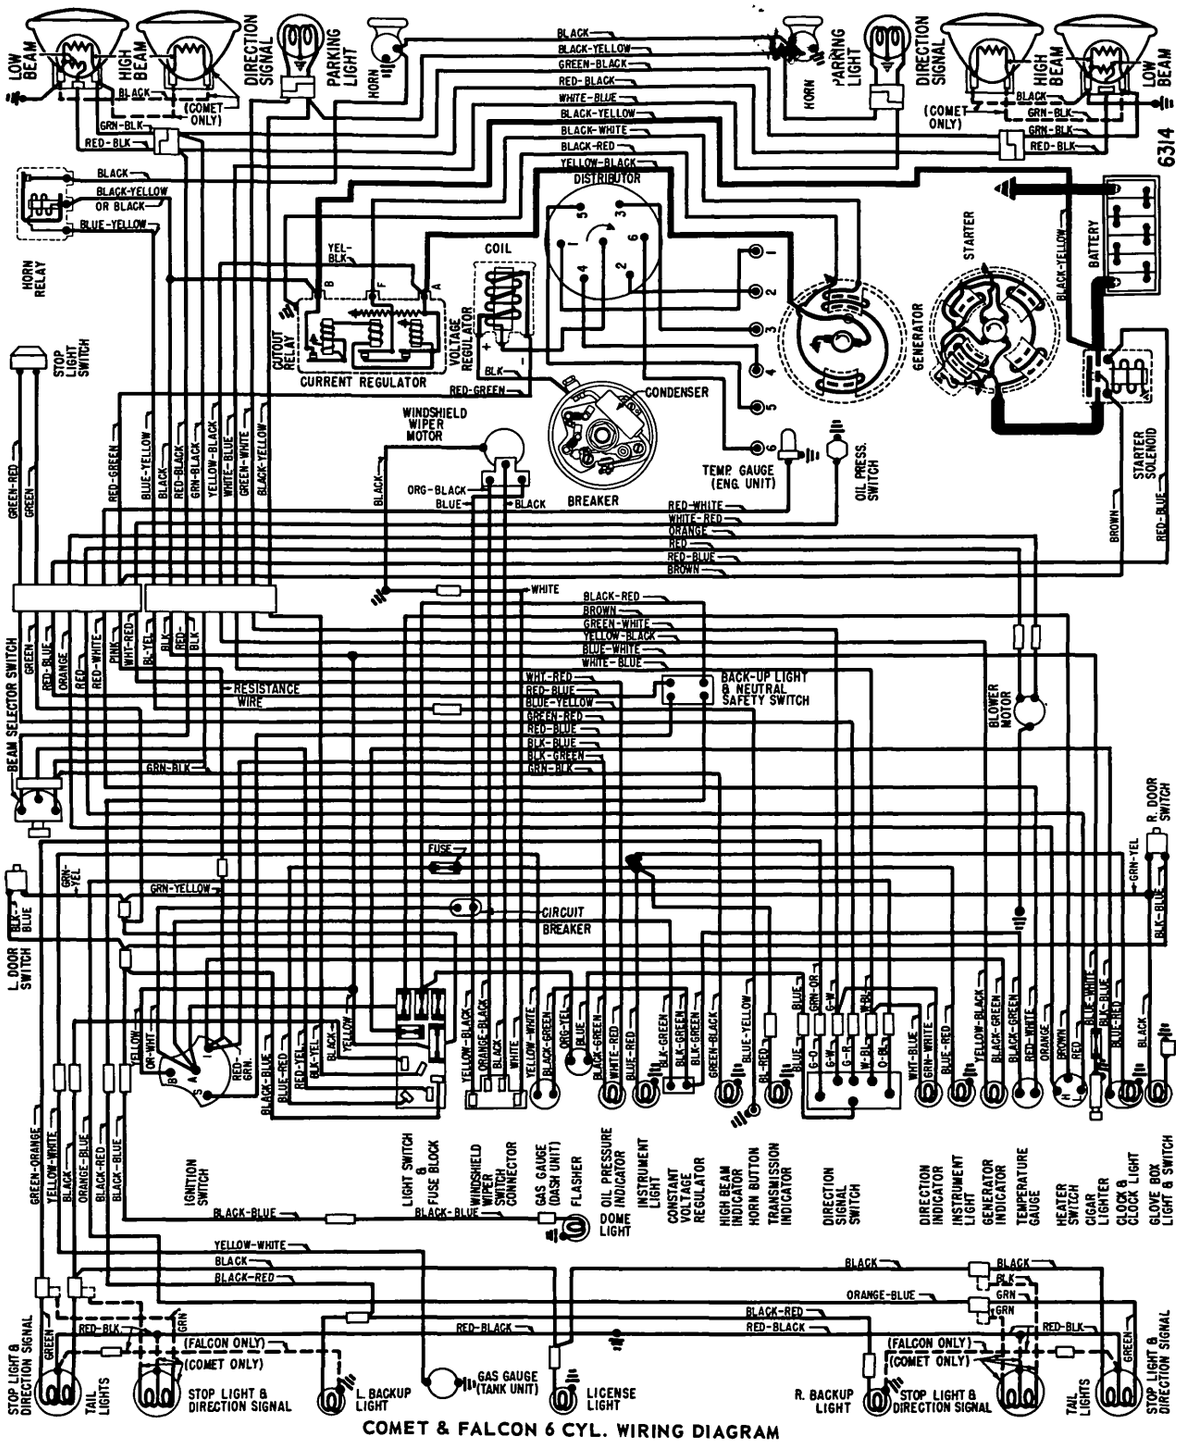


FUSES & CIRCUIT BREAKERS

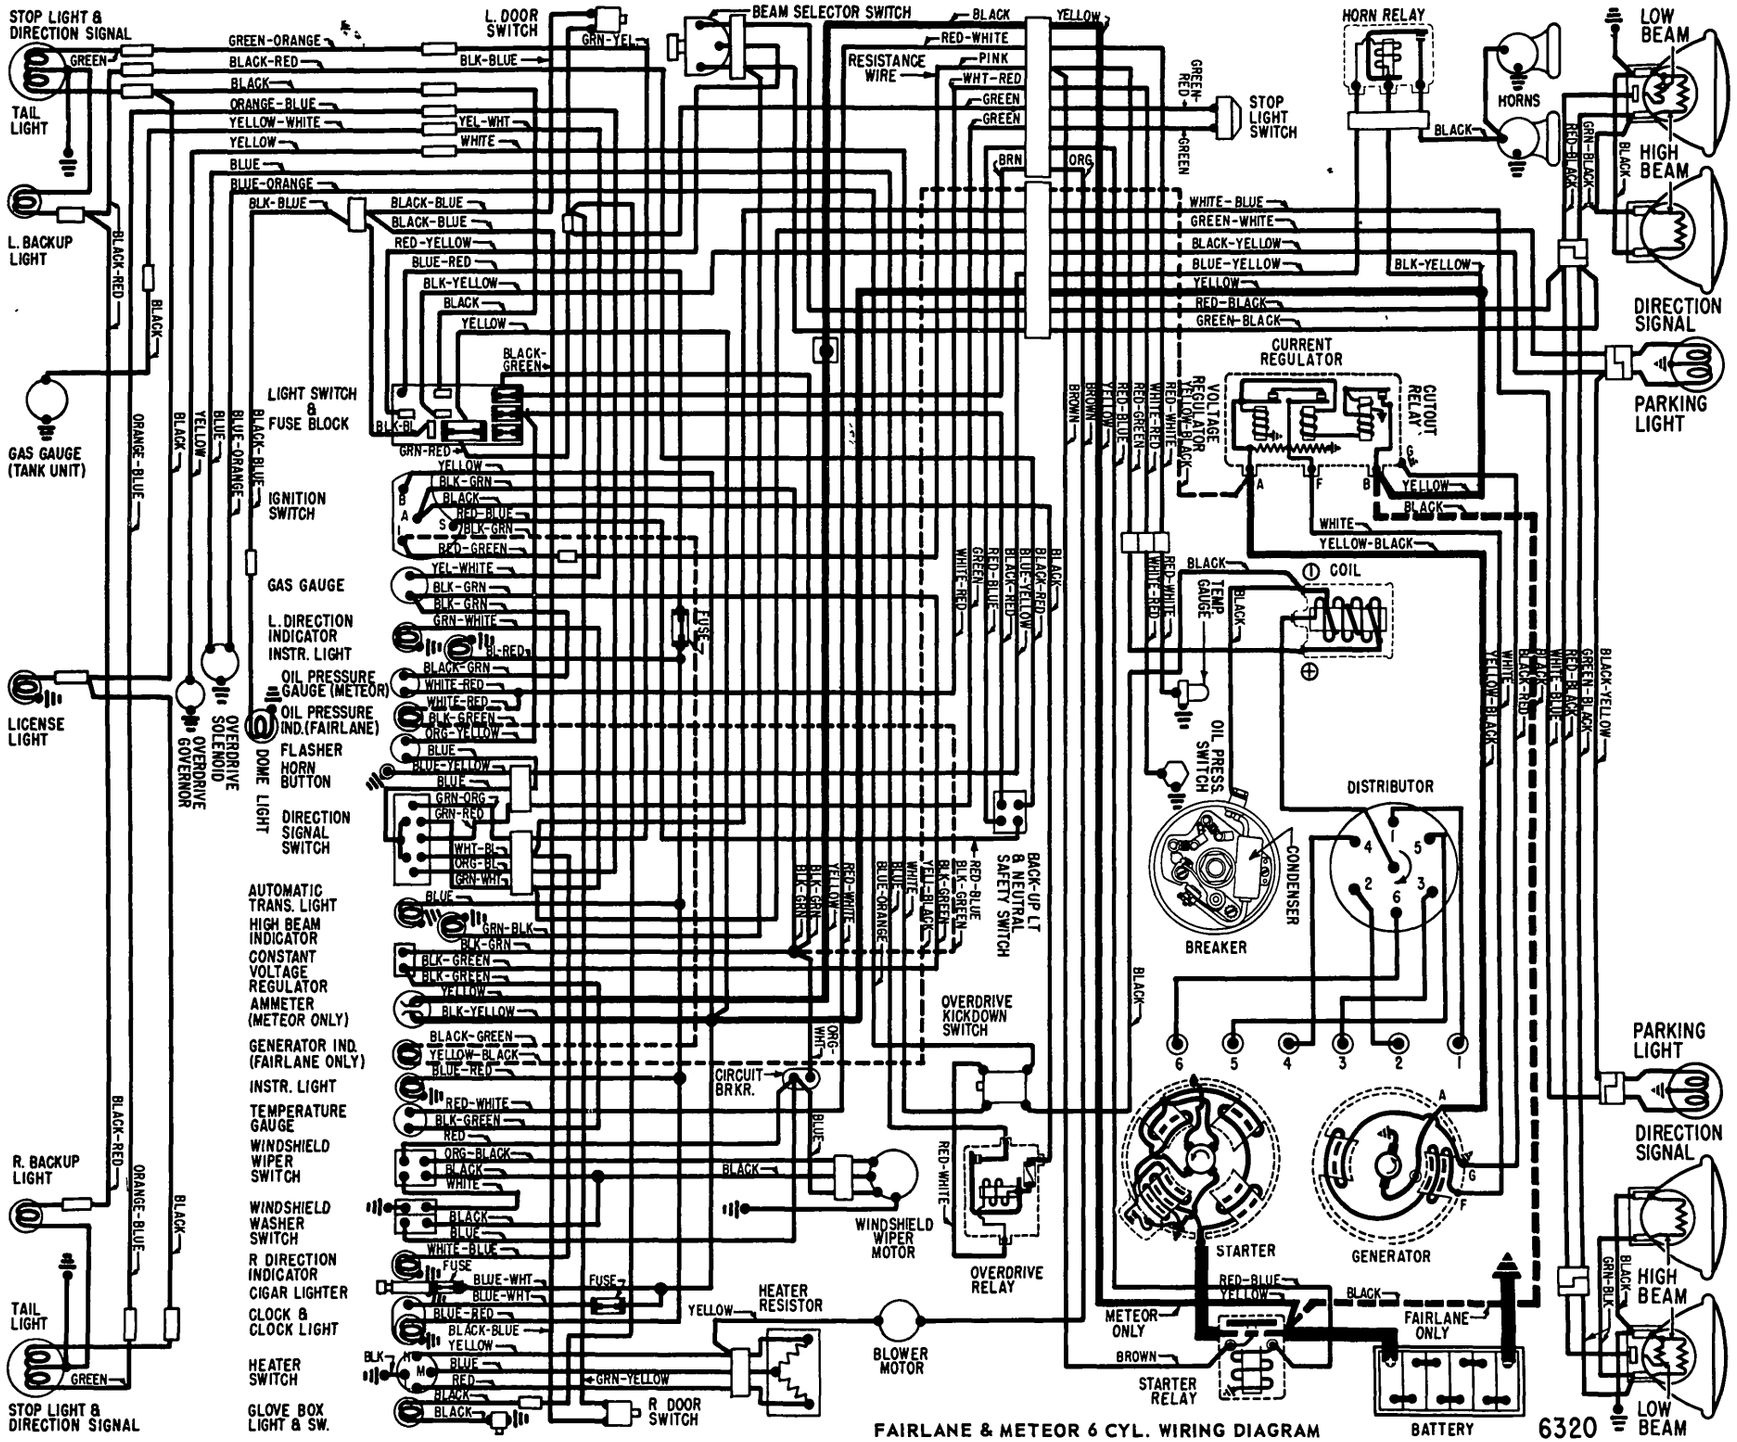
CIRCUIT BREAKERS

1 - Headlight circuit. On headlight switch.
2 - Windshield wipers. At lower left end of instrument panel near steering column.
3 - Electric Windows (including Tailgate), Seats, Convertible Top. On starter relay.

FUSES

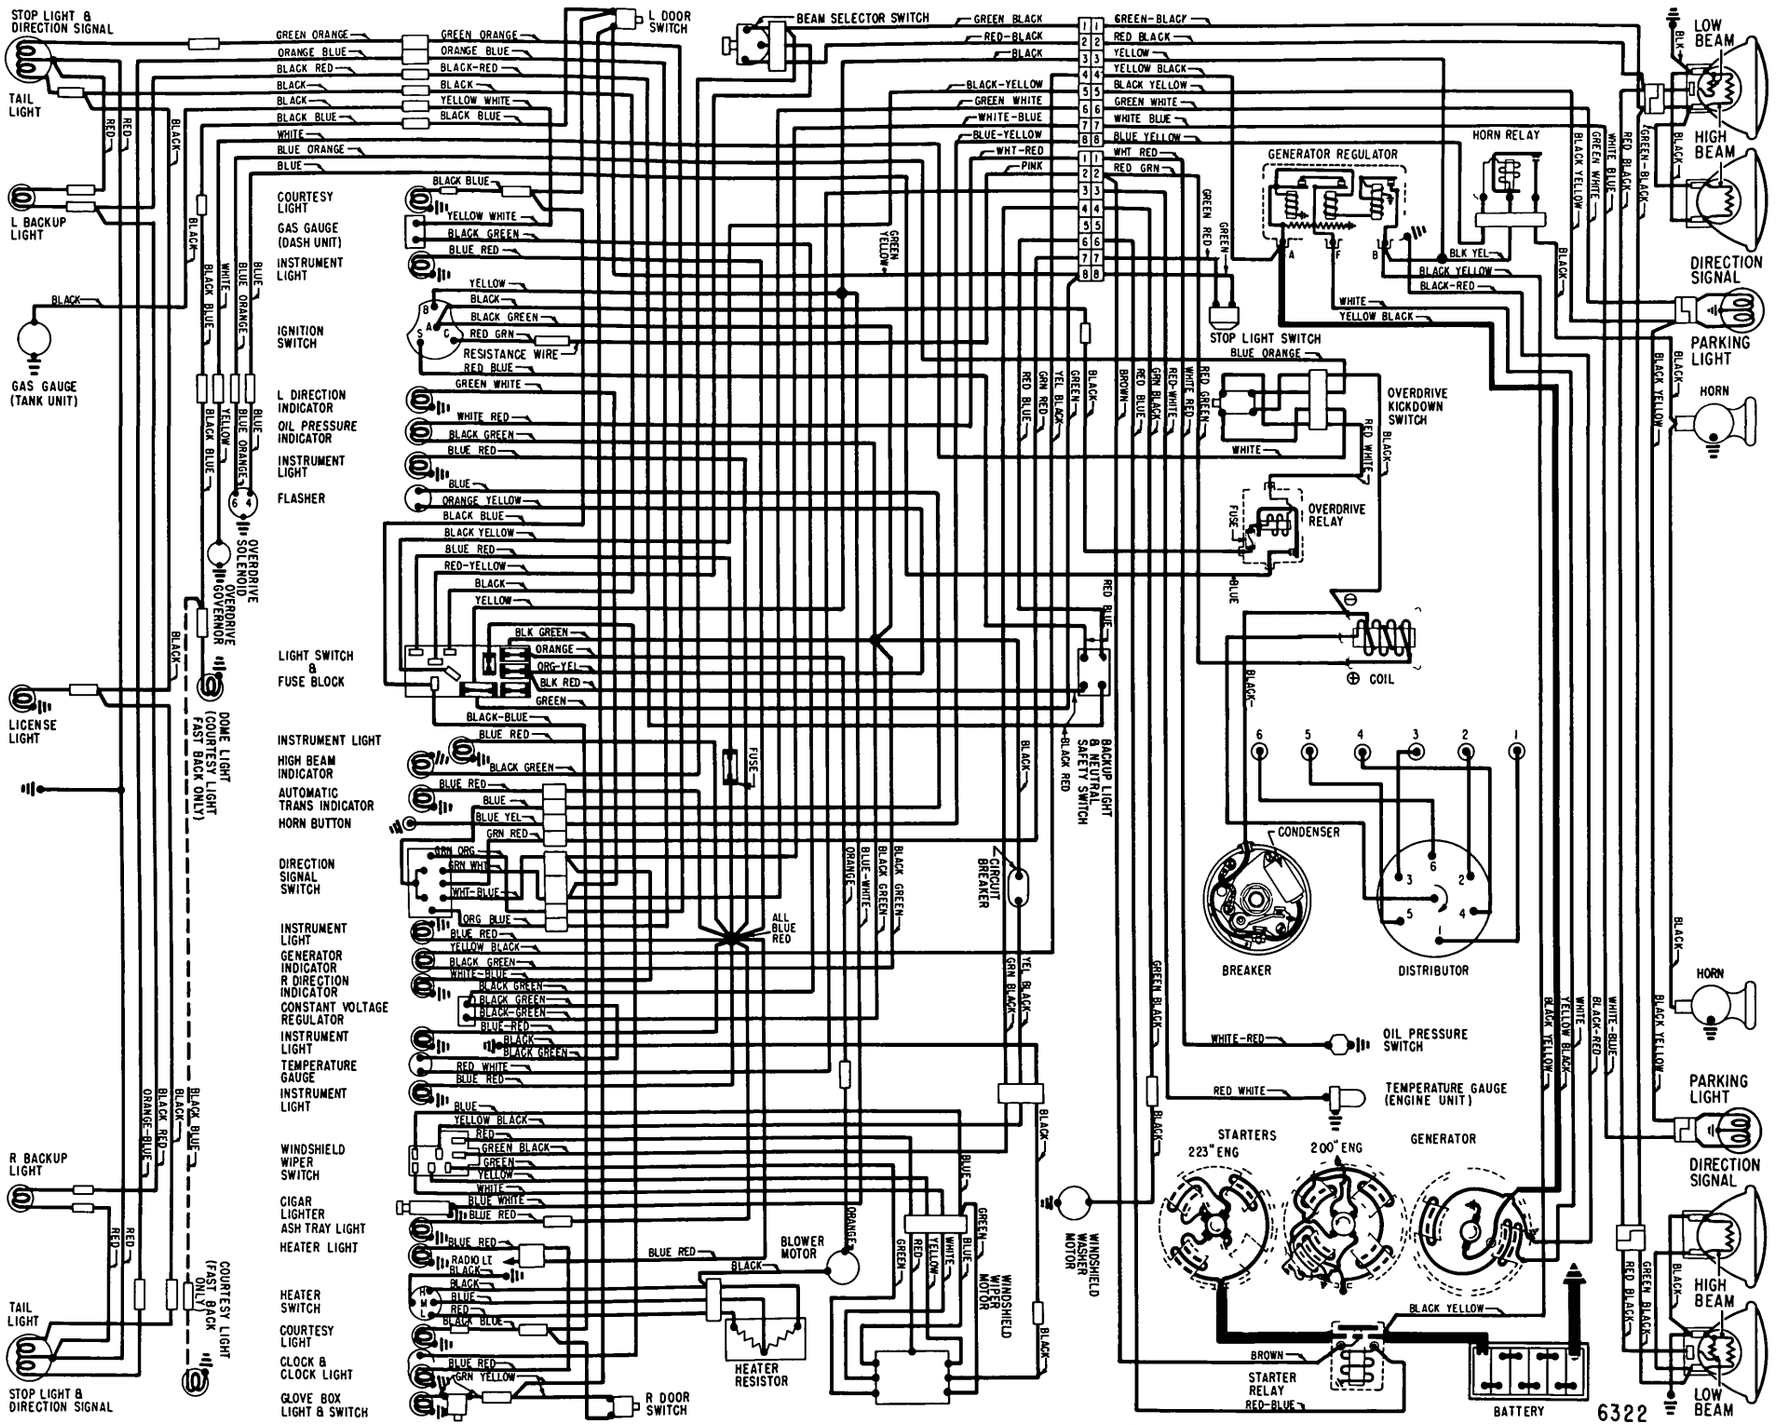


1 - Fuse block on headlight switch.
2 - In-line fuses in feed wire for each of the following units: Clock (Fairlane & Meteor only), Air Conditioner, Spotlight, Windshield Washer Pump, Instrument Panel Lamp Rheostat.
3 - Fuse on Overdrive Relay.



LIGHTING FUSE BLOCK

SWITCHES, GAUGES, & SPEEDOMETER



► *1963 GALAXIE TURN SIGNAL SWITCH NOT CANCELLING CORRECTION:* May be caused by turn signal lever binding on steering column tube and pin flange assembly. To correct, remove signal lever and grind off the 1/16" lip in slot in housing, using a fine mill file.

Ford & Falcon, Mercury & Comet 6 Cars 1963

FORD GALAXIE 6 CYL WIRING DIAGRAM (SEE COMET & FALCON FOR 200" ENGINE IGNITION WIRING)

SWITCHES, GAUGES, & SPEEDOMETER

► *INDICATOR GAUGES INACCURATE READING & MALFUNCTION NOTE:* **1)** On Temperature and Oil Pressure gauges, unit is grounded at sending unit threads. To insure good ground connection, use Sealer C3AZ-19554-B on threads of sending units. This sealer has aluminum particles in it to insure grounding.

2) On FM-radio equipped cars, radio suppression choke is installed on ignition (input) side of gauge voltage regulator. Make sure choke is installed on correct terminal before checking for malfunction or inaccurate readings.

NEUTRAL SAFETY SWITCH

All Models - Switch located on steering column under instrument panel. To adjust, loosen steering column-to-switch attaching screws and position switch so starter circuit is closed when selector lever is in "N" or "P" positions, then tighten attaching screws. Starter circuit must be open in all positions except "N" or "P".

HEADLIGHT SWITCH REMOVAL

Press down on button on top of switch and remove knob and shaft. Remove retaining bezel nut (Tool No. 17470-N-51), and remove switch. Separate fuse block from switch and disconnect wiring.

STOP LIGHT SWITCH

On brake master cylinder. Not adjustable.

TURN SIGNAL FLASHER

Clipped on back of instrument cluster above and to left of speedometer (except Fairlane), at extreme left of instrument cluster (Fairlane).

SPEEDOMETER REMOVAL

Falcon & Comet - Disconnect speedometer cable, then remove instrument cluster bezel, lens, and cluster mask plate from cluster housing. Remove speedometer attaching screws and remove speedometer.

Fairlane, Meteor, Galaxie - Speedometer and other instruments may be removed from cluster after cluster removed from instrument panel (see below).

INSTRUMENT CLUSTER REMOVA L

Falcon & Comet - Remove instrument cluster bezel, lens, and cluster mask plate from cluster housing. Remove fuel or temperature gauge as required.

Fairlane & Meteor - Disconnect speedometer cable and remove wiring harness from retaining clamps. *NOTE - On Meteor, disconnect ammeter wire from terminal block on steering column right support and remove wire from ammeter loops.* Disconnect cluster from instrument panel and lay on steering column. Disconnect all wires and lamps from cluster, then remove cluster.

Galaxie - Remove steering column cover plate, and, on automatic transmission cars, turn shift indicator needle downward on shifting shaft. Disconnect speedometer cable. Remove wiring harness from retaining clips, then disconnect cluster from instrument panel and lay cluster on steering column. Disconnect all wiring, and remove lights from cluster. Remove cluster.

BELT ADJUSTMENT

Belt Tension (Lbs.) With T nsion Gauge T63L-8620-A

All Engines

Belt	① New	② Us d
Generator (Single Belt)	90-120	60-90
Generator (Dual Belt)		
Front	90-120	60-90
Rear	85-135	55-100
Power Steering	120-150	90-120
Air Conditioning	120-150	90-120

① - Run belt 5 minutes and reset tension.
② - Any belt operated 10 minutes or longer.

ENGINE

ENGINE IDENTIFICATION

See MODEL IDENTIFICATION following.

ENGINE REMOVAL

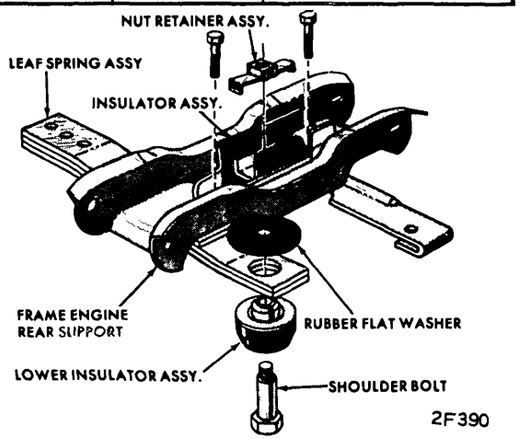
Engine (without transmission) may be removed from above in the usual manner. Observe the following: Remove radiator, fan and pulley, and starter. On some models, the flywheel or converter housing upper retaining bolts are reached through access holes in floor pan. Be sure to support transmission and converter.

OIL PAN REMOVAL & INSTALLATION

Comet - Drain crankcase and remove dipstick. Disconnect engine front mounts, raise engine and place 2" wood blocks between mounts and engine. With engine resting on blocks, remove stabilizer bar attaching nuts and pull stabilizer bar down. Remove oil pan. *NOTE - Rotate crankshaft as necessary for clearance.* To install, reverse removal procedure.

Falcon, Fairlane, Meteor - Drain crankcase and remove dipstick. Remove clutch retracting spring. Remove front crossmember. Remove stabilizer bar attaching nuts and pull stabilizer down. Remove oil pan. *NOTE - Rotate crankshaft as necessary for clearance.* To install, reverse removal procedure.

Galaxie - R m val - Drain crankcase, then remove flywheel housing inspection cover and dipstick. On station wagons, disconnect stabilizer bar and pull bar as far forward as possible. On all models, remove crankcase ventilation system assembly. Remove oil pan. *NOTE - Rotate crankshaft as necessary for clearance.*



Installation - *CAUTION - Flywheel housing cover gasket must also be replaced whenever oil pan gasket replaced.* Oil pan gasket has a dovetail design which mates with flywheel housing cover gasket. Sealer (AB-19560-A or equivalent) must be applied to the junction points of oil pan and housing cover gaskets. Install oil pan by reversing removal procedure.

GENERAL SPECIFICATIONS

Engine	HP at RPM	Compr. Ratio	Bore	Stroke	Displac m nt
144"	85 at 4200	8.7-1	3.50"	2.50"	144 cu. ins.
170"	101 at 4400	8.7-1	3.50"	2.94"	170 cu. ins.
200"	116 at 4400	8.7-1	3.68"	3.126"	200 cu. ins.
223"	138 at 4200	8.4-1	3.625"	3.60"	223 cu. ins.

ENGINE REAR MOUNT (CANTILEVER SPRING TYPE)

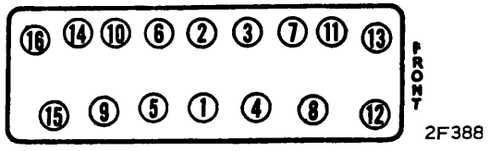
To prevent high frequency high speed vibration caused by transmission extension contact with rear mount, .20" minimum clearance must be maintained between rear mount upper insulator and transmission extension. Tighten spring-to-support attaching shoulder bolt until bolt bottoms. Do not add washers between lower insulator and spring as noise and vibration would result.

CANTILEVER SPRING ENGINE REAR MOUNT ASSEMBLY

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

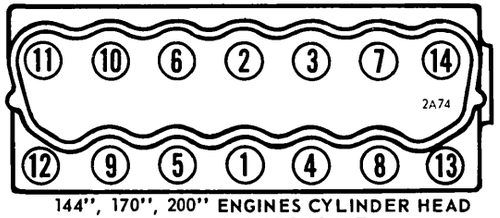
FLYWHEEL INSTALLATION
(144", 170", 200")

Flywheel attaching bolt holes in crankshaft flange are drilled through flange Flywheel retaining capscrews must be coated with oil resistant sealer to prevent engine oil leak at this location (may be diagnosed as a rear oil seal leak)



EXHAUST PIPE INSTALLATION
(144 , 170 , 200)

Exhaust manifold studs for exhaust pipe attachment have interference threads and nuts will not hold torque if used more than once Install new nuts whenever pipe disconnected from manifold and torque nuts to 40-50 ft lbs



CYLINDER HEAD

R m val - When removing head install guide studs in front and rear cylinder head bolt holes on manifold side of head Make guide studs from 7/16 14 x 6 or 1/2 - 13 x 6 bolts depending on cylinder head bolt size by cutting off bolt head tapering end and slotting for screwdriver engagement

Installation - On 144 170 ' 200 engines coat both sides of new gasket with head gasket sealer On 223 engine gasket is ' sandwich ' type (steel core bonded between rubber asbestos sheets) and sealer must **not** be used On 144 170 200 ' engines coat right side front and rear head bolts with sealer On 223 ' engine coat all left side bolts with sealer Install head over guide studs (see Removal' above) install two end bolts finger tight to hold head then install remaining bolts Tighten bolts in sequence shown in diagrams in **three** steps to torque limits shown in table below **Do not disturb bolts after final step completed**

223" ENGINE CYLINDER HEAD TIGHTENING SEQUENCE

144", 170", 200" ENGINES CYLINDER HEAD TIGHTENING SEQUENCE

Cylinder Head Torques (Ft Lbs)

144' 170 200'	55	65	75
223'	95	105	115

ENGINE NOTES

► *1962 63 FAIRLANE & METEOR ENGINE REAR MOUNT BOLT REPLACEMENT NOTE* New type bolt locking nut cotter pin and flat washer used to attach rear support bracket used on later cars Use new type for **all** service replacement Torque for new bolt is 58 75 ft lbs

► *1963 223 ENGINE EXHAUST VALVE PRODUCTION CHANGE & REPLACEMENT NOTE* New type valve No C3AZ-6505-A with diffused aluminum on head and face used to minimize burning and for resistance to detonation Use new type for service replacement on all 1961-63 engines *NOTE On "Zero Lash" rocker arm type engines, also install new rocker arm eccentric separating spring (see below)*

► *1963 223' ENGINE "ZERO LASH" ROCKER ARM SPRING CHANGE & ROCKER ARM NOISE CORRECTION* Use later type rocker arm eccentric separating spring (Rocker Arm Assy No C3AZ 6564-A Kit No C3AZ-6A521 A) which is used on later cars *NOTE Use this spring in conjunction with later type alum inumized exhaust valves (see above)*

► *1963 223" ENGINE OIL PAN GASKET INSTALLATION NOTE* New type gasket used on 1963 engines require special installation procedures *See "Oil Pan Instal lation"*

► *1963 GALAXIE TAXI (223 ' ENGINE) TIMING GEAR NOISE CORRECTION* Caused by burrs on timing gears To correct replace gears

► *1963 NOISY HYDRAULIC LIFTERS CORRECTION* May be due to oil contamination because of restricted carburetor air cleaner *See "Rough Idle, Poor Performance & Fuel Economy" under TUNE UP SPECIFICATIONS*

► *1960-63 144", 170", 200" ENGINES OIL PUMP INTERMEDIATE SHAFT REPLACEMENT NOTE* On units with oil pump cover made of cast iron oil pump intermediate shaft is chamfered at both ends and has no retaining ring Intermediate shaft may be replaced without removing oil pan and oil pump

► *1963 223" ENGINE CAMSHAFT & BEARINGS INSTALLATION & INTERCHANGEABILITY NOTE* Engines built after approximately October 18 1962 have camshaft with cross-drilled oil passage in No 3 bearing journal new bearings with larger oil holes and with anti-siphon hole in rocker arm shaft oil outlet tube eliminated Old and new parts are not interchangeable Make sure correct camshaft camshaft bearings and rocker arm shaft oil outlet tube are used when replacing parts

FITTING PISTONS

Place a length of ½" wide feeler stock (see table below for feeler thickness) between inverted piston and cylinder wall 90° from piston pin holes. Hold piston in bore so bottom of piston skirt is about 1½" below top of block and piston pin bore is parallel to crankshaft. *Feeler must extend entire length of piston.* Pull feeler from cylinder with a spring scale and note reading on scale. Specifications should agree with table below.

PISTON CLEARANCE CHART

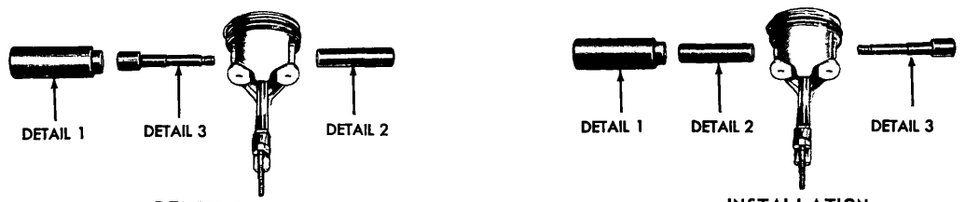
PISTON & ROD ASSEMBLY

PISTON PIN REPLACEMENT (144", 170", 200")

TOOL T60K-6135-A MODIFICATION - If tool not previously modified to prevent damage to piston, make following modifications so piston will not be damaged when Detail 2 of tool seats against piston pin boss: Grind a 1/16" - 45° chamfer around outer edge of Detail 2.



Removal - Press pin out of piston and connecting rod using Tool T60K-6135-A and vise and wrench, or Tool 6135-J and arbor press, as shown in illustrations.

Installation - Lightly coat all parts with engine oil, assemble piston and connecting rod correctly and press pin into piston and rod as follows: **1)** With Tool T60K-6135-A and vise and wrench, draw pin into assembly until pin seats in Detail 2. **2)** With Tool 6135-J and arbor press, press pin into assembly until Detail 2 is firmly seated in Detail 1. *See illustrations.*

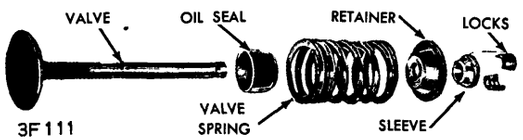
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

MAIN BEARING CAP INSTALLATION

1) All Caps - Caps are numbered from front of engine and should be installed in correct position with arrow on cap pointing to front of engine.



2) Rear Cap - Coat only rear mating surface of cap with oil resistant sealer. Do not use sealer forward of oil slinger groove (144", 170", 200"), forward of side seal grooves (223"). Install cap immediately after sealer applied so sealer will not set and cause an oil leak.

REPLACEMENT BEARINGS

Standard size replacement main and connecting rod bearings available in 2 sizes marked Red and Blue for selective fit. Any combination of red and blue inserts may be used to obtain desired clearances.

THRUST BEARING ALIGNMENT

Install all bearing caps except thrust bearing cap and torque to specifications. Install thrust bearing cap with bolts finger tight. Pry crankshaft to rear of engine, then to front of engine. While holding crankshaft forward, tighten thrust bearing cap bolts to specifications. Check crankshaft endplay.

VALVE ASSEMBLY (EXPLODED)

VALVE STEM OIL SEALS

Cup type used on all valves. Install cupped side down below upper spring retainer.

VALVE SPRING INSTALLATION

Valve spring ends must be square within 1/16". Install springs with damper (closed) coil end downward. Installed height of springs (measured from spring contact area on head to underside of spring retainer) should be 1 9/16- 1 39/64" (except Galaxie); 1 3/4- 1 25/32" (Galaxie). If height greater than maximum allowable, install .030" spacers as necessary to meet specifications. *CAUTION* - To avoid overstressing springs and overloading camshaft lobes, DO NOT INSTALL more than 2 spacers under each spring.

VALVE GUIDE SERVICING

To ream guides for installation of valves with oversize stems, always use reamers in sequence and reface valve seat after valve guide is reamed. Reamers are furnished .003" oversize with standard diameter pilot; .015" oversize reamer with .003" oversize pilot; and .030" oversize reamer with .015" oversize pilot.

REAR MAIN BEARING OIL SEAL

NOTE - Upper seal can be replaced only with crankshaft removed from engine.

Upper & Lower Seal - *CAUTION - Use Installing & Forming Tool as indicated in table below, and follow procedure listed exactly to prevent seal shift and oil leaks.* Pre-form seal by hand and install into block or cap with thumbs, seating seal at center and then working from the ends toward the center. Now place installing tool properly in block or cap as follows: Large flanged face of tool must be toward rear of engine for upper seal, and toward rear face of cap for lower seal. Tool flanges must bottom on seal groove rear flange and bearing saddle (insert removed). Hold tool firmly and strike top of tool sharply. Cut seal ends flush with block or cap. Trim frayed ends.

Side Seals (223") - Dip side seals in penetrating oil and install **immediately** into grooves. *CAUTION - DO NOT use sealer. Seals expand with oil.* Tap seals firmly into position. DO NOT trim ends.

Testing Seal Installation - Squirt a few drops of oil into parting lines between cap and cylinder block from the outside. Blow compressed air against seals from the inside of block. If air bubbles appear in oil, seal leaks.

Crankshaft Rear Seal Installing Tool

Engine	Tool No.
144", 170", 200"	T60K-6701 or 6701-D
223"	T52L-6701-AGD or 6701-A

ENGINE FRONT COVER

Removal - Drain crankcase and cooling systems. Remove radiator, fan, belt, pulley, damper, water pump, and oil pan. Remove front cover.

Installation - Use Pilot (alignment tool) as indicated in table below to center cover on crankshaft. Push in on tool and tighten cover bolts to specifications. Reverse removal procedure to complete installation.

Engine Front Cover Aligning Tool

Engine	Tool No.
144", 170", 200"	T61K-6019-A or 6059-E
223"	T52L-6306-AEE

TIMING CHAIN VIBRATION DAMPER(223")

There should be .030-.070" clearance between chain and snubber pad when all slack is removed from chain.

ENGINE FRONT COVER OIL SEAL

Remove old seal with punch and clean recess in cover. Drive new seal in cover with tool listed in table below until seal is fully seated and make sure spring is positioned properly in seal.

Front Cover Seal Installing Tool

Engine	Tool No.
144", 170", 200"	T60K-6700-A or 6700-C

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

HYDRAULIC LIFTERS

See illustration for arrangement of parts. Leakdown rate should be 10-100 seconds. Use a lifter tester according to directions of manufacturer.

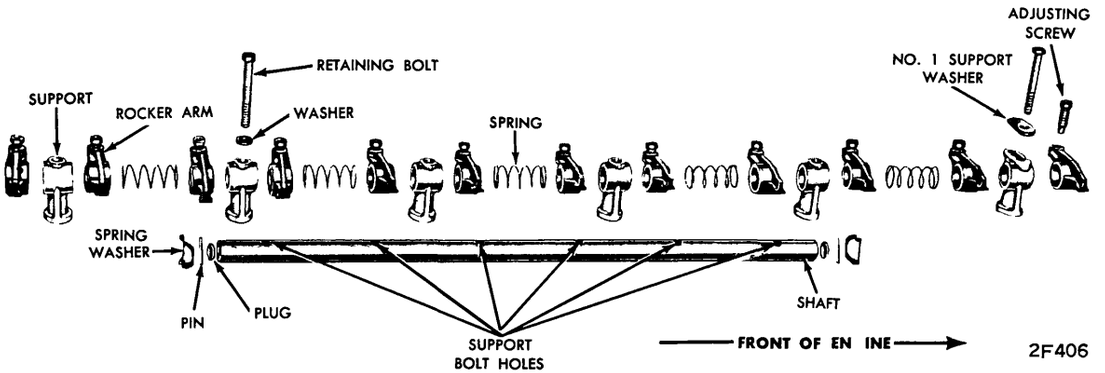
HYDRAULIC VALVE LIFTER (EXPLODED)

HYDRAULIC LIFTER OPERATING RANGE ADJUSTMENT (144", 170", 200")

Place No. 1 piston at TDC of compression stroke and adjust intake and exhaust valves for that cylinder as detailed below. Repeat adjustment for each cylinder in firing order by turning crankshaft 1/3-turn at a time in direction of rotation. Proceed as follows: Loosen rocker arm adjusting screw (counterclockwise) until there is end clearance in pushrod, then turn adjusting screw clockwise until all pushrod-to-rocker arm clearance is just removed (check by moving pushrod with fingers as screw is tightened). **Now tighten adjusting screw an additional 2½ turns** to place lifter plunger at approximate center of its travel. *NOTE - With lifter fully collapsed, clearance between rocker arm and valve stem tip should be .067-.200".*

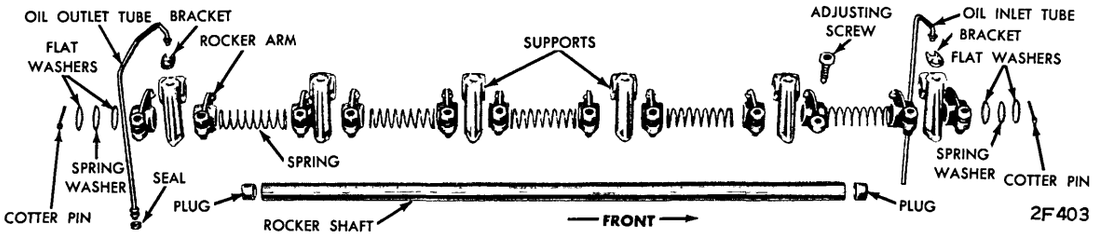
ROCKER ARM ADJUSTING SCREW NOTE - If torque required to turn self-locking adjusting screw less than 3 ft. lbs., install new standard or .002" oversize screw. If minimum 7 ft. lbs. torque cannot be obtained with oversize adjusting screw, replace rocker arm and adjusting screw assembly.

"ZERO LASH" ROCKER ARM ADJUSTMENT (223")



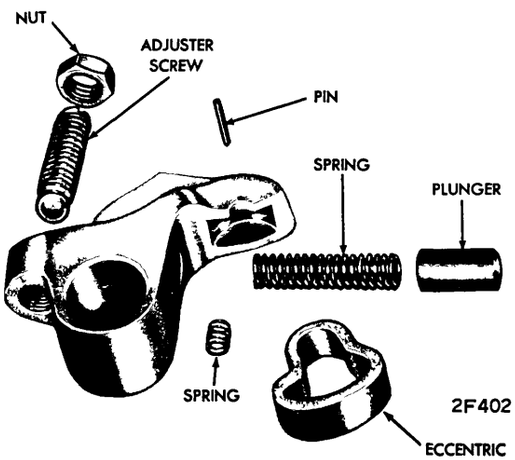
Adjust intake and exhaust valves of each cylinder in turn in firing order with each piston at TDC at end of compression stroke as follows:

1) Push rocker arm eccentric in toward rocker arm until recess mark on eccentric is inboard of valve stem tip (eccentric will remain in position when released and should be near limit of its travel). Push eccentric end of rocker arm down until eccentric contacts valve stem tip and all vertical and horizontal clearance in eccentric is removed.



2) Tighten rocker arm adjusting screw to remove all lash between screw and pushrod socket. *CAUTION - Do not turn screw beyond this position or valve will be forced open.* Push outward slightly on eccentric. If all vertical clearance was not removed, eccentric will move out slightly until upper edge of eccentric bottoms in rocker arm, but recess mark must still be inboard of valve stem tip.

3) Continue to push eccentric outward and loosen rocker arm adjusting screw until recess mark in eccentric is centered directly over valve stem tip. Tighten adjusting screw locknut.



Final Adjustment - With engine idling at normal temperature, make minor adjustment with adjusting screw until eccentric recess mark is centered over valve stem tip during entire valve cycle of operation. Tighten adjusting screw locknut to 30-35 ft. lbs.

144", 170", 200" ENGINES ROCKER ARM & SHAFT ASSEMBLY (EXPLODED)

223" ENGINE ROCKER ARM & SHAFT ASSEMBLY (EXPLODED)

"ZERO LASH" ROCKER ARM ASSEMBLY (EXPLODED)

ROCKER ARM ASSEMBLY OVERHAUL

"Zero Lash" Type

Eccentric recess depth in rocker arm should not exceed .300" measured from radius corners of front cutout (below pin hole) perpendicular to greatest depth of recess. *See illustration for arrangement of parts.*

Eccentric Plunger Spring Specifications

Free Length	1.52"
Lbs. Pressure	ℂ 5.75-6.25 lbs. at 1.17"

ℂ - Wear limit 5.5 lbs. at 1.17".

Conventional Type

See illustration for arrangement of parts. End plugs must have cup side facing out, and oil holes in shaft must be facing downward. When installing, make sure that inlet line "O" ring seals are in place, and that support end of outlet pipe enters locating hole in shaft to position shaft properly.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE OILING

Normal Oil Pressure - 35-55 lbs. at 2000 RPM (Hot).
Pressur Regulator Valve - In pump body. Not adjustable.

ENGINE OILING SYSTEM

144", 170", 200" Engines

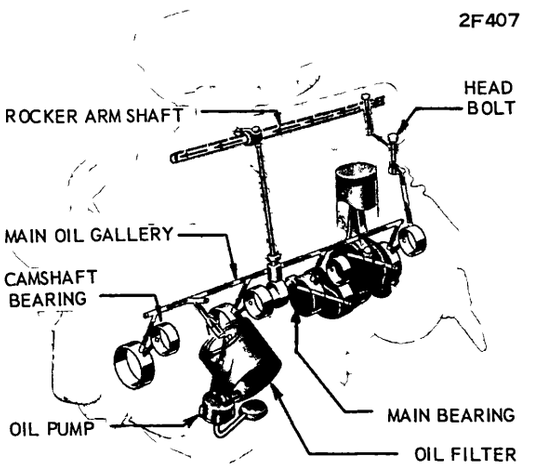
Force feed type. Rotor type oil pump used. *See illustration and note the following:*

Hydraulic Lifters - Lubricated directly from main oil gallery.

Timing Chain & Sprockets - Lubricated by splash from oil pan.

Rocker Arms, Pushrods & Valve Stems - Oil from lower hole in rear camshaft bearing flows around grooved rear camshaft journal and out through upper hole in rear camshaft bearing through vertical passage in block and around left rear corner cylinder head bolt to oil port at rear rocker arm shaft bracket pad. Oil then flows around this bracket bolt to hollow rocker arm shaft, and is distributed to each rocker arm for rocker arm, pushrod, and valve tip lubrication. Excess oil is discharged from rocker arm shaft at front shaft bracket. Oil from rocker chamber runs down pushrods to lubricate pushrod seat and lifter and drains back into the oil pan through cored openings in the block.

Oil Filter - Full flow type. Mounted externally on left front corner of engine. Filter has integral bypass valve and anti-drain back diaphragm.

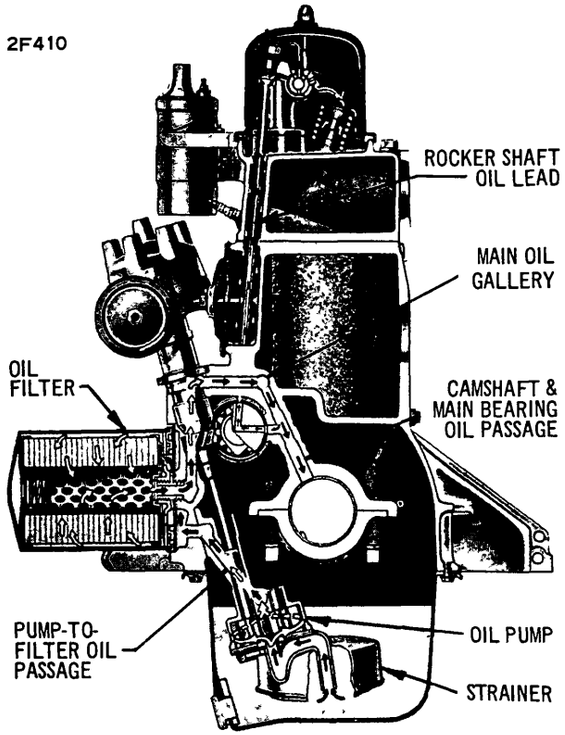


223" Engine

Force feed type with rotor type oil pump. *See illustration and note the following:*

Timing Chain & Sprockets - Lubricated through drilled passage in front end of block which directs oil from front camshaft bearing to crankshaft sprocket (camshaft journal has flat which registers with bearing supply hole and timing chain lubrication hole once in each revolution). Oil slinger on front end of crankshaft also throws oil onto chain.

Rocker Arms, Pushrods, & Valves - Drilled passage in No. 3 (rear intermediate) camshaft journal feeds oil at reduced pressure to drilled passage in block. A tube extending up through block and cylinder head directs



(Continued)

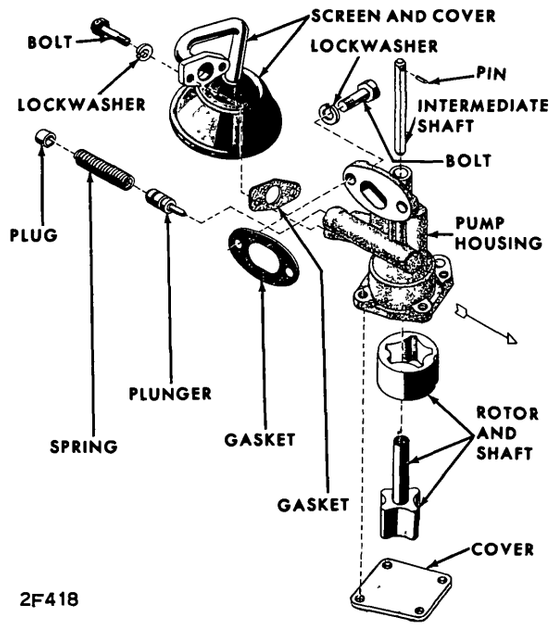
144", 170", 200" ENGINES OILING SYSTEM

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

this oil to the No. 6 (rear) rocker shaft bracket and into the hollow rocker arm shaft. Oil then flows through drilled passages in rocker arm to lubricate rocker arm bushing, pushrod socket and valve tip. Oil drainage from rocker arm drains down pushrods for valve lifter lubrication. Excess oil from rocker arm shaft flows through outlet pipe at No. 1 (front) rocker shaft bracket. This pipe terminates at drilled hole in lifter chamber directly above distributor drive shaft for distributor and drive gear lubrication (see below). *"ZERO LASH" ROCKER ARM NOTE* - Spring in rocker arm recess between arm and eccentric separates arm and eccentric for increased oil flow around eccentric. Rocker arm plunger and spring assembly is filled with oil to provide a cushioning effect to eccentric movement.

223" ENGINE OILING SYSTEM

ENGINE COOLING



Thermostat - Located in water outlet elbow.
Low Temp. - Starts to open 155-162°F, fully open 182°F.
High Temp. - Starts to open 185-192°F, fully open 212°F.
Pressure Valve - 12-15 lb. radiator filler cap.

WATER PUMP

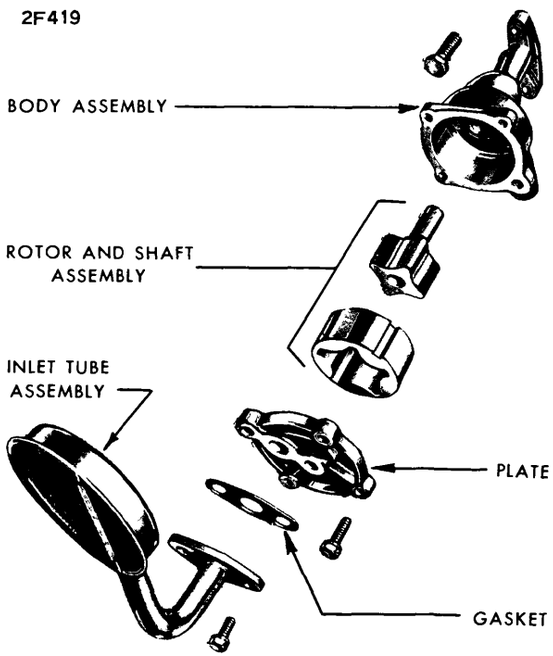
Special tool sets are available for water pump overhaul. Other suitable support plates and drivers may be used

(Continued)

Valve Lifter & Fuel Pump Eccentric - Oil drainage from rocker arm flows down pushrods into lifter chamber for valve lifter and pushrod seat lubrication. A drilled hole in the lifter chamber floor directly above fuel pump eccentric on camshaft provides lubrication for the eccentric. A return hole at rear of lifter chamber allows oil to drain back into the crankcase
Distributor & Drive Gear - Oil return pipe from rocker arm shaft terminates at drilled hole in lifter chamber. This hole is directly above distributor drive gear on camshaft and gears are lubricated by this return oil. A transverse passage in the block at the oil return pipe location in the lifter chamber directs drain oil to relieved section of distributor housing. Oil holes in housing direct oil to distributor lower bushing and drive gear.
Oil Filter - Full flow type mounted on pad on right side of crankcase. Filter has integral bypass valve and anti-drain back diaphragm.

223" ENGINE OIL PUMP (EXPLODED)

OIL PUMP



Rotor type pump used on all engines. See illustrations for arrangement of parts Pump cover screw torque is 6-9 ft. lbs.

CAR BUILD DATE CODE

Stamped under DATE on car patent plate. Number designates day of month, letter designates month as follows: **A** January through **M** December (**I** not used)

CAPACITIES

	Comet & Falcon	Fairlane & Meteor	Galaxie
Water (Qt.) ①	8½	8½	15
Crankcase (Qt.) ②	3½	3½	4
Fuel (Gal.)	14	16	③ 20
Manual Trans. (Pt.)	2½	2½	3
Auto. Trans. (Pt.)	7½	7½	10
Rear Axle (Pt.)	2½	4½	4½

① - Add 1 Qt. for heater.
② - Add 1 Qt. with filter change.
③ - 21 Gal. on Station Wagon.

ENGINE BUILD DATE CODE

Stamped on engine as indicated in table below. Number carries identification data as follows:

① ② ③ ④ ⑤
3 3 H 26 M

① - Engine Plant **1 & 2** - Cleveland; **3** - Dearborn; **4** - Lima; **5** - Green Island.
② - Year. **3** 1963.
③ - Month. **A** January through **M** December (**I** not used).
④ - Day of Month.
⑤ - Any of various inspectors marks.

Engine	Build Date Location
144", 170", 200"	Above Crankcase Vent Outlet Pipe
223"	Above Generator, Left Side

FILTERS & CLEANERS

	① Service Interval
Oil Filter	Replace at Oil Change
Air Cleaner	② Clean at 6000 miles
Breather Cap	Clean at 6000 miles
Fuel Filter	Replace at 36,000 miles

① - Replace or clean more often if necessary.
② - Replace element at 24,000 miles.

REPLACING OIL FILTER

Coat gasket face of filter with oil, thread filter on bracket by hand until gasket contacts adapter surface, then tighten filter an additional ½-turn Run engine and check for leaks. *CAUTION - Do not overtighten.*

SERVICING AIR CLEANER (DRY TYPE)

Attach element to a ¼" drill and spin element for 2 minutes inside a splash shield set on floor. *Do not use solvent.* Inspect element for cracks or splits.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

TRANSISTOR IGNITION

See "Ford Motor Co Transistor Ignition" in Electrical Section

TUNE-UP NOTES

► *1963 VERY ROUGH OR NO IDLE CORRECTION:* May be caused by restricted idle fuel jet (check by removing air cleaner and covering idle air bleed with engine running - increase in RPM indicates restriction) To correct, thoroughly clean all passages with compressed air

► *1963 CARBURETOR MAIN METERING JET SIZE "TAILORING" TO CORRECT FOR RICHNESS OR LEANNESS:* A one size richer or leaner jet may be installed in place of the standard jet for better performance, depending on the particular condition *NOTE* - Make sure any factors contributing to a rich or lean condition have been eliminated before changing jets *See "Ford 2 & 4-Barrel Carburetor Jet Specification Table" in Carburetion Section*

► *1963 221" & 260" ENGINES HARD HOT START & ROUGH IDLE CORRECTION & PRODUCTION CHANGE:* May be caused by excess fuel vapors in carburetor bowl To correct, install new air horn, No C3OZ-9524-B, which has smaller internal diameter of vent tubes *NOTE* - This change made in production on December 14, 1962

► *1963 352" 2-BBL ENGINE CARBURETOR & DISTRIBUTOR MODIFICATIONS FOR IMPROVED ACCELERATION & FUEL ECONOMY:* 1) Distributor C2AF-12127-A used on 390" Engine used on later production on this engine Either install this distributor or modify existing distributor (COAF-12127-D or E) as follows: Install Orange Primary Weight Spring, B8A-12192-B, Green Secondary Weight Spring, B7A-12191-B, Blue Vacuum Diaphragm Spring, COTZ-12192-A, and Vacuum Advance Stop, COTZ-12202-A. Adjust Mechanical and Vacuum Advance of modified distributor to specifications listed for C2AF-12127-A *(see "Distributor Advance Specifications")*

2) Replace carburetor Booster Venturi Assembly "FA" (C1AZ-9A523-C) with "F" Booster Venturi Assembly (C0AE-9A523-A) *NOTE - Carburetors with "F" booster in production identified by orange paint on code tag*

3) Install 1 size leaner main metering jet *NOTE - Carburetors with this jet installed in production have "B" on code tag after prefix and suffix*

► *1963 HARD HOT START & FUEL ECONOMY CORRECTION & PRODUCTION CHANGE:* May be caused by excessive choke because choke spring is sensitive to cooler engine compartment air To correct, clamp heater hose to choke housing cover using Clamp C3AZ-18572-A, and three Cover Screws C3AZ-9B874-A *NOTE - Heater hose clamped to choke housing on later cars*

► *1963 HESITATION ON ACCELERATION CORRECTION (EARLY CARS).* May be caused by improperly seated (staked) accelerator pump ball checks To correct, stake balls properly

► *HESITATION, STUMBLE, ROUGH ENGINE IDLE CORRECTION (CARS WITH FORD CARBS).* *See "Automatic Choke Torsion Spring Adjustment" in Ford 2 & 4-Barrel Carburetors in Carburetion Section.*

► *1958-63 HESITATION OR STUMBLE ON ACCELERATION CORRECTION (CARS WITH FORD CARBS):* Plastic accelerator pump cavity filler block, No C3OZ-9F565-A, may be installed in accelerator pump cavity if carburetor not already equipped This filler block used in some late production 1962 cars and in most all 1963 cars

► *1963 ENGINE STALLING CORRECTION:* May be caused by engine coolant tag being drawn into air cleaner opening To correct, shorten tag wire and relocate tag

► *TRANSISTOR IGNITION CAUTION: Special procedure for connecting dwell meter, "bumping" engine, and other operations must be followed to prevent damage to transistor ignition system ,See "Ford Motor Co. Transistor Ignition" in Electrical Section*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

IGNITION TIMING

Set timing at idle speed (below 550 RPM to insur there is no mechanical advance) with distributor vacuum line disconnected Degrees given are BTDC Minimum allowable setting is 2° BTDC Maximum allowable setting is 5° BTDC more than recommended figure except as noted

NOTE - Timing may be advanced 2° (except where noted) when new points installed to compensate for rubbing block initial wear during first 6000 miles of operation

FIRING ORDER (ALL ENGINES)

MANIFOLD HEAT CONTROL VALVE

On applications where flywheel type counterweight used, counterweight must be installed between the manifold and fender apron (to the outside)

THERMOSTATIC AIR INTAKE DUCT

Description - Thermostatically controlled carburetor air cleaner intake duct to provide heated air to intake manifold.

Testing - 1) Remove assembly from engine and separate shroud and tube assembly from air cleaner duct and valve assembly.

2) If valve plate binds or does not move freely, remove thermostat and valve plate and clean thoroughly.

3) Place thermostat and air duct assembly in 75-78°F water for 3 minutes. Keep assembly immersed and turn thermostat as necessary to obtain "heat on" (no cold air) position, then tighten locknut.

4) Run water above 100°F over thermostat and duct assembly. If valve plate does not close, replace thermostat. Dry assembly with compressed air. Valve plate should move to "heat on" position.

① - Prefix & Suffix of number on tag on carburetor or stamped on main body (Ford Carb), on choke plate flange (Holley Carb)
② - Top of float parallel with top of fuel bowl with bowl inverted
③ - At lower edge of sight plug opening ± 1/16"
④ - ± 1/64" ⑤ - ± 1/32"
⑥ - Front Carb Centered; Rear Carb 90° Clockwise from Centered (no choke action)

ACCELERATING PUMP

FORD CARBURETOR NOTE - Pump over-travel lever has four holes (No. 1 hole is nearest throttle shaft, and No. 4 hole is furthest from throttle shaft). Accelerating pump plunger lever has two holes.

Ford Carb. (221", 260" Engines) - Accelerating pump operating rod must be installed in No. 4 hole (furthest from throttle shaft) for all operating conditions. Install opposite end of pump rod in inner hole (closest to pump plunger) of plunger lever.

Ford Carb. (289", 352", 390" Engines) - Install pump operating rod in proper hole of over-travel lever as indicated in table below for various operating conditions Install opposite end of pump rod in inner hole (closest to pump plunger) of plunger lever *NOTE - For operation over 5000 ft altitude, place pump operating rod in No. 1 hole*

Over-Travel Lever Hole	Operating Condition
No. 1	Over 80°F and/or 5000 Ft. Alt.
No. 2	40-80°F.
No. 3	Below 40°F
No. 4	Below -15°F

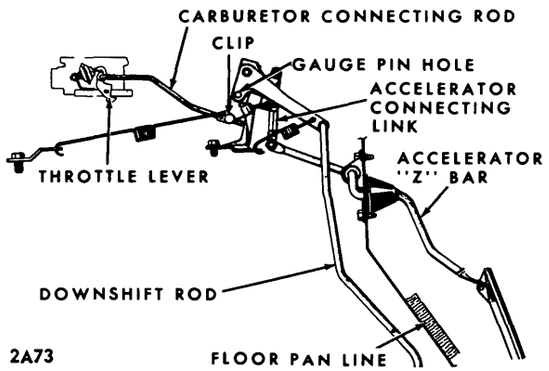
Holley Carb. (390", 406", 427" Engines) - Align No 1 (top) hole of pump cam with top hole of throttle lever for short stroke (warm weather or average conditions) Align No 2 (bottom) hole of pump cam with bottom hole of throttle lever for longest stroke (cold weather operation)

MANIFOLD FUEL DISTRIBUTION

Carburetor right barrel feeds cylinders 1,4,6,7. Carburetor left barrel feeds cylinders 2,3,5,8.

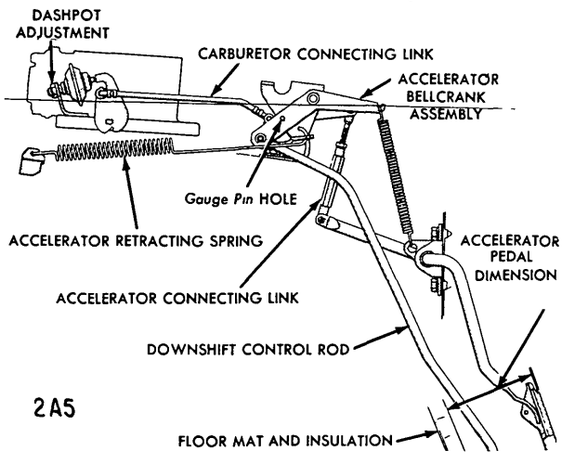
THROTTLE LINKAGE ADJUSTMENT

Falcon & Comet Auto. Trans. - With engine at normal operating temperature, and idle speed correctly set, make anti-stall dashpot adjustment (see below), then proceed as follows: Adjust length of carburetor throttle lever-to-bellcrank connecting rod so a .245-.250" diameter rod can be repeatedly inserted in bellcrank alignment holes Leave rod inserted in bellcrank alignment holes and adjust accelerator connecting link to obtain accelerator pedal height of 4 7/16" measured from top front corner of pedal pad to floor mat Remove gauge rod



Fairlane & Meteor Auto. Trans. - With engine at normal operating temperature, and idle speed correctly set, make anti-stall dashpot adjustment (see below), then proceed as follows: Stop engine and adjust accelerator connecting link for accelerator pedal height of 3 15/16" (Fairlane), 4 5/16" (Meteor) from top front corner of accelerator pedal to floor mat. Disconnect carburetor

(Continued)



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

connecting rod from carburetor throttle lever and insert a 1/4" gauge pin through gauge pin holes in bellcrank. Adjust length of carburetor connecting rod for free fit into throttle lever with throttle lever held against hot idle screw. Gauge pin must be a free fit in gauging holes. Connect carburetor connecting rod and remove gauge pin.

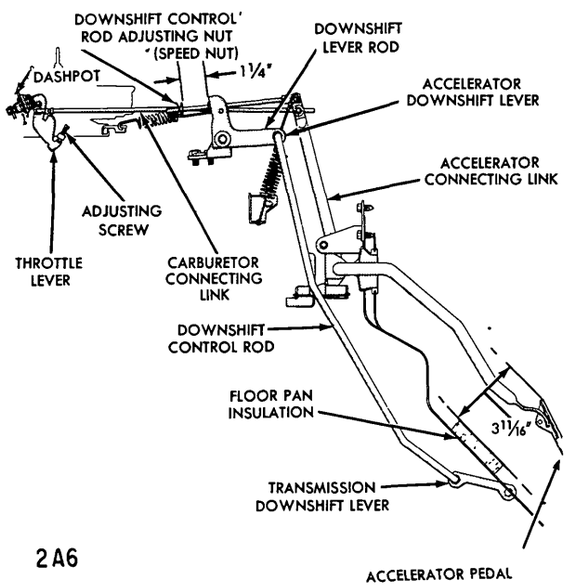
Galaxie & Monterey 2-Speed Auto. Trans. - With engine idle speed correctly set, make anti-stall dashpot adjustment (see below), then proceed as follows: Stop engine and make sure carburetor throttle arm stopscrew is against hot idle step of carburetor fast idle cam. Adjust accelerator connecting link for accelerator pedal height of 3 11/16" (Galaxie), 3 1/2" (Monterey) from top front corner of accelerator pedal to floor mat. Disconnect carburetor connecting link at carburetor, insert a 1/4" gauge pin through holes in bellcrank assembly, and adjust carburetor connecting link so gauge pin will slide in and out of holes freely several times when connecting link is connected to carburetor.

FAIRLANE & METEOR
AUTO. TRANS. THROTTLE LINKAGE

GALAXIE & MONTEREY
AUTO. TRANS. THROTTLE LINKAGE

Galaxie & Monterey 3-Speed Auto. Trans. - With engine idle speed correctly set, make anti-stall dashpot adjustment (see below), then proceed as follows: Make sure carburetor throttle lever is against idle adjusting screw. Disconnect carburetor connecting link from accelerator bellcrank. Insert 1/4" gauge pin through holes in bellcrank assembly. Lift connecting link to normal operating position, maintain forward pressure on link so carburetor throttle lever is firmly against idle adjusting screw, and adjust length of link so sleeve fits freely into bellcrank lever. **Rotate sleeve one full turn counterclockwise to lengthen link.** Remove gauge pin and connect link. Make sure gauge pin will still enter gauging holes freely (adjust connecting link again as necessary). Adjust accelerator connecting link so pedal height is 3 11/16" (Galaxie), 3 1/2" (Monterey) from top front corner of pedal to floor mat.

Thunderbird Auto. Trans. - With engine idle speed correctly set, make anti-stall dashpot adjustment (see below), then proceed as follows: Make sure carburetor throttle lever is against idle adjusting screw. Disconnect carburetor connecting link at carburetor and adjust link to obtain accelerator pedal height of 3 11/16" from top front corner of pedal to floor mat. Place speed nut on downshift lever rod 1 1/4" from forward face of bushing in downshift lever (distance from bellcrank to nut will be 1 1/4").



TRIPLE CARBURETOR LINKAGE SYNCHRONIZATION

All Triple Carburetor Equipped Cars - 1) Insert a 1/8" diameter gauge pin in gauging holes in bellcrank lever and bracket on left side of engine near distributor (at anti-stall dashpot if equipped) to lock lever in closed throttle position.

2) Disconnect throttle rods at both front and rear carburetor throttle levers, then disconnect center carburetor throttle rod at bellcrank lever. Adjust length of front carburetor throttle rod so that with rod installed, throttle lever of front carburetor will be completely closed when center carburetor throttle lever is closed against idle speed adjusting screw stop (normal idle position).

3) Adjust rear carburetor in same manner then install front and rear throttle rods to throttle levers and tighten locknuts.

4) With center carburetor throttle lever against idle stop, adjust throttle rod so trunnion will just engage in hole in bellcrank lever, then install rod retainer clip. Remove gauge pin and adjust anti-stall dashpot as required.

THUNDERBIRD AUTO. TRANS. THROTTLE LINKAGE

ANTI-STALL DASHPOT ADJUSTMENT

All Except Triple Carburetors - With carburetor hot or slow idle speed correctly adjusted, hold throttle valve closed. Clearance between dashpot plunger and throttle lever with dashpot plunger fully depressed should be .060-.090". Adjust by loosening locknut and turning dashpot in bracket.

Triple Carburetor Cars - With idle speed and mixture correctly set, and carburetor linkage synchronized, proceed as follows: Insert a 1/8" diameter gauge pin in gauging holes in bellcrank lever and bracket on left side of engine at dashpot. Clearance between dashpot plunger and bellcrank lever with dashpot plunger fully depressed should be 1/8-3/16". To adjust, turn dashpot in mounting bracket. Tighten locknut and remove gauge pin.

406" & 427" TWO-CARBURETOR ADJUSTMENT

Make adjustments in the following sequence:

INTER-CONNECTING LINKAGE

1) Disconnect inter-carburetor linkage at front and rear carburetors and at bellcrank lever. Disconnect accelerator rod at left side bellcrank lever (on manifold).

2) Adjust primary carburetor rod to length of 4 3/16" (from center of hole to center of bent end), install rod on bellcrank lever and upper stud of front carburetor lever. Move bellcrank lever so front carburetor throttle valves in wide open position and hold in this position.

3) Install slotted end of secondary carburetor rod on rear carburetor throttle lever, move throttle lever to wide open position, adjust rod so that hole in rod engages stud on bellcrank lever freely, connect rod..

4) Move left side of bellcrank assembly (on manifold) so that throttle valves on both carburetors are wide open *(CAUTION - Accelerator lever must b engaged between pin and pad of accelerator pedal).* Have someone depress accelerator pedal to the floor and hold pedal in this position. Accelerator rod pin should engage bellcrank lever. Adjust as necessary.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

INITIAL IDLE SPEED & MIXTURE

Turn throttle stopscrew on each carburetor in 3 full turns from point where throttle valves tightly closed Turn all idle mixture screws (2 on each carburetor) out 1-1/2 turns from lightly seated position

FINAL HOT IDLE SPEED & MIXTURE

1) Attach tachometer Operate engine in neutral until it reaches normal operating temperature *NOTE* - If equipped with Air Conditioning, engine must be operated at least 20 minutes
2) Set engine idle speed at 750 RPM by turning throttle stopscrew on each carburetor equally and alternately *CAUTION - Fast idle adjusting screw must not contact fast idl cam whil making this adjustment*
3) Adjust each idle mixture screw (front carburetor first, rear carburetor last) by turning screw in until engine runs rough (lean), then out until engine runs rough (rich), and finally in just enough to smooth out the roughness (will provide a slightly rich mixture) Final setting of all adjusting screws must be equal within 1/8 turn
4) Recheck idle speed and adjust as necessary

MANUAL THROTTLE CONTROL ADJUSTMENT

Air Condition d Car (If Equipped) - Attach a tachometer to engine and place transmission selector lever in "N" or "P". Turn air conditioning on and make sure magnetic clutch is engaged. Using hand throttle, bring engine speed to 750-1000 RPM and secure stop closest to throttle control handle against cable armor so engine cannot be operated higher than above range with hand throttle.

POWER STEERING IDLE SPEED-UP CONTROL ADJUSTMENT

Pow r Steering Cars (If Equipped) - With engine at correct idle speed, turn wheels against linkage stops, loosen locknuts on control valve mounting bracket, and adjust control valve to maintain same idle speed with linkage against stops. *CAUTION - Do not hold wheels against stops for more than 15 seconds.*

BELT ADJUSTMENT

Belt Tensi n (Lbs.) With Tension Gauge T63L-8620-A

	New Belt	ℂUsed Belt
Generator (Single Belt)	110-140	80-110
Generator (Dual Belt)		
Front	110-140	80-110
Rear	105-155	75-120
Power Steering	120-150	90-120
Air Conditioning Compressor	120-150	90-120

ℂ - Any belt operated 10 minutes or longer is a used belt.

ELECTRICAL

►*1963 RECURRING RUN-DOWN BATTERY CORRECTION (60 AMP LEECE-NEVILLE ALTERNATOR CARS):* If current output of system is correct, trouble may be caused by burned or stuck load relay contacts due to stop and go driving and subsequent high charging rate through contacts To check for current leak, turn off all electrical components, disconnect battery positive cable, and note if spark occurs If spark occurs, there is current leak To correct, replace load relay contacts, and remove wire from regulator "G" terminal and connect to regulator "B" terminal This removes load relay contacts from alternator output circuit and connects alternator output terminal directly to battery *NOTE - This change made on later production cars.*

BATTERY

12 Volt Type.

Engine	Capacity Amp. Hr. (20 Hr. Rate)
221", 260", 289" Std	55
Optl	65
352", 390" Synchro-mesh Std	55
Optl	65 or 70
352", 390" Auto Trans Std	65
Optl	70
406", 427" Std	70

Battery Ground - Negative, to cylinder head.

Engine Ground - Cylinder head, Intake manifold, or Cylinder block to dash.

STARTER

221", 260", 289" Engines

Torque	RPM	Volts	Amperes
0 ft. lbs.	ℂ	12.0	70
15.5 ft. lbs.		5.0	670

ℂ - With starter on engine and engine idling.

Current Draw & Cranking Speed - 100-150 amps. at 250-290 RPM.

352", 390", 406", 427" Engines

Torque	RPM	Volts	Amperes
0 ft. lbs.	ℂ	12.0	80-110
14.8 ft. lbs.		5.0	580

ℂ - With starter on engine and engine idling.

Current Draw & Cranking Speed - 155-210 amps. at 150-180 RPM.

Brush Spring Tension (All Models) - 45-58 ozs.

GENERATOR

Generator Type	Amperes	Volts	Gen. RPM
Ford	30	15.0	2525
Autolite	40	15.0	1800

Brush Spring Tension - 20-26 ozs. (Ford Gen.), 34-41 ozs. (Autolite Gen.).
Field Current - 1 2-1 8 amps at 12 volts & 75°F (All)

GENERATOR REGULATOR

Cutout Relay

Cuts In - 12.0-12.8 volts (Ford), 12.5-13.8 volts (Autolite).
Cuts Out - 6-9 amps. (Ford), 8 amps. (Autolite) reverse current.

Voltage Regulator

Setting - 14.6-15.4 volts (Ford), 14.3-15.1 volts (Autolite) at 75°F.

Current Regulator

Setting - 28-32 amps. (Ford), 33-47 amps. (Autolite).

ALTERNATOR

FORD

Alternator	Amperes	Volts	Alt. RPM
30 Amp. Type	30	15.0	(hot) 6500
40 Amp. Type	40	15.0	(hot) 6500

LEECE-NEVILLE

Current Output - 60 amps. at 1600 Engine RPM.

ALTERNATOR REGULATOR

FORD

►*1963 THUNDERBIRD & MONTEREY REGULATOR PRODUCTION CHANGE:* Regulators with yellow paint on regulator base have been modified to correct engine compartment whine. *See "Engine Compartment Whin Noise Correction" under Engine Data (following).*

Field Relay

Closing Voltage - 3-4 volts.
Contact Gap - .015-.022". **Air Gap** - .022-.030".

Voltage Regulator

Setting - 14.1-14.9 volts at 75°F.
Contact Gap (Lower Contacts) - .010-.015".
Air Gap - .045-.052" with upper contacts closed.

LEECE-NEVILLE

Load Relay

Closing Voltage - 5.6-6.4 volts.

Voltage Regulator

Setting - 13.5-14.3 volts at 75°F.

Current Regulator

Setting - 58-62 amperes.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

FUSES & CIRCUIT BREAKERS

ALL (EXCEPT THUNDERBIRD)
